1. Mw. 1649. P

TO THE RIGHT HONOVRABLE EDVVARD LORD HERBERT OF *Gherbury* and *Castle Island*, and one of his Majesties most Honorable Counsell of War.

My Lord,

IT is not the far-fetcht pedegree of noble Ancestors, nor those Honours your Lordship deservedly possesses, that make mee crave your Patronage to this my Labour; but it is that Heroick mind, enriched with the choice endowments of Nature and Art, and that earnest affection wherewith your Honour [illegible] all Sciences, Arts, and Artists, with [illegible] acces into the inner man, which [illegible] your Honors assistance, in protecting [illegible] many favours is made yours. I know [illegible] Wisdom of our times, consists [illegible] carping at all things that see light, [illegible] earnestly hunt after the publike fame [illegible] by this easily trod, and despicable [illegible] they tread with as much confidence [illegible] which they vainly and unjustly brand with [illegible] their Fate, and flourishes when it is forgotten [illegible] they had being.

I know your Lordships disposition to be far differing from these men, and that you rather endeavour to build [illegible] your Learning and [illegible] your own, than *Herostratus* [illegible] fair built fabrick of another [illegible] with that your Honour

A [illegible]

could propagate this good, and that all Detractors might be turned into Actors, and then I know it would much mitigate their rigour in cenſuring others, when as they themſelves were alſo expoſed unto the ſame Hazzard.

I think it impertinent to acquaint your Honour with the Nature of the Work, my Pains in tranſlating, or the Benefit that may enſue thereon, for that I know your Honour ignorant of nothing in this kind; neither doubt I of your favourable acceptance of the good will of him, that thinks himſelf much honoured by being

Yours,

THOMAS JOHNSON.

TO

To the Reader.

I Have here for the publike good taken pains to ſubject my ſelf to common cenſure, the which I doubt not but to find as various as the faces of the Cenſurers; but I expect no thanks, nor hunt after other praiſe, than that I have laboured for my Countries good, if that deſerve any. I fear not Calumniation (though ſure to hear of it) and therefore I will not Apologize, but inform thee of ſome things concerning the Author his work, and the reaſon that induced me to the tranſlation thereof, with ſome few things beſides. For the Author, who was principall Surgeon to two or three Kings of *France*, he was a man well verſed in the writings of the Antient and modern Phyſitians, and Surgeons, as you may evidently find by ſundry places alledged in his works. For his experience, or practiſe (the chief help to attain the higheſt perfection in this Art) it was wonderfull great, as you may collect by his voyages recorded in the laſt part of this work; as alſo by that which *James Guillemau*, Surgeon to the *French* King, a man both learned and judicious in his profeſſion, avers, ſpeaking of his own education and progreſſe in the Art of Surgery. I ſo laid (* ſaith he) the firſt foundation of this Art in the Hoſpitall of *Paris*, being as it were, an ample Theater of wounds and diſeaſes of all kindes, that for two whole years, during which time I was there converſant, nothing was conſulted of, nothing performed, the Phyſitians, and Surgeons being preſent, whereof I was not an Auditor or Actor. There flouriſhed at theſe times, and yet doth, *Ambroſe Parey*, principall Surgeon to the moſt Chriſtian King, the Author of this great work, moſt renowned for the moſt gracious favour of Kings, Princes and Nobles towards him, for his Authority amongſt his equals, for his Chirurgicall operations amongſt all men. Therefore I earneſtly endeavoured to be received into his family, as unto another *Machaon*, or *Podalirius*: once admitted, I ſo by all dutifulneſſe and due reſpect acquired his favour, that he, unleſſe I were preſent and aſſiſting, did nothing (ſuch is his naturall gentleneſſe and curteſie to all ſuch as are ſtudious of the Art) at home or abroad, in the field, in the tents, or laſtly in this famous City of *Paris*, about the bodies of Dukes, Noblemen, or Citizens, in whoſe cure, he by the ardent deſire of them all, had ſtill the prime place.

* In his Epiſtle prefixed before the Latin edition of this Author.

Now for this work, hear what this ſame man in the ſame place affirmeth further: I not content with theſe means, which may ſeem ſufficient, and too much, as deſirous to ſatisfie my long thirſt, determined to try whether I could draw, or borrow any thing from ſtrangers, which our men wanted, to the fuller knowledge of Surgery. To this purpoſe I travailed over *Germany*, and then for four years ſpace I followed the *Spaniſh* Army in the Low-countries; whereas I did not only careſully cure the wounded Souldier, but alſo heedfully and curiouſly obſerve what way of curing the renowned *Italian*, *Germane*, and *Spaniſh* Surgeons obſerved, who together with me were imployed in the Hoſpitall, for the healing of the wounded and ſick. I obſerved them all to take no other courſe than that which is here delivered by *Parey*. Such as did not underſtand *French*, got ſome pieces of this work for large rewards, turned into Latin, or ſuch Languages as they underſtood, which they kept charily, and made great ſtore of; and they eſteemed, and admired, and embraced this work alone, above all other works of Surgery, &c. Our Author alſo himſelf, not out of a vain-glorious oſtentation, but a mind conſcious of the truth of his aſſertion, affirms thus much of this his work. I have (ſaith he) ſo certainly toucht the mark whereat I aimed, that Antiquity may ſeem to have nothing wherein it may exceed us, beſides the glory of invention, nor poſterity any thing left, but a certain ſmall hope to add ſome things, as it is eaſie to add to former inventions. Thus much concerning our Author, and the excellency of his work.

Now come I to my tranſlation, the which, as deſiring more a publike good, than private praiſe, I have performed plainly and honeſtly, labouring to fit it to the capacity of the meaneſt Artiſt; for theſe are they to whom I chiefly commend this work, and from whom I expect acceptation. I being by the earneſt perſwaſions of ſome of this profeſſion, chiefly, and almoſt wholly perſwaded and incited to take this pains, who knowing the diſability of underſtanding this Author in Latin or *French*, in many of the weaker members of the large body of their profeſſion, diſperſed over this Kingdome, and the reſt of his Majeſties Dominions, whoſe good, and encreaſe in knowledge may be wiſht, that ſo they may be the better inabled to do good to ſuch as ſhall implore their aid in their profeſſion.

To the Reader.

There are ſome (I know) will blame me for Engliſhing this work, as laying open the myſteries of a worthy Art, to the unworthy view of the vulgar. To ſuch I could anſwer as * *Ariſtotle* did to *Alexander*: but for the preſent I will give them theſe, which I think may ſatisfie any but the purpoſely malicious: the firſt is drawn from the goodneſſe of the thing, as intended for thoſe that want ſuch guides to direct them in their Art; for it is commonly granted, that, *Bonum quo communius eo melius.* Secondly, it hath been the cuſtome of moſt Writers in all Ages and Countries thus to do: *Hippocrates*, *Galen*, and the other Greeks, writ in their mother tongue the myſteries of their Art: thus did *Celſus*, *Serenus*, and others in Latin: *Meſue*, *Avicen*, *Serapio*, and others, in Arabick; as alſo, to go no further, our Author writ this work in his native *French*, and learned men have done the like in this, and all other Arts. And it is a great hinderance to us in theſe dayes, that we muſt be forced to learn to underſtand two or three tongues, before we can learn any ſcience, whereas the Ancients learned and taught theirs in their mother tongue: ſo that they ſpent a great deal leſſe time about words, and more upon the ſtudy of that Art or Science they intended to learn and follow. Thirdly, I muſt tell you, that, *Ex libris nemo evaſit Artifex*, No man becomes a workman by book: ſo that unleſſe they have had ſome inſight in the Art, and be in ſome ſort acquainted both with the tearms of Art; as alſo with the knowledge and uſe of the inſtruments thereto belonging, if by reading this, or any other book of the like naaure they becomes Surgeons, I muſt needs liken them (as *Galen* doth another ſort of men *) to Pilots by book only: to whoſe care, I think none of us would commit his ſafety at Sea, nor any if wiſe, will commit themſelves to theſe at land, or Sea either, unleſſe wholly deſtitute of other.

Vide Aul. Gel. l. 20. c. 4.

Gal. de ſimp. l. 6. Τοῖς ἐκ βιβλίων Κυβερνήταις.

The other things whereof I muſt alſo give you notice, are theſe. The figures in the Anatomy are not the ſame uſed by my Author (whoſe were according to thoſe of *Veſalius*) but according to thoſe of *Bauline*, which were uſed in the work of Dr. *Crook*; and theſe indeed are the better and more compleat. Alſo pag. 528. I thought it better to give the true figure of the Helmet floured Aconite, mentioned out of *Pliny*, than to reſerve the faigned picture of *Matthiolus*, which in our Author was encreaſed with the further fiction of a Helmet. I have in ſome few places in the margent, which you ſhall find marked with a ſtar, put ſhort annotations, for the better illuſtration of that which is obſcure, &c. I have alſo in the Text to the ſame purpoſe, here and there put two or three words, contained in theſe limits [ ], which I find here and there turned into a plain Parentheſis, eſpecially toward the latter end of the book, but the matter is not great. Further I muſt acquaint you that the Apologie and Voiages, being the laſt part of this work, and not in the Latin, but *French* editions, were tranſlated into *Engliſh* out of *French* by *George Baker*, a Surgeon of this City, ſince that time, as I hear, dead beyond the Seas.

This is all, Courteous Reader, that I have thought neceſſary to acquaint thee withall concerning this, which I would deſire thee to take with the ſame mind that it is preſented to thee, by him that wiſheth thee all happpineſſe.

THOMAS JOHNSON.

THE AUTHORS EPISTLE DEDICATORIE

To Henry the third, the most Christian King of *France* and *Poland*.

EVen as (most Christian King) we see the members of mans body by a friendly consent are alwayes busied, and stand ready to perform those functions for which they are appointed by nature, for the preservation of the whole, of which they are parts; so it is convenient that we, which are, as it were, Citizens of this earthly Common-weal should be diligent in the following of that calling which (by Gods appointment) we have once taken upon us: and content with our present estate, not carried away with rashnesse and envy, desire different and divers things whereof we have no knowledg. He which doth otherwise, perverts & defiles with hated confusion the order and beauty, on which this Univers consists. Wherefore when I considered with my self, that I was a member of this great Mundane body, and that no altogether unprofitable; I endeavoured earnestly, that all men should be acquainted with my duty, and that it might be known how much I could profit every man. For God is my witnesse, and all good men known that I have now laboured fifty years with all care and pains in the illustration and amplification of Chirurgery; and that I have so certainly touched the mark whereat I aimed, that Antiquity may seem to have nothing wherein it may exceed us, beside the glory of invention; nor posterity any thing left but a certain small hope to add some things, as it is easie to add to former inventions. In performance whereof, I have been so prodigall of my self, my watchings, faculties and means, that I spared neither time, labour, nor cost, whereby I might satisfie and accomplish my own desires, this my great work, add the desires of the studious. Neither may we doubt but their studies would at length wax cold, if they only furnished with the Theorick and Precepts in Schools and that with much labour, should see no manuall operation, nor manifest way of performing the Art. For which cause I seeking the praise and profit of the French *Nation, even with the*

hinderance of my particular eſtate, have endeavoured to illuſtrate and increaſe Chirurgery, hitherto obſcure either by the infelicity of the former ages, or the envy of the Profeſſors; and not only with precepts and rules, but being a lover of carved works I beautified it with 300. forms, or graven figures, and apt delineations, in which whoſoever ſhall attentively look ſhall find five hundred anatomicall or organicall figures belonging to the Art, (if they be reckoned particularly). To every of theſe I have given their names and ſhewed their uſe, leſt they ſhould ſeem to have been put in vainly for oſtentation or delight. But although there be few men of this profeſſion which can bring ſo much authority to their writings either with reaſon, or experience as I can; notwithſtanding I have not been ſo arrogant, but intending to publiſh my work, I firſt communicated it with men the moſt excellent in the Art of Phyſick, who gave me greater incouragement to perfect and publiſh it, that it might be in common uſe: profeſſing they wiſhed nothing more, than that it might be turned into Latin, (ſo by which means it ſhould bee known to forain Nations, that there is no kind of Learning which is not delivered with great dexterity of wit in this Kingdom over which you rule. And thus much I dare boldly affirm, that there is ſcarſe any, be he never ſo ſtately or ſupercilious, but that he may here find ſome thing which may delight him, and by which he may better his knowlrdg. Therefore I doubted not to conſecrate this book unto your Majeſty both as a Pattern and treaſury of my labours, aſwell in reſpect of my duty, who am yours by nature and education, as that I might manifeſt to all, your Highneſſe exceeding bounty towards me, in placing me, (having heretofore injoyed the office of principall Chirurgeon under three Kings your Majeſties Predeceſſors) in the ſame dignity, and that of your own accord. And moreover I did conjecture that it would fall out, as now it doth, that this my work carried through the world by the fame of your Majeſties name, ſhould neither fear the face nor view of any, ſupported by the favour and Majeſty of a moſt invincible Monarch *and moſt excellent and renowned Prince. Neither did King* Charles *the ninth of happy memory, incited by the relation of the moſt gracious Queen his Mother, refuſe to read it, being he underſtood it proceeded from him, who having happily paſſed all his time in private and publike imployments, and converſed with all men of all ſorts, was judged moſt worthy to obtain this favour, as to have the front of this work adorned and beautified with the ſplendor of his prefixed name. I encouraged by this hope, deſired that my requeſt ſhould paſſe as by a certain continuation and ſucceſſion from a moſt powerfull, to a moſt Invincible King; and do wholly conſecrate theſe my labours taken for my Countries good unto your ſacred Majeſty. God grant that your Majeſty may have happy ſucceſſe of all your enterpriſes abundantly added to* Neſtors *years.*

Patis. 8. Feb: Anno Dom. 1579.

Your moſt Chriſtian Majeſties
faithfull Servant

Ambroſe Parey.

The Preface.

MOſt men derive the Originall of Phyſick from heaven; for thoſe who hold the beſt opinion of the Creation of the world, affirm, the Elements being created and ſeparated each from other, man being not as yet made; incontinently by the divine decree, all herbes and plants with infinite variety of flowers, endued with various ſents, taſtes, colours, and forms, grew and ſprung forth of the bowels of the Earth, enriched with ſo many and great vertues, that it may be thought a great offence to attribute to any other than the deity, the benefit of ſo great a bleſſing ſo neceſſary for ſo many uſes. Neither could Mans Capacity ever have attained to the knowledg of thoſe things without the guidance of the Divine power. For God the great Creator and faſhioner of the World, when firſt he inſpired *Adam* by the breath of his mouth into a living and breathing man, he taught him the nature, the proper operations, faculties and vertues of all things contained in the circuit of this Univerſe. So that if there be any who would aſcribe the glory of this invention to man, he is condemned of ingratitude even by the judgment of *Pliny*. But this knowledg was not buryed in oblivion with *Adam*: but by the ſame gift of God was given to thoſe whom he had choſen and ordained for Phyſick, to put their helping hands to others that ſtood in need thereof. Which opinion was not only received in the common manner and by the tacite conſent of all Nations, but confirmed by *Moſes* in the Scripture. Which thing *Jeſus* the ſon of *Sirach* the wiſeſt amongſt the Jews, hath confirmed ſaying; *Honor the Phyſitian with the honor due unto him, for the moſt High hath created him becauſe of neceſſity: and of the Lord cometh the gift of healing. The Lord hath created Medicins of the Earth, and he that is wiſe will not abhor them. Give place and honour to the Phyſitian, for God hath created him, let him not go from thee, for thou haſt need of him.* The *Græcians* who firſt ſeem more fully and with greater fame to have profeſſed the Art of Phyſick, do in a manner conſent with this opinion, in acknowledging *Apollo* to have been the inventer thereof, neither did they it without a reaſonable cauſe. For whether by *Apollo* they may underſtand the Sun who by its gentle and vitall heat doth bring forth, temper and cheriſh all things; or elſe ſome

Geneſ. 1.
Eccleſ. 38. 1.

Heros,

Heros, who incited by an excellent and almoſt divine underſtanding firſt taught and put in practiſe the Medicinall vertues of Herbs; in which ſenſe *Ovid* brings him in ſpeaking thus:

Herbes are of mine invention, and throngh all
The world, they me the firſt Phyſitian call.

The originall of Phyſick ariſing from thoſe beginnings ſhall alwayes be celebrated, as celeſtiall, and was increaſed principally after this manner. After *Apollo*, *Æſculapius* his ſon inſtructed by his father reduced this Art being as yet rude and vulgar into a little better and more exquiſite form, for which cauſe he was reputed worthy to be accounted as one of the Gods. At the ſame time flouriſhed *Chiron* the *Centaure*, who for that he excelled in knowledg of Plants, and taught *Æſculapius* (as many report) their faculties, is thought by *Pliny* and ſome others to have been the inventor of Phyſick. *Æſculapius* had two ſons, *Podalirius* and *Machaon*, who following their fathers ſteps and profeſſing Phyſick, did principally beautifie and practiſe that part thereof which is called Chirurgery, and for that cauſe were accounted the Inventers thereof. After thoſe *Aſclepiades* left this Art much inlarged as hereditary to his poſterity; by whoſe ſtudy and diligence, that part of the Art was invented and annexed, which by a more curious skill ſearcheth and cureth thoſe diſeaſes which lye hid within the body. *Hippocrates* the *Coan* the ſon of *Heraclidas*, born of the noble race of *Aſclepiades*, Prince of the Phyſitians that were before him, perfected Phyſick and reduced it into an Art and wrote divers Books thereof in Greek. *Galen* ſucceeded him ſix hundred years after, who was a man moſt famous not only for his knowledg in Phyſick, but alſo in all other ſciences, who faithfully interpreting every thing that was obſcure and difficult in the writings of *Hippocrates*, enlarged the ſcience with many volumes. Thus therefore was the beginning, thus the increaſe and perfecting the Art of Phyſick, as much as can be hoped for from mans induſtry. Although indeed we cannot deny but that Experience hath much profited this Art, as it hath and doth many other. For as men perceived that ſome things were profitable, ſome unprofitable for this or that diſeaſe, they ſet it down, and ſo by diligent obſervation and marking of ſingularities, they eſtabliſhed univerſall and certain precepts and ſo brought it into an Art. For ſo we find it recorded in ancient Hiſtories, before the invention of Phyſick, that the *Babylonians* and *Aſſyrians* had a cuſtom amongſt them to lay their ſick and diſeaſed perſons in the porches and entries of their houſes, or to carry them into the ſtreets and market places, that ſuch as paſſed by and ſaw them, might give them counſel to take thoſe things to cure their diſeaſes, which they had formerly found profitable in themſelves or any other in the like affects, neither might any paſſe by a ſick man in ſilence.

Plin. l. 7. c. 2.

lence. Alſo *Strabo* writes that it was a cuſtom in *Greece* that thoſe which were ſick ſhould reſort to *Æſculapius* his Temple in *Epidaurum*, that there as they ſlept, by their dreams they might be admoniſhed by the God what means they ſhould uſe to be cured; and when they were freed from their diſeaſes, they writ the manner of their infirmities and the means by which they were cured in tables and faſtened them to the pillars of the Temple, not only for the glory of the God, but alſo for the profit of ſuch, as ſhould afterwards be affected with the like maladies. All which tables (as fame reports) *Hippocrates* tranſcribed, and ſo from thoſe drew the Art of Phyſick. Beaſts alſo have added much to this Art. For one man was not only inſtructed by another, but learned alſo much from brute beaſts, for they by the only inſtinct of nature have found out divers herbs, and remedies, by which they freed and preſerved themſelves from infirmities, which might preſently be transferred to mans uſe. Wherefore conſidering that ſuch and ſo many have concurred to bring this Art to perfection, who hereafter dare call in queſtion the excellency thereof? chiefly if he reſpect the ſubject thereof, Mans body, a thing more noble than all other Mundane things, and for which the reſt were created. Which thing moved *Herophilus* in times paſt to call Phyſitians *The hands of the Gods*. For as we by putting forth our hand, do help any man out of the water or mud into which he is fallen: even ſo we do ſuſtain thoſe that are thrown down from the top of health to the gates of death by violence of diſeaſes, with happy medicins, and as it were by ſome ſpeciall and divine gift deliver them out of the jaws of death. *Homer* the Prince of Greek Poets affirms that one Phyſitian is far more worthy than many other men. All Antiquity gave Phyſitians ſuch honour, that they worſhipped them with great veneration as Gods, or the ſons of their Gods. For who is it which is not much delighted with the divine force of healthful medicins, with which (we ſee by dayly experience) Phyſitians, as armed with *Mercuries* rod, do bring back thoſe languiſhing ſouls which are even entring the gates of death? Hence it cometh to paſſe that the divine Poets of ancient times, as *Orpheus*, and *Muſæus*, and *Heſiod*, and the moſt renowned Philoſophers, *Pythagorus*, *Plato*, *Ariſtotle*, *Theophraſtus*, *Chryſippus*, *Cato Cenſorius*, and *Varro*, eſteemed nothing more excellent than to excell in the knowledg of Medicins, and to teſtifie the ſame by written monuments to poſterity. For what can be more noble and worthy of a generous diſpoſition than to attain to that by the benefit of Phyſick, that adorned with the ornaments of dignity thou mayeſt have power over other men, and favoured of Princes, Kings, and Emperours, mayeſt appoint and preſcribe to them thoſe things which are profitable to preſerve health, and cure their diſeaſes? But if you look for benefit by ſci-

ences;

ences; then know that the professors hereof have beside sufficient gain, acquired much honour and many friends. *Hippocrates* coming to *Abdera* to cure *Democritus* of his madness, not only the men of the City, but also the women, children, and people of every age, sexe and rank, went forth to meet him, giving him with a common consent and loud voice the title of a *Tutelary* Deity and father of their Country. But the *Athenians*, for freeing their country from the plague, with triumphant pompe celebrated playes to his honour, and bountifully set upon his head as if he had been a King, a Crown of gold weighing a 1000. pieces of their golden coin, and erected his statue, f a perpetuall monument of his piety and learning. *Erasistratus* the Nephew of *Aristotle* by his daughter, received, freely given him by *Ptolomy* King of *Egypt*, for the cure of his son, 100. Talents of Gold. The Emperour *Augustus* honoured *Antonius Musa* with a golden statue. *Quintus Stertinius* yearly received out of the Emperours Treasury 12000. 500. pieces of gold. In the time of our Grandfathers *Petrus Aponensis* called *Conciliator* was so famous through all *Italy* for his knowledg in Physick, that he could scarse be intreated to come to any man of fashion that was sick, unless he gave him 50. crowns, for every day he was absent from home: but when hee went to cure *Honorius* the Bishop of *Rome*, he received 400. crowns for every day he was absent. Our *French* Chronicles relate in what credit & estimation *James Cotterius* the Physitian was with *Lewis* the 11. King of *France*; for they report he gave him monethly out of his Treasury 10000. crowns. Physick in times past hath been in such esteem with many famous and noble personages, that divers Kings and Princes delighted with the study thereof, and desirous to attain glory and credit thereby, called sundry herbs after their own names. For so *Gentian* took its name of *Gentius* King of *Illyria*; the herb *Lysimachia* of *Lysimachus*, the King of *Macedon*, the *Mithridatick* herb or *Scordium*, of *Mithridates* the King of *Pontus* & *Bithinia*, *Achilla* of *Achylles*, *Centorie* of *Chiron* the *Centaure*; *Artemisia* of *Artemisia* the Queen of *Caria*. *Attalus* King of *Pergamus*, *Salomon* of *Judea*, *Evax* of *Arabia*, and *Iuba* the King *Mauritania*, were not only inflamed with a desire of the knowledg of Plants; but either they have written books of it, or for the great commodity of posterity, invented by their skil many choise antidotes compounded of divers simples; neither the desire of learning this noble science is yet altogether extinct. As may appear by that *Indian* plant *Tobaco*, called by some the noble herb, *Catherines* herb and *Medices* herb, but commonly the Queens herb, because *Catherine Medices* the mother of our Kings, by her singular study and industry made manifest the excellent vertue it hath in curing malign ulcers and wounds, which before was unknown to the *French*. For these worthy men understood that their glory,

In what esteem Physitians have formerly been.

Names given to Plants.

thus

thus faſtened and ingraffed into the deep, and as it were ever living roots of plants, would never decay; but ſhould be propagated to all poſterity in many ſucceeding ages, growing up with their ſprouting and budding ſhouts, ſtalks, flowers and fruits. Neither did theſe famous men whil'ſt they adorned this part of Phyſick ſuffer the other, which treats of the diſſection of mans body, be buried in oblivion, and without their knowledg; as inſtructed with the precepts and learning of the wiſeſt men, how artificiall and unimitable by mortall hand this fabrick of our body is. Neither is it probable that *Apis*, *Oſiris* and *Ptolomy* Kings of *Egypt*, *Solomon*, *Alexander* the great, *Mithridates*, *Attalus*, ſeeing they dedicated themſelves wholly to the contemplation of naturall things; neglected the uſe of Anatomy, and being men moſt deſirous to know themſelves, to have been ignorant of the ſtructure of their own bodies being the habitations of their ſouls immortal and made to the Image of God: ſeeing they obſerved with certain judgment the different lights of the Sun, Moon and Stars; and paſſed over ſo many lands, ſo many ſeas, ſo many regions, ſo far remote one from another, by wayes ſo terrible by reaſon of cold, uncouthneſs, darkneſs, by rocks, by fire and ſword, with great labour, charge and danger of life, only that they might ſatisfie their minds thurſting after the knowledg of things; and to have left untouched a thing truly noble, admirable, and moſt worthy of knowledg, eaſie to be attained by any and to be acquired without any danger of life, or fortunes.

Seeing there be three parts of that Phyſick which at this time we profeſſe, *Chirurgery* which by the uſe of the hand, *Diet* which with a convenient manner of feeding and ordering the body, and *Pharmacy* that by medicins attempt to expell diſeaſes, and preſerve health; The prime Phyſitians do not without reaſon contend w^ch^ of theſe may be accounted the chief. Certainly *Herophilus* had *Pharmacy* in ſuch eſteem, that he thought medicins were firſt mixed and adminiſtred to the ſick by *Apollo* (whom Antiquity thought a great Deity.) And *Pliny* had ſo good an opinion of Diet, that he exclaims; The true remedies and Antidotes againſt diſeaſes are put into the pot and eaten every day by the poor people. Verily all learned men confeſſe that the manner of curing which is performed by diet, is much more facile & proſperous, than that which is done by medicins; as thoſe things which ſought with much labor and coſt are taken with much loathing, and taken are ſcarce retained, but retained they oft work with much labour and pain: Which things long ago moved *Aſclepiades* to exclude the uſe of medicins, as hurtfull to the ſtomach. Yet if we will beleeve *Celſus*, neither of theſe parts merit the preheminence, but both of them give place to Chirurgery. For ſeeing that fortune is very powerfull in diſeaſes, and the ſame Meats and Medicins are often good and often vain, truly

Phyſick is divided into three parts.

truly it is hard to ſay, whether the health is recovered by the benefit of Diet and *Pharmacy*, or by the ſtrength of the body. Moreover in thoſe caſes, in which we moſt prevail with medicins, although the profit be more manifeſt, yet it is evident that health is often ſought in vain even by theſe things, and often recovered without them. As it may be perceived by ſome troubled with ſore eyes, and others with Quartain feavers, who having been long troubled by Phyſitians are ſometimes healed without them. But the effect of Chirurgery as it is very neceſſary, ſo it is the moſt evident amongſt all the parts of phyſick. For who without Chirurgery can hope to cure broken, or luxated parts, who wounds and ulcers, who the falling of the matrix, the ſtone in the bladder, a member infeſted with a Gangrene or Sphacele? Beſides, this part alſo is the moſt ancient; for *Podalirius* and *Machaon* following their Generall *Agamemnon* to the *Trojane* wars, yeelded no ſmall comfort to their fellow Souldiers. Whom notwithſtanding *Homer* affirms not to have given any help in the Peſtilence, nor in divers other diſeaſes, but only were accuſtomed to heal wounds by inſtruments and medicins.

The excellency of Chirurgery.

And if the difficulty of learning it argue the excellency of the Art, who can doubt but Chirurgery muſt be the moſt excellent, ſeeing that none ought to be accounted a Chirurgeon or which can perform his duty, without the knowledg of Diet and *Pharmacy*? But both the other can perform their parts without Chirurgery if we may beleeve *Galen*. But if we conſider the matter more neerly according to truth; we ſhall underſtand thoſe three parts have a certain common bond and are very near of kindred, ſo that the one implores the aid of the other; neither can the Phyſitian do any thing praiſe-worthy without the conſpiracy and joint conſent of theſe three; therefore in ancient times there was but one performer and uſer of all the three parts. But the multitude of men daily increaſing, and on the contrary mans life decreaſing, ſo that it did not ſeem able to ſuffice for to learn and exerciſe all the three, the workmen divided themſelves. Wherefore that which happens to any man either by lot, or counſell, that let him follow, maintain and only uſe, as mindfull how ſhort his life is, and how long the Art.

A Table of the Books and Chapters.

Chap.		Pag.
I.	WHat Chirurgery is,	1
II.	Of chirurgicall operations,	*ib.*
III.	Of things naturall,	3
IV.	Of elements,	*ib.*
V.	Of temperaments,	4
VI.	Of humors,	8
VII.	Of the practice of the aforesaid rules of temperaments,	13
VIII.	Of the faculties,	15
IX.	Of the actions,	17
X	Of the spirits,	18
XI.	Of the adjuncts of things naturall,	20
XII.	Of things not naturall,	21
XIII.	Of the air,	*ib.*
XIV.	Of meat and drink,	23
XV.	Of motion and rest,	25
XVI.	Sleep and watching,	26
XVII.	Repletion, inanition or emptinesse,	28
XVIII.	Of the perturbations or passions of the mind,	29
XIX.	Of things against nature, and first of the cause of a disease,	30
XX	Of a disease,	31
XXI.	Of a symptome,	
XXII.	Of indications,	32
XXIII.	Of certain wonderfull and extravagant wayes of curing diseases,	37
XXIV.	Of certain juggling and deceitfull wayes of curing,	*ib.*

The second book, Of living creatures and of the excellency of man, from 41. *to pag.* 59.

The third book, Treating of the Anatomy of mans body, 60

I.	The division or partition of mans body,	63
II.	Of the containing parts of the *Epigastrium* and the preparation to anatomicall administration,	66
III.	Of the outmost skin or cuticle,	67
IV.	Of the true skin,	*ib.*
V.	Of the fleshy panicle,	68
VI	Of the fat,	69
VII.	Of the common coat of the muscles,	70
VIII.	What a muscle is, and how many differences there be thereof,	*ib.*
IX.	Of the parts of a muscle,	73
X.	A more particular inquisition into each part of a muscle,	*ib.*
XI.	Of the muscles of the *Epigastrium*, or lower belly,	74
XII.	Of the white-line, and *Peritonæum*, or rim of the belly,	77
XIII.	Of the *Epiploon*, *Omentum*, or *Zirbus*, that is, the kall,	78
XIV.	Of the ventricle or stomach,	79
XV.	Of the guts,	81
XVI.	Of the mesentery,	83
XVII.	Of the glandules in generall, and of the *Pancreas*, or sweet-bread,	*ib.*
XVIII.	Of the liver,	84
XIX.	Of the bladder of the gall,	85
XX	Of the spleen or milt,	86
XXI.	Of the *Vena Porta*, and gate-vein, and the distribution thereof,	*ib.*
XXII.	Of the originall of the artery, and the division of the branch, descending to the naturall parts,	87
XXIII.	Of the distribution of the nerves to the naturall parts	89
XXIV.	The manner of taking out the guts,	89
XXV.	The originall and distribution of the descendent hollow-vein,	*ib.*
XXVI.	Of the kidneys or reins,	91
XXVII.	Of the spermatick vessels,	92
XXVIII.	Of the testicles or stones,	*ib.*
XXIX.	Of the various bodies or parastat's, and of the ejaculatorie vessels, and the glandulous or prostates,	93
XXX.	Of the ureters,	95
XXXI	Of the bladder,	*ib.*
XXXII.	Of the yard,	97
XXXIII.	Of the spermatick vessels and testicles in women,	*ib.*
XXXIV.	Of the womb,	99
XXXV.	Of the coats containing the infant in the womb, and of the navill,	102
XXXVI.	Of the navill,	103

The fourth book, Treating of the vitall parts contained in the Chest.

I.	What the *Thorax* or the chest is, into what parts it may be divided, and the nature of these parts,	105
II.	Of the containing and contained parts of the chest,	106
III.	Of the breasts or dugs,	107
IV.	Of the clavicles, or collar-bones and ribs,	*ib.*
V.	The anatomicall administration of the *sternon*,	108
VI.	Of the *Pleura*, or coat investing of the ribs,	109
VII.	Of the *Mediastinum*,	*ib.*
VIII.	Of the *Diaphragma*, or midriffe,	110
IX.	Of the lungs,	*ib.*
	Of the *Pericardium* or purse of the heart,	111
X.	Of the heart,	112
XI.	Of the orifices and valves of the heart,	114
XII.	Of the distribution of the *Vena Arteriosa*, and the *Arteria Venosa*,	*ib.*
XIII.	Of the distribution of the hollow-vein,	115
XIV.	Of the distribution of the nerves or sinews of the sixth conjugation,	119
XV.	The division of the arteries,	*ib.*
XVI.	Of the *Thymus*,	121
XVII	Of the *Aspera* artery or weazon,	122
XVIII.	Of the gullet,	123

The fifth book, Of the animall parts contained in the head.

I	A generall description of the head,	124
II.	Of the musculous skin of the head, (commonly called the hairy scalp) and of the *Pericranium*,	125
III.	Of the sutures,	*ib.*
IV.	Of the *Cranium*, or skull,	126
V.	Of the *Meninges*, that is, the two membranes called *Dura Mater* and *Pia Mater*,	128
VI.	Of the brain,	*ib.*
VII.	Of the ventricles and mamillary processes of the brain,	130
VIII.	Of the seven conjugations of the nerves of the brain, so called, because they alwayes shew the nerve conjugated and doubled, that is, on each side one,	133
IX.	Of the *Rete Mirabile*, or wonderfull net, and of the wedg bone,	135
X.	Of the holes of the inner *basis* of the skull,	136
XI.	Of the perforations of the externall *basis* of the brain,	*ib.*
XII.	Of the spinall marrow, or pith of the back,	137

The sixth book, treating of the muscles and bones, and the other ex treame parts of the b'. 138

I. Of the bones of the face, *ib.*

A Table of the Books and Chapters.

Chap. Page

II. Of the teeth, 139
III. Of the broad muscle, 140
IV. Of the eye-lids and eye-brows, 142
V. Of the eyes, ib.
VI. Of the muscles, coats, and humors of the eye, 144
VII. Of the nose, 145
VIII. Of the muscles of the face, 146
IX. Of the muscles of the lower jaw, ib.
X. Of the ears and *Paratides*, or kernels of the ears, 148
XI. Of the bone *Hyoides*, and the muscles thereof, 149
XII. Of the tongue, 150
XIII. Of the mouth. 151
XIV. Of the *Gargareon*, or Vvula, ib.
XV. Of the *Larinx*, or throtle, 152
XVI. Of the neck and parts thereof, 153
XVII. Of the muscles of the neck, 156
XVIII. Of the muscles of the chest and loins, 161
XIX Of the muscles of the shoulder blade, 163
XX. The description of the hand taken in generall, 164
XXI. The distribution of the subclavian vein, and first of the *Cephalica* or *Humeraria*, 165
XXII. The description of the Axillary vein, ib.
XXIII. The distribution of the axillary artery, 166
XXIV. Of the nerves of the neck, back, and arm, ib.
XXV. The description of the bone of the arm, and the muscles which move it, 168
XXVI. A description of the bones of the cubit, and the muscles moving them, 170
XXVII. A description of the bones of the wrist, afterwrist and fingers, 171
XXVIII. Of the muscles which seated in the cubit move the wand, and with it the hand, 173
XXIX. Of the muscles of the inside of the hand, 174
XXX. A description of the leg taken in generall, 175
XXXI A description of the crurall vein, 176
XXXII A description of the crurall artery, 177
XXXIII. Of the nerves of the loins, holy-bone, and thigh, ib.
XXXIV. Of the proper parts of the thigh, 178
XXXV. Of the muscles moving the thigh, 180
XXXVI. Of the bones of the leg or shank, 181
XXXVII. Of the muscles of the legs, 182
XXXVIII. Of the bones of the foot, 183
XXXIX. Of the muscles moving the foot, 185
XL. Of the muscles moving the toes of the feet, 186
XLI. An epitome or brief recitall of the bones in mans body, 187
XLII. An epitome of the names and kinds of composure of the bones, 190

The seventh Book, Of tumors against nature in generall.

I. What a tumor against nature, vulgarly called an Impostume, is, and what be the differences thereof, 195
II. Of the generall causes of tumors, 196
III. The signs of impostumes or tumors in generall, ib.
IV. Of the Prognosticks in impostumes, 197
V. Of the generall cure of tumors against nature, 198
VI. Of the four principall and generall tumors, and of other impostumes which may be reduced to them, 199
VII. Of a Phlegmon, ib.
VIII. Of the causes and signs of a phlegmon, 200
IX. Of the cure of a true Phlegmon, ib.
X Of the cure of an ulcerated phlegmon, 202
XI. Of feavers, and the cure of the feavers which accompany a Phlegmon, 204
XII. Of an *Erysipelas*, or inflammation, 205
XIII, Of the cure of an *Erysipelas*, ib.
XIV. Of the *Herpes*, that is, reaters, or ringworms, or such like, 208
XV. Of feavers, which happen upon erysepelous tumors ib.
XVI. Of an *Oedema* or cold phlegmatick tumor, 209
XVII. Of the cure of flatulent and wateriſh tumors, 211
XVIII. Of the cure of a flatulent and wateriſh tumor, ib.
XIX Of an *Atheroma*, *Steatoma*, and *Meliceris*, 212
XX. Of the cure of *Lupiæ*, that is, wens, or ganglions 213
XXI. Of a *Ganglion* more particularly so called, 214
XXII. Of the *Struma* or *Scrophulæ*, that is, the Kings evill, 215
XXIII Of the feaver which happens upon an œdematous tumor, 216
XXIV. Of *Scirrhus* or an hard tumor proceeding of melancholy, 217
XXV. Of the cure of a *Scirrhus*, 218
XXVI. Of a cancer already generated, ib.
XXVII. Of the causes, kinds, and prognosticks of a cancer, 219
XXVIII. Of the cure of a cancer beginning and not yet ulcerated, 220
XXIX. Of the cure of an ulcerated cancer, ib.
XXX. Of the topick medicins to be applyed an to ulcerated, and not ulcerated cancer, 221
XXXI. Of the feaver which happeneth in *Scirrhous* tumors, 223
XXXII. Of an *Aneurisma*, that is, the dilatation or springing of an artery vein or sinew, 224

The Eighth book, Of the particular tumors against Nature.

I. Of an *Hydrocephalos*, or watery tumor which commonly affects the heads of infants, 226
II Of a *Polypus* being an eating disease in the nose, 227
III. Of the *Parotides*, that is, certain swellings about the ears, 228
IV. Of the *Epulis*, or overgrowing of the flesh of the Gums, 229
V. Of the *Ranula*, ib.
VI. Of the swelling of the glandules, or almonds of the throat, 230
VII. Of the inflammation and relaxation in the *Vvula* or *Columella*, ib.
VIII. Of the *Angina* or squinzy, 232
IX. Of the *Bronchocele*, or rupture of the throat, 233
X. Of the Piurisie, 234
XI. Of the Dropsie, ib.
XII. Of the cure of the dropsie, 235
XIII. Of the the tumor and relaxation of the navell, 238
XIV. Of the tumors of the groins and cods called *Hernia*, that is, Ruptures, ib.
XV. Of the cure of ruptures, 239
XVI. Of the golden ligature or the *Punctus Aureus*, as they call it, 242
XVII. Of the cure of other kinds of ruptures, 244
XVIII. Of the falling down of the fundament, 246
XIX Of the *Paronychiæ*, ib.
XX. Of the swelling of the knees, 247
XXI. Of the *Dracunculus*, ib.

The ninth Book; Of wounds in generall.

I. What a wounds is, what the kinds and differences thereof are, and from whence they may be drawn, or derived, 251
II. Of the causes of wounds, 252
III. Of the signs of wounds, ib.
IV. Of Prognosticks to be made in wounds, 253
V. Of the cure of wounds in generall, ib.
VI. Of sutures, 255
VII. Of the Flux of blood, which usually happens in wounds, 256
VIII. Of the pain which happens upon wounds, 257
IX. Of convulsion by reason of a wound, ib.
X. The cure of a convulsion, 258
XI. Of the cure of a convulsion, by sympathy and pain, 259.
XII. Of the Palsie, ib.
XIII. Of the cure of the palsie, 260
XIV. Of swouning, 261
XV. Of *Delirium* (i.) raving, talking idly, or doting, ib.

The tenth Book, Of the green and bloudy wounds of each part.

I. Of the kinds and differences of a broken skull, 262
II. Of the causes and signs of a broken skull, 264
III. Of the signs of a broken skull, which are manifest to our sense, 265

IV. Of

Chap. Pag.
IV. Of a fiſſure being the firſt kind of a broken skull, ib.
V. Of a contuſion, which is the ſecond part of a fracture. 267
VI. Of an effracture, depreſſion of the bone, being the third kind of a fracture. 269
VII. Of a ſear, being the fourth kind of a broken skull. 271
VIII. Of a *Reſonitus*, or counterfiſſure, being the fifth kind of fracture, ib.
IX. Of the moving or concuſſion of the brain, 272
X. Of prognoſticks to be made in fractures of the skull, 274
XI. Why when the brain is hurt by a wound of the head, there may follow a convulſion of the oppoſite part, 275
XII. A convulſion of the deadly ſigns in the wounds of the head, 275
XIII. Of ſalutary ſigns in wounds of the heads, 277
XIV. Of the generall cure of a broken skull, and of the ſympromes uſually happening thereupon, ib.
XV. Of the particular cure of wounds of the head, and of the muſculous skin, 279
XVI. Of the particular cure of a fracture or broken skull, 281
XVII. Why we uſe trepaning, in the fractures of the skull, 282
XVIII. A deſcription of trepans, 283
XIX. Of the places of the skull, whereto you may not apply a trepan, 285
XX. Of the corruption and *Caries*, or rottenneſſe of the bones of the head, 286
XXI. Of the diſcommodities which happen to the *Craſſa meninx*, by fractures of the skull, 287
XXII. Of the cure of the brain being ſhaken or moved, 289
XXIII. Of the wounds of the face, 290
XXIV. Of the wounds of the eyes, 291
XXV. Of the wounds of the cheeks, 293
XXVI. Of the wounds of the noſe, 294
XXVII. Of the wounds of the tongue, ib.
XXVIII. Of the wounds of the ears, 295
XXIX. Of the wounds of the neck and throat, ib.
XXX. Of the wounds of the cheſt, 296
XXXI. Of the cure of the wounds of the cheſt, 297
XXXII. Of the differences, cauſes, ſigns, and cure of an *Hectick* feaver, 299
XXXIII. Of the wounds of the *Epigaſtrium*, and of the whole lower belly, 301
XXXIV. Of the cure of wounds of the lower belly, 302
XXXV. Of the wounds of the groins, yard and teſticles, 303
XXXVI. Of the wounds of the thighs and legs. ib.
XXXVII. Of the wounds of the nerves, and nervous parts, ib.
XXXVIII. Of the cure of the wounds of the nervous parts, 304
XXXIX. Of the wounds of the joints, 305
XL. Of the wonnds of the Ligaments, 306

Of wounds made by Gunſhot, other fiery Engines, and of all ſorts of weapons; the eleventh book. The Preface.

The firſt diſcourſe wherein wounds made by gunſhot, are freed from being burnt, or cauterized according to *Vigoes* method. 309
Another diſcourſe of theſe things, which King *Charles* the ninth, returning from the *Expedition*, and taking of *Roven*, inquired of me concerning wounds made by gunſhot, 311
I. A divition of wounds drawn from the variety of the wounded parts and the bullets which wound, 315
II. Of the ſigns of wounds made by gunſhot, ib.
III. How theſe wounds muſt be ordered at the firſt dreſſing, ib.
IV. A deſcription of fit inſtruments to draw forth bullets, and other ſtrange bodies. 316
V. What dreſſing muſt firſt be uſed, after the ſtrange bodies are pluckt or drawn out of the wound, 318
VI. How you ſhall order it at the ſecond dreſſing, 319
VII. By what means ſtrange bodies, left in at the firſt dreſſing, may be drawn forth, 320
VIII. Of indications to be obſerved in this kind of wounds, ib.
Chap. Pag.
IX. What remains for the Chirurgeon to do in this kind of wounds, 321
X. Of bullets which remain in the body, for a long time after the wound is healed up, 322
XI. How to correct the conſtitutions of the air, ſo that the noble parts may be ſtrengthened, and the whole body beſide, ib.
XII. Certain memorable hiſtories, ib.
XIII. An apology concerning wounds made by gunſhot, 324
XIV. Another apology, againſt thoſe who have laboured with new reaſons, to prove that wounds made by gunſhot are poyſoned, 326
XV. How wounds made by arrows differ from thoſe made by gunſhot, 327
XVI. Of the diverſity of arrows and darts, ib.
XVII. Of the difference of the wounded parts 328
XVIII. Of drawing forth arrows, ib.
XIX. How arrows broken in a wound may be drawn forth, 329
XX. What to be done, when an arrow is left faſtened or ſticking in a bone, ib.
XXI. Of poyſonous wounds. ib.

Of Contuſions and Gangrene, the twelfth book.

I. Of a contuſion, 330
II. Of the generall cure of great and enormous contuſions, ib.
III. How we muſt handle contuſions when they are joined with a wound, 331
IV. Of thoſe contuſions which are without a wound, ib.
V. By what means the contuſed part may be freed from the ſear, and imminent danger of a gangrene, ib.
VI. Of that ſtrange kind of ſymprome which happens upon contuſions of the ribs, 332
VII. A diſcourſe of *Mummia*, or mummy, ib.
VIII. Of combuſtions and their differences, 333
IX. Of hot and attractive medicins to be applyed to burns, 334
X. Of a gangrene and mortification, 335
XI. Of the generall and particular cauſes of a gangrene, ib.
XII. Of the antecedent cauſes of a gangrene, ib.
XIII. Of the ſigns of a gangrene, 336
XIV. Of the prognoſticks in gangrenes, 337
XV. Of the generall cure of a gangrene, ib.
XVI. Of the particular cure of a gangrene, ib.
XVII The ſigns of a perfect *necroſis*, or mortification, 338
XVIII. Where amputation muſt be made, ib.
XIX. How the ſection or amputation muſt be performed, 339
XX. How to ſtanch the bleeding when the member is taken off, ib.
XXI. How after the blood is ſtanched, you muſt dreſſe the wounded member, 340
XXII. How you muſt ſtop the bleeding, if any of the bound up veſſels chance to get looſe, ib.
XXIII. How to perform the reſidue of the cure of the amputated member, ib.
XXIV. What juſt occaſion moved the Author to deviſe this new form of remedy, to ſtanch the blood after the amputation of a member, and to forſake the common way uſed almoſt by all Chirurgeons; which is by application of actuall cauteries, 341
XXV. The practice of the former precepts is declared, together with a memorable hiſtory of a certain ſouldier, whoſe arm was taken off at the elbow, 342

Of ulcers, fiſtula's, and hæmroids, the thirteenth book.

I. Of the nature, cauſes and differences of ulcers, 343
II. Of the ſigns of ulcers, 344
III. Of the Prognoſticks of ulcers, ib.
IV. Of the generall cure of ulcers, 345
V. Of a diſtempered ulcer, 346
VI. Of an ulcer with pain. 347
VII. Of ulcers, with overgrowing or proudneſſe of fleſh, ib.
VIII. Of an ulcer putrid and breeding worms, ib.
IX. Of a ſordid ulcer, 348
X. Of a virulent and malign ulcer, which is termed *eſcarotick*, and of a Chironian ulcer, ib.

A Table of the Books and Chapters.

Chap. pag.

XI. An advertisement to the young Chirurgeon touching the distance of times wherein malign ulcers are to be dressed, 349
XII. How to bind up ulcers. ib.
XIII. Of the cure of particular ulcers, and first of those of the eyes, 350
XIV. Of the *Ozena* and ulcers of the nose, ib.
XV. Of the ulcers of the mouth, ib.
XVI. Of the ulcers of the ears, 351
XVII. Of the ulcers of the windpipe, weazon, stomach, and guts, ib.
XVIII. Of the ulcers of the kidnies and bladder, 352
XIX. Of the ulcers of the womb, 353
XX. Of the varices, and their cure by cutting, ib.
XXI. Of fistula's, 354
XXII. Of the cure of fistula's, 355
XXIII. Of the fistula's in the fundament, ib.
XXIV. Of hæmorrhoides, 356

Of Bandages or Ligatures, the fourteenth Book.

I. Of the differences of bandages, 357
II. Sheweth the indications and generall precepts of fitting of bandages and ligatures, ib.
III. Of the three kinds of bandages necessary in fractures, 358
IV. Of the binding up of fractures associated with a wound, 359
V. Certain common precepts of the binding up of fractures and luxations, ib.
VI. Of the uses for which ligatures serve, 360
VII. Of bolsters or compresses, ib.
VIII. Of the use of splints, junks, and cases, 361

Of Fractures, the fifteenth Book.

I. What a Fracture is, and what the differences thereof are, 361
II. Of the signs of a fracture, 362
III. Prognosticks to be made in fractures, ib.
IV. The generall cure of broken and dislocated bones, 363
V. By what means you may perform the third intention in curing fractures and dislocations, which is, the hindering and correction of accidents and symptoms, 364
VI. Of the fracture of the nose, 365
VII. Of the fracture of the lower jaw, ib.
VIII. Of the fracture of the clavicle, or collar bone, 366
IX. Of the fracture of the shoulder blade, ib.
X. Of the fracture and depression of the *Sternon*, or breast bone, 367
XI. Of the fracture of the ribs, ib.
XII. Of certain preternaturall affects which ensue upon broken ribs, 368
XIII. Of the fracture of the *vertebræ*, or rack bones of the back, and their processes, 369
XIV. Of the fracture of the holy bone, ib.
XV. Of the fracture of the rump, ib.
XVI. Of the fracture of the hip, or *os ilium*, ib.
XVII. Of a fracture of the shoulder, or arm bone, ib.
XVIII. Of the fracture of the cubit, or ell and wand, 370
XIX. Of the fracture of a hand, ib.
XX. Of the fracture of a thigh, ib.
XXI. Of the fracture of the thigh nigh to the joint, or the upper or lower head of the bone, ib.
XXII. Of the fracture of the *Patella*, or whirle bone of the knee, ib.
XXIII. Of a broken leg, ib.
XXIV. Of something to be observed in ligation, when a fracture is associated with a wound, 375
XXV. What was used to the Authors leg after the first dressing, ib.
XXVI. What may be the cause of the convulsion twitchings of broken members, 376
XXVII. Certain documents concerning the parts whereon the Patient must necessarily rest, whilst he lyes in his bed, ib.
XXVIII. By what means we may know the *Callus* is a breeding, 377
XXIX. Of those things that may hinder the generation of a *Callus*, and how to correct the fault thereof, if it be ill formed, 378
XXX. Of fomentations which be used in broken bones 379
XXXI. Of the fractures of the bones in the feet. ib.

Of Dislocations or Luxations, the sixteenth Book.

I. Of the kinds and manners of dislocations, 379
II. Of the differences of dislocations. 380
III. Of the causes of dislocations, ib.
IV. The signs of dislocations, ib.
V. Of prognosticks to be made upon luxations, 381
VI. Of the generall cure of dislocations, 382
VII. The description of certaine engins, serving for the restoring of dislocations, ib.
VIII. Of the dislocation of the jaw bone, 383
IX. How to set the jaw dislocated forwards on both sides, 384
X. Of restoring the jaw dislocated forwards but on one side, ib.
XI. Of the luxation of the collar bone, ib.
XII. Of the luxation of the spine, or back bone, 385
XIII. Of the dislocation of the head, ib.
XIV. Of the dislocation of the *vertebræ*, of rack bones of the neck, ib.
XV. Of the dislocated *vertebræ* of the back. 386
XVI. How to restore the spine outwardly dislocated, ib.
XVIII. A more particular inquiry of the dislocation of the *vertebræ*, proceeding from an internall cause, 387
XVIII. Prognosticks of the dislocated *vertebræ* of the back, ib.
XIX. Of the dislocation of the rump, 388
XX. Of the luxation of the ribs, ib.
XXI. Of a dislocated shoulder, ib.
XXII. Of the first manner of setting a shoulder, which is with ones fist. (389)
XXIII. Of the second manner of restoring a shoulder, that is, with the heel; when as the Patient by reason of pain can neither sit, nor stand. (390)
XXIV. Of the third manner of restoring a shoulder, ib.
XXV. Of the fourth manner of restoring a dislocated shoulder, (391)
XXVI. Of the fifth manner of putting the shoulder into joint, which is performed by a Ladder, ib.
XXVII. The sixth manner of restoring a shoulder, luxated into the arm-pit, (392)
XXVIII. How to restore a shoulder dislocated forwards, (394)
XXIX. Of the shoulder luxated outwardly, (395)
XXX. Of the shoulder dislocated upwards. ib.
XXXI. Of the dislocation of the elbow, ib.
XXXII. How to restore the elbow, dislocated outwardly, (396)
XXXIII. Of the dislocation of the elbow to the inside, and of a compleat and uncompleat luxation, (397)
XXXIV. Of the dislocation of the *Styliformis* or bodkin-like processe of the cubit or ell, ib.
XXXV. Of the dislocation of the wrist, (398)
XXXVI. Of the dislocated bones of the wrist, ib.
XXXVII. Of the dislocated bones of the after-wrist, 389
XXXVIII. Of the dislocated finger, ib.
XXXIX. Of a dislocated thigh, or hip, ib.
XL. Prognosticks belonging to a dislocated hip, 390
XLI. Of the signs of the hip dislocated outwardly, or inwardly, ib.
XLII. Of the thigh bone dislocated forwards, 391
XLIII. Of the thigh bone dislocated backwards, ib.
XLIV. Of restoring the thigh bone dislocated inwards, 392
XLV. Of restoring the thigh dislocated outwardly, 393
XLVI. Of restoring the thigh dislocated forwards, 394
XLVII. Of restoring the thigh dislocated backwards, ib.
XLVIII. Of the dislocation of the whirl bone of the knee, ib.
XLIX. Of the dislocated knee, 395

L. Of

Chap. Pag.

L. Of a knee dislocated forwards, 395.
LI. Of the separation of the greater and lesser focile, ib.
LII. Of the leg bone or greater focile dislocated, and divided from the pasterbone, ib.
LIII. Of the dislocation of the heel, 396
LIV. Of the symptomes which follow upon the contusion of the heel, ib.
LV. Of the dislocated pastern, or ancle bone, 397
LVI. Of the dislocation of the instep and back of the foot, ib.
LVII. Of the dislocation of the toes, ib.
LVIII. Of the symptomes, and accidents which may befall a broken or dislocated member, 398

Of divers other preternaturall affects whose cure is commonly performed by Surgery, The seventeenth book.

I. Of an *Alopecia*, or the falling away of the hairs of the head, 399
II. Of the *tinea* or scald head, ib.
III. Of the *vertigo* or giddinesse, 401
IV. Of the *hemicrania* or megrim, ib.
V. Of certain affects of the eye, and first of staying up the upper eye-lid when it is too lax, 402
VI. Of *lagophthalmus*, or the hare-eye, 403
VII. Of the *Chalazion*, or hail stone, and the *Hordeolum*, or barly corn of the eye-lids, ib.
VIII. Of the *rhytis*, or finesse of the eye-lids, ib.
IX. Of the eye-lids fastened or glewed togeather, 404
X. Of the itching of the eye-lids, ib.
XI. Of *lippitudo*, or blear-eyes, 405
XII. Of the *Opthalmia*, or inflammation of the eyes, ib.
XIII. Of the *proptosis*, that is, the falling or the starting forth of the eye, and of the *phthisis* and *camosis* of the same, 406
XIV. Of the *ungula*, or web. ib.
XV. Of the *ægilops*, *fistula lacrymosa*, or weeping fistula of the eye, 407
XVI. Of the *staphyloma* or grape-like swelling, 408
XVII. Of the *hypopyon*, that is, the suppurate or putrid eye, 409
XVIII. Of the *mydriasis*, or dilation of the pupil of the eye, ib.
XIX. Of a cataract ib.
XX. Of the Physicall cure of a beginning cataract, 410
XXI. By what signs ripe and curable cataracts, may be discovered from unripe and uncurable ones, 411
XXII. Of the couching a cataract, ib.
XXIII. Of the stopping of the passage of the ears, and of the falling of things thereinto, 412
XXIV. Of getting little bones, and such like things out of the jaws and throat, 413
XXV. Of the tooth ach, ib.
XXVI. Of other affects of the teeth, 414
XXVII. Of drawing of teeth, 415
XXVIII. Of clensing the teeth, 417
XXIX. Of the impediment and contraction of the tongue, ib.
XXX. Of superfluous fingers, and such as stick togeather, ib.
XXXI. Of the too short a prepuce, and of such as have been circumcised, 418
XXXII. Of *phimosis*, and *paraphimosis*, that is so great a constriction of the prepuce about the the glans or nut that it cannot be bared or uncovered at pleasure, ib.
XXXIII. Of those whose glans is not rightly perforated, and of the too short or too strait ligament bridle, or coard of the yard. 419
XXXIV. Of the causes of the stone, ib.
XXXV. Of the signs of the stone in the kidneys and bladder, 420
XXXVI. Prognostickes in the stone, 421
XXXVII. What cure is to be used when we fear the stone, 422
XXXVIII. What is to be done when the stone falleth out of the kidney into the ureter, 423
XXXIX. What must be done the stone being fallen into the neck of the bladder, 424
XL. What course must be taken, if the stone sticking in the *ureter*, or urinary passage, cannot be gotten out by the forementioned art, 425

Chap. Pag.

XLI. What manner offection is to be made, when a stone is in a boyes bladder, 426
XLII. How to cut men, for the taking out of the stone in the bladder, 427
XLIII. What cure must be used to the wound when the stone is taken forth, 431
XLIV. How to lay the patient after the stone is taken away, 432
XLV. How to cure the wound made by the incision, ib.
XLVI. What cure is to be used to ulcers, when as the urine flows through them, long after the stone is drawn out, 433
XLVII. How to take stones out of womens bladders, 433
XLVIII. Of the suppression of the urine by internall causes, 434
XLIX. A digression concerning the purging of such as are unprofitable in the whole body by the urine, 435
L. By what externall causes the urine is suppresst, and prognosticks concerning the suppression thereof, ib.
LI. Of bloudy urine, 436
LII. Of the signs of the ulcerated Kidneys, ib.
LIII. Of the signs of the ulcerated bladder, 437
LIV. Prognostiks of the ulcerated reins and bladder, ib.
LV. What cure must be used in the suppression of the urine, 437
LVI. Of the *diabete*, or inability to hold the urine, 438
LVII. Of the strangury, ib.
LVIII. Of the colick, 439
LIX. Of phleborotomy or bloud-letting, 441
LX. How to open a vein or draw blood from thence, 442
LXI. Of cupping-glasses or *ventoses*, 443
LXII. Of leeches and their use, 445

Of the Gout, the eighteenth book.

I. Of the description of the gout. 446
II. Of the occult causes of the gout, ib.
III. Of the manifest causes of the gout, 448
IV. Out of what part the matter of the gout may flow down upon the joints, ib.
V. The signs of the Arthritick humor flowing from the brain, 449
VI. The signs of a gouty humor, proceeding from the liver, ib.
VII. By what signs we may understand this or that humor, to accompany the gout in malignity, ib.
VIII. Prognosticks in the gout, 450
IX. The generall method of preventing and curing the gout, 451
X. Of vomiting, 452
XI. The other generall remedies for the gout, ib.
XII. What diet is convenient for such as have the gout, 453
XIII. How to strengthen the joints, 454
XIV. Of the palliative cure of the gout, and the materiall causes thereof, 455
XV. Of locall medicins that may be used to a cold gout, 456
XVI. Of locall medicins to be applyed to a hot or sanguine gout, 458
XVII. Of locall medicins for a cholerick gout, ib.
XVIII. What remedies must be used in pains of the joints proceeding of a distemper only, without matter, 460
XIX. What is to be done after the fit of the gout is over, ib.
XX. Of the *tophi*, or knots which grow at the joints of such as are troubled with the gout, 461
XXI. Of the flatulencies contained in the joints, and counterfeiting true gouts, and of the remedies to be used thereto, 462
XXII. Of the *Ischias*, hip gout, or *Sciatica*, ib.
XXIII. The cure of the *sciatica*, 463
XXIV. Of the flatulent convulsion, or convulsive contraction, which is commonly called by the *French* Gout cramp, and by the *English* the cramp, 464

Of

A Table of the Books and Chapters.

The nineteenth Book.

Chap. pag.

I. Of the *lues venerea*, and thoſe ſymptomes which happen by the means thereof, 464
II. Of the cauſes of the *lues venerea*, 465
III. In what humor the malignity of the *lues venerea* reſides, 466
IV. Of the ſigns of the *lues venerea*, 467
V. Of prognoſticks, *ib.*
VI. How many and by what means there are to oppugn this diſeaſe, 468
VII. How to make choice of the wood *Guaicum*, *ib.*
VIII. Of the preparation of the decoction of *Guaicum*, 469,
IX. Of the ſecond manner of curing the *lues venerea* which is performed by friction or unction, 470
X. Of the choice preparation and mixing of *Hydrargyrum*, *ib.*
XI. How to uſe the unction, 471
XII. What cautions to be uſed in rubbing, or anointing the Patient, 472
XIII. Of the third manner of cure, which is performed by cerates and emplaiſters, as ſubſtitutes of unctions, 473
XIV. Of the fourth manner of curing the *lues venerea*, 475
XV. Of the cure of the ſymptomes, or ſymptomatique affects of the *lues venerea*, and firſt of the ulcers of the yard, *ib.*
XVI. How a *Gonorrhœa* differeth from a virulent ſtrangury, 476
XVII. Of the cauſes and difference of the ſcalding, or ſharpneſſe of the urine, *ib.*
XVIII. Prognoſticks in a virulent ſtrangury, 477
XIX. The chiefe heads of curing a *Gonorrhœa*, 478
XX. The generall cure both of the ſcalding of the water, and the virulent ſtrangury, *ib.*
XXI. Of the proper cure of a virulent ſtrangury, *ib.*
XXII. Of caruncles, or fleſhy excreſcences which ſometimes happen to grow in the *urethea* by the heat or ſcalding of the urin. 479
XXIII. What other remedies ſhall be uſed to caruncles occaſioned by the lues *venerea*, 481
XXIV. Of venereall *Buboes*, or ſwellings in the groins, 482
XXV. Of the *exoſtoſis*, bunches, or knots growing upon the bones, by reaſon of the *lues venerea*, 483
XXVI. Why the bones become rotten, and by what means it may be perceived, *ib.*
XXVII. Of actuall and potentiall cauteries, 488
XXVIII. Of the vulnerary potion, *ib.*
XXIX. Of tetters, ring-worms, or chops, occaſioned by the *lues venerea*, 489
XXX. Of curing the *lues venerea* in infants and little children, *ib.*

The twentieth Book, Of the ſmall pox and meazles; as alſo of worms and the leproſie, from 491. to 503. 491

The one and twentieth Book, Of poyſons, and of the biting, and ſtinging of a mad dog, and the bitings and ſtingings of other venemous creatures, from pag. 504. to pag. 534. 504

The two and twentieth Book, Of the Plague.

I. The deſcription of the plague, 535
II. Of the divine cauſes of an extraordinary plague, *ib.*
III. Of the naturall cauſes of the plague, 536
IV. Of the preparation to humors to putrefaction, and admiſſion of peſtiferous impreſſions, 537
V. What ſignes in the air and earth prognoſticate a plague, 538
VI. By uſing what cautions in air and diet, one may prevent the plague, 539
VII. Of the cordiall remedies by which we may preſerve our bodies in fear of the plague, and cure thoſe already infected therewith, *ib.*
VIII. Of locall medicins to be applyed outwardly, 542
IX. Of other things to be obſerved for prevention, in fear of the plague, 544
X. Of the office of Magiſtrates in time of the plague, *ib.*
XI. What caution muſt be uſed in chooſing Phyſitians, Apothecaries, and Surgeons, who may have care of ſuch as are taken with the plague, 545
XII. How ſuch as undertake the cure of the plague ought to arm themſelves, *ib.*
XIII. Of the ſigns of ſuch as are infected with the plague, 546
XIV. What ſigns in the plague are mortall, 547
XV. Signs of the plague coming by contagion of the air without any fault of the humours, 548
XVI. Signs of the plague drawn into the body by the fault and putrefaction of humours, 549
XVII. Of the prognoſtication that is to be inſtituted in the plague, 549
XVIII. How a peſtilent fever comes to be bred into, 550
XIX. Into what place the Patient ought to betake himſelfe ſo ſoone as he finds himſelfe infected, 551
XX. What diet ought to be obſerved, and firſt of the choice of meat, 552
XXI. What drink the Patient infected ought to uſe, 553
XXII. Of antidotes to be uſed in the plague, 555
XXIII. Of Epithems to be uſed for the ſtrengthening of the principal parts, 556
XXIV. Whether purging and blood-letting be neceſſary in the beginning of peſtilent diſeaſes, 557
XXV. Of purging medicins in a peſtilent diſeaſe, 558
XXVI. Of many ſymptomes which happen together with the plague, and firſt of the pain of the head, 560
XXVII. Of the heat of the kidnies, 561
XXVIII. Of the eruptions and ſpots, which commonly are called by the name of purples, and tokens, *ib.*
XXIX. Of the cure of eruptions and ſpots, 562
XXX. Of a peſtilent *Bubo* or plague ſore, 563
XXXI. Of the cure of *Buboes* or plague ſores, *ib.*
XXXII. Of the nature, cauſes, and ſignes of a peſtilent carbuncle, 566
XXXIII. What prognoſticks may be made in peſtilent buboes and carbuncles *ib.*
XXXIV. Of the cure of a peſtilent carbuncle, 568
XXXV. Of the itching and inflammation happening in peſtilent ulcers, and how to cicatrize them, 569
XXXVI. Of ſundry kinds of evacuations, and firſt of ſweating and vomiting, *ib.*
XXXVII. Of ſpitting, ſalivation, ſneezing, belching, hicketting, and making water, 570
XXXVIII. Of the menſtruall and hæmorrhoidall purgation, 571
XXXIX. Of procuring evacuation by ſtool, or a flux of the belly, 572
XL. Of ſtopping the flux of the belly, *ib.*
XLI. Of evacuation by inſenſible tranſpiration, 574
XLII. How to cure infants and children taken with the plague, *ib.*

The three and twentieth Book, Of the meanes and manner to repair or ſupply the defects of mans Body.

I. How the loſſe of the naturall or true eye may be covered, hidden, or ſhadowed, 576
II. By what meanes a part of the noſe that is cut off, may be reſtored; or how in ſtead of the noſe that is cut off, another counterfeit noſe may be faſtned, or placed in the ſtead, 577
III. Of the placing of teeth artificially made in ſtead of thoſe that are loſt or wanting, 578
IV. Of filling the hollowneſſe of the palat, *ib.*
V. How to help ſuch as cannot ſpeak by reaſon of the loſſe of ſome part of the tongue, 580
VI. Of covering and repairing certaine defects or defaults in the face, *ib.*
VII. Of the defects of the ears, 581
VIII. Of amending the deformity of ſuch as are crook-back't, *ib.*

IX. How

Chap. Pag.
IX. How to relieve ſuch as have their urine flow from them againſt their wils, and ſuch as want their yards, 582
X. By what means the periſhed function or action of a thumb or finger may be corrected and amended, 583
XI. Of the helping thoſe that are *vari* or *valgi*, crook legged, or crook footed, inwards, or outwards, 584
XII. By what means arms, legs, and hands may be made by art, and placed in the ſtead of naturall arms, legs, or hands, that are cut off, and loſt, 585
XIII. Of amending or helping lameneſs or halting, 589

Of the Generation of Man, the four and twentieth Book.

I. Why the generative parts are endued with great pleaſure, 590
II. Of what qualitie the ſeed is, whereof the male, and whereof the female is engendred, 592
III. What is the cauſe why females of all brute beaſts, being great with young, do neither deſire nor admit the males, untill they have brought forth their young, 592
IV. What things are to be obſerved, as neceſſary unto generation in the time of copulation, 593
V. By what ſigns it may be known, whether the woman have conceived or not, *ib.*
VI. That the womb ſo ſoon as it hath received the ſeed, is preſently contracted or drawn together, 594
VII. Of the generation of the navell, *ib.*
VIII. Of the umbilicall veſſels, or the veſſels belonging to the navell, 595
IX. Of the ebullition or ſwelling of the ſeed in the womb, and of the concretion of the bubbles or bladders, or the three principall entrals, *ib.*
X. Of the third bubble or bladder, wherein the head and the brain is formed, 596
XI. Of the life or ſoul, 597
XII. Of the naturall excrements in generall, and eſpecially of thoſe that the child or infant being in the womb excludeth, 599
XIII. With what travell the child is brought into the world, and of the cauſe of this travell, 601
XIV. Of the ſituation of the infant in the womb, *ib.*
XV. Which is the legitimate and naturall, and which the illegitimate or unnaturall time of childbirth, 602
XVI. Signs of the birth at hand, 603
XVII. What is to be done preſently after the child is born, 604
XVIII. How to pull away the ſecundine or after-birth, 606
XIX. What things muſt be given to the infant by the mouth, before he be permitted to ſuck the teat or dug, *ib.*
XX. That mothers ought to give ſuck to their owne children, 607
XXI. Of the choiſe of nurſes, *ib.*
XXII. What diet the nurſe ought to uſe, and in what ſituation ſhe ought to place the infant in the cradle, 609
XXIII. How to make pap for children, 610
XXIV. Of the weaning of children, 611
XXV. By what ſignes it may be known whether the child in the womb be dead or alive, 612
XXVI. Of the chirurgicall extractions of the child from the womb, either dead or alive, *ib.*
XXVII. What muſt be done unto the woman in travell, preſently after her deliverance, 615
XXVIII. What care muſt be uſed to the dugs and teats of thoſe that are brought to bed, 616
XXIX. What the cauſes of difficult and painfull travell in childbirth are, 617
XXX. The cauſe of abortion or untimely birth, 618
XXXI. How to preſerve the infant in the womb when the mother is dead, 619
XXXII. Of ſuperfetation, 620
XXXIII. Of the tumor called *mola*, or a mole growing in the womb of women, *ib.*
XXXIV. How to diſcerne a true conception from a falſe conception or *mola*, 621
XXXV. What cure muſt be uſed to the *mola*, 623
XXXVI. Of tumors or ſwellings happening to the *pancreas* or ſweet-bread, and the whole meſenterie, 624
XXXVII. Of the cauſe of barrenneſſe in women, 625
XXXVIII. Of the barrenneſſe or unfruitfulneſſe of women, 626
XXIX. The ſigns of a diſtempered womb, 627
XL. Of the falling down, or perverſion, or turning of the womb, 628
XLI. The cure of the falling down of the womb, *ib.*
XLII. Of the tunicle or membrane called *hymen*, 630
XLIII. A memorable hiſtory of the membrane called *hymen*, 634
XLIV. Of the ſtrangulation of the womb, 635
XLV. The ſignes of imminent ſtrangulation of the womb, 633
XLVI. How to know whether the woman be dead in the ſtrangulation of the womb, or not, *ib.*
XLVII. How to know whether the ſtrangulation of the womb comes of the ſuppreſſion of the flowers, or the corruption of the ſeed, 634
XLVIII. Of the cure of the ſtrangulation of the womb, *ib.*
XLIX. Of womens monthly flux or courſes, 636
L. The cauſes of the monthly flux or courſes, 637
LI. The cauſes of the ſuppreſſion of the courſes or menſtruall flux, 638
LII. What accidents follow the ſuppreſſion or ſtopping of the monthly flux or flowers, *ib.*
LIII. Of provoking the flowers or courſes, 639
LIV. Of the ſignes of the approaching of the menſtruall flux, *ib.*
LV. Accidents follow immoderate fluxes of the flowers or courſes, 640
LVI. Of ſtopping the immoderate flowing of the flowers and courſes, 641
LVII. Of locall medicines to be uſed againſt the immoderate flowing of the courſes, *ib.*
LVIII. Of women fluxes or the whites, *ib.*
LIX. Of the cauſes of the whites, 642
LX. The cure of the whites, *ib.*
LXI. Of the *hæmorrhoides* and warts of the neck of the womb, 643
LXII. Of the cure of the warts that are in the neck of the womb, 644
LXIII. Of chaps, and thoſe wrinckled and hard excreſcences, which the greeks call *condylomata*, 645
LXIV. Of the itching of the womb, *ib.*
LXV. Of the relaxation of the great gut, or inteſtine, which happeneth to women, 646
LXVI. Of the relaxation of the navell in children, *ib.*
LXVII. Of the pain that children have in breeding of teeth, *ib.*

Of Monſters and prodigies, the five and twentieth Book, from pag. 648. to pag. 695. 648

Of the faculties of ſimple medicines and alſo of their compoſition and uſe, the ſix and twentieth book.

I. What a medicine is, and how it differeth from nourishment, 696
II. The differences of medicins in their matter and ſubſtance, *ib.*
III. The difference of ſimples in their qualities and effects, 697
IV. Of the ſecond faculties of medicines, 698
V. Of the third faculties of medicines, 699
VI. Of the fourth faculties of medicines, *ib.*
VII. Of taſtes, 700
VIII. Of the preparation of medicines, 701
IX. Of repelling, or repercuſſive medicines, 702
X. Of attractive medicines, 703
XI. Of reſolving medicines, 704
XII. Of ſuppuratives, 705
XIII. Of mollifying things, *ib.*
XIV. Of deterſives, or mundificatives, 706
XV. Of ſarcoticks, 707
XVI. Of epuloticks, or skinning medicines, *ib.*
XVII. Of agglutinatives, 708.

XVIII. Of

A Table of the Books and Chapters.

Chap. pag.
XVIII. Of pyroticks, or cauſtick medicins, 708
XIX. Of anodynes, or ſuch as mitigate or aſſwage paine, 709
XX. Of the compoſition and uſe of medicines, 710
XXI. Of the weight and meaſures, and the notes of both of them, 711
XXII. Of Clyſters, ib.
XXIII. Of ſuppoſitorics, nodules, and peſſaries, 713
XXIV. Of oils, 714
XXV. Of liniments, 715
XXVI. Of ointments, ib.
XXVII. Of cerats and emplaſters, 717
XXVIII. Of cataplaſms and pultises, 720
XXIX. Of fomentations, ib.
XXX. Of embrocations, 721
XXXI. Of epithems, ib.
XXXII. Of potentiall cauteries, 722
XXXIII. Of veſicatories, 723
XXXIV. Of *collyria*, 724
XXXV. Of errhines, and ſternutatories, ib.
XXXVI. Of apophlegmatiſms, or maſticatories, 725
XXXVII. Of gargariſms, ib.
XXXVIII. Of dentifrices, 726
XXXIX. Of baggi, or quilts, 727
XL. Of fumigations, ib.
XLI. Of a particular, or halfe bath, 728
XLII. Of baths, ib.
XLIII. Of ſtoves, or hot-houſes, 731
XLIV. Of *fuci*, that is, waſhes, and ſuch things for the ſmoothing and beautifying of the skin, ib.
XLV. Of the *gutta roſacea*, or a fiery face, 733
XLVI. To black or colour the hair, 734
XLVII. Of *Pſilothra*, or depilatories, and alſo of ſweet waters, ib.

Of Diſtillation, the ſeven and twentieth Book.

I. What diſtillation is, and how many kindes thereof there be, 735
II. Of the matter and form of fornaces, ib.
III. Of veſſels fit for diſtillation, 736
IV. What things are to be conſidered in diſtillation, ib.
V. Of what faſhion the veſſels for the diſtilling of waters, ought to be, 737
VI. How the materials muſt be prepared before diſtillation, 738
VII. Of the art of diſtilling of waters, 739
VIII. How to diſtill *aqua vitæ*, or the ſpirits of wine, 740
IX. Of the manner of rectifying, that is, how to increaſe the ſtrength of waters, that have been once diſtilled, 741
X. Of diſtillation by filtring ib.
XI. What and how many wayes there are to make oils, 742
XII. Of extracting of oils of vegetables by diſtillation, ib.
XIII. Another manner how to draw the eſſence and ſpirits of herbs, flowers, ſeeds, and ſpices, as alſo of rubarb, agarick, turbith, hermodactyls, and other purgers, 744
XIV. How to extract oil out of gums, condenſed juices, and roſins, as alſo out of ſome woods, ib.
XV. Of extracting of oils out of the harder ſorts of gums, as myrrh, maſtick, frankincenſe, and the like, ib.
XVI. The making of oil of vitriol, 746
XVII. A table or catalogue of medicines and inſtruments ſerving for the cure of diſeaſes, 747

How to make reports, and to embalm the dead, the eight and twentieth Book.

The nine and twentieth Book, A Treatiſe containing divers voyages.

A Table of the Chapters of the three Tracts.

Chap. pag.
I. Reckons up the branches or propagations of the *vena portæ*, or the gate-vein, and explaines an aphoriſm of *Hippocrates*, that makes very much to the purpoſe, 1
II. Treats of the ſuperior, or aſcendent trunk of the *vena cava*, or hollow vein, and the branches which it ſcatters through the head, 5
III. Shews how the axillary vein is diſtributed through the arm, 9
IV. Explaines the lower, or deſcendent trunk of the hollow vein, 11
V. Reckons up the propagations, and branches of the outer Iliacall branch diſſeminated through the *crus*, or great foot, that reaches from the lower part of the buttock to the end of the toes, 14
An explanation of the Table of the Veins, 17

The ſecond Treatiſe concerning the Arteries.

I. Shewes the upper or aſcendent trunk of the great Artery, with its propagations that are diſtributed through the head, 21
II. Declares the hiſtory of the axillary artery being diſtributed through the arm, 23
III. Shewes the inferiour or deſcendent trunk of the great Artery, and the propagation thereof through the middle and loweſt bellies, ib.
IV. The propagations of the outer Iliacall branches which are diſtributed through the *crus*, or great foot, containing the thigh, leg, and foot, 30
An explanation of the Table of the Arteries, 31

The third Treatiſe concerning the Nerves.

I. Of the nerves of the brain, 35
II. Concerning the nerves of the ſpinall marrow properly ſo called, and firſt of thoſe of the rack bones of the neck, 40
III. Concerning the nerves of the marrow of the rack bones of the cheſt, 42
IV. Concerning the marrow of the rack bones of the loines, 43
V. Concerning the nerves of the marrow of *Os ſacrum* or the great bone, 44
VI. Concerning the nerves which are diſtributed through the arms, 45
VII. Of the nerves that are diſtributed through the *crura*, or thighs, legs, and feet, 47
An explanation of the two Tables of the Nerves, 49 & 50

AN INTRODVCTION OR *COMPENDIOVS WAY TO* CHIRURGERY.

CHAP. I.

What Chirurgery is.

CHIRURGERY is an Art, which teacheth the way by reaſon, how by the operation of the hand we may cure, prevent, and mitigate diſeaſes, which accidentally happen unto us. Others have thought good to deſcribe it otherwiſe; as that, It is that part of Phyſick which undertaketh the cure of Diſeaſes by the ſole induſtry of the Hand: as, by cutting, burning, ſawing off, uniting fractures, reſtoring diſlocations, and performing other works, of which we ſhall hereafter treat. Chirurgery alſo is thus defined by the Author of the *Medicinall Definitions*; The quick motion of an intrepid hand joyned with experience; or, an artificiall action by the hand uſed in Phyſick, for ſome convenient intent. Yet none muſt think to attain to any great perfection in this Art, without the help of the other two parts of Phyſick; I ſay, of Diet and Pharmacie, and the divers applications of proper Medicines, reſpecting the condition of the Cauſes, Diſeaſes, Symptomes, and the like circumſtances, which comprehended under the names of things naturall, not naturall, and beſides nature, (as they commonly call them) we intend to deſcribe in their proper place. But if any reply, that there be many which do the works of Chirurgery, without any knowledg of ſuch like things, who notwithſtanding have cured deſperate Diſeaſes with happy ſucceſs: Let them take this for an anſwer, That ſuch things happen rather by chance, than by the induſtry of the Art; and that they are not provident that commit themſelves to ſuch. Becauſe that for ſome one happy chance, a thouſand dangerous errors happen afterwards, as *Galen* (in divers places of his Method) ſpeaks againſt the Empericks. Wherefore ſeeing we have ſet down Chirurgery to be a diligent operation of the hands, ſtrengthened by the aſſiſtance of Diet and Pharmacy, we will now ſhew what, and of what nature the operations of it are.

The definition of Chirurgery.

What neceſſary for a Chirurgeon.

CHAP. II.

Of Chirurgicall Operations.

FIve things are proper to the duty of a Chirurgeon; To take away that which is ſuperfluous; to reſtore to their places ſuch things as are diſplaced; to ſeparate thoſe things which are joyned together; to joyn thoſe which are ſeparated; and to ſupply the defects of nature. Thou ſhalt far more eaſily and happily attain to the knowledg of theſe things by long uſe and much exerciſe, than by much reading of Books, or daily hearing of Teachers. For ſpeech, how perſpicuous and elegant ſoever it be, cannot ſo vively expreſs any thing, as that which is ſubjected to the faithfull eyes and hands.

The nature of a Chirurgeon.

Experience more neceſſary for a Chirurgeon, than Art.

Examples of taking away that which is superfluous.

We have examples of taking away that which abounds in the Amputation or cutting off a finger, if any have six on one hand, or any other monstrous member that may grow out: in the lopping off a putrefied part inwardly corrupted; in the extraction of a dead child, the secondine, mole, or such like bodies out of a womans womb: In taking down of all Tumors, as Wens, Warts, Polypus, Cancers, and fleshy excrescences of the like nature; in the pulling forth of bullets, of pieces of maile, of darts, arrows, shells, splinters, and of all kind of weapons in what part of the body soever they be. And he taketh away that which redounds, which plucks away the hairs of the ey-lids which trouble the ey by their turning in towards it: who cuts away the web, possessing all the * *Adnata*, and part of the * *Cornea*: who letteth forth suppurated matter: who taketh out stones in what part soever of the body they grow; who puls out a rotten or otherwise hurtfull tooth; or cuts a nail that runs into the flesh: who cuts away part of the *Uvula*, or hairs that grow on the ey-lids: who taketh off a Cataract; who cuts the navill or foreskin of a childe newly born; or the skinny caruncles of womens privities.

* Two tunicles of the eys.

Examples of replacing.

Examples of placing those things which are out of their naturall site, are manifest in restoring dislocated bones; in re-placing of the guts and kall fallen into the cods, or out of the navill or belly by a wound; or of the falling down of the womb, fundament, or great gut, or the eye hanging out of its circle, or proper place.

Example of separating things joined together.

But we may take examples of disjoyning those things which are continued; from the fingers growing together, either by some chance, as burning; or by the imbecillity of the forming faculty: by the disjunction of the membrane called *Hymen*, or any other crouling the neck of the womb; by dissection of the ligament of the tongue, which hinders children from sucking and speaking, and of that which hinders the *Glans* from being uncovered of the foreskin; by the division of a varicous vein, or of a half cut nerve or tendon, causing convulsion; by the division of the membrane stopping the auditory passage, the nose, mouth, or fundament, or the stubborn sticking together of the hairs of the ey-lids. Refer to this place all the works done by Caustick, the Saw, Trepan, Lancet, Cupping-glasses, Incision-knife, Leeches, either for evacuation, derivation, or revulsion sake.

Examples of uniting things disjoined.

The Chirurgeon draws together things separated, which healeth wounds by stitching them, by bolstering, binding, giving rest to, and fit placing the part: which repairs fractures; restoring luxated parts: who by binding the vessel, stayeth the violent effusion of blood: who cicatriceth cloven lips, commonly called Hare-lips: who reduceth to equality the cavities of Ulcers and Fistula's.

Examples of supplying defects.

But he repairs those things which are defective either from the infancy, or afterwards by accident, as much as Art and Nature will suffer; who sets on an ear, an ey, a nose, one or more teeth; who fils the hollowness of the palat eaten by the Pox, with a thin plate of gold or silver, or such like; who supplies the defect of the tongue in part cut off, by some new addition; who fastens to a hand, an arm, or leg with fit ligaments, workmanlike: who fits a doublet bumbasted, or made with iron plates to make the body streight; who fils a shoo too big with cork, or fastens a stocking or sock to a lame mans girdle to help his gate. We will treat more fully of all these in our following Work. But in performing those things with the hands, we cannot but cause pain: (for who can without pain cut off an arm, or leg, divide and tear asunder the neck of the bladder, restore bones put out of their places, open Ulcers, bind up wounds, and apply causteries, and do such like?) notwithstanding the matter often comes to that pass, that unless we use a judicious hand, we must either die, or lead the remnant of our lives in perpetuall misery. Who therefore can justly abhor a Chirurgeon for this, or accuse him of cruelty? or desire they may be served, as in ancient times the Romans served *Archagatus*, who at the first made him free of the City; but presently after, because he did somewhat too cruelly burn, cut, and perform the other works of a good Chirurgeon, they drew him from his house into the *Campus Martius*, and there stoned him to death, as we read it recorded by *Sextus Cheroneus*, *Plutarch*'s nephew by his Daughter. Truly it was an inhumane kind of ingratitude, so cruelly to murder a man intent to the works of so necessary an Art. But the Senate could not approve the act, wherefore to expiate the crime as well as then they could, they made his Statue in Gold, placed it in *Æsculapius* his Temple, and dedicated it to his perpetuall memory. For my part, I very well like that saying of *Celsus*: A Chirurgeon must have a strong, stable, and intrepid hand, and a mind resolute and merciless; so that to heal him he taketh in hand, he be not moved to make more haste than the thing requires; or to cut less than is needfull; but which doth all things as if he were nothing affected with their cries; not giving heed to the judgment of the vain common people, who speak ill of Chirurgeons because of their ignorance.

The properties of a good Chirurgeon.

CHAP.

CHAP. III.

Of things Naturall.

THat the Chirurgeon may rightly, and according to Art perform the foresaid works, he must set before his eys certain Indications of working. Otherwise he is like to become an Emperick, whom no Art, no certain reason, but only a blind temerity of fortune moves to boldness and action. These Indications of actions are drawn from things (as they call them) naturall, not naturall, and besides nature, and their adjuncts, as it is singularly delivered of the Ancients, being men of an excellent understanding. Wherefore we will prosecute according to that order, all the speculation of this Art of ours. First therefore things Naturall are so termed, because they constitute and contain the nature of mans body, which wholly depends of the mixture and temperament of the four first bodies, as it is shewed by *Hippocrates* in his book *de Natura humana*: wherefore the consideration thereof belongs to that part of Physick, which is named *Physiologia*; as the examination of things not naturall to *Diætetice*, or Diet, because by the use of such things it endevours to retain and keep health: but *Therapeutice*, or the part which cures the Diseases, and all the effects besides nature, challenges the contemplation of those things which are not agreeable to nature. But the things which are called Naturall, may be reduced to seven heads: besides which there comes into their fellowship those which we term annexed.

From whence we must draw Indications.

What things are called naturall.

To what part of physick things not naturall pertain.

To what things besides nature.

The seven principall heads of things Naturall, are: *Elements, Temperaments, Humors, Parts or members, Faculties, Actions, Spirits.* To these are annexed, and somewhat near: *Age, Sex, Colour, Complexure, Time or season, Region, Vocation of life.*

CHAP. IIII.

Of Elements.

What an Element is.

AN Element (by the definition which is commonly received amongst Physitians) is the least and most simple portion of that thing which it compoleth: or that my speech may be the more plain, the four first and simple bodies are called Elements; Fire, Air, Water, and Earth; which accommodate and subject themselves as matter to the promiscuous generation of all things which the Heavens engirt, whether you understand things perfectly, or unperfectly mixed. Such Elements are only to be conceived in your mind, being it is not granted to any externall sense to handle them in their pure and absolute nature. Which was the cause that *Hippocrates* expressed them not by the names of substances, but of proper qualities, saying, Hot, Cold, Moist, Dry; because some one of these qualities is inherent in every Element, as his proper and essentiall form, not only according to the excess of intrinsick, but also of the active faculty, to which is adjoined another simple quality, and by that reason principall, but which notwithstanding is not to the highest degree of his kind, as you may understand by *Galen* in his first book of Elements. So, for example sake, in the Air we observe two qualities, Heat and Moisture, both principall, and not remitted by the commixture of any contrary quality, for otherwise they were not simple. Therefore thou maist say, What hinders that the principall effects of heat shew not themselves as well in the Air, as in the Fire? because, as we said before, although the Air have as great a heat according to his nature, extent, and degree, no otherwise than Fire hath, yet it is not so great in its active quality. The reason is, because that the calfactory force in the Air is hindered, and quilled by society of his companion and adjoyned quality, that is, Humidity which abateth the force of heat, as on the contrary, dryness quickneth it. The Elements therefore are endewed with these qualities.

Elements are understood by reason, not by sense.

Why *Hipp.* expressed the Elements by their names of qualities.

Two principal qualities are in each Element.

Why the Air heats not so vehemently as the Fire.

Names of the substances.		Names of the qualities.
Air	is	*Moist and hot.*
Water		*Cold and moist.*
Earth		*Cold and dry.*
Fire		*Hot and dry.*

These four Elements in the composition of naturall bodies, retain the qualities they formerly had, but that by their mixture and meeting together of contraries, they are somewhat tempered and abated. But the Elements are so mutually united one with another, and all with all, that no simple part may be found; no more than in a mass of the Emplaister *Diacalcitheos* you can shew any *Atomus* oil, or Litharge by it self; all things are so confused

How the Elements may be understood to be mixed in compound bodies.

and united by the power of heat, mixing the ſmalleſt particulars with the ſmalleſt, and the whole with the whole, in all parts. You may know and perceive this concretion of the four Elementary ſubſtances in one compound body, by the power of mixture, in their diſſolution by burning a pile or heap of green wood: For the flame expreſſes the Fire; the ſmoke, the Air; the moiſture that ſweats out at the ends, the Water; and the aſhes, the Earth: You may eaſily perceive by this example ſo familiar and obvious to the ſenſe, what diſſolution is, which is ſucceeded by the decay of the compound body; on the contrary, you may know that the coagmentation, or uniting and joyning into one of the firſt mixed bodies is ſuch, that there is no part ſincere or without mixture. For if the heat which is predominant in the fire, ſhould remain in the mixture in its perfect vigor, it would conſume the reſt by its pernicious neighborhood; the like may be ſaid of Coldneſs, Moiſture, and Drineſs; although of theſe qualities, two have the title of Active, that is, Heat and Coldneſs, becauſe they are the more powerfull; the other two Paſſive, becauſe they may ſeem more dull and ſlow, being compared to the former. The temperaments of all ſublunary bodies ariſe from the commixture of theſe ſubſtances and elementary qualities, which hath been the principall cauſe that moved me to treat of the Elements. But I leave the force and effects of the Elementary qualities to ſome higher contemplation, content to have noted this, that of theſe firſt qualities, (ſo called, becauſe they are primarily and naturally in the four firſt bodies) others ariſe and proceed, which are therefore called the ſecond qualities; as of many, theſe, Heavineſs, Lightneſs, variouſly diſtributed by the four Elements, as the Heat or Coldneſs, Moiſtneſs or Drineſs have more power over them. For of the Elements, two are called light, becauſe they naturally affect to move upwards: the other two heavie, by reaſon they are carryed downward by their own weight. So we think the fire the lighteſt, becauſe it holds the higheſt place of this lower world; the Air, which is next to it in ſite, we account light; for the water which lies next to the Air, we judg heavie; and the earth the center of the reſt we judg to be the heavieſt of them all. Hereupon it is, that light bodies, and the light parts in bodies, have moſt of the lighter Elements; as on the contrary heavie bodies have more of the heavier. This is a brief deſcription of the Elements of this frail world, which are only to be diſcerned by the underſtanding, to which I think good to adjoin another deſcription of other Elements, as it were ariſing or flowing from the commixture of the firſt: For beſides theſe, there are ſaid to be Elements of generation, and Elements of mans body. Which as they are more corporall, ſo alſo are they more manifeſt to the ſenſe. By which reaſon *Hippocrates* being moved, in his Book *de Natura humana*, after he had deſcribed the nature of Hot, Cold, Moiſt, and Dry, he comes to take notice of theſe by the order of compoſition. Wherefore the Elements of our generation, as alſo of all creatures which have blood, are ſeed and menſtruous blood. But the Elements of our bodies, are the ſolid and ſimilar parts ariſing from theſe Elements of generation. Of this kind are bones, membranes, ligaments, veins, arteries, and many others manifeſt to the eye, which we will deſcribe at large in our Treatiſe of Anatomie.

Why of the firſt qualities, two are active, and two paſſive.

Why the firſt qualities are ſo called.

What the ſecond qualities are.

What Elements light, what heavy.

What the Elements of generation are.

What the Elements of mixt bodies.

CHAP. V.

Of Temperaments.

What a Temperament is.

TEmperament is deemed, a proportionable mixture of hot, cold, moiſt, and dry; or, it is a concord of the firſt diſagreeing faculties. That harmony ſpringes from the mixture of the four firſt bodies of the world. This whether Temperament or Concord is given to Plants and brute Beaſts for the beginning of their life, and ſo conſequently for their life and form. But as Plants are inferior in order and dignity to beaſts, ſo their * life is more baſe and infirm, for they have only a growing faculty, by which they may draw an Alimentary juice from the earth, as from their mothers breaſt, to preſerve them and their life, by which they may grow to a certain bigneſs, and laſtly, by which they may bring forth their like for the perpetuall continuance of their kind. But the * life of beaſts, have to the three formes, the gift of ſenſe annexed: by breath whereof, as by a certain inward knowledg they ſhun thoſe things that are hurtfull, and follow thoſe which profit them; and by the power of their will, they move themſelves whither they pleaſe. But the ſoul of man far more perfect and noble than the reſt, ariſeth not from that earthly mixture and temper of the Elements, but acknowledgeth and hath a far more divine off-ſpring; as we ſhall teach hereafter.

What the life performs in Plants.

* *Anima.*

What in beaſts.

Mans ſoule comes from above.

The manifold diviſion of a Temperament.

They divide a Temperament in the firſt diviſion, into two kinds; as one a temperate, another an untemperate. The untemperate is of two ſorts: The one wholly vicious, which hath altogether exceeded the bounds of mediocrity: The other, which hath ſomewhat ſtrayed from the mediocrity of temper, but notwithſtanding is yet contained within the limits of health: as that which brings no ſuch evident harm to the actions, but that it ſomewhat hinders them, ſo that they cannot ſo well and perfectly perform their duties. But the vicious Temperament doth three manner of ways corrupt the functions, either by

A Temperament, *ad Paſſum.*

weak-

weakning, depraving, or aboliſhing them. For ſo ſtupor, or aſtoniſhment, diminiſheth and ſloweth the quickneſs of motion; convulſion depraves it; the Palſie aboliſheth it, and taketh it away. The temperate Temperament is alſo divided into two kinds; which is either to equality of weight or juſtice. It is called a Temperature to weight which ariſeth from the equall force of exactly concurring qualities, and as placed in a perfect ballance, draws down neither to this nor that part. They think the example of this Temperament to appear in the inner skin of the fingers ends of a man tempered to Juſtice. For ſeeing the moſt exquiſite touch reſides there, they ought to be free from all exceſs of contrariety; for otherwiſe being corrupted by too much heat or cold, moiſture or drineſs, they could give no certain judgment of the tangible qualities. For which thing nature hath excellently provided in the fabrick and coagmentation of the parts, of which the skin conſiſts. For it is compoſed of hot and moiſt fleſh, and therefore ſoft, and of a tendon and nerve cold and dry, and therefore hard; which are not only equally fitted and conjoyned, but wholly confuſed and mixed together, by which it comes, that removed from all extremes of oppoſition, it is placed in the midſt, as a rule to judg of all the exceſſes that happen to the touch. So it was fit the eye, which was to be the inſtrument of ſight, ſhould be tinctured with no certain colour, that it might be the leſs deceived in the judgment of colours. So it was convenient the hearing ſhould not be troubled with any diſtinct ſound, whereby it might more certainly judg of equall and unequall ſounds, not diſtinguiſhed by a ratable proportion; neither was it fit the tongue ſhould have any certain taſte, leſt the acceſs of that taſte ſhould deceive it in knowing and judging of ſo many different taſtes. The Temperature tempered to juſtice, is that, which although it is a little abſent from the exact and ſevere parility of mixed qualities, yet hath that equality which doth fully and abundantly ſuffice for to perform all the functions fitly and perfectly, which nature doth require, wherefore we can judg no otherwiſe of it than by the integrity of the Actions. For hence it took its name; for as diſtributive Juſtice equally gives to every one rewards, or puniſhment according to their deſerts; ſo Nature, having regard to all the parts of the body, gives them all that temper which may ſuffice to perform thoſe duties, for which they are ordained. Let us for an example conſider a Bone; no man doubts, but that, like as the other ſimilar parts of the body, proceeds from the mixture of the four Elements: but nevertheleſs nature weighing the uſe of it, and ordaining it to ſupport the reſt of the body, would have more of the terrene and dry Element infuſed into it, that it might be the ſtronger and firmer to ſuſtain weight. But a Ligament, ſeeing it was made for other uſes, hath leſs of that earthly drineſs than the bone, but more than the fleſh, altogether fitted to its nature. So it hath ſeemed good to nature to endue all the parts of the body, not only with an equall portion, but alſo proportion of Elements and qualities; we call that a Temperament to juſtice: and we ſay, that it is in Plants, brute Beaſts, and all naturall bodies, which enjoy that temper and mediocrity, which may be agreeable to their nature. Hereupon by compariſon ariſe eight kinds of intemperate tempers: As

Ad pondus, vel ad juſtitiam.

A Temperament *ad juſtitiam.*

The temperament of a bone.

The kinds of untemperate tempers.

- Four ſimple
  - *Hot*, *Cold* } temperate in { *Drineſs* and *Moiſture*.
  - *Moiſt*, *Dry* } temperate in { *Heat* and *Cold*.
- Four compounds
  - *Hot* and *Moiſt*
  - *Hot* and *Dry*
  - *Cold* and *Moiſt*
  - *Cold* and *Dry*.

But theſe Temperaments are either of the whole Body, or of ſome part thereof;

And that either
- Principal, as
  - the *Brain*
  - the *Heart*
  - the *Liver*
  - the *Stones*. Or
- Of the reſt of the parts compoſed of other which have no principality in the body.

Again, ſuch Temperaments are either healthfull, which ſuffice perfectly to perform their actions; or unhealthfull, which manifeſtly hurt them, the ſignes whereof may be read deſcribed by *Galen*. And you muſt obſerve that when we ſay the body, or any part of it is hot, we underſtand more hot than is fit for one of that kinde which is tempered to juſtice; as when we ſay a man hath a hot liver, we mean his liver is hotter, than a man juſtly tempered ſhould have; for all other tempers, whether of the whole body, or any of the parts thereof, are to be referred to this; and in the cure of diſeaſes we muſt look upon it, as the mark, and labour to preſerve it by the uſe of convenient things, as much as lies in our power. Wherefore, becauſe it is very neceſſary to know the diſtinction of Temperaments, I have

Lib. 2. de Temper. & in Art. medica.

thought good in this place, briefly to handle the Temperaments of the parts of the body, ages, ſeaſons of the year, humors, and medicines. Therefore the temperaments of the parts of our body are of this nature, not only by the judgment of the touch of a mans hand, which is juſtly tempered, (who is often deceived by flowing heat, which ſpread from the heart into all the body, imparts a certain kind of heat to all the parts) but alſo by the rule of their reaſon, compoſure and ſubſtance, as

What the temperaments of mans body are.

A Bone is the moſt dry and cold.
A Griſle leſs than it.
A Ligament leſs than a Griſle.
A Tendon is ſo much dryer and colder than the membrane, by how much it in the ſame temper exceeds a Vein and Artery. Then follow the harder Veins, for the ſofter are in a middle temper of dryneſs and moiſture, like as the skin; although all, both ſoft and hard, are of a cold temper. Wherefore all theſe parts of their own nature are cold and without blood: although the Veins and Arteries wax hot, by reaſon of the heat of the blood they contain, which notwithſtanding alſo borroweth that heat from the heart, as a part moſt hot, and ſofter than the skin; the liver next followeth the heart, in the order of the hotter parts, which is far ſofter than the skin it ſelf: for if, according to *Galens* opinion, the heart is ſomewhat leſs hard than the skin, and that is far harder than the liver, as appears by touching them, it muſt neceſſarily follow that the liver much exceeds the skin in ſoftneſs; I underſtand the skin ſimple, and ſeparated from the fleſh lying under it, to which it firmly cleaves. The fleſh is more moiſt and hot than the skin, by reaſon of the blood diſperſed in it. The ſpinall marrow is colder and moiſter than the skin; but the brain ſo much exceeds it in moiſture, as it is exceeded by the fat. The lungs are not ſo moiſt as the fat; and the ſpleen, and kidneys are of the like nature, and nevertheleſs they are all moiſter than the skin.

Ad finem, lib. de temper.

The temperaments of ages.

According to the diverſities of ages, the temperaments both of the whole body, and all its parts, undergo great mutations; for the bones are far harder in old men than in children, becauſe our life is, as it were, a certain progreſs to dryneſs; which when it comes to the height, conſequently cauſeth death. Wherefore in this place we muſt ſpeak of the Temperaments of ages, when firſt we ſhall have defined what an age is. Therefore an age is defined, A ſpace of life in which the conſtitution of the body of its ſelf and own accord, undergoeth manifeſt changes. The whole courſe of life hath four ſuch Ages. The firſt is Childhood, which extends from the birth to the eighteenth year of age, and hath a hot and moiſt temper, becauſe it is next to the hot and moiſt beginnings of life, ſeed, and blood. Youth followeth this, which is prolonged from the eighteenth to the twenty fifth year, and is temperate, and in the midſt of all exceſſes. Mans eſtate ſucceedeth youth, which they deny to extend beyond the thirty fifth year of age, in its proper temper it is hot and dry; whereby it cometh to paſs that then the heat is felt more acride and biting, which in childhood ſeemed milde; becauſe the progreſs of the life to dryneſs, hath much waſted the native humidity.

What an age is.

Old-age divided into two parts.

* Three degrees of the ſecond part of Old-age.

Then ſucceeds Old-age, ever divided into two parts; the firſt whereof extends from the thirty fifth, to the forty ninth year; thoſe of this age are called Old-men, (**but we commonly call them middle-ag'd men.*) The latter is, as it were, divided by *Galen* into three degrees; the firſt whereof are thoſe, who having their ſtrength ſound and firm, undergo civil affairs and buſineſſes: which things thoſe which are in the ſecond degree of Old-age cannot do, becauſe of the debility of their now decaying ſtrength: but thoſe which are in the laſt degree, are afflicted with moſt extreme weakneſs and miſery, and are as much deprived of their ſenſes and underſtanding, as of the ſtrength of their bodies; whereof aroſe this Proverb, *Old men, twice children.* Thoſe Old men of the firſt rank are pleaſant and curteous; and thoſe we ſay, are beginning to grow Old, or in their green Old-age; thoſe of the ſecond ſort delight in nothing but the boord and bed; but old decrepit men of the laſt order, think of nothing elſe, than their graves and monuments. Their firm and ſolid parts are of a cold and dry temperature, by reaſon of the decay of the radicall moiſture, which the inbred heat cauſeth in the continuance of ſo many years. Which thing may happen in a ſhort ſpace, by the vehement flame of the ſame naturall heat, turned by fevers into a fiery heat. But if any to prove Old men moiſt, will object, That they cough up, and ſpit much, I will anſwer him, as an old Doctor once ſaid; That a pitcher filled with water, may pour forth much moiſture; yet no man will deny but that ſuch a veſſel of its own terrene nature and matter is moſt dry; ſo old men may plainly be affirmed to be moiſt, by reaſon of their defect of heat, and abundance of excrements. But this deſcription of ages is not to be taken ſo ſtrictly as alwayes to be meaſured by the ſpaces and diſtances of years, for there are many which by their own miſdemeanor ſeem elder at forty, than others do at fifty.

Old men have their ſolid parts dry.

A compariſon of the four ages to the four ſeaſons of the year

Laſtly, the famous Philoſopher *Pythagoras* divided mans life into four ages, and by a certain proportion compared the whole courſe thereof to the four ſeaſons of the year; as Childhood to the Spring, in which all things grow and ſprout out, by reaſon of plenty and abundance of moiſture. And Youth to the Summer, becauſe of the vigor and ſtrength which men enjoy at that age. And mans eſtate, or conſtant age, to Autumn; for that then

after

after all the dangers of the fore-paſſed life, the gifts of diſcretion and wit acquire a ſeaſonableneſs or ripeneſs, like as the fruits of the earth enjoy at that ſeaſon. And laſtly, he compares Old-age to the ſterile and fruitleſs Winter, which can eaſe and conſolate its tediouſneſs by no other means, than the uſe of fruits gathered and ſtored up before, which then are of a cold and troubleſome condition. But for extreme Old-age, which extends to eighty or a hundred years, it is ſo cold and dry, that thoſe which arrive at that decrepit age are troubleſome, harſh, touchy, froward, crabby, and often complaining, untill at the length deprived of all their ſenſes, tongue, feet, and underſtanding, they doting, return again to childiſhneſs, as from the ſtaff to the ſtart. And thus much of the Temperaments of ages.

The tempers of the ſeaſons of the year.

But now in like manner we will explain the Temperatures of the ſeaſons of the year, which are four; the Spring, Summer, Autumn, Winter. The Spring continues almoſt from the twelfth or thirteenth day of *March* to the midſt of *May*; *Hippocrates* ſeemeth to make it hot and moiſt; which opinion ſeemeth not to have ſprung from the thing it ſelf, but from an inveterate error of the ancient Philoſophers, who would fit the Temperaments of the four ſeaſons of the year, as anſwering in proportion to the temperatures of the four ages. For if the matter come to a juſt tryall, all men will ſay, the Spring is temperate, as that which is in the midſt of the exceſs of heat, cold, moiſture and drineſs; not only by compariſon, becauſe it is hotter than Summer, and colder than Winter; but becauſe it hath that quality of its own proper nature. Wherefore it is ſaid of *Hippocrates*, The Spring is moſt holeſome, and leaſt deadly; if ſo be that it keep its native temper, from which if it decline, or ſucceed a former untemperate ſeaſon, as Autumn or Winter, it will give occaſion to many diſeaſes deſcribed by *Hippocrates*; not that it breeds them, but becauſe it brings them to fight, which before lay hid in the body. Summer is comprehended in the ſpace of almoſt four months; it is of a hot and dry temper, a breeder of ſuch diſeaſes as proceed from choler, becauſe that humor at this time is heaped up in many bodies by aduſtion of blood bred in the Spring; but all ſuch diſeaſes do ſpeedily run their courſe. The beginning of Autumn, is from the time the Sun enters into Libra, and endures the like ſpace of time as the Spring. But when it is dry, it hath great inequality of heat and cold, for the mornings and evenings being very cold, the noondays on the contrary are exceeding hot. Wherefore many diſeaſes are in Autumn, and then long and deadly, eſpecially if they incline towards Winter; becauſe all daily and ſodain changes to heat and cold are dangerous. The Winter poſſeſſes the remnant of the year, and is cold and moiſt, it increaſes naturall heat, ſtirs up the appetite, and augments Phlegme. It encreaſes heat by *Antiperiſtaſis*, or contrariety of the encompaſſing air, which being then cold, prohibits the breathing out of heat: whereby it happens that the heat being driven in and hindered from diſſipation, is ſtrengthened by co-uniting its forces. But it augments Phlegme, for that men are more greedy, the Appetite being encreaſed by the ſtrengthened heat: from whence proceeds much crudity, and a large ſtore of diſeaſes, eſpecially Chronick or Long, which ſpread and encreaſe rather in this winter-ſeaſon than in any other part of the year. To this diſcourſe of the temper of the ſeaſons of the years, is to be revoked the variety of tempers which happens every day, which certainly is not to be neglected, that there may be place of election, eſpecially if nothing urge. For hither belongs that ſaying of *Hippocrates*; When in the ſame day it is one while hot, another cold, Autumnall diſeaſes are to be expected. Therefore an Indication taken from hence is of great conſequence to the judgment of diſeaſes; for if it agree with the diſeaſe, the diſeaſe is made more contumacious, and difficult to cure. Whereupon the Patient and Phyſitian will have much trouble; but if on the contrary it reclaim and diſſent, the health of the Patient is ſooner to be expected. Neither is it a thing of leſs conſequence to know the cuſtoms and habits of the places and Countreys in which we live; as alſo the inclination of the Heavens, and temperature of the Air; but let us leave theſe things to be conſidered by Naturall Philoſophers, that we may deliver our judgment of the temperaments of *Humors*. Blood, as that which anſwers to the Air in proportion, is of a hot and moiſt nature, or rather temperate, as *Galen* teſtifies; for, ſaith he, it is certain and ſure, that the Blood is neither hot nor moiſt, but temperate, as in its firſt compoſure none of the four firſt Qualities exceeds other by any manifeſt exceſs, as he repeats it upon the 39th Sentence. Phlegm, as that which is of a waterith nature, is cold and moiſt; no otherwiſe than Choler being of a fiery temper, is hot and dry. But Melancholy aſſimilated to earth, is cold and dry. This which we have ſpoken in generall of Phlegm and Melancholy, is not always true in every kind of the ſaid Humors. For ſalt Phlegm is of a hot and dry temperature; as alſo all kinds of Melancholy which have aroſe or ſprung by aduſtion from the native and alimentary, as we will teach in the following Chapter. Now the temperaments of Medicines have not the ſame form of judgment, as thoſe things which we have before ſpoken of; as, not from the Elementary quality, which conquering in the contention and mixture, obtains the dominion; but plainly from the effects, which taken or applyed, they imprint in a temperate body. For ſo we pronounce thoſe things, hot, cold, moiſt, or dry, which produce the effects of Heat, Coldneſs, Moiſture, or Dryneſs. But we will defer the larger explication of theſe things to that place, where we have peculiarly appointed

appointed to treat of Medicines; where we will not ſimply enquire whether they be hot or cold, but what degree of heat and cold, or the like other quality: in which ſame place we will touch the temperature and all the nature of taſtes, becauſe the certaineſt judgment of Medicines is drawn from their taſtes. Hitherto of Temperaments; now we muſt ſpeak of Humors, whoſe uſe in Phyſicall ſpeculation is no leſs than that of Temperaments.

CHAP. VI.

Of Humors.

The knowledg of the Humor is neceſſary. Lib. *De natura Humana.*

TO know the nature of *Humors*, is a thing not only neceſſary for Phyſitians, but alſo for Chirurgeons, becauſe there is no diſeaſe with matter which ariſeth not from ſome one, or the mixture of more *Humors*. Which thing *Hippocrates* underſtanding, writ, every Creature to be either ſick or well according to the condition of the *Humors* in the body. And certainly all putrid feavers proceed from the putrefaction of *Humors*. Neither do any acknowledg any other originall or diſtinction of the differences of Abſceſſes or Tumors: neither do ulcerated, broken, or otherwiſe wounded members hope for the reſtauration of continuity, from other than from the ſweet falling down of Humors to the wounded part. Which is the cauſe that often in the cure of theſe affects, the Phyſitians are neceſſarily buſied in tempering the Blood, that is, bringing to a mediocrity the four Humors compoſing the maſs of blood, if they at any time offend in quantity, or quality. For whether if any thing abound or digreſs from the wonted temper in any exceſs of heat, cold, viſcoſity, groſneſs, thinneſs, or any ſuch like quality, none of the accuſtomed functions will be well performed. For which cauſe thoſe chief helps to preſerve and reſtore health have been divinely invented: *Phlebotomie*, or blood-letting, which amends the quantity of too much blood; and Purging, which corrects and draws away the vicious quality. But now let us begin to ſpeak of the Humors, taking our beginning from the definition.

The helps of Health.

What an Humor is.

The manifold diviſion of Humors.

An Humor (is called by Phyſitians) what thing ſo ever is liquid and flowing in the body of living Creatures endued with Blood, and that is either naturall, or againſt nature. The naturall is ſo called becauſe it is fit to defend, preſerve and ſuſtain the life of a Creature. Quite different is the nature and reaſon of that which is againſt nature. Again, the former is either Alimentary or Excrementitious: The Alimentary which is fit to nouriſh the body, is that Humor which is contained in the veins and arteries of a man which is temperate and perfectly well; and which is underſtood by the generall name of Blood, which is let out at the opening of a vein. For Blood otherwiſe taken, is an Humor of a certain kind, diſtinguiſhed by heat and warmneſs from the other Humors comprehended together with it, in the whole maſs of the blood. Which thing, that it may the better be underſtood, I have thought good in this place to declare the generation of Blood by the efficient and materiall cauſes. All things which we eat or drink, are the materials of Blood; which things drawn into the bottom of the Ventricle by its attractive force, and there detained, are turned by the force of concoction implanted in it, into a ſubſtance like to Almond-butter. Which thing, although it appear one and like it ſelf, yet it conſiſts of parts of a different nature, which not only the variety of meats, but one and the ſame meats yeelds of it ſelf. We term this *Chylus*, (when it is perfectly concocted in the ſtomach.) But the * Gate-vein receives it driven from thence into the ſmall Guts, and ſucked in by the Meſeraick-veins, and now having gotten a little rudiment of change in the way, carries it to the Liver, where by the Blood-making faculty, which is proper and naturall to this part, it acquires the abſolute and perfect form of Blood. But with that Blood, at one and the ſame time and action all the Humors are made, whether alimentary or excrementitious. Therefore the Blood, that it may perform its office, that is, the faculty of nutrition, muſt neceſſarily be purged and cleanſed from the two excrementitious Humors: of which the bladder of Gall draws one, which we call yellow Choler; and the Spleen the other, which we term Melancholy. Theſe two Humors are naturall, but not alimentary or nouriſhing, but of another uſe in the body, as afterwards we will ſhew more at large. The Blood freed from theſe two kinds of Excrements, is ſent by the veins and arteries into all parts of the body for their nouriſhment. Which although then it ſeem to be of one ſimple nature, yet notwithſtanding it is truly ſuch, that four different and unlike ſubſtances may be obſerved in it, as, Blood, properly ſo named, Phlegm, Choler, and Melancholy, not only diſtinct in colour, but alſo in taſte, effects, and qualities. For, as *Galen* notes in his book *de Natura humana*, Melancholy is acide or ſour, Choler bitter, Blood ſweet, Phlegm unſavory. But you may know the variety of their effects, both by the different temper of the nouriſhed parts, as alſo by the various condition of the diſeaſes ſpringing from thence. For therefore ſuch ſubſtances ought to be tempered and mixed amongſt themſelves in a certain proportion, which remaining, health remains; but violated, diſeaſes follow. For all acknowledg, that an *Oedema* is cauſed by Phlegmatick; a *Scirrhus*, by Melancholick; an *Eryſipelas*, by Cholerick; and a *Phlegmone*, by

What the *Chylus* is.
* *Vena porta.*

Where the Blood is perfected.

The receptacles of Choler and Melancholy.

Four unlike Humors in the Blood.

pure

pure and laudable blood. *Galen* teaches by a familiar example of new wine presently taken from the Press, that these 4 substances are contained in that one mass, and mixture of the blood. In which every one observes 4 distinct Essences; for the flower of the wine working up, swims at the top, the dregs fall down to the bottom, but the crude and watery moisture, mixed together with the sweet and vinous liquor, is every where diffused through the body of the wine: the flower of the wine, represents Choler, which bubbling up on the superficies of blood, as it concretes and grows cold, shineth with a golden colour; the dregs, Melancholy, which by reason of its heavinesse ever sinketh downward, as it were, the mud of the blood; the crude and watery portion, Phlegm; for as that crude humor, except it be rebellious in quantity, or stubborn by its quality, there is hope it may be changed into wine, by the naturall heat of the wine; so Phlegm, which is blood half concocted, may by the force of native heat be changed into good and laudable blood. Which is the cause that nature decreed or ordained no peculiar place as to the other 2 Humors, whereby it might be severed from the blood: But the true and perfect liquor of the wine represents the pure blood, which is the more laudable and perfect portion of both the humors of the confused mass. It may easily appear by the following scheme, of what kind they all are, and also what the distinction of these four Humors may be.

A comparison of blood and new wine.

Phlegm is Blood half concocted.

Why it hath no proper receptacle.

	NATURE.	CONSISTENCE.	COLOUR.	TASTE.	USE.
Blood is	*Of Nature very, hot, and moist, or rather temperate.*	*Of indifferent consistence, neither too thick nor too thin.*	*Of Colour red, rosie, or crimson.*	*Of Taste sweet.*	*Of such use, that it chiefly serves for the nourishment of the fleshy parts, and carryed by the vessels, imparts heat to the whole body.*
Phlegm is	*Of Nature watery, cold and moist.*	*Of Consistence, liquid.*	*Of Colour, white.*	*Of Taste, sweet, or rather unsavory, for we commend that water which is unsavory.*	*Fit to nourish the brain, and all the other cold and moist parts, to temper the heat of the blood, and by its slipperinesse to help the motion of the joynts.*
Choler is	*Of Nature fiery, hot and dry.*	*Of Consistence, thin.*	*Of Colour yellow, or pale.*	*Of Taste, bitter.*	*It provoketh the expulsive faculty of the guts, attenuates the Phlegm cleaving to them, but the Alimentary is fit to nourish the parts of like temper with it.*
Melancholy is	*Of Nature earthly, cold, and dry.*	*Of Consistence, grosse and muddy.*	*Of Colour, blackish.*	*Of Taste, acide, sour or biting.*	*Stirs up the Appetite, nourishes the Spleen, and all the parts of like temper to it, as the bones.*

Blood hath its neareſt matter from the better portion of the *Chylus*: and being begun to be laboured in the veins, at length gets form and perfection in the Liver; but it hath its remote matter from meats of good digestion and quality, seasonably eaten after moderate exercise; but for that, one age is better than another, and one time of the year more convenient than another. For blood is made more copiously in the Spring, because that season of the year comes neareſt to the temper of the blood, by reason of which the blood is rather to be thought temperate, than hot and moist; for that *Galen* makes the Spring temperate; and besides, at that time blood-letting is performed with the best success: Youth is an age very fit for the generation of blood, or by *Galens* opinion, rather that part of life that continues from the 25, to the 35 year of our age. Those in whom this Humor hath the dominion, are beautified with a fresh and rosie colour, gentle, and well-natured, pleasant, merry, and facetious. The generation of Phlegm, is not by the imbecillity of heat, as some of the Ancients thought; who were perswaded that Choler was caused by a raging, Blood by a moderate, and Phlegm and Melancholy by a remiss heat. But that opinion is full of manifest error: for if it be true that the *Chylus* is laboured and made into blood in the same part, and by the same fire, that is, the Liver; from whence in the same moment of time should proceed that strong and weak heat, seeing the whole mass of the blood different in its four essentiall parts, is perfected and made at the same time, and by the same equall temper of the same part, action, and blood-making faculty; therefore from whence have

Lib. 1. de nutr.

One and the same heat is the efficient cause of all humors at the same time.

have we this variety of Humors? From hence, for that those meats by which we are nourished, enjoy the like condition that our bodies do, from the four Elements, and the four first Qualities: for it is certain, and we may often observe, in what kind soever they be united or joined together, they retain a certain hot portion imitating the fire; another cold, the water; another dry, the earth; and lastly, another moist like to the air. Neither can you name any kind of nourishment, how cold soever it be, not Lettuce it self, in which there is not some fiery force of heat. Therefore it is no marvail, if one and the same heat working upon the same matter of *Chylus*, varying with so great dissimilitude of substances, do by its power produce so unlike humors, as from the hot, Choler; from the cold, Phlegm; and of the others, such as their affinity of temper will permit.

The heat of the Sun alone doth melt wax and harden clay.

There is no cause that any one should think that variety of humors to be caused in us, rather by the diversity of the active heat, than wax and a flint placed at the same time, and in the same situation of climat and soil, this to melt by the heat of the Sun, and that scarce to wax warm. Therefore that diversity of effects is not to be attributed to the force of the efficient cause, that is of heat, which is one, and of one kinde in all of us; but rather to the materiall cause, seeing it is composed of the confluxe, or meeting together of various substances, gives the heat leave to work, as it were out of its store, which may make and produce from the hotter part therof Choler, and of the colder and more rebellious Phlegm. Yet I will not deny, but that more Phlegm, or Choler may be bred in one and the same body, according to the quicker, or slower provocation of the heat; yet nevertheless it is not consequent, that the originall of Choler should be from a more acide, and of Phlegm from a more dull heat in the same man. Every one of us naturally have a simple heat, and of one kind, which is the worker of divers operations, not of it self, seeing it is always the same, and like it self, but by the different fitness, pliableness, or resistance of the matter on which it works. Wherefore Phlegm is generated in the same moment of time, in the fire of the same part, by the efficiency of the same heat, with the rest of the blood, of the more cold, liquid, crude, and watery portion of the *Chylus*. Whereby it comes to pass, that it shews an express figure of a certain rude or unperfect blood, for which occasion nature hath made it no peculiar receptacle, but would have it to run friendly with the blood in the same passages of the veins, that any necessity hapning by famin, or indigency, and in defect of better nourishment, it may by a perfecter elaboration quickly assume the form of blood. Cold and rude nourishment make this humor to abound principally in winter, & in those which incline to old-age, by reason of the similitude which Phlegm hath with that season and age. It makes a man drowsie, dul, fat, and swollen up, and hasteneth gray-hairs. Choler is as it were, a certain heat and fury of humors, which generated in the Liver, together with the blood is carried by the veins and arteries through the whole body. That of it which abounds, is sent, partly into the guts, and partly into the bladder of the gall, or is consumed by transpiration, or sweats; It is somewhat probable that the Arteriall blood is made more thin, hot, quick, and pallid, than the blood of the Veins, by the commixture of this Alimentary Choler. This Humor is chiefly bred and expel'd in youth, and acrid and bitter meats give matter to it: but great labours of body and mind give the occasion. It maketh a man nimble, quick, ready for all performance, lean, and quick to anger, and also to concoct meats. The melancholick humor, or Melancholy, being the grosser portion of the blood, is partly sent from the Liver to the Spleen to nourish it, and partly carried by the vessels into the rest of the body, and spent in the nourishment of the parts endued with an earthly driness; it is made of meats of gross juice, and by the perturbations of the mind, turned to fear and sadness. It is augmented in Autumn, and in the first and crude Old-age; it makes men sad, harsh, constant, froward, envious and fearfull. All men ought to think, that such Humors are wont to move at set hours of the day, as by a certain peculiar motion or tide, Therefore the blood flows from the ninth hour of the night, to the third hour of the day; then Choler to the ninth of the day; then Melancholy to the third of the night; the rest of the night that remains, is under the dominion of Phlegm. Manifest examples hereof appears in the French-Pox. From the elaborat and absolute mass of the blood, (as we said before) two kinds of Humors, as excrements of the second concoction, are commonly and naturally separated, the one more gross, the other more thin. This is called either absolutely Choler, or with an adjunct, yellow Choler. That is called Melancholy, which drawn by the Spleen in a thinner portion, and elaborate by the heat of the Arteries, which in that part are both many and large, becomes nourishment to the part; the remnant thereof is carried by the veiny Vessel into the orifice of the ventricle, whereby it may not cause but whet the appetite, and by its astriction strengthen the actions thereof. But yellow Choler drawn into the bladder of the gall, remains there so long, till being troublesome, either in quantity or quality, it is excluded into the guts, whereby it may cast forth the excrements residing in them; the expulsive faculty being provoked by its acrimony, and by its bitterness kils the worms that are bred there. This same Humor is accustomed to die the urine of a yellow colour. There is another serous Humor, which truly is not fit to nourish but profitable for many other things, which is not an excrement of the second, but of the first concoction. Therefore nature would that mixed with the *Chylus*, it should come to

The divers condition of the matter alone, is the cause of variety.

The effect of Phlegm.

The effects of Choler.

The effects of Melancholy.

What motions are in each quarter of the body.

The Melancholy Humor doth not cause, but whet the appetite.

A serous or wheyish humor

the

the Liver, and not be voided with the excrements, whereby it might allay the groſneſs of the blood, and ſerve it for a vehicle; for otherwiſe the blood could ſcarce paſs through the capillary veins of the Liver, and paſſing the ſinous and gibbous pares thereof, come to the hollow vein. Part of this ſerous humor ſeparated together with the blood which ſerves for the nouriſhment of the Reins, and ſtraight carried into the bladder, is turned into that urine which we daily make; the other part therefore carryed through all the body together with the blood, performing the like duty of tranſportation, is excluded by ſweats into which it degenerates. Beſides the forenamed, the *Arabians* have mentioned four other humors, which they term Alimentary and ſecondary, as being the next matter of nouriſhment, as thoſe four the blood contains, the remote. They have given no name to the firſt kind, but imagin it to be that humor, which hangs ready to fall like to little drops in the utmoſt orifices of the veins. They call the ſecond kind, * Dew; being that humor, which entred already into the ſubſtance of the part, doth moiſten it. The third they call by a barbarous name, *Cambium*, which already put to the part to be nouriſhed, is there faſtned. The fourth named *Gluten*, or Glew, is only the proper and ſubſtance-making humidity of the ſimilar parts, not their ſubſtance. The diſtinction of the degrees of nutrition recited by *Galen* in his books of Naturall faculties, anſwer in proportion to this diſtinction of humors. The firſt is, that the blood flow to the part that requires nouriſhment; then that being there arrived, it may be agglutinated; then laſtly, that having loſt its former form of nouriſhment, it may be aſſimilated.

Secundary Humors.

* Ros.

Thoſe humors are againſt nature, which being corrupted, infect the body and the parts in which they are contained by the contagion of their corruption, retaining the names and titles of the humors, from whoſe perfection and nature they have revolted, they all grow hot by putrefaction, although they were formerly by their own nature cold. And they are corrupted, either in the veins only, or within and without the veins: In the veins Blood and Melancholy; but both without and within the veins, Choler and Phlegm. When Blood is corrupted in its thinner portion, it turns into Choler, when in its thicker, into Melancholy; for the Blood becomes faulty two manner of ways, either by the corruption of its proper ſubſtance by putrefaction, or by admixtion of another ſubſtance by infection. The Melancholy humor which is corrupted in the veins, is of three ſorts: The firſt is of a Melancholy juice putrefying, and by the force of a ſtrange heat, turned, as it were, into aſhes, by which it becomes aduſt, acrid and biting. The other ariſeth from that Choler which reſembles the yolks of eggs, which by aduſtion becomes leek-coloured, then æruginous, or of a blewiſh green, then red, and laſtly black, which is the very worſt kind of Melancholy, hot, malign, eating, and exulcerating, and which is never ſeen or voided with Feavers. The third comes from Phlegm putrefying in the veins, which firſt degenerates into ſalt Phlegm, but ſtraight by the ſtrength of extraneous heat degenerates into Melancholy.

Humors againſt nature.

Into what Humors the blood when it corrupts, doth degenerate.

The Melancholy Humor corrupted, is of three kinds.

Phlegm not naturall is bred, either

- In the Veins, and is either
  - Acide and very crude, as which hath had none or very little impreſſion of heat, but that which it firſt had in the ſtomach.
  - Salt, which is bred by the ſweet, putrefying and aduſt, or mixture of aduſt and ſalt particles.
- Or without the Veins, & is of four ſorts; either
  - Wateriſh, as is that thin moiſture which diſtils from the brain by the noſtrils.
  - Mucous, as when that wateriſh is thickned into filth by the help of ſome accidentall or ſmall heat.
  - Glaſſie, or * Albuminous, reſembling molten glaſs, or rather the white of an egg, and is moſt cold.
  - *Gypſea*, or Plaiſter-like, which is concrete into the hardneſs and form of chalk, as you may ſee in the joints of the fingers in a knotty gout, or in inveterate diſtillations upon the Lungs.

* *Albuminea.*

Choler not naturall is bred, either

- In the Veins, as the * vitelline (like in conſiſtence to the yolk of a raw egg) which the acrimony of ſtrange heat breeds of yellow Choler, which ſame in diſeaſes altogether deadly, degenerates into green, æruginous, & laſtly into a blue, or colour like that which is dried by woad.
- Or in the capacity of the upper belly, as the ventricle, and this is of five kinds:
  - The firſt is called *Porracea*, or leek-coloured, reſembling the juice of a leek in greenneſs.
  - The ſecond *æruginoſa*, or æruginous, like in colour to verdigreaſe.
  - The third blewiſh, or woad-coloured, like the colour died by woad.
  - The fourth red, differing in this from blood, whoſe colour it imitates, that it never cometh into knots, or clods like blood.
  - The fifth very red, generated by the exceſs of the former, which cauſeth burning feavers.

* *Vitellina.*

The

The kinds of ſuch Choler, are often caſt forth by vomit in diſeaſes, the ſtrength of the diſeaſe being paſt; being troubleſome to the parts through which they are evacuated, by their bitterneſs, acrimony, and biting.

The ſignes of a Sanguine perſon.

I Think it manifeſt, becauſe the matter and generation of fleſh is principally from blood, that a man of a fleſhy, denſe, and ſolid habit of body, and full of a ſweet and vaporous juice, is of a Sanguine complexion. And the ſame party hath a flouriſhing and roſie colour in his face, tempered as with an equal mixture of white and red; of white, by reaſon of the skin lying utmoſt; of red, becauſe of the blood ſpread underneath the skin: for always ſuch as the humor is, ſuch is the colour in the face. In manners, he is curteous, gentle, eaſie to be ſpoken to, not altogether eſtranged from the love of women, of a lovely countenance and ſmooth forehead, ſeldom angry, but taking all things in good part; for as the inclination of humors is, ſo alſo is the diſpoſition of manners. But blood is thought the mildeſt of all humors; but the ſtrong heat of the inward parts maketh him to eat and drink freely. Their dreams are pleaſant, they are troubled with diſeaſes ariſing from blood, as frequent Phlegmons, and many ſanguine puſtles breaking through the skin, much bleeding, and menſtruous fluxes. Wherefore they can well endure blood-letting, and delight in the moderate uſe of cold and dry things; and laſtly, are offended by hot and moiſt things. They have a great and ſtrong Pulſe, and much urine in quantity, but milde of quality, of an indifferent colour add ſubſtance.

Such as the humor is, ſuch is the colour.

The manners and diſeaſes of Sanguine perſons.

The ſignes of a Cholerick perſon.

CHolerick men are of a pale or yellowiſh colour, of a lean, ſlender and rough habit of body, with fair veins and large Arteries, and a ſtrong and quick pulſe: their skin being touched, feels hot, dry, hard, rough and harſh, with a pricking and acrid exhalation which breathes forth of their whole body. They caſt forth much choler by ſtool, vomit and urine. They are of a quick and nimble wit, ſtout, hardy and ſharp vindicators of received injuries, liberall even to prodigality, and ſomwhat too deſirous of glory. Their ſleep is light, and from which they are quickly waked; their dreams are fiery, burning, quick, and full of fury; they are delighted with meats and drinks which are ſomewhat more cold and moiſt, and are ſubject to Tertian and burning feavers, the Phrenſie, Jaundiſe, Inflammations, and other Cholerick puſtles, the Lask, Bloody flux, and bitterneſs of the mouth.

Cholerick are not commonly fat.

The manners and diſeaſes of Cholerick perſons.

The ſignes of a Phlegmatick perſon.

THoſe in whom Phlegm hath the dominion, are of a whitiſh coloured face, and ſometimes livid and ſwollen, with their body fat, ſoft, and cold to touch.

They are moleſted with Phlegmatick diſeaſes, as Oedematous tumors, the Dropſie, Quotidian feavers, falling away of the hairs, and catarrhes falling down upon the Lungs, and the *Aſpera Arteria*, or Weaſon: they are of a ſlow capacity, dull, ſlothfull, drowſie; they do dream of rains, ſnows, floods, ſwimming, and ſuch like, that they often imagin themſelves overwhelmed with waters; they vomit up much watery and Phlegmatick matter, or otherwiſe ſpit and evacuate it, and have a ſoft and moiſt tongue.

And they are troubled with a dog-like hunger, if at any time it ſhould happen that their inſipid Phlegm become acide; and they are ſlow of digeſtion, by reaſon of which they have great ſtore of cold and Phlegmatick humors; which if they be carried down into the windings of the Colick-gut, they cauſe murmuring and noiſe, and ſometimes the Colick.

For much wind is eaſily cauſed of ſuch like Phlegmatick excrements wrought upon by a ſmall and weak heat, ſuch as Phlegmatick perſons have, which by its naturall lightneſs is diverſly carried through the turnings of the guts, and diſtends and ſwels them up, and whiles it ſtrives for paſſage out, it cauſeth murmurings and noiſes in the belly, like wind breaking through narrow paſſages.

The manners and diſeaſes of phlegmatick perſons.

From whence noiſe or rumbling in the belly proceeds.

Signes of a Melancholick perſon.

THe face of Melancholy perſons is ſwart, their countenance cloudy and often cruell, their aſpect is ſad and froward; frequent Scirrhous, or hard-ſwellings, tumors of the Spleen, Hæmorroids, *Varices* (or ſwollen Veins) Quartain feavers, whether continuall or intermitting; Quintain, Sextain, and Septimane feavers: and to conclude, all ſuch wandering feavers or agues ſet upon them. But when it happens the Melancholy humor is ſharpned, either by aduſtion, or commixture of Choler, then Tetters, the black Morphew, the Cancer ſimple and ulcerated, the Leprous and filthy ſcab, ſending forth certain ſcaly and branlike excreſcences, (being vulgarly called Saint *Manis* his evil;) and the Leproſie it ſelf invades them: They have ſmall veins and arteries, becauſe coldneſs hath dominion over them; whoſe property is to ſtraiten, as the quality of heat is to dilate. But if at any time their Veins ſeem big, that largeneſs is not by reaſon of the laudable

Diſeaſes familiar to Melancholy perſons.

laudable blood contained in them, but from much windineſs; by occaſion whereof it is ſomewhat difficult to let them blood; not only, becauſe that when the Vein is opened, the blood flows ſlowly forth, by reaſon of the cold flowneſs of the humors; but much the rather, for that the vein doth not receive the impreſſion of the Lancet, ſliding this way and that way, by reaſon of the windineſs contained in it, and becauſe that the harſh drineſs of the upper skin, reſiſts the edg of the inſtrument. Their bodies ſeem cold and hard to the touch, and they are troubled with terrible dreams, for they are obſerved to ſeem to ſee in the night Devils, Serpents, dark dens and caves, ſepulchers, dead corpſes, and many other ſuch things full of horror, by reaſon of a black vapor, diverſly moving and diſturbing the brain, which alſo we ſee happens to thoſe, who * fear the water, by reaſon of the biting of a mad dog. You ſhall finde them froward, fraudulent, parſimonious, and covetous even to baſeneſs, ſlow ſpeakers, fearfull, ſad, complainers, carefull, ingenious, lovers of ſolitarineſs, man-haters, obſtinate maintainers of opinions once conceived, ſlow to anger, but angred not to be pacified. But when Melancholy hath exceeded natures and its own bounds, then by reaſon of putrefaction and inflammation all things appear full of extreme fury and madneſs, ſo that they often caſt themſelves headlong down from ſome high place, or are otherwiſe guilty of their own death, with fear of which notwithſtanding they are terrified.

From, or by what their Veins are ſwollen.

Their dreams.

* *Hydrophobi.*
Their manners.

But we muſt note that changes of the native temperament, do often happen in the courſe of a mans life, ſo that he which a while agone was Sanguine, may now be Cholerick, Melancholick, or Phlegmatick; not truly by the changing of the blood into ſuch Humors, but by the mutation of Diet, and the courſe or vocation of life. For none of a Sanguine complexion but will prove Cholerick if he eat hot and dry meats, (as all like things are cheriſhed and preſerved by the uſe of their like, and contraries are deſtroyed by their contraries) and weary his body by violent exerciſes, and continuall labors; and if there be a ſuppreſſion of Cholerick excrements, which before did freely flow, either by nature or art. But whoſoever feeds upon Meats generating groſs blood, as Beef, Veniſon, Hare, old Cheeſe, and all ſalt meats, he without all doubt ſliding from his nature, will fall into a Melancholy temper; eſpecially if to that manner of diet, he ſhall have a vocation full of cares, turmoils, miſeries, ſtrong and much ſtudy, carefull thoughts and fears, and alſo if he ſit much, wanting exerciſe, for ſo the inward heat, as it were, defrauded of its nouriſhment, faints, and grows dull, whereupon groſs and droſſie humors abound in the body. To this alſo the cold and dry condition of the place in which we live, doth conduce, and the ſuppreſſion of the Melancholy humor accuſtomed to be evacuated by the Hæmorrhoids, courſes, and ſtools.

From whence the change of the native temper.

How one may become Cholerick.

How Melancholick.

But he acquires a Phlegmatick temper, whoſoever uſeth cold and moiſt nouriſhment, much feeding, who before the former meat is gone out of the belly, ſhall ſtuff his paunch with more, who preſently after meat runs into violent exerciſes, who inhabit cold and moiſt places, who lead their life at eaſe in all idleneſs; and laſtly, who ſuffer a ſuppreſſion of the Phlegmatick humor accuſtomly evacuated by vomit, cough, or blowing the noſe, or any other way, either by nature or art. Certainly it is very convenient to know theſe things, that we may diſcern if any at the preſent be Phlegmatick, Melancholick, or of any other temper, whether he be ſuch by nature, or neceſſity. Having declared thoſe things which concern the nature of Temperaments, and deferred the deſcription of the parts of the body to our Anatomy, we will begin to ſpeak of the Faculties governing this our life, when firſt we ſhall have ſhewn by a practicall demonſtration of examples, the uſe and certainty of the aforeſaid rules of Temperaments.

How Phlegmatick.

CHAP. VII.

Of the Practice of the aforeſaid rules of Temperaments.

THat we may draw the Theorick of the Temperaments into practice, it hath ſeemed good for avoyding of confuſion which might make this our Introduction ſeem obſcure, if we would proſecute the differences of the Tempers of all men of all Nations, to take thoſe limits which Nature hath placed in the world; as South, North, Eaſt, and Weſt, and, as it were, the Center of thoſe bounds, that the deſcribed variety of Tempers, in colour, habit, manners, ſtudies, actions, and form of life of men that inhabit thoſe Regions ſituated ſo far diſtant one from another, may be as a ſure rule, by which we may certainly judg of every mans temperature in particular, as he ſhall appear to be nearer or further off from this or that Region. Thoſe which inhabit the South, as the *Africans*, *Ethiopians*, *Arabians*, and *Egyptians*, are for the moſt part deformed, lean, duskie coloured, and pale, with black eys and great lips, curled hair, and a ſmall and ſhrill voice. Thoſe which inhabit the Northern parts, as the *Scythians*, *Muſcovites*, *Polonians*, and *Germans*, have their faces of colour white, mixed with a convenient quantity of blood, their skin ſoft and delicate, their hair long, hanging down

Font bounds or Region of the world.

The forces of temperaments in particulars.

The temperature of the Southern people.

Of the Northern.

down and ſpreading abroad, and of a yellowiſh, or reddiſh colour; of ſtature they are commonly tall, and of a well proportioned, fat and compact habit of body, their eyes gray, their voice ſtrong, loud and big. But thoſe who are ſituated between theſe two former, as the *Italians* and *French*, have their faces ſomewhat ſwart, are well favoured, nimble, ſtrong, hairy, ſlender, well in fleſh, with their eyes reſembling the colour of Goats-eyes, and often hollow eyed, having a cleer, ſhrill and pleaſing voyce.

The Southern people prevail in wit, the Northern in ſtrength.

The Southern people are exceeded ſo much by the Northern in ſtrength and ability of body, as they ſurpaſs them in wit and faculties of the mind. Hence is it you may read in Hiſtories, that the *Scythians*, *Goths* and *Vandals* vexed *Africk* and *Spain* with infinite incurſions, and moſt large and famous Empires have been founded from the North to South; but few or none from the South to the North. Therefore the Northern people thinking all right and law to conſiſt in Arms, did by Duell only determine all cauſes and controverſies ariſing amongſt the Inhabitants, as we may gather by the ancient laws, and cuſtomes of the *Lumbards*, *Engliſh*, *Burgonians*, *Danes* and *Germans*; and we may ſee in *Saxo* the *Grammarian* that ſuch a law was once made by *Fronto* King of *Denmark*. The which cuſtome at this day is every where in force amongſt the *Muskowites*. But the Southern people have alwayes much abhorred that faſhion, and have thought it more agreeable to Beaſts than Men. Wherefore we never heard of any ſuch thing uſed by the *Aſſyrians*, *Ægyptians*, *Perſians* or *Jews*. But moved by the goodneſs of their wit, they erected Kingdomes and Empires by the onely help of Learning and hidden ſciences. For ſeeing by nature they are Melancholik, by reaſon of the dryneſs of their temperature, they willingly addict themſelves to ſolitarineſs and contemplation, being endued with a ſingular ſharpneſs of wit. Wherefore the *Æthiopians*, *Egyptians*, *Africans*, *Jews*, *Phœnicians*, *Perſians*, *Aſſyrians*, and *Indians*, have invented many curious ſciences, revealed the Myſteries and ſecrets of Nature, digeſted the Mathematiques into order, obſerved the motions of the heavens, and firſt brought in the worſhip and religious ſacrifices of the gods: Even ſo far that the *Arabians* who live only by ſtealth, aud have only a Waggon for their houſe, do boaſt that they have many things diligently and accurately obſerved in Aſtrology by their Anceſtors, which every day made more accurate and copious, they, as by an hereditary right, commend to poſterity, as it is recorded by *Leo* the *African*. But the Northern people, as the *Germans*, by reaſon of the aboundance of humors and blood, by which the mind is as it were oppreſt, apply themſelves to works obvious to the ſenſes, and which may be done by the hand. For their minds oppreſt with the earthly maſs of their bodies, are eaſily drawn from heaven and the contemplation of Celeſtiall things, to theſe inferior things, as to find out Mines by digging, to buy and caſt metalls, to draw and hammer out works of Iron, ſteel and braſs. In which things they have proved ſo excellent, that the glory of the Invention of Guns and Printing belongs to them.

The Southern people learned and religious.

The Northern famous Warriours, and Artificers.

The endowments of ſuch as inhabit between them.

The people who inhabit the middle regions between theſe, are neither naturally fit for the more abſtruſe ſciences, as the Southern people are, nor for Mechanick works, as the Northern, but intermeddle with civil affairs, commerce and Merchandizing. But are endued with ſuch ſtrength of body as may ſuffice to avoid and delude the crafts and arts of the Southern Inhabitants; and with ſuch wiſdom as may be ſufficient to reſtrain the fury and violence of the Northern. How true this is, any one may underſtand by the example of the *Carthaginians* and *Africans*, who when they had held *Italy* for ſome years by their ſubtile counſels, crafty ſleights and devices; yet could not eſcape, but at the length their Arts being deluded, and they ſpoiled of all their fortunes, were brought in ſubjection to the *Romans*. The *Gothes*, *Hunnes* and other Northern people have ſpoiled and overrun the *Romane* Empire by many incurſions and inroads, but deſtitute of counſell and providence, they could not keep thoſe things which they had gotten by Armes and valour. Therefore the opinion of all Hiſtorians is agreeing in this, that good laws, the form of governing a Common-wealth, all politick ordinances, the Arts of diſputing and ſpeaking, have had their beginnings from the *Greeks*, *Romans* and *French*. And from hence in times paſt and at this day a greater number of Writers, Lawyers and Counſellors of State have ſprung up, than in all the whole world beſides. Therefore that we may attribute their gifts to each Region, we affirm that, The Southern people are born and fit for the Studies of learning, the Northern for warres, and thoſe which be between them both for Empire and rule. The *Italian* is naturally wiſe, the *Spaniard* grave and conſtant; the *French* quick and diligent, for you would ſay hee runs when he goes, being compared to the ſlow and womaniſh pace of the *Spaniard*, which is the cauſe that *Spaniards* are delighted with *French* ſervants for their quick agility in diſpatching buſineſs. The Eaſtern people are ſpecially indued with a good, firm and well tempered wit, not keeping their counſels ſecret and hid. For the haſte is of the nature of the Sun, and that part of the day which is next to the riſing of the Sun is counted the right ſide and ſtronger, and verily in all things living the right ſide is alwayes the more ſtrong and vigorous. But the Weſtern people are more tender and effeminate, and more cloſe in their carriage and mind,

The Northern know how to overcome, but not how to uſe the victory.

The aboundance of counſellors and Lawyers from *France* and *Italy*.

The manners of the Eaſtern people.

nor

not easily making any one partaker of their secrets. For the West is as it were subject to the Moon, because at the change it alwayes inclines to the West, whereby it happens, that it is reputed as nocturnall, sinister and opposite to the East; and the West is less temperate and wholsome. Therefore of the winds none is more wholsome than the East wind which blows from the West with a most fresh and healthfull gale, yet it seldome blows, and but only at Sun-set.

The East wind healthfull.

The Northern people are good eaters, but much better drinkers, witty when they are a little moistened with wine, and talkers of things both to be spoken and concealed, not very constant in their promises and agreements, but principal keepers and preservers of shamefastness and chastity, far different from the inhabitants of the South, who are wonderfull soaring, sober, secret and subtle, and much addicted to all sorts of wicked Lust. *Aristotle* in his Problemes saith that those nations are barbarous and cruell, both which are burnt with immoderate heat, and which are oppresst with excessive cold, because a soft temper of the Heavens, softens the manners and the mind. Wherefore both, as well the Northern, as Scythians and Germans; and the Southern, as Africans, are cruell; but these have this of a certain naturall stoutness, and souldierlike boldness, and rather of anger then a wilfull desire of revenge; because they cannot restrain by the power of reason the first violent motions of their anger by reason of the heat of their blood. But those of a certain inbred and inhumane pravity of manners, wilfully and willingly premeditating they perform the works of cruelty, because they are of a sad and melancholy nature. You may have an example of the Northern cruelty from the Transilvanians against their seditious Captain *George*, whom they gave to be torne in pieces alive and devoured by his Souldiers, (being kept fasting for three dayes before for that purpose) who was then unbowelled, and rosted, and so by them eaten up. The cruelty of *Hannibal* the Captain of the Carthaginians may suffice for an instance of the Southern cruelty. He left the Roman Captives wearied with burdens and the length of the way, with the soles of their feet cut off; But those he brought into his tents, joyning brethren and kinsmen together he caused to fight, neither was satisfied with blood before he brought all the victors to one man. Also we may see the cruell nature of the Southern Americans, who dip their children in the blood of their slain enemies, then suck their blood, and banquet with their broken and squeased Limbs.

Northern people great eaters and drinkers.

Who are to be counted Barbarous.

The Northern and Southern have each their Cruelues.

Valer. Max. lib. 9. cap. 2.

And as the Inhabitants of the South are free from divers Plethorick diseases, which are caused by aboundance of blood, to which the Northern people are subject, as Feavers, Defluxions, Tumors, Madness, with laughter which causeth those which have it to leap and dance, (the people commonly tearm it *S. vitus his evill*) which admits of no remedy but Musick: so they are often molested with the Frensie invading with madness and fury; by the heat whereof they are often so ravished and carried beside themselves that they foretell things to come; they are terrified with horrible dreams, and in their fits they speak in strange and forain tongues, but they are so subject to the scurfe and all kind of scabs and to the Leprosie as their homebred disease, that no houses are so frequently met withall by such as travell through either of the Mauritania's, as Hospitalls provided for the Lodging of Leapers.

The diseases of the Southern people.

Those who inhabit rough and Mountainous places, are more brutish, tough and able to indure labour: but such as dwell in Plains, especially if they be moorish, or fennish, are of a tender body, and sweat much with a little labour; the truth of which is confirmed by the Hollanders and Frizlanders. But if the Plain be such as is scorched by the heat of the Sun, and blown upon by much contrariety of winds, it breeds men who are turbulent, not to be tamed, desirous of sedition and novelty, stubborn, impatient of servitude, as may be perceived by the sole example of the Inhabitants of *Narbon* a province of *France*.

Mountainers.

Those who dwell in poor and barren places are commonly more witty and diligent and most patient of labours; the truth of which the famous wits of the *Athenians*, *Ligurians* and *Romans*, and the plain country of the *Beotians* in *Greece*, of the *Campanians* in *Italy*, and of the rest of the Inhabiters adjoining to the *Ligurian* Sea, approves.

CHAP. VIII.

Of the Faculties.

A Faculty is a certain power, and efficient cause, proceeding from the temperament of the part, and the performer of some actions of the body. There are three principall Faculties governing mans body as long as it enjoyes its integrity; the Animall, Vital and Natural. The Animall is seated in the proper temperament of the Brain, from whence it is distributed by the Nerves into all parts of the body we have sense & motion. This is of three kinds, for one is Moving, another sensitive, the third principall. The sensitive consists in the five external senses, sight, hearing, taste, smel & touch. The moving principally remains in the Muscles & nerves as the fit instruments

What a faculty is.

3. Faculties.

of voluntary motion. The Principall comprehends the Reasoning faculty, the Memory and Fantasie. *Galen* would have the common or inward sense to be comprehended within the compass of the Fantasie, although *Aristotle* distinguish between them.

The Vitall abides in the Heart, from whence heat and life is distributed by the Arteries to the whole body: this is principally hindered in the diseases of the Brest; as the Principall is, when any disease assails the Brain; the prime action of the vitall faculty is Pulsation, and that continued agitation of the Heart and Arteries, which is of threefold use to the body: for by the dilatation of the Heart and Arteries the vitall spirit is cherished by the benefit of the Air which is drawn in; by the contraction thereof the vapours of it are purged and sent forth, and the native heat of the whole body is tempered by them both.

The triple use of the Pulse.

The last is the Naturall faculty which hath chosen its principall seat in the Liver, it spreads or carries the nourishment over the whole body; but it is distinguished into 3. other faculties; The Generative, which serves for the generation and forming of the Issue in the wombe; the Growing or increasing faculty, which flourisheth from the time the Issue is formed, untill the perfect growth of the solid parts into their full dimensions of length, height and bredth. The nourishing faculty, which as servant to both the other repairs and repays the continuall efflux, and waste of the threefold substance; for Nutrition is nothing else but a replenishing, or repairing whatsoever is wasted or emptied. This nourishing faculty endures from that time the Infant is formed in the wombe untill the end of life. It is a matter of great consequence in Physick to know the 4. other faculties, which as servants attend upon the nourishing faculty; which are the Attractive, Retentive, Digestive, and Expulsive faculty. The Attractive draws that juyce which is fit to nourish the body, that I say which by application may be assimilated to the part. This is that faculty which in such as are hungry draws down the meat scarce chewed, and the drink scarse tasted, into the gnawing and empty stomack. The Retentive faculty is that which retains the nourishment once attracted untill it be fully laboured and perfectly concocted; And by that means it yeelds no small assistance to the Digestive faculty. For the naturall heat cannot perform the office of concoction, unless the meat be embraced by the part, and make some stay therein. For otherwise the meat carryed into the stomach never acquires the form of *Chylus*, unless it stay detained in the wrinkles thereof, as in a rough passage, untill the time of *Chylification*. The Digestive facultie assimilates the nourishment, being attracted and detained, into the substance of that part whose faculty it is, by the force of the inbred heat and proper disposition or temper of the part. So the stomach plainly changes all things which are eat and drunk into *Chylus*, and the Liver turns the *Chylus* into blood. But the Bones and Nerves convert the red and liquid blood which is brought down unto them by the capillary or small veins, into a white and solid substance. Such concoction is far more laborious in a Bone and Nerve, than in the Musculous flesh. For the blood being not much different from its nature, by a light change and concretion turns into flesh. But this Concoction will never satisfie the desire of Nature and the parts, unless the nourishment purged from its excrements, put away the filth and drosse, which must never enter into the substance of the part. Wherefore there do not only two sorts of excrements remain of the first and second Concoction, the one thick, the other thin, as we have said before; but also from the third Concoction which is performed in every part. The one of which we conceive only by reason, being that which vanisheth into Air by insensible transpiration. The other is known sometimes by sweats, sometimes by a thick fatty substance staining the shirt; sometimes by the generation of hairs and nails, whose matter is from fuliginous and earthly excrements of the third Concoction. Wherefore the fourth faculty was necessary which might yeeld no small help to nourishment; it is called the Expulsive, appointed to expell those superfluous excrements which by no action of heat, can obtain the form of the part. Such faculties serving for nutrition are in some parts two-fold; as some common, the benefit of which redounds to the whole body, as in the ventricle, liver and veins; Others only attending the service of those parts in which they remain, and in some parts all these 4. aswell common as proper, are abiding and residing as in those parts we now mentioned: some with the 4. proper have only two common, as the Gall, Spleen, Kidnies and Bladder. Others are content only with the proper, as the similar and Musculous parts, who if they want any of these 4. faculties, their health is decayed either by want of nourishment, and ulcer, or otherwise. The like unnaturall affects happen by the deficiency of just and laudable nourishment. But if it happen those faculties do rightly perform their duty, the nourishment is changed into the proper part, and is truly assimilated as by these degrees. First it must flow to the part, then be joyned to it, then agglutinated, and lastly as we have said, assimilated. Now we must speak of the Actions which arise from the faculties.

The naturall faculty is threefold.

What Nutrition is.

Four other faculties attend upon the nourishing faculty.

The necessity of the retentive faculty.

Two excrements of every concoction.

The work of the expulsive faculty.

By what degrees the nourishment is assimilated.

CHAP.

CHAP. IX.
of the Actions.

What an Action is.

AN Action or Function is an active motion proceeding from a faculty; for as the faculty depends on the Temperament, so the Action on the faculty, and the Act or work depends upon the Action by a certain order of consequence. But although that the words Action and Act or work are often confounded, yet there is this difference between them, as that the Action signifies the motion used in the performance of any thing; but the Act or work, the thing already done and performed: for example, Nutrition and the Generating of flesh are naturall Actions; but the parts nourished, and a hallow ulcer filled with flesh are the works of that motion, or action. Wherefore the Act ariseth from the Action, as the Action ariseth from the faculty, the integrity or perfection of the instruments concurring in both. For as, if the faculty be either defective, or hurt, no Action will be well performed: so unless the Instruments keep their native and due conformity (which is their perfect health, the operator of the Action proper to the instrument) none of those things, which ought to be, will be well performed. Therefore for the performance of blameless and perfect actions, it is fit a due conformity of the Instrument concur with the faculty. But Actions are two fold; for they are either Naturall, or Voluntary. They are termed Naturall, because they are performed not by our will, but by their own accord and against our will: As are, that continuall motion of the Heart, the beating of the Arteries, the expulsion of the Excrements, and such other like which are done in us by the Law of Nature whether we will, or no. These Actions flow either from the Liver and veins, or from the Heart and Arteries. Wherefore we may comprehend them under the names of Naturall and Vitall Actions. For we must attribute his Action to each faculty, lest we may seem to constitute an idle faculty, and no way profitable for use. The unvoluntary vitall actions, are the dilatation and contraction of the Heart and Arteries, the which we comprehend under the sole name of the Pulse; by that they draw in, and by this they expell, or drive forth. The unvoluntary vitall actions be,

An action and and Act are different.

Naturall actions.

Generation	} which proceed from the	} Generative	} faculties.
Growth and		} Growing, and	
Nutrition		} Nourishing	

Generation is nothing else then a certain producing or acquiring of matter, and an introducing of a substantiall form into that matter, this is performed by the assistance of two faculties; of the Altering, which doth diversly prepare and dispose the seed and menstruous blood to put on the form of a Bone, nerve, Spleen, flesh and such like; of the Forming faculty, which adorns with figure, site, and composition, the matter ordered by so various a preparation.

What Growth is.

Growth is an inlarging of the solid parts into all the dimensions, the pristine and ancient form remaining safe and sound in figure and solidity. For the perfection of every growth is judged only by the solid parts; for if the body swell into a mass of flesh, or fat, it shall not therefore be said to be grown: but then only when the solid parts do in like manner increase, especially the bones, because the growth of the whole body follows their increase, even although at the same time it wax lean and pine away.

What Nutrition is.

Nutrition is a perfect assimilation of that nourishment which is digested, into the nature of the part which digests. It is performed by the assistance of 4. subsidiary or helping actions, Attractive, Retentive, Digestive, and Expulsive.

Action voluntary.

The voluntary actions which we willingly perform, are so called, because we can at our pleasure hinder, stir up, slow or quicken them. They are three in generall, the sensitive, moving, and principall Action. The sensitive * Soul comprehends all things in five senses, in Sight, Hearing, Smell, Taste and Touch. Three things must necessarily concur to the performance of them, the Organ, the *Medium* or mean, and the Object. The principall Organ, or Instrument, is the Animall spirit diffused by the nerves into each several part of the body, by which such actions are performed. Wherefore for the present we will use the Parts themselves for their Organs. The Mean is a Body, which carryes the Object to the Instrument. The Object is a certain externall quality, which hath power by a fit *Medium* or Mean to stir up and alter the Organ. This will be more manifest by relating the particular functions of the senses by the necessary concurring of these three.

* *Anima sentiens.*

How sight is performed.

Sight, is an action of the seeing faculty, which is done by the Eye, fitly composed of its coats and humors, and so consequently the Organicall body of this Action. The Object is a visible quality brought to the Eye. But such an Object is twofold; for either it is absolutely visible of its self, and by its own Nature, as the Sun, the fire, the Moon and Stars: or desires as it were the help of another that it may be actually such, for so by the coming of the light colours, which were visible in power onely, being brought to the Eye, they do seem and appear such as they actually are.

But ſuch Objects cannot arrive at the Eye, but through a clear and illuminate *Medium*, as the Air, Water, Glaſſe and all ſorts of Cryſtall.

How hearing. The Hearing hath for its Organ the Ear and Auditory paſſage, which goes to the ſtony bone furniſhed with a Membrane inveſting it, an Auditory Nerve, and a certain inward ſpirit there contained. The Object is every ſound ariſing from the ſmitten or broken Air, and the Colliſion of two bodies meeting together. The *Medium* is the encompaſſing Air which carries the ſound to the Ear.

How ſmelling. Smelling (according to *Galens* opinion) is performed in the Mamillary proceſſes produced from the proper ſubſtance of the brain, and ſeated in the upper part of the noſe: although others had rather ſmelling ſhould be made in the very foremoſt ventricles of the brain. This Action is weak in man in compariſon of other Creatures: the Object thereof is every ſmell, or fumid exhalation breathing out of bodies. The *Medium* by which the Object is carried to the noſes of Men, Beaſts and Birds, is the Air, but to Fiſhes the Water it ſelf. The Action of taſte is performed by the tongue being tempered well and according to nature, and furniſhed with a nerve ſpred over its upper part from the third and fourth conjugation of the brain. The Object is * Taſte, of whoſe nature and kinds we will treat more at large in our Antidotary. The *Medium* by the which the Object is ſo carried to the Organ, that it may affect it, is either externall or internall: The externall is that ſpattle which doth as it were anoint and ſupple the tongue; the internall is the ſpongy fleſh of the tongue it ſelf, which affected with the quality of the Object doth preſently ſo poſſeſs the nerve that is implanted in it, that the kind and quality thereof by the force of the ſpirit may be carryed into the common ſenſe. All parts endued with a nerve enjoy the ſenſe of touching, which is chiefly done, when a tractable quality doth penetrate even to the true and nervous skin, which lyeth under the Cuticle, or ſcarf-skin; we have formerly noted, that it is moſt exquiſite in the skin which inveſts the ends of the fingers. The Object is every tractable quality, whether it be of the firſt rank of qualities, as Heat, Cold, Moiſture, Dryneſs, or of the ſecond, as Roughneſs, Smoothneſs, Heavineſs, Lightneſs, Hardneſs, Softneſs, Rarity, Denſity, Friability, Unctuoſity, Groſneſs, Thinneſs. The *Medium* by whoſe procurement the inſtrument is affected, is either the skin or the fleſh interwoven with many Nerves.

* *Sapor.*

How touching.

Of motion. The next Action, is that Motion, which by a peculiar name we call voluntary; this is performed and accompliſhed by a Muſcle, being the proper Inſtrument of voluntary Motion. Furthermore every motion of a member poſſeſſing a Muſcle is made either by bending and contraction, or by extention. Although generally there be ſo many differences of voluntary motion, as there are kinds of ſite in place; therefore Motion is ſaid to be made upward, downward, to the right hand, to the left, forward and backward; Hither are referred the many kinds of motions, which the infinite variety of Muſcles produce in the body. Into this rank of Voluntary Actions, comes Reſpiration, or breathing, becauſe it is done by the help of the Muſcles; although it be chiefly to temper the heat of the Heart. For we can make it more quick, or ſlow as we pleaſe, which are the conditions of a voluntary Motion.

How reſpiration may be a voluntary motion.

Laſtly, that we may have ſomewhat in which we may ſafely reſt and defend our ſelves againſt the many queſtions which are commonly moved concerning this thing, wee muſt hold, that Reſpiration is undergone and performed by the Animall faculty, but chiefly inſtituted for the vitall.

The third principall Action. The principall Action and prime amongſt the Voluntary is abſolutely divided in three, Imagination, Reaſoning and Memory.

Imagination is a certain expreſſing, and apprehenſion which diſcerns and diſtinguiſheth between the forms and ſhapes of things ſenſible, or which are known by the ſenſes.

Reaſoning is a certain judiciall eſtimation of conceived or apprehended forms or figures, by a mutuall collating or comparing them together.

Memory is the ſure ſtorer of all things, and as it were the Treaſury which the mind often unfolds and opens, the other faculties of the mind being idle and not imployed. But becauſe all the forementioned Actions whether they be Naturall, or Animall and voluntary, are done and performed by the help and aſſiſtance of the Spirits; therefore now we muſt ſpeak of the Spirits.

CHAP. X.

Of the Spirits.

What a ſpirit is. THe Spirit is a ſubtile and aery ſubſtance, raiſed from the purer blood that it might be a vehicle for the faculties (by whoſe power the whole body is governed) to all the parts, and the prime inſtrument for the performance of their office. For they being deſtitute of its ſweet approach doe preſently ceaſe from action, and as dead do reſt from their accuſtomed labours. From hence it

is

is that making a variety of Spirits according to the number of the faculties, they have divided them into three; as one Animall, another Vitall, another Naturall. Spirits threefold.

The Animall hath taken his ſeat in the brain; for there it is prepared and made, that from thence conveyed by the Nerves, it may impart the power of ſenſe and motion to all the reſt of the members. An argument hereof is, that in the great cold of Winter, whether by the intercepting them in their way, or by the concretion, or, as it were, freezing of thoſe ſpirits the joynts grow ſtiff, the hands numb, and all the other parts are dull, deſtitute of their accuſtomed agility of motion, and quickneſs of ſenſe. It is called Animall, not becauſe it is the * Life, but the chief and prime inſtrument thereof: wherefore it hath a moſt ſubtil and aery ſubſtance; and enjoys divers names, according to the various condition of the Senſories or ſeats of the ſenſes into which it enters; for that which cauſeth the ſight, is named the Viſive: you may ſee this by night, rubbing your eys, as ſparkling like fire. That which is conveyed to the Auditory paſſage, is called the Auditive or Hearing: That which is carried to the inſtruments of Touching, is termed the Tactive; and ſo of the reſt. The Animall ſpirit. Why ſo called. * *Anima.*

This Animall ſpirit is made and laboured in the windings and foldings of the Veins and Arteries of the brain, of an exquiſit ſubtil portion of the vitall brought thither by the *Carotidæ Arteriæ*, or ſleepy Arteries; and ſometimes alſo of the pure air, or ſweet vapour drawn in by the Noſe in breathing. Hence it is, that with Ligatures we ſtop the paſſage of this ſpirit, from the parts we intend to cut off. An Humor which obſtructs or ſtops its paſſage, doth the like in Apoplexies and Palſies, whereby it happens that the members ſituate under that place do languiſh and ſeem dead, ſometimes deſtitute of motion, ſometimes wanting both ſenſe and motion. How it is made;

The Vitall ſpirit is next to it in dignity and excellency, which hath its chief manſion in the left ventricle of the Heart, from whence, through the Channels of the Arteries, it flows into the whole body, to nouriſh the heat which reſides fixed in the ſubſtance of each part, which would periſh in ſhort time, unleſs it ſhould be refreſhed by heat flowing thither together with the ſpirit. And becauſe it is the moſt ſubtil next to the Animall, Nature (leſt it ſhould vaniſh away) would have it contained in the Nervous coat of an Artery, which is five times more thick than the coat of the Veins, as *Galen*, out of *Herophilus*, hath recorded. The Vitall ſpirit.

It is furniſhed with matter from the ſubtil exhalation of the blood, and that air which we draw in breathing. Wherefore it doth eaſily and quickly periſh by immoderate diſſipations of the ſpirituous ſubſtance, and great evacuations; ſo it is eaſily corrupted by the putrefaction of Humors, or breathing in of peſtilent air and filthy vapours; which thing is the cauſe of the ſo ſuddain death of thoſe which are infected with the Plague. This ſpirit is often hindred from entring into ſome part, by reaſon of obſtruction, fulneſs, or great inflammations; whereby it follows, that in a ſhort ſpace, by reaſon of the decay of the fixed and inbred heat, the parts do eaſily fall into a Gangrene, and become mortified. What the matter of it is.

The Naturall ſpirit (if ſuch there be any) hath its ſtation in the liver and Veins. It is more groſs and dull than the other, and inferior to them in the dignity of the Action, and the excellency of the uſe. The uſe thereof is to help the concoction both of the whole body, as alſo of each ſeverall part, and to carry blood and heat to them. There is ſome doubt of the Naturall ſpirit.

Beſides thoſe already mentioned, there are other Spirits fixed and implanted in the ſimilar and prime parts of the body, which alſo are naturall, and Natives of the ſame place in which they are ſeated and placed. And becauſe they are alſo of an aery and fiery nature, they are ſo joined or rather united to the Native heat, that they can no more be ſeparated from it than flame from heat; wherefore they with theſe that flow to them, are the principall inſtruments of the Actions which are performed in each ſeverall part; And theſe fixed Spirits have their nouriſhment and maintenance from the radicall and firſt-bred moiſture, which is of an aery and oily ſubſtance, and is, as it were, the foundation of theſe Spirits, and the inbred heat. Therefore without this moiſture, no man can live a moment. But alſo the chief Inſtruments of life are theſe Spirits, together with the Native heat. Wherefore this radicall Moiſture being diſſipated and waſted, (which is the ſeat, fodder, and nouriſhment of the Spirits and heat) how can they any longer ſubſiſt and remain? Therefore the conſumption of the naturall heat, followeth the decay of this ſweet and ſubſtance-making moiſture, and conſequently death, which happens by the diſſipating and reſolving of naturall heat. Fixed Spirits. The radicall Moiſture. Naturall death.

But ſince then theſe kind of Spirits with the naturall heat, is contained in the ſubſtance of each ſimilar part of our body, (for otherwiſe it could not perſiſt) it muſt neceſſarily follow, that there be as many kinds of fixed Spirits, as of ſimilar parts. For becauſe each part hath its proper temper and encreaſe, it hath alſo its proper Spirit, and alſo its own proper fixed and implanted heat, which here hath its abode, as well as its Originall. Wherefore the Spirit and heat which is ſeated in the bone, is different from that which is impact into the ſubſtance of a Nerve, Vein, or ſuch other ſimilar part; becauſe the temper of theſe parts is different, as alſo the mixture of the Elements from which they firſt aroſe and ſprung up. Neither is this contemplation of Spirits of ſmall account, for in theſe conſiſt all the force and efficacy of our Nature.

Theſe

The uſe and neceſſity of the Spirits.

These being by any chance diſſipated or waſted, we languiſh; neither is any health to be hoped for, the flour of life withering and decaying by little and little. Which thing ought to make us more diligent, to defend them againſt the continuall efflux of the threefold ſubſtance. For if they be decayed, there is left no proper indication of curing the diſeaſe; ſo that we are often conſtrained, all other care laid aſide, to betake our ſelves to the reſtoring and repairing the decayed powers. Which is done by meats of good juice, eaſie to be concocted and diſtributed; good Wines, and fragrant ſmels.

What the remedy for the diſſipation of the Spirits.

What the remedy for oppreſſion of the Spirits is.

But ſometimes theſe Spirits are not diſſipated, but driven in and returned to their fountains, and ſo both oppreſs and are oppreſt; whereupon it happens we are often forced to dilate and ſpread them abroad by binding and rubbing the parts. Hitherto we have ſpoke of theſe things which are called Naturall, becauſe we naturally conſiſt of them; it remains that we now ſay ſomewhat of their Adjuncts and Aſſociates by familiarity of Condition.

The Adjuncts and Aſſociates to things Naturall: are,
- *Age*: of which, by reaſon of the ſimilitude of the Argument, we were conſtrained to ſpeak, when we handled the Temperatures.
- *Sex.*
- *Colour*: of which we have already ſpoken.
- The conformation of the *Inſtrumentall* parts.
- *Time*: whoſe force we have alſo conſidered.
- *Region.*
- Order of *Diet*, and condition of *Life*.

CHAP. XI.

Of the Adjuncts of things Naturall.

What ſex is.

SEX is no other thing than the diſtinction of Male and Female; in which this is moſt obſervable, that for the parts of the body, and the ſite of theſe parts, there is little difference between them; but the Female is colder than the Male. Wherefore their ſpermaticall parts are more cold, ſoft, and moiſt; and all their naturall actions leſs vigorous and more depraved.

The nature of women.

Of Eunuchs.

The Nature of Eunuchs is to be referred to that of women, as who may ſeem to have degenerated into a womaniſh nature, by deficiency of heat; their ſmooth body, and ſoft and ſhrill voice do very much aſſimilate women. Notwithſtanding you muſt conſider, that there be ſome Manly women, which their manly voice, and chin covered with a little hairineſs, do argue: and on the contrary, there are ſome womanizing, or womaniſh men, which therefore we term dainty and effeminate.

Of Hermaphrodites.

The Hermaphrodite is of a doubtfull nature, and in the middle of both ſexes ſeems to participate of both Male and Female.

Colour the bewrayer of the Temperament.

The Colour which is predominant in the habit and ſuperficies of the body, and lyes next under the skin, ſhews the Temperament of what kind ſoever it be; for as *Galen* notes *in Comment. ad Aphor.* 2. *ſect.* 1. Such a colour appears in us, as the contained Humor hath. Wherefore if a roſie hew colour the cheeks, it is a ſign the body abounds with blood, and that it is carried abroad by the plenty of Spirits. But if the skin be dyed with a yellow colour, it argues Choler is predominant; if with a whitiſh and pallid hue, Phlegm; with a ſable and duskie, Melancholy. So the colour of the Excrements which are according to Nature, is not of the leaſt conſideration. For thus, if an Ulcer being broken ſend forth white matter, it argues the ſoundneſs of the part from whence it flows; but if ſanious or bloody, green, blackiſh, or of divers colours, it ſhews the weakneſs of the ſolid part, which could not aſſimilate by concoction the colour of the excrementitious humor. The like reaſon is of unnaturall Tumors: For, as the colour, ſo the dominion of the Humor cauſing or accompanying the ſwelling commonly is.

The perfection of the organicall parts, conſiſts in four things.

The conformity and integrity of the Organicall parts is conſidered by their figure, greatneſs, number, ſituation, and mutuall connexion. We conſider the figure, when we ſay, almoſt all the externall parts of the body are naturally round, not only for ſhew, but for neceſſity, that being ſmooth and no way cornered, they ſhould be leſs obnoxious to externall injuries; we ſpeak of Greatneſs, when we ſay, ſome are large and thick, ſome lank and lean. But we conſider their Number, when we obſerve ſome parts to abound, ſome to want, or nothing to be defective or wanting. We inſinuate Site and Connexion, when we ſearch, whether every thing be in its proper place, and whether they be decently fitted, and well joined together.

We have handled the varieties of the four ſeaſons of the Year, when we treated of Temperaments. But the conſideration of Region (becauſe it hath the ſame judgment that the Air) ſhall be referred to that diſquiſition or enquiry which we intend to make of the Air, amongſt the things not naturall.

The

The manner of life, and order of Diet are to be diligently observed by us, because they have great power either to alter, or preserve the Temperament. But because they are of almost infinite variety, therefore they scarce seem possible to fall into Art, which may prosecute all the differences of Diet and Vocations of life. Wherefore if the Calling of Life be laborious, as that of Husbandmen, Mariners, and other such trades, it strengthens and dries the parts of the body. Although those which labour much about Waters, are most commonly troubled with cold and moist diseases, although they almost kill themselves with labour. Diet.

Again, those which deal with Metals, as all sorts of Smiths, and those which cast and work brass, are more troubled with hot diseases, as Feavers. But if their Calling be such, as they sit much, and work all the day long sitting at home, as Shoomakers; it makes the body tender, the flesh effeminate, and causeth great quantity of excrements. A life as well idle and negligent in body, as quiet in mind, in all riotousness and excesses of Diet, doth the same. For from hence the body is made subject to the Stone, Gravel, and Gout.

That calling of life which is performed with moderate labour, clothing, and diet, seems very fit and convenient to preserve the naturall temper of the body. The ingenious Chirurgeon may frame more of himself that may more particularly conduce to the examination of these things. Therefore the things naturall, and those which are near or neighbouring to them being thus briefly declared; the Order seems to require, that we make enquiry of things not Naturall. The commodities of an indifferent Diet.

CHAP. XII.

Of things not Naturall.

THe things which we must now treat of, have by the later Physitians been termed Not-naturall; because they are not of the number of those which enter into the constitution or composure of mans body; as the Elements, Humors, and all such things which we formerly comprehended under the name of Natural: although they be such as are necessary to preserve and defend the body already made and composed. Wherefore they were called by *Galen* Preservers; because by the due use of them the body is preserved in health. Also, they may be called Doubtfull, and Neuters, for that rightly and fitly used, they keep the body healthfull, but inconsiderately, they cause diseases. Whereby it comes to pass, that they may be thought to pertain to that part of Physick which is of preserving health; not because some of these things should be absolutely and of their own nature wholsom, and others unwholsom; but only by this, that they are, or prove so by their convenient, or preposterous use. Therefore we consider the use of such like things from four conditions, Quantity, Quality, Occasion, and Manner of using: If thou shalt observe these, thou shalt attain and effect this, That those things which are of themselves, are, as it were, doubtfull, shall bring certain and undoubted health. For these four Circumstances do so far extend, that in them as in the perfection of Art, the Rules which may be prescribed to preserve health are contained. But *Galen* in another place, hath in four words comprehended these things not Naturall; as, things Taken, Applyed, Expelled, and to be Done. Things Taken, are those which are put into the body, either by the mouth, or any other way; as the air, meat and drink. Things Applyed, are those which must touch the body, as the Air now mentioned, affecting the body with a diverse touch of its qualities of heat, cold, moisture, or drines. Expelled, are what things soever being unprofitable are generated in the body, and require to be expelled. To be Done, are labour, rest, sleep, watching, and the like. We may more distinctly, and by expression of proper Names, revoke all these things to six: Why they are called things not naturall. *Galen* 1. ad Glauconem. *Lib. de sanitat. tuenda.*

Which are
- *Air.*
- *Meat* and *Drink.*
- *Labor* and *Rest.*
- *Sleep* and *Watching.*
- *Repletion* and *Inanition*; or things to be expelled, or retained and kept.
- *Perturbations* of the Minde.

CHAP.

CHAP. XIII.

Of the Air.

How neceſſary for life the Air is.

AIR is ſo neceſſary to life, that we cannot live a moment without it; ifſo be that breathing, and much more tranſpiration, be not to be ſeparated from life. Wherefore it much conduceth to know, what Air is wholſom, what unwholſom, and which by contrariety of qualities fights for the Patient againſt the diſeaſe; or on the contrary by a ſimilitude of qualities ſhall nouriſh the diſeaſe, that if it may ſeem to burden the Patient by increaſing or adding to the diſeaſe, we may correct it by Art. So in curing the wounds of the head, eſpecially in winter, we labour by all the means we may to make the air warm. For cold is hurtfull to the Brain, Bones, and the wounds of theſe parts; and heat is comfortable and friendly. But alſo the Air being drawn into the body by breathing when it is hotter than ordinary, doth with a new warmth over-heat the heart, lungs, and ſpirits, and weaken the ſtrength by the diſſipation of the Spirits too much attenuated; ſo being too cold, in like manner the ſtrength of the faculties faints and grows dull, either by ſuppreſſion of the vapors, or by the inſpiſſation or thickning of the Spirits.

What Air is hurtfull.

Therefore to conclude, that Air is to be eſteemed healthfull, which is clear, ſubtil, and pure, free and open on every ſide, and which is far remote from all carion-like ſmels of dead carkaſſes, or the ſtench of any putrefying thing whatſoever: the which is far diſtant from ſtanding pools, and fens, and caves, ſending forth ſtrong and ill vapors; neither too cloudy nor moiſt by the nearneſs of ſome river.

Such an Air, I ſay, if it have a vernall temper, is good againſt all diſeaſes. That Air which is contrary to this, is altogether unhealthfull; as that which is putrid, ſhut up, and preſt by the ſtraitneſs of neighbouring Mountains, infected with ſome noiſom vapor. And becauſe I cannot proſecute all the conditions of Airs, fit for the expelling of all diſeaſes, as which are almoſt infinite; it ſhall ſuffice here to have ſet down, what we muſt underſtand by this word *Air*.

Three things are underſtood by the name of the Air.

Phyſitians commonly uſe to underſtand three things by the name of *Air*; The preſent ſtate of the Air; the Region in which we live; and the ſeaſon of the Year. We ſpoke of this laſt, when we treated of Temperaments. Wherefore we will now ſpeak of the two former. The preſent ſtate of the Air, one while for ſome ſmall time, is like the Spring, that is, temperate; otherwhiles like the Summer, that is, hot and dry; otherwhiles like the Winter, that is, cold and moiſt; and ſometimes like the Autumn, which is unequall; and this laſt conſtitution of the Air is the cauſe of many diſeaſes. When upon the ſame day, it is one while hot, another cold, we muſt expect Autumnall diſeaſes. Theſe tempers and varieties of conſtitutions of the Air, are chiefly and principally ſtirred up by the winds; as which being diffuſed over all the Air, ſhew no ſmall force by their ſodain change. Wherefore we will briefly touch their natures: That which blows from the Eaſt, is called the Eaſt-wind, and is of a hot and dry nature, and therefore healthfull. But the Weſtern-wind is cold and moiſt, and therefore ſickly. The South-wind is hot and moiſt, the Author of putrefaction and putrid diſeaſes. The North-wind is cold and dry, therefore healthy: wherefore it is thought, if it happen to blow in the Dog-days, that it makes the whole year healthfull, and purges and takes away the ſeeds of putrefaction, if any chance to be in the Air. But this deſcription of the four Winds, is then only thought to be true, if we conſider the Winds in their own proper nature, which they borrow from theſe Regions from which they firſt proceed. For otherwiſe they affect the Air quite contrary, according to the diſpoſition of the places over which they came; as Snowie places, Seas, Lakes, Rivers, Woods, or ſandy Plains, from whence they may borrow new qualities, with which they may afterwards poſſeſs the Air, and ſo conſequently our bodies.

Aphor. 4. ſect. 2. The force of the Winds.

How the winds acquire other faculties, than they naturally have.

The Weſtwind of it ſelf unwholſom.

Hence it is we have noted the Weſtern-wind unwholſom, and breeding diſeaſes, by reaſon of the proper condition of the Region from whence it came; and ſuch, that is cold and moiſt; the *Gaſcoins* find it truly to their ſo great harm, that it ſeldom blows with them, but it brings ſome manifeſt and great harm, either to their bodies, or fruits of the earth. And yet the *Greeks* and *Latins* are wont to commend it for healthfulneſs, more than the reſt. But alſo the riſing and ſetting of ſome more eminent ſtars, do often cauſe ſuch cold winds, that the whole Air is cooled, or infected with ſome other malign quality. For vapors and exhalations are often raiſed by the force of the Stars, from whence winds, clouds, ſtorms, whirlwinds, lightnings, thunders, hail, ſnow, rain, earthquakes, inundations, and violent raging of the ſea, have their originall. The exact contemplation of which things, although it be proper to Aſtronomers, Coſmographers, and Geographers, yet *Hippocrates* could not omit it, but that he muſt ſpeak ſomething in his book *De Aëre & Aquis*; where he touches by the way, the deſcription of the neighbouring Regions, and ſuch as he knew.

What force ſtars have upon the Air.

From this force of the Air, either hurtfull, or helping in diſeaſes, came that famous obſerva-

obſervation of *Guido* of *Caulias*; That wounds of the head are more difficult to cure at *Paris*, than at *Avignion*, and the plain contrary of wounds of the legs; for the air of *Paris*, compared to that of *Avignion*, is cold and moiſt, wherefore hurtfull and offenſive to the wounds of the head. On the contrary, the ſame air, becauſe it obſcures the ſpirits, incraſſates the blood, condenſates the humors, and makes them leſs fit for defluxions, makes the wounds of the legs more eaſie to be healed, by reaſon it hinders the courſe of the humors, by whoſe defluxion the cure is hindred. But it is manifeſt, that hot and dry places make a greater diſſipation of the naturall heat, from whence the weakneſs of the powers; by which ſame reaſon, the Inhabitants of ſuch places do not ſo well endure blood-letting; but more eaſily ſuffer purgations, though vehement, by reaſon of the contumacie of the humor, cauſed by drineſs. To conclude, the Air changes the conſtitutions of our bodies, either by its qualities, as if it be hotter, colder, moiſter, or drier; or by its matter, as if it be groſſer, or more ſubtil than is fit, or corrupted by exhalations from the earth, or by a ſodain and unaccuſtomed alteration, which any man may prove, who makes a ſodain change out of a quiet air into a ſtormy and troubled with many winds. But becauſe, next to the Air, nothing is ſo neceſſary to nouriſh mans body, as Meat and Drink, I will now begin to ſpeak of them both.

How the air of *Paris* comes to be ill for wounds of the head, and good for thoſe of the leggs.

By what means the air changes our bodies.

CHAP. XIIII.

Of Meat and Drink.

THat this our Treatiſe of meat and drink may be more brief and plain, I have thought good to part it into theſe heads, as to conſider the goodneſs and ilneſs of both of them, their quantity, quality, cuſtom, delight, order, time, and to accommodate them all to the ages and ſeaſons of the year. We judge of the goodneſs and pravity of meats and drinks, from the condition of the good or vicious humours, or juice which they beget in us. For evill juice cauſeth many diſeaſes. As on the contrary, good juice drives away all diſeaſes from the body, except the fault happen from ſome other occaſion, as from quantity, or too much exceſs. Wherefore it is principally neceſſary, that thoſe who will preſerve their preſent health, and hinder the acceſs of diſeaſes, feed upon things of good nouriſhment and digeſtion, as are good wine, the yolks of egs, good milk, wheaten bread well baked, the fleſh of Capons, Partridge, Thruſhes, Larks, Veal, Mutton, Kid, and ſuch like other, which you may find mentioned in the Books which *Galen* writ, *De Alimentorum facultatibus*; where alſo he examins thoſe which are of evill juice by their manifeſt qualities, as acrimony, bitterneſs, ſaltneſs, acidity, harſhneſs, and ſuch like.

The goodneſs of nouriſhments.

But unleſs we uſe a convenient quantity and meaſure in our meats, howſoever laudable they be, we ſhall never reap theſe fruits of health we hoped for. For they yeeld matter of diſeaſes, by the only exceſs of their quantity; but we may by this know the force of quantity on both parts, becauſe often the poiſonous quality of meats of ill nouriſhment doth not hurt, by reaſon they were not taken into the body into a great quantity. That meaſure of quantity is chiefly to be regarded in diſeaſes: for as *Hippocrates* ſaith, If any give meat to one ſick of a Feaver, he gives ſtrength to the well, and increaſes the diſeaſe to the ſick, eſpecially if he do not uſe a mean. Wherefore it is a thing of no ſmall conſequence, to know what diſeaſes require a ſlender, and what a large diet; of which thing there is large relation made in the 1 *Sect.* of the Aphoriſms of *Hippocrates*; where he teacheth, the ſick muſt feed more largely in the beginnings of long diſeaſes, whereby they may be enabled to endure the length of the diſeaſe, and laſt to the ſtate thereof. But in ſharp and violent diſeaſes, which preſently come to their height, we muſt uſe a ſlender diet; but moſt ſlender, when the diſeaſe is in the height; and beſides, all our conſultations in this kinde, muſt be referred to the ſtrength of the Patients. But thoſe who do joy their perfect health, muſt uſe a quantity of meat, agreeable to their evacuation and tranſpiration; for men, by reaſon of the ſtrength of their heat, and the more copious diſſipation of the triple ſubſtance, have greater appetite than women; altogether by the ſame reaſon, that young people, and ſuch as grow, need more frequent and plentifull nouriſhment, than old men; and alſo amongſt young men of the like age, ſome do rightly require more copious nouriſhment than otherſome, that is, according to the quantity of their evacuations and cuſtom. Certainly for gluttony, it is ſuch as may be extended to all; but we all ſhould take ſo much meat and drink, that our powers may be refreſhed and not oppreſſed; for by the decree of *Hippocrates*, theſe be the two compendiary ways of preſerving health; not to be over-filled with meat, and to be quick to work; and thus much of the quantity of meats. Neither muſt theſe who are either ſound, or ſick, have leſs regard to the qualities of their Meats; and thoſe are either the firſt, as heating, cooling, moiſtening, drying; or the ſecond, attenuating, incraſſating, obſtructing, opening, or ſome other-like, working according to the condition of their nature. The manner of our diet is not only to be framed according

Their quantity

The quantity of meats muſt be eſteemed according to the nature of the diſeaſe, and ſtrength of the Patient.

The qualities of meat.

to

to theſe, but alſo to be varied; for the preſent ſtate of ſuch as be in health, requires to be preſerved by the uſe of like things. As hot and moiſt nouriſhment is to be preſcribed to children, as to thoſe which are hot and moiſt: and cold and dry to old men, as to thoſe who are cold and dry; if ſo be that vulgar ſaying be true, that, *Health delights in the uſe of like things*. Yet becauſe Old-age how green and new-begun howſoever it be, is of it ſelf, as it were, a diſeaſe, it ſeems to be more convenient, both to truth, and for health, that old people ſhould eat meats contrary to their nature, that is, hot and moiſt, that ſo we may defer as much as we can, the cauſes of death, cold and drineſs, which haſten the deſtruction of that age. For we muſt reſiſt diſeaſes by the uſe of their contraries, as thoſe things which are contrary to nature. For otherwiſe, as much meat as you give to the ſick, you add ſo much ſtrength to the diſeaſe. And the ſame is the cauſe why *Hippocrates* ſaid, that a moiſt diet is convenient for all ſuch as are ſick of Feavers, becauſe a Feaver is a dry diſtemperature. Therefore we muſt diligently pry into the nature of the diſeaſe, that knowing it, we may endevour to abate its fury by the uſe of contraries.

Old-age is a diſeaſe.

Aphor. 16. *ſect.* 1.

The force of Cuſtom.

But if Cuſtom (as they ſay) be another nature, the Phyſitian muſt have a great care of it, both in ſound and ſick. For this ſometimes by little and little, and inſenſibly, changes our naturall temperament, and in ſtead thereof gives us a borrowed temper. Wherefore if any would preſently or ſodainly change a Cuſtom which is ſometimes ill, into a better, truly he will bring more harm than good; becauſe all ſodain changes (according to the opinion of *Hippocrates*) are dangerous. Wherefore if neceſſity require that we ſhould withdraw any thing from our Cuſtom, we muſt do it by little and little, that ſo nature may by degrees be accuſtomed to contraries without violence, or the diſturbance of its uſuall government. For that meat and drink which is ſomwhat worſe, but more pleaſant and familiar by cuſtom, is to be preferred (in *Hippocrates* opinion) before better, but leſs pleaſant and accuſtomed. Hence is it, that Country-men do very well digeſt Beef and Bacon, which commonly they uſe; but will turn into nidorulent vapors, Partridg, Capons, and other meat of good nouriſhment, ſooner than change them into good and laudable *Chylus*. The cauſe of which thing is not only to be attributed unto the property of their ſtronger, & as it were, burning heat, but much more to Cuſtom; which by a certain kind of familiarity, cauſeth that meats of hard digeſtion, are eaſily turned into laudable blood. For the force of Cuſtom is ſo great, that accuſtomed Meats are more acceptable; whereby it comes to paſs, that while the ſtomach delights in them, it more ſtraitly embraces them, and happily digeſts them, without any trouble of loathing, vomiting, or heavineſs. All the contrary meet and happen in the uſe of Meats which are unpleaſant to the taſte and ſtomach. For the ventricle abhorring thoſe things, makes manifeſt how it is troubled by its acide and nidorulent belchings, loathing, nauſeouſneſs, vomit, heavineſs, pain of the head, and trouble of the whole body.

Aphor. 91. *ſect.* 2.

Aphor. 38. *ſect.* 2.

Accuſtomed meats are more gratefull, and ſo by that means more nouriſhing.

Wherefore we muſt diligently enquire, what Meats the Patient chiefly delighted in, that by offering them, his appetite languiſhing by reaſon of ſome great evacuation, vomit, or the like, may be ſtirred up. For it will be better and more readily reſtored by things acceptable, though they be ſomewhat worſe, as we noted a little before out of *Hippocrates*. By which words he plainly taught, that it is the part of a good and prudent Phyſitian to ſubſcribe to, and pleaſe the palat of his Patient.

The order of eating our meats.

But ſeeing that order is moſt beautifull in all things, it is truly very neceſſary in eating our Meat: for how laudable ſoever the Meats be in their quantity and quality, howſoever familiar by uſe, and gratefull by cuſtom, yet unleſs they be eaten in due order, they will either trouble or moleſt the ſtomach, or be ill, or ſlowly and difficultly concocted; wherefore we muſt diligently obſerve, what Meats muſt be eaten at the firſt, and what at the ſecond courſe; for thoſe Meats which be hard to concoct, are not to be eaten before thoſe which are eaſie of digeſtion; neither dry and aſtringent things, before moiſtening and looſing.

We muſt begin our meals with moiſt or liquid meat.

But on the contrary, all ſlippery, fat, and liquid things, and which are quickly changed, ought to go before, that ſo the belly may be moiſtned; and then aſtringent things muſt follow, that the ſtomach, by their help, being ſhut and drawn together, may more ſtraitly comprehend the Meat on every ſide, and better perform the Chylification by its proper heat united and joined together.

For this cauſe *Hippocrates*, *Lib. de victu in acutis*, commands thoſe things to be always eaten in the morning, which are fit to looſen the belly, and in the evenings ſuch as nouriſh the body. Yet notwithſtanding drink ought not to precede or go before meat, but on the contrary meat muſt precede drink, by the order preſcribed by him.

The time of eating.

Whether ought we in our eating to have leſs care of the time, than we have of the order; for the time of eating of ſuch as are healthfull, ought to be certain and fixt; for at the accuſtomed hour, and when hunger preſſes, any ſound man, and which is at his own diſpoſure may eat, but exerciſe and accuſtomed labors ought to go before; for it is fit, according to the precept of *Hippocrates*, that labor precede meat, whereby the excrements of the third concoction may be evacuated; the native heat increaſed, and the ſolid parts confirmed and ſtrengthened, which are three commodities of exerciſe very neceſſary to

The profit of labour before meat.

the

the convenient taking of meat. But in ſick perſons we can ſcarce attend and give heed to theſe circumſtances of time, and accuſtomed hour of feeding; for that Indication of giving meat to the ſick, is the beſt of all, which is drawn from the motion of the diſeaſe, and the declining of the fit: for if you give meat in feavers, ſpecially the fit then taking the Patient, you nouriſh not him, but the diſeaſe. For the meat then eaten, is corrupted in the ſtomach, and yeelds fit matter for the diſeaſe: For meat (as we noted before out of *Hippocrates*) is ſtrength to the ſound, and a diſeaſe to the ſick; unleſs it be eaten at convenient time, and diligent care be had of the ſtrength of the Patient, and greatneſs of the diſeaſe.

We muſt not give meat in a fit of a Feaver.

But neither is it convenient that the meat ſhould be ſimple, and of one kind, but of many ſorts, and of divers diſhes dreſſed after different forms, leſt nature by the continuall and hatefull feeding upon the ſame meat, may at the length loath it, and ſo neither ſtraitly contain it, nor well digeſt it; or the ſtomach accuſtomed to one meat, taking any loathing thereat, may abhor all other; and as there is no deſire of that we do not know, ſo the dejected appetite cannot be delighted and ſtirred up with the pleaſure of any meat which can be offered. For we muſt not credit thoſe ſuperſtitious or too nice Phyſitians, who think the digeſtion is hindred by the much variety of meats.

Variety of meats.

The matter is far otherwiſe, for by the pleaſure of what things ſoever the ſtomach allured doth require, it embraces them more ſtraitly, and concocts them more perfectly. And our nature is deſirous of variety.

Why variety of meats is good.

Moreover, ſeeing our body is compoſed of a ſolid, moiſt, and airy ſubſtance, and it may happen, that by ſo many labors, which we are compelled to undergo and ſuſtain in this life, one of theſe may ſuffer a greater diſſipation and loſs than another; therefore the ſtomach is neceſſarily compelled to ſeek more variety, leſt any thing ſhould be wanting to repair that which is waſted. But alſo the age and ſeaſon of the year, yeeld Indications of feeding, for ſome things are convenient for a young man, ſome for an old; ſome in ſummer, ſome in winter. Wherefore we ought to know what befits each age and ſeaſon. Children need hot, moiſt, and much nouriſhment, which may not only ſuffice to nouriſh, but increaſe the body. Wherefore they worſt endure faſting, and of them, eſpecially thoſe who are the moſt lively and ſpiritfull. With old men it is otherwiſe, for becauſe their heat is ſmall, they need little nouriſhment, and are extinguiſhed by much. Wherefore old men eaſily endure to faſt; they ought to be nouriſhed with hot and moiſt meats, by which their ſolid parts now growing cold and dry, may be heated and moiſtned, as by the ſweet nouriſhment of ſuch like meats. Middle-ag'd men delight in the moderate uſe of contraries, to temper the exceſs of their too acrid heat. Young people as temperate, are to be preſerved by the uſe of like things.

Indications of feeding, taken from the age.

The manner of Diet in Winter muſt be hot, and inclining to drineſs. Wherefore then we may more plentifully uſe roſt-meats, ſtrong wines and ſpices; becauſe in the Winter-ſeaſon we are troubled with the cold and moiſt air, and at the ſame time, have much heat inwardly; for the inner parts, according to *Hippocrates*, are naturally moſt hot in the Winter and the Spring, but feaveriſh in Summer; ſo the heat of Summer is to be tempered by the uſe of cold and moiſt things, and much drink. In the temperate Spring all things muſt be moderate; but in Autumn, by little and little, we muſt paſs from our Summer to our Winter diet.

Indication from the time of the year.

CHAP. XV.

Of Motion and Reſt.

HEre Phyſitians admoniſh us, that by the name of Motion, we muſt underſtand all ſorts of exerciſes, as walking, leaping, running, riding, playing at tennis, carrying a burden, and the like. Friction or rubbing is of this kind, which in times paſt was in great uſe and eſteem, neither at this day is it altogether neglected by Phyſitians. They mention many kinds of it, but they may be all reduced to three; as, one gentle, another hard, a third indifferent; and that of the whole body, or only of ſome part thereof. The Friction is called hard, which is made by the rough, or ſtrong preſſure of the hands, ſponges, or a courſe and new linnen cloth: it draws together, condenſates, binds and hardens the fleſh, yet if it be often and long uſed, at length it rarifies, diſſolves, attenuates, and diminiſhes the fleſh, and any other ſubſtance of the body; and alſo it cauſeth revulſion, and draws the defluxion of humors from one part to another. The gentle Friction, which is performed by the light rubbing of the hand, and ſuch like, doth the contrary; as, ſoftens, relaxes, and makes the skin ſmooth and unwrinkled; yet unleſs it be long continued, it doth none of theſe worthy to be ſpoken of. The indifferent kinds, conſiſting in the mean betwixt the other two, increaſeth the fleſh, ſwels or puffs up the habit of the body, becauſe it retains the blood and ſpirits which it draws, and ſuffers them not to be diſſipated.

What motion ſignifies.

Three kinds of Fictions.

Hard.

Gentle.

Indifferent.

The use of exercises.

The benefit of exercise is great, for it increases naturall heat, whereby better digestion follows, and by that means nourishment, and the expulsion of the excrements; and lastly, a quicker motion of the spirits, to perform their offices in the body, all the ways and passages being cleansed. Besides, it strengthens the respiration, and the other actions of the body, confirms the habit, and all the limbs of the body, by the mutuall attrition of the one with the other; whereby it comes to pass they are not so quickly wearied with labor. Hence we see that Country people are not to be tired with labor.

What the fittest time for exercise.

If any will reap these benefits by exercise, it is necessary that he take opportunity to begin his exercise, and that he seasonably desist from it, not exercising himself violently and without discretion; but at certain times according to reason.

Wherefore the best time for exercise will be before meat (that the appetite may be increased by augmenting the naturall heat) all the excrements being evacuated, lest nature being hungry and empty, do draw and infuse the ill humors contained in the guts and other parts of the body, into the whole habit, the liver, and other noble parts. Neither is it fit presently, after meat, to run into exercise, lest the crude humors and meats not well concocted, be carried into the veins. The measure and bounds of exercise must be, when the body appears more full, the face looks red, sweat begins to break forth, we breath more strongly and quick, and begin to grow weary; if any continue exercise longer, stiffness and wearines assails his joints, and the body flowing with sweat suffers a loss of the spirituous and humid substance, which is not easily repaired; by which it becomes more cold, and lean even to deformity.

The quality of exercise.

The quality of exercise which we require, is in the midst of exercise, so that the exercise must be neither too slow and idle, neither too strong nor too weak, neither too hasty nor remiss, but which may move all the the members alike. Such exercise is very fit for sound bodies. But if they be distempered, that sort of exercise is to be made choice of, which by the quality of its excess, may correct the distemper of the body, and reduce it to a certain mediocrity. Wherefore such men as are stuffed with cold, gross, and viscous humors, shall hold that kind of exercise most fit for them, which is more laborious, vehement, strong, and longer continued. Yet so, that they do not enter into it before the first and second concoction, which they may know by the yellowness of their urine. But let such as abound with thin and cholerick humors, chuse gentle exercises, and such as are free from contention, not expecting the finishing of the second concoction, for the more acride heat of the solid parts delights in such half concocted juices, which otherwise it would so burn up, all the glutinous substance thereof being wasted, that they could not be adjoyned or fastened to the parts. For the repeating or renewing of exercise, the body should be so often exercised, as there is a desire to eat. For exercise stirs up and revives the heat which lies buried and hid in the body: for digestion cannot be well performed by a sluggish heat; neither have we any benefit by the meat we eat, unless we use exercise before.

For whom strong exercises are convenient.

* Anapigmia.

The last part of exercise begun and performed according to reason, is named, * *The ordering of the body*, which is performed by an indifferent rubbing and drying of the members; that so the sweat breaking forth, the filth of the body, and such excrements lying under the skin, may be allured and drawn out; and also that the members may be freed from stiffness and wearines. At this time it is commonly used by such as play at Tennis.

What discommodities proceed from idleness.

But, as many and great commodities arise from exercise conveniently begun and performed, so great harm proceeds of idleness; for gross and vicious juices heaped up in the body commonly produce crudities, obstructions, stones both in the reins and bladder, the Gout, Apoplexie, and a thousand other diseases.

CHAP. XVI.

Of Sleep and Watching.

THat this our speech of Sleep and Watching, which we now intend, may be more plain, we will briefly declare, what commodity or discommodity they bring; what time and what hour is convenient for both; what the manner of lying must be, and the choice thereof; what the dreams in sleeping, and what pains or heavines and chearfulness after sleep may portend.

What sleep is.

Sleep is nothing else than the rest of the whole body, and the cessation of the Animall faculty from sense and motion. Sleep is caused, when the substance of the brain is possessed, and after some sort overcome and dulled by a certain vaporous, sweet and delightsome humidity; or when the spirits almost exhaust by performance of some labor, cannot any longer sustain the weight of the body, but cause rest by a necessary consequence, by which means nature may produce other from the meat by concoction turned into blood.

The use of sleep.

Sleep fitly taken much helps the digestion of the parts, because in the time of rest, the heat being the worker of all concoction, is carried back to them, together with the

spirits

ſpirits. Neither doth ſleep only give eaſe to the wearied members, but alſo leſſens our cares, and makes us to forget our labors.

The night is a fit time to ſleep and to take our reſt in, as inviting ſleep by its moiſture, ſilence and darkneſs. For the heat and Spirits in the thick obſcurity of night, are driven in and retained in the center of the body; as on the contrary by the daily, and as it were, friendly and familiar light of the Sun, they are allured and drawn forth into the ſuperficies, and outward part of the body; from whence they leave ſleeping, and begin to wake. Beſides alſo, which makes not a little to that opportunity and benefit which we look for from ſleep, the night ſeaſon ſuffices for the work of juſt and perfect concoction. Which is one reaſon amongſt many that ſleep on the day time may be hurtfull. For we are wakened from our ſleep by the heat and ſpirits, called forth to the skin either by the light, or noiſe on the day time, before that the concoction which was begun be finiſhed. But that ſleep cannot but be light which comes without neceſſity of ſleeping. Wherefore the concoction being attempted, but not perfected, the ſtomach is filled with crudities, diſtended with acide or ſour belchings, and the brain troubled with groſs vapors and excrementitious humidities. From whence proceeds pain and heavineſs of the head, and ſtore of cold diſeaſes. But although ſleep on the night time be wholſome, yet it is fit, that it be reſtrained within the limits of an indifferent time. For that which exceeds, hinders the evacuation of excrements both upwards and downwards: but in the mean time the heat which is never idle, draws from them ſome portion or vapor into the veins, principall parts and habit of the body, to become matter for ſome diſeaſe. We muſt meaſure this time, not by the ſpace of hours, but by the finiſhing the work of concoction, which is performed in ſome ſooner than in other ſome. Yet that which is longeſt is perfected and done in ſeven or eight hours. The ventricle ſubſiding and falling into its ſelf and its proper coats, and the urine tinctured yellow, gives perfect judgment thereof. For on the contrary the extenſion of the ſtomach, acide belching, pain of the head, and heavineſs of the whole body, ſhew that the concoction is unperfect.

Fit time for ſleep and the nature of the night.

Sleep on the day-time.

There ought to be a moderation of our nights ſleep.

How to be known.

In ſleeping we muſt have ſpeciall care of our lying down; for firſt we muſt lye on our right ſide, that ſo the meat may fall into the bottom of our ſtomach, which being fleſhy, and leſs membranous, is the hotter, and more powerfull to aſſimilate. Then a little after we muſt turn upon our left ſide, that ſo the Liver with its Lobes, as with hands may on every ſide embrace the ventricle, and as fire put under a kettle, haſten the concoction. Laſtly, towards morning it will not be unprofitable to turn again upon our right ſide, that by this ſituation the mouth of the ſtomach being opened, the vapors which ariſe from the elixation of the *Chylus* may have freer paſſage. Lying upon the back is wholly to be avoided; for from hence the Reins are inflamed, the Stone is bred, Palſies, Convulſion, and all diſeaſes which have their originall from the defluxion into the ſpinall marrow, and to the Nerves taking beginning from thence. To lye upon the belly is not unprofitable for ſuch as have uſed to lye ſo, if they be not troubled with defluxions into the eys; for ſo the humor will more eaſily flow into the part affected. But thus the work of concoction is not a little furthered, becauſe by that form of lying, not only the inward heat is contained and gathered together about the ventricle, but the encompaſſing warmneſs of the ſoft feathers of the bed aids and aſſiſts it.

What the form and ſite of our body ought to be while we ſleep.

The harm of lying on our backs.

Upon our bellies.

Neither are the Dreams which we have in our ſleep to be neglected, for by the diligent conſideration of theſe, the affections and ſuperfluous Humors which have chief power in the body are marvailouſly known. For thoſe who have raging choler running up and down their bodies while they ſleep, all things to them appear bright, ſhining, fiery, burning, full of noiſe and contention. Thoſe who abound with Phlegm, dream of floods, ſnows, ſhowers, and inundations and falling from high places. Thoſe who are Melancholy dream of gapings and gulfs in the earth, thick and obſcure darkneſs, ſmokes, caves, and all black and diſmall things. But thoſe whoſe bodies abound in blood, dream of marriages, dances, embracings of women, feaſts, jeſts, laughter, of orchards and gardens; and to conclude, of all things pleaſant and ſplendent.

The conſideration of dreams.

Alſo we muſt obſerve how the Patient doth after ſleep, whether more lively and chearfull, or more heavie: for by the opinion of *Hippocrates*,

Cum labor à ſomno eſt, lethalem collige morbum:
Sin profit ſomnus, nihil hinc lethale timendum eſt. *Aphor. 1. ſect. 2.*

Pain ſleep enſuing, an ill diſeaſe doth ſhow:
But if ſleep profit bring, no harm from thence will flow.

And as ſleep, ſo watching, if it exceed meaſure, is hurtfull; for it hurts the temperature of the brain, weakens the ſenſes, waſtes the ſpirits, breeds crudities, heavineſs of the head, falling away of the fleſh, and leanneſs over all the body; and to conclude, it makes ulcers more dry, and ſo conſequently rebellious, difficult to heal and malign. There are many other things may be ſpoken of ſleep and watching, but theſe may ſuffice a Chirurgeon.

CHAP. XVII.

Of Repletion, and Inanition, or Emptineſs.

The kinds of Repletions, or rather of Exceſſes.

THere are, to be ſhort, two ſorts of Repletion, or of all exceſs; one is of a ſimple quality, without any defluxion, or ſociety of any humor, as appears in diſtempers without matter: the other is of quantity and maſs, the body being diſtended with too much meat, or too great quantity of humors; from whence proceed an infinite number of diſeaſes. They call the Repletion of meats, ſatiety or fulneſs; and it is of two kinds: The one which is called * Repletion or Fulneſs to the veſſels; the other * Repletion to the ſtrength.

*Repletio { ad vaſa / ad vires

We judg of ſatiety to the veſſels, by the diſtention and ſwelling of the veins and entrails; as the ſtomach. We call ſatiety to the ſtrength, when the body is loaded with more meats than it can well bear. But alſo there is a double Repletion of humors. For either it is of ſome one humor, or of all the humors; they call this by a peculiar name, *Plethora*.

Gal. Meth. 13. *cap.* 6.

For *Galen* defines *Plethora* an equal exceſs of all the humors. For if at any time he define a *Plethora* to be an exceſs of blood only; then verily by the name of blood, he underſtands an equal comprehenſion of the four humors; as it is taught in Phyſick ſchools.

What *Cacochymia*.

The Repletion which is cauſed by ſome one humor, is termed by *Galen* in the place before mentioned, *Cacochymia*, (that is, An evil juice) whether the Repletion proceed of a Cholerick, Melancholick, Phlegmatick, or ſerous Humor.

The kinds of evacuation.

Now Inanition, or evacuation is no other thing than the expulſion or effuſion of humors which are troubleſome, either in quantity or quality. Of Evacuations, ſome are univerſall, which expell ſuperfluous humors from the whole body; ſuch are purging, vomiting, tranſpiration, ſweats, Phlebotomy. Some particular, which are performed only to evacuate ſome part, as the brain by the noſe, palat, eys, ears; the lungs by the weazon; the ſtomach by vomit and ſtool; the guts by ſtool; the liver and the ſpleen by urine and ordure. Theſe evacuations are ſometimes performed by nature, freeing it ſelf of that which is troubleſome to it; otherwhiles by the Art of the Phyſitian in imitation of nature.

And again, one of theſe is good and requiſite, when only the humor which is hurtfull either in quantity or quality, is evacuated; The other not requiſite, or immoderate, when the profitable Humors, together with the unprofitable, are expelled.

The commodities of moderate ſcratching.

But what evacuations ſoever theſe be, they are performed and done, either by the ſcratching and rubbing of the skin, as when a Cholerick, ſalt, or ſerous Humor, or ſome windineſs lying between the skin and the fleſh, cauſe itching. For by ſcratching the skin, it gets paſſage out, which is manifeſt by the efflux of a ſerous matter burning, or cauſing ſcabs and ulcers, if the humor be ſomewhat groſs, but inſenſible and not ſo manifeſt, if it be windineſs, the skin by that rubbing being rarified, and the groſs flatulency attenuated. Wherefore they do ill who hinder their Patients from ſcratching, unleſs they ſcratch ſo cruelly and hard, that there may be danger (by reaſon of the great heat and pain thereby cauſed) of ſome defluxion or falling down of humors into the part.

Or theſe evacuations are performed by much matter evacuated from an opened Bile, or running Ulcer, a Fiſtula, or ſuch like ſores. Or by ſweats which are very good and healthfull, eſpecially in ſharp diſeaſes, if they proceed from the whole body, and happen on the criticall days.

The force of vomits.

By vomit, which often violently draws theſe humors from the whole body, even from the utmoſt joints, which purging medicins could not evacuate, as we may ſee in the Palſie, and Sciatica, or Hip-gout.

Salivation.

By ſpitting, as in all who are ſuppurated either in the ſides or lungs. By Salivation, or a Phlegmatick flux by the mouth, as in thoſe who are troubled with the French-pox. By ſneezing and blowing the noſe; for by theſe, the brain oppreſt with moiſture, disburdeneth its ſelf, whether it be done without, or with the help of ſternutatories and errhines; wherefore children, and ſuch as have ſomewhat moiſt brains, purge themſelves often this way.

The whole body is alſo purged by urine.

By hicket and belching; for by theſe the windineſs contained in the ſtomach, is often expelled. By urine, for by this not only Feavers, but which is more to be admired, the French-pox hath often been terminated and cured.

For there have been ſome troubled with the Pox, in whom a flux of the vicious and venenate humor could not by Unctions of quickſilver be procured, either from the mouth or belly; yet have been wonderfully freed by abundance of urine, both from danger of death and their diſeaſe. By bleeding; for nature hath often found a way for grievous diſeaſes, eſpecially in young bodies, by bleeding at the noſe, and by their courſes in women. By a flux, or laſk, purgation, ſweats; inſenſible evacuation and tranſpiration; for ſo tumors, the matter being brought to ſuppuration, do ſometimes vaniſh away and are diſſolved, both of their own accord, as alſo by diſſolving or diſcuſſing medicins. We do the ſame by exerciſe, diet, hot-houſes, long ſleep, waking, and ſhedding of tears. By ſucking, as with cupping-glaſſes, and horſ-leeches, in wounds made by venemous bitings.

In

In all ſuch kinds of evacuations, we muſt conſider three things, the quantity, quality, and manner of evacuation. As for an example, when an *Empyema* is opened, the matter which runs out, ought to be anſwerable in proportion to the purulent matter, which was contained in the capacity of the breaſts; otherwiſe, unleſs all the matter be emptied, there may happen a relapſe; the matter ſhould be white, ſoft, equal, and nothing ſtinking: Laſtly, you muſt let it forth not all together, and at one time, but by little and little, and at ſeverall times, otherwiſe not a little quantity of the Spirits and heat doth flow out together, with the unprofitable matter, and ſo conſequently a diſſolution of all the powers.

We muſt obſerve three things in every evacuation.

CHAP. XVIII.

Of the Perturbations, or Paſſions of the minde.

THe Perturbations are commonly called the Accidents of the minde, becauſe as bodily accidents from the body, ſo may theſe be preſent and abſent from the mind, without the corruption of the ſubject. The knowledg of theſe muſt not be lightly paſſed over by the Chirurgeon; for they ſtir up great troubles in the bodies, and yeeld occaſion of many and great diſeaſes; of which things, joy, hope, and love, may give an apparent teſtimony. For by theſe motions the heat and ſpirits are ſometimes gently, ſometimes violently diffuſed over all the body, for the enjoying of the preſent, or hoped for good. For then the heart is dilated, as to embrace the thing beloved, and the face is died with a roſie and lively colour. For it is likely, that the faculty it ſelf is ſtirred by the object, by whoſe power the heart it ſelf is moved.

Why the Paſſions of the minde are called Accidents. Their force.

For it is firſt neceſſary, before we be moved by any Paſſions, that the ſenſes in their proper ſeats, in which they are ſeldom deceived, apprehend the objects, and ſtraight, as meſſengers carry them to the common ſenſe, which ſends their conceived forms to all the faculties. And then, that each faculty, as a Judge may afreſh examin the whole matter, how it is, and conceive in the preſented objects ſome ſhew of good, or ill, to be deſired, or ſhunned. For what man that was well in his wits, did ever fall into a laughter, unleſs he formerly knew, or ſaw ſomewhat ſaid or done, which might yeeld occaſion of laughter? Therefore Joy proceeds from the heart, for the thing cauſing mirth or joy, being conceived, the faculty moves the heart, which ſhaken and moved by the faculty which hath dominion over it, is dilated and opened, as ready to embrace the exhilarating object. But in the mean time by the force of that dilatation, it ſends forth much heat, and ſpirits together with the bloud into all the body. A great part of which comming to the face, dilates it, the forehead is ſmooth and plain, the eies look bright, the cheeks become red, as died with Vermilion, the lips and mouth are drawn together, and made plain and ſmooth; ſome have their cheeks dented with two little pits (which from the effects are called laughing cheeks) becauſe of the contraction or curling, which the muſcles ſuffer by reaſon of their fulneſs of bloud and ſpirits, all which to be brief is nothing but to laugh.

From whence they have their force.

The reaſon of Joy.

Joy recreates and quickens all the faculties, ſtirs up the ſpirits, helps concoction, makes the body to be better liking, and fattens it, the heat, bloud, and ſpirits flowing thither, and the nouriſhing dew or moiſture, watering and refreſhing all the members; from whence it is, that of all the paſſions of the mind, this only is profitable, ſo that it exceed not meaſure; for immoderate and unaccuſtomed joy carries ſo violently the bloud and ſpirits from the heart, into the habit of the body, that ſodain and unlookt for death enſues, by a ſpeedy decay of the ſtrength, the laſting fountain of the vitall humour being exhauſted. Which thing principally happens to thoſe who are leſs hearty, as women and old men.

The effects of Joy.

Anger cauſeth the ſame effuſion of heat in us, but far ſpeedier than joy; therefore the ſpirits and humors are ſo enflamed by it, that it often cauſes putrid feavers, eſpecially if the body abound with any ill humour.

Anger.

Sorrow, or grief dries the body by a way quite contrary to that of anger, becauſe by this the heart is ſo ſtraitned, the heat being almoſt extinct, that the accuſtomed generation of ſpirits cannot be performed; and if any be generated, they cannot freely paſs into the members with the bloud; wherefore the vitall faculty is weakned, the lively colour of the face withers and decays, and the body waſtes away with a lingering conſumption.

Sorrow.

Fear in like ſort draws in and calls back the ſpirits, and not by little and little as in ſorrow, but ſodainly and violently; hereupon the face growes ſodainly pale, the extreme parts cold, all the body trembles or ſhakes, the belly in ſome is looſed, the voice as it were ſtays in the jawes, the heart beats with a violent pulſation, becauſe it is almoſt oppreſt by the heat, ſtrangled by the plenty of bloud, and ſpirits aboundantly ruſhing thither; The hair alſo ſtands upright, becauſe the heat and bloud are retired to the inner parts, and the utmoſt parts are more cold and drie than ſtone; by reaſon whereof the utmoſt skin and the pores, in which the roots of the hairs are faſtned, are drawn together.

Fear.

Hippocr. lib. 4. de morb.

Shame.

Shame is a certain affection mixed, as it were, of Anger and Fear; therefore if, in that conflict of, as it were, contending passions, Fear prevail over Anger, the face waxeth pale, (the blood flying back to the heart;) and these or these Symptomes rise, according to the vehemency of the contracted and abated heat. But if on the contrary, Anger get the dominion over Fear, the blood runs violently to the face, the eyes look red, and sometimes they even fome at the mouth.

Shamefastness.

There is another kind of shame, which the *Latins* call *Verecundia* (we Shamefastness) in which there is a certain flux, and reflux of the heat, and blood, first recoiling to the heart, then presently rebounding from thence again. But that motion is so gentle, that the heart thereby suffers no oppression, nor defect of spirits; wherefore no accidents worthy to be spoken of, arise from hence: this affect is familiar to young maids and boyes, who if they blush for a fault committed unawares, or through carelesness, it is thought an argument of a vertuous and good disposition.

An agony.

But an agony, which is a mixt passion of a strong fear, and vehement anger, involves the heart in the danger of both motions; wherefore by this passion, the vitall faculties is brought into very great danger. To these six Passions of the mind, all other may be revoked, as Hatred and Discord, to Anger: Mirth and Boasting, to Joy; Terrors, Frights and Swoundings, to Fear; Envy, Despair and Mourning, to Sorrow.

By these it is evident, how much the passions of the mind can prevail, to alter and overthrow the state of the body; and that by no other means, than that by the compression and dilatation of the heart, they diffuse and contract the spirits blood, and heat; from whence happens the dissipation, or oppression of the spirits.

Why the first signs of passions of the mind appear in the face.

The signes of these Symptomes quickly shew themselves in the face; the heart, by reason of the thinness of the skin in that part, as it were painting forth the notes of its affections. And certainly the face is a part so fit to disclose all the affections of the inward parts, that by it you may manifestly know an old man from a young, a woman from a man, a temperate person from an untemperate, an *Ethiopian* from an *Indian*, a *Frenchman* from a *Spaniard*, a sad man from a merry, a sound from a sick, a living from a dead. Wherefore many affirm that the manners, and those things which we keep secret and hid in our hearts, may be understood by the face and countenance.

The use of passions of the mind.

Now we have declared what commodity and discommodity may redound to the man from these forementioned passions, and have shewed that anger is profitable to none, unless by chance to some dull by reason of idleness, or oppresst with some cold, clammy and phlegmatick humor; and fear convenient for none, unless peradventure for such as are brought into manifest and extream danger of their life by some extraordinary sweat, immoderate bleeding, or the like unbridled evacuation: Wherefore it behoves a wise Chirurgeon to have a care, left he inconsiderately put any Patient committed to his charge into any of these passions, unless there be some necessity thereof, by reason of any of the forementioned occasions.

CHAP. XIX.

Of things against Nature, and first of the Cause of a disease.

What things against nature are.

HAving intreated of things naturall, and not naturall, now it remains we speak of things (which are called) against nature, because that they are such as are apt to weaken & corrupt the state of our body. And they be three in number; The cause of a disease, a Disease, and a Symptome. The cause of a disease is an affect against nature, which causes the disease. Which is divided into Internall and Externall. The External, originall or primitive comes from some other place, and outwardly into the body: such be meats of ill nourishment, and such weapons as hostilely wound the body.

What, and how many the causes of diseases be.

The primitive cause.

Internall antecedent.

Internall conjunct.

The Internall have their essence and seat in the body, and are subdivided into antecedent and conjunct. That is called an antecedent cause, which as yet doth not actually make a disease, but goes near to cause one; so humors copiously flowing, or ready to flow into any part, are the antecedent causes of diseases; The conjunct is that which actually causes the disease, and is so immediately joyned in affinity to the disease, that the disease being present, it is present, and being absent, it is absent.

Again, of all such causes, some are born together with us, as the over-great quantity and malign quality of both the seeds, and the menstruous blood from diseased Parents are causes of many diseases, and specially of those which are called Hereditary.

Other happen to us after we be born, by our diet and manner of life, a stroke, fall or such other like. Those which be bred with us, cannot be wholly avoided or amended, but some of the other may be avoided, as a stroke and fall; some not, as those which necessarily enter into our body, as Air, Meat, Drink, and the like.

The congenit, or inevitable cause of death.

But if any will reckon up amongst the internal, inherent, and inevitable causes, the dayly, nay hourely dissipation of the radicall moisture, which the naturall heat continually preys upon;

upon; I do not gainsay it, no more than that division of Causes celebrated and received of Philosophers, divided into Materiall, Formall, Efficient, and Finall; for such a curious contemplation belongs not to a Chirurgeon, whom I only intend plainly to instruct. Wherefore that we have written may suffice him.

CHAP. XX.

Of a Disease.

A Disease is an affect against Nature, principally, and by it self, hurting and depraving the action of the part in which it resides. The division of a Disease is threefold; Distemperature, ill Conformation, and the Solution of Continuity. — What a disease is, and how various.

Distemperature is a Disease of the similar parts dissenting, and changed from their proper and native temper. That digression from the native temper, happens two ways; either by a simple distemperature from the excess of one quality; and this is fourfold, Hot, Cold, Moist, and Dry; or by a compound distemperature, by the excess of two qualities, which also is fourfold, Hot and Moist, Hot and Dry; Cold and Moist, Cold and Dry. Again, every distemper is the fault of one simple and single quality, as an inflammation; or hath some vicious humors joined with it, as a Phlegmon: Again, a Distemperature is either equal, as in a *Sphacele*; or unequal, as in a *Phlegmon*, beginning or increasing. — A Distemperature.

Ill Conformity is a fault of the organicall parts, whose composure is thereby depraved. This hath four kinds; the first is, when the figure of the part is faulty, either by nature or accident, or some cavitie abolished; as if a part which nature would have hollow for some certain use, do grow or close up: Or lastly, if they be rough, or smooth otherwise than they should, as if that part which should be rough, be smooth, or the contrary. Another is in the magnitude of the part increased, or diminished contrary to nature. The third is in the number of the parts increased or diminished; as if a hand have but four or else six fingers. The fourth is in the site and mutuall connexion of the parts; as if the parts which should be naturally united and continued be pluckt asunder, as happens in Luxations; or the contrary. The third generall kind of disease, is the solution of continuity, a Disease common both to the similar and organicall parts, acquiring diversity of names, according to the variety of the parts in which it resides. — Ill Conformation. — Solution of Continuity.

CHAP. XXI.

Of a Symptome.

WE do not in this place take the word Symptome in the most generall acceptation, for every change or accident which happens to man besides his own nature; but more reservedly and specially, only for that change which the disease brings, and which follows the disease, as a shadow doth the body. — What a Symptome is.

There be three kindes of a Symptome properly taken. The first is, when the action is hurt; I say hurt, because it is either abolished, weakned, or depraved; so blindness is a deprivation or abolishing of the action of seeing; dulness of sight, is a diminution or weakning thereof; and a suffusion, such as happens at the beginning of a Cataract, when they think flies, hares, and such like bodies fly to and fro before their eys, is a depravation of the sight. — Three kinds thereof.

The second is a simple affect of the body, and a full fault of the habit thereof being changed, happening by the mutation of some qualities: such is the changing of the native colour into a red by a Phlegmon, and into a livid and black by a Gangrene; such is the filthy stench the nose affected with a *Polypus* sends forth; the bitter taste, in such as have the Jaundise; and the rough and rugged skin in them which are Leprous.

The third is the fault of the overmuch retention of excrements which should be expelled, and expulsion of such as should be retained; for the evacuation of an humor profitable both in quantity and quality, is against nature, as bleeding in a body not full of ill Humors, nor Plethorick; and also the retention of things hurtfull in substance, quantity and quality, as the Courses in women, the urine, and the stone in the bladder.

CHAP.

CHAP. XXII.

of Indications.

What Indication is.

THe knowledg and exerciſe of Indications befits that Chirurgeon, whom no blind raſhneſs of fortune, but reaſon; no chance, but counſell directs in the undertaking and performing the works of his Art. For an Indication is a certain ſafe and ſhort way, which leads the Phyſitian, as by the hand, to the attainment of his purpoſed end, of preſerving the ſound, or curing the ſick.

See *Method.* Cap. 7. *Lib. de opt. ſecta*, Cap. 11.

For *Galen* doth define an Indication to be a certain inſinuation of what is to be done, or a quick and judicious apprehenſion of that which may profit or hurt. And as Faulconers, Mariners, Plowmen, Souldiers, and all manner of Artizens, have their peculiar terms and words, which are neither known, nor uſed by the vulgar; ſo this word Indication is proper and peculiar to Phyſitians and Chirurgeons, as a Term of Art not vulgar; by conſideration of which, as by ſome ſign, or ſecret token, they are admoniſhed what is to to be done to reſtore health, or repell an imminent danger.

The kinds of Indications.

There are three prime and principall kinds of Indications, every of which is ſubdivided into many other. The firſt is from things naturall. The ſecond from thoſe things which are termed not naturall. The third from thoſe things which are contrary to nature. Things naturall ſhew they muſt be preſerved by their like, and in the compaſs of theſe are contained all the Indications which are drawn from the nature of the Patient, that is, from his ſtrength, temper, age, ſex, habit, cuſtome, diet.

Things not naturall may be doubted as uncertain, for one while they indicate the ſame things with things naturall, that is, they coindicate with the ſtrength, temper and the reſt; otherwhiles they conſent with things againſt nature, that is, they coindicate with the diſeaſe. Wherefore *Galen* when he ſaith, that Indications are drawn from three things; The diſeaſe, the nature of the Patient, and the encompaſſing air; by propoſing the familiar example of the air, he would have us to underſtand the other things not naturall; becauſe we may ſhun or imbrace them more or leſs as we will our ſelves, but we muſt, whether we will or no, endure the preſent ſtate of the air. Therefore the air indicates ſomething to us, or rather coindicates; for if it nouriſh the diſeaſe, as conſpiring with it, it will indicate the ſame that the diſeaſe, that is, that it muſt be preſerved in the ſame ſtate.

Lib. 9. Method. cap. 9.

Indications drawn from things naturall.

Things contrary to nature indicate they muſt be taken away by their contraries; therefore that we may more accurately and fully handle all the Indications drawn from things naturall, we muſt note, that ſome of theſe are concerning the ſtrength of the Patient, by care to preſerve which, we are often compelled for a time to forſake the cure of the proper diſeaſe: for ſo a great ſhaking happening at the beginning of an ague or feaver, we are often forced to give ſuſtenance to the Patient, to ſtrengthen the powers ſhaken by the vehemency of the ſhaking, which thing notwithſtanding lengthens both the generall and particular fits of the ague. Other pertain to the temper, other reſpect the habit, if the Patient be ſlender, if fat, if well fleſht, if of a rare, or denſe conſtitution of body. Other reſpect the condition of the part affected in ſubſtance, conſiſtence, ſoftneſs, hardneſs, quick or dull ſenſe, form, figure, magnitude, ſite, connexion, principality, ſervice, function and uſe. From all theſe, as from notes, the skilfull Chirurgeon will draw Indications according to the time and part affected: for the ſame things are not fit for ſore eyes, which were convenient for the ears, neither doth the phlegmon in the jaws and throat admit the ſame form of cure, as it doth in other parts of the body. For none can there outwardly apply repercuſſives, without preſent danger of ſuffocation. So there is no uſe of repercuſſives in defluxions of thoſe parts which in ſite are neer the principall. Neither muſt thou cure a wounded Nerve and Muſcle, after one manner. The temperature of a part, as Moiſture, alwayes indicates its preſervation, although the diſeaſe be moiſt, and give Indication of drying, as an ulcer. The principality of a part alwayes inſinuates an Indication of aſtringent things, although the diſeaſe require diſſolving, as an Obſtruction of the Liver; for otherwiſe unleſs you mix aſtringent things with diſſiolving, you will ſo diſſolve the ſtrength of the part, that hereafter it cannot ſuffice for ſanguification. If the texture of a part be rare, it ſhews it is leſs apt, or prone to obſtruction; if denſe, it is more obnoxious to that diſeaſe, hence it is that the Liver is oftener obſtructed than the Spleen. If the part be ſituate more deep, or remote, it indicates the medicines muſt be more vigorous and liquid, that they may ſend their force ſo far. The ſenſibleneſs, or quick-ſenſe of the part, gives Indication of milder medicines, than peradventure the ſigns, or notes of a great diſeaſe require. For the Phyſitian which applies things equally ſharp to the Horny tunicle of the eye being ulcerated, and to the Leg, muſt need be counted either cruell, or ignorant. Each ſex and Age hath its Indications, for ſome diſeaſes are curable in youth, which we muſt not hope to cure in old age; for hoarſneſs and great diſtillations in very old men, admit no digeſtion, as *Hippocrates* ſaith.

What the conditions of the parts affected do indicate.

Indications from the ages.

Aphor. 40. li. 2.

Nunquam

Nunquam decrepitus Branchum coquit, atque Coryzam.
The feeble Sire, for age that hardly goes,
Ne're well digests the hurtfull Rheume or poſe.

Moreover according to his decree the diſeaſes of the Reins, and whatſoever pains moleſt the bladder, are difficultly healed in old men; and alſo reaſon perſwades that a Quartain admits no cure in Winter, and ſcarce a Quotidian; and ulcers in like manner are more hard to heal in Winter; that hence we may underſtand certain Indications to be drawn from time; and to increaſe the credit of the variety and certainty of Indications, ſome certaine time, and ſeaſons in thoſe times command us to make choiſe of medicines; for as *Hippocrates* teſtifies; *Aphor. 6 ſect. 6.* *Aphor. 5 ſect. 4.*

Ad Canis ardorem facilis purgatio non eſt:
In Dogdayes heat it is not good,
By purging for to cleanſe the blood.

Neither ſhalt thou ſo well preſcribe a ſlender diet in Winter, as in the Spring, for the air hath its Indications. For experience teaches us, that wounds of the head are far more difficultly and hardly cured, at *Rome*, *Naples*, and *Rochell* in *Xantoigne*. But the times of diſeaſes yeeld the principall Indications, for ſome Medicines are only to be uſed at the beginning and end of diſeaſes, others at the increaſe and vigour of the diſeaſe. Wee muſt not contemn thoſe Indications which are drawn from the vocation of life, and manner of Diet; for you muſt otherwiſe deal with the painfull Husbandman (when he is your Patient) which leads his life ſparingly and hardly, than with the Citizen who lives daintily and idlely. To this manner of life and Diet may be referred a certain ſecret and occult property, by which many are not only ready to vomit at eating of ſome meats, but tremble over all their bodies when they hear them but ſpoken of. I knew a prime Nobleman of the *French* Nobility, who was ſo perplext at the ſerving in of an Eel to the Table, at the midſt of dinner and amongſt his friends, that he fell into a ſwound, all his powers failing him. *Galen* in his book *de Conſuetudine* tells that *Arius* the *Peripatetick* died ſodainly, becauſe compelled by the advice of thoſe Phyſitians he uſed, he drank a great draught of cold water in the intolerable heat of a Feaver. For no reaſon, ſaith *Galen*, than that, becauſe he knowing he had naturally a cold ſtomach from his childhood, perpetually abſtained from cold water. From our diet. Hatred ariſing from ſecret properties.

For as much as belongs to Indications taken from things againſt nature; the length and depth of a wound or ulcer indicates one way; the figure cornered, round, equall and ſmooth, unequall and rough, with a hollowneſs ſtraight or winding, indicate otherwiſe; the ſite right, left, upper, lower in another manner, and otherwiſe the force and violence of antecedent and conjunct cauſes. For oftentimes the condition of the cauſe indicates contrary to the diſeaſe, as when abundance of cold and groſs humors cauſe and nouriſh a Feaver. So alſo a Symptome often indicates contrary to the diſeaſe, in which contradiction, that Indication muſt be moſt eſteemed, which doth moſt urge; as for example ſake, if ſwounding happen in a Feaver, the feaverish burning ſhall not hinder us from giving wine to the Patient. Indications taken from things againſt nature.

Wherefore theſe Indications are the principalleſt and moſt noble which lead us, as by the hand, to doe theſe things which pertain to the cure, prevention and mitigating of diſeaſes. But if any object, that ſo curious a ſearch of ſo many Indications is to no purpoſe, becauſe there are many Chirurgeons, which ſetting only one before their eyes, which is drawn from the Eſſence of the diſeaſe, have the report and fame of skilfull Chirurgeons, in the opinion of the vulgar; But let him know that it doth not therefore follow, that this indication is ſufficient for the cure of all diſeaſes; for we do not alwayes follow that which the Eſſence of the diſeaſe doth indicate to be done. But chiefly then, where none of the forerecited Indications doth reſiſt or gainſay; you may underſtand this by the example of a *Plethora*, which by the Indication drawn from the Eſſence of the thing requires Phlebotomy; yet who is it, that will draw blood from a child of three months old? Beſides, ſuch an Indication is not artificiall but common to the Chirurgeon with the common people. For who is it that is ignorant, that contraries are the remedies of contraries? and that broken bones muſt be united by joyning them together? but how it muſt be performed and done, this is of Art and peculiar to a Chirurgeon, and not known to the vulgar. Which the Indications drawn from thoſe fountains we pointed at before, aboundantly teaches, which, as by certain limits of circumſtances, encompaſs the Indication which is taken from the Eſſence of the diſeaſe, leſt any ſhould think, we muſt truſt to that only. For there is ſome great and principall matter in it, but not all. For ſo the meaneſt of the common people is not ignorant, that the ſolution of continuity is to be cured by repairing that which is loſt. But in what parts we may hope for reſtitution of the loſt ſubſtance, and in which not, is the part of a skilfull Chirurgeon to know and pronounce. Wherefore he will not vainly beſtow his We do not alwayes follow the Indication which is from the diſeaſe. In what parts we cannot hope for reſtoring of ſolution of continuity

labour

labor to cure the nervous part of the *Diaphragma*, or Midriffe being wounded, or the Heart, ſmall Guts, Lungs, Liver, Stomach, Brain or Bladder; and that I may ſpeak in a word, Empericks are not much more skilfull than the common people, although they do ſo much extoll themſelves above others by the name of experience. For although experience be another inſtrument to find out things with reaſon, yet without reaſon, it will never teach, what the ſubſtance of the part in which the diſeaſe lies, may be; or what the action, uſe, ſite, connexion, from whence ſpeciall and proper Indications are drawn; With which the Chirurgeon being provided and inſtructed ſhall not only know by what means to find out a remedy, but alſo, leſt he may ſeem to mock any with vain promiſes, he ſhall diſcern what diſeaſes are uncurable, and therefore not to be medled withall.

Experience without reaſon is like a blind man without a guide.

But implicit or intricate diſeaſes require each to be cured in their ſeverall order, except ſome one of them be deſperate, or ſo urge & preſs that the Phyſitian think it neceſſary after prepoſterous order, to begin with it, although often he be forced to make ſome one of theſe diſeaſes incurable, or give occaſion of cauſing ſome new one: into which ſtraits we are neceſſarily compelled to fall, when, (for example) we determine to pull, or take away ſome extraneous body; for the performance whereof we are compelled to inlarge the wound. So we are forced by neceſſity to open the neck of the bladder, (that ſo we may draw forth the ſtone therein contained) with a wound which often degenerates into an uncurable Fiſtula. For that diſeaſe which threatens danger of preſent death is of ſuch moment, that to ſhun that it may be counted a ſmall matter, and commodious for the ſick to bring in other diſeaſes, though uncurable. For if a convulſion happen by pricking a Nerve, which we cannot heal by any remedies, then by cutting the Nerve aſunder we end the convulſion, but deprive the part into which that Nerve did goe, of the uſe of ſome voluntary motion. So if in any great joynt there happen a Luxation with a wound, becauſe there is danger of convulſion by trying to reſtore and ſet right the luxated part, we are forc'd for ſhunning thereof, to attend the wound only, and in the mean time to let alone the Luxation. Otherwiſe in implicit diſeaſes if there be nothing which may urge, or call us from the ordinary cure, we muſt obſerve this order, that beginning with that affect, which hinders the cure of the principall diſeaſe, we proſecute the reſt in the ſame and their proper order, untill all the diſeaſes being overcome we ſhall reſtore the part affected to its integrity. Therefore let us take for an example, an ulcer in the Leg, a *Varix* (or big ſwollen vein) and a Phlegmonous tumor round about it; and laſtly, a body wholly plethorick and filled with ill humors; order and reaſon require this, that uſing the adviſe of ſome learned Phyſitian we preſcribe a convenient diet, and by what means we may, bring him to an equality by purging and blood-letting, and then we will ſcarifie in divers places the part where it is moſt ſwollen, then preſently apply Leeches, that ſo we may free it from the burden of the conjunct matter; then uſe Cauteries to help the corruption of the bone, and in the mean time change the circular figure of the ulcer into an ovall, or triangular; then at the length we will undertake the cutting of the *Varix*, and cure the ulcer which remains according to Art, and ſo at the length cicatrize it. In all this whole time the Patient ſhall neither walk, nor ſtand, nor ſit, but ly quietly, having his Leg orderly and decently rowled up. But if (as it often happens) the temper of the hurt part, be different from the temper of the whole body, the manner of curing muſt be ſo tempered, that we increaſe the doſis of hot or cold medicines, according to the ratable proportion of the indications requiring this or that, therefore imagine the part ulcerated to be ſuch, as that it is two degrees dryer than the juſt temper, but the whole body to exceed the ſame temper in one degree of humidity: reaſon and Art will require, that the medicin applyed to the ulcer be dryer by one degree than that which the part would otherwiſe require if it were temperate; but on the contrary let us ſuppoſe thus: the whole body to be one degree more moiſt then the temper requires, and the ulcerated part to be one degree dryer: truly in this caſe the medicine that is applyed to the ulcer by reaſon of the part it ſelf, ſhall not be increaſed in dryneſs, but wholly compoſed and tempered to the Indication of the ulcer, becauſe the force of the moiſture exceeding in the like degree, doth counterpoiſe the ſuperfluous degree of dryneſs. But it is more eaſie by an artificiall conjecture to determine of all ſuch things, than by any rules or precepts.

Indications in implicit diſeaſes.

An example of Indications in implicit diſeaſes.

What we muſt do when the temper of the part is different from the temper of the whole body.

An artificiall conjecture is of much force in Indications.

To theſe ſo many and various Indications, I think good to add two other, the one from ſimilitude; the other of a certain crafty deviſe, & as the latter Phyſitians term it, of a certain ſubtile ſtratagem. We draw Indication from ſimilitude, in diſeaſes which newly ſpring up and ariſe, as which cannot be cured by Indications drawn from their contraries, as long as their Eſſence is unknown and hid; wherefore they think it neceſſary to cure them by a way and Art like thoſe diſeaſes, with which they ſeem to have an agreeing ſimilitude of Symptomes and Accidents; Our Anceſtors did the ſame in curing the French Pocks, at the firſt beginning thereof, as long as they aſſimilated the cure to that of the Leproſie, by reaſon of that affinity, which both the diſeaſes ſeem to have. But we follow crafty devices and ſubtile counſels, when the Eſſence of the diſeaſe we meet, with is wholly ſecret and hid, either becauſe it is altogether of a hidden and ſecret nature, and which cannot be unfolded by manifeſt qualities, or elſe reſides in a ſubject which is not ſufficiently known to us, nor of a phyſicall contemplation, as the Mind. For then we being deſtitute of Indications taken

Indication from ſimilitude.

Indication of a ſubtile device.

from

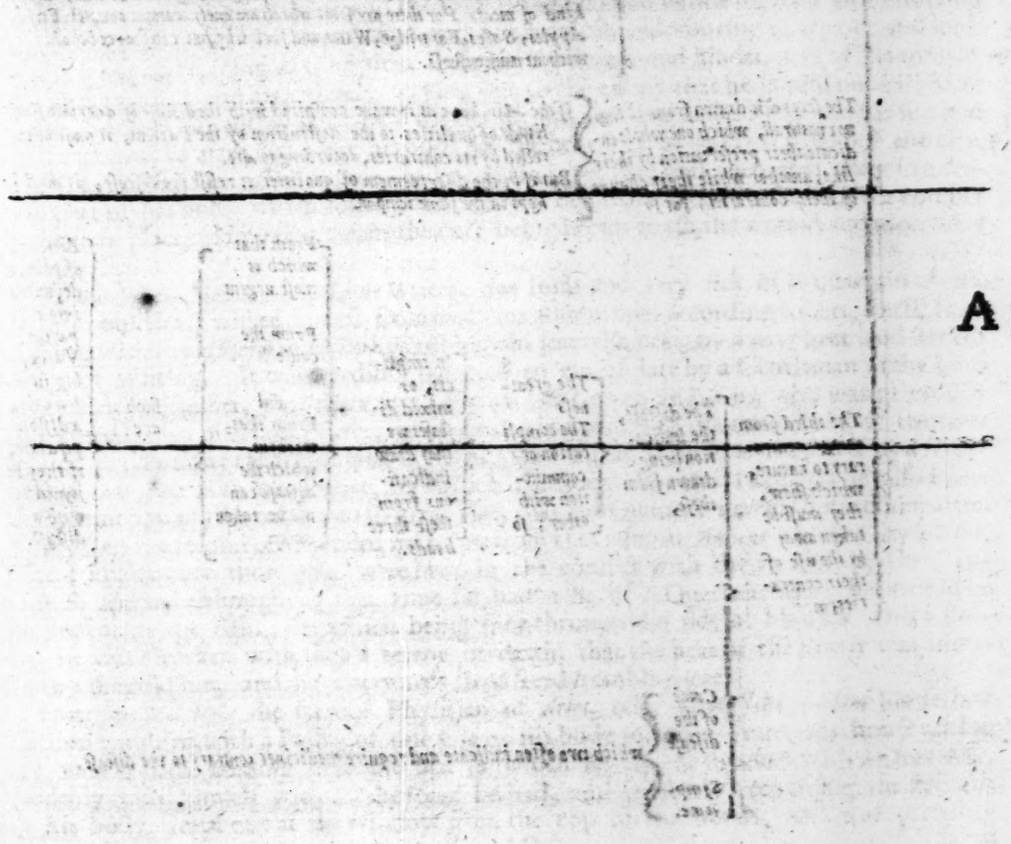
from the nature of the thing, are compelled to turn our cogitations to impostures and crafty counsels; and they say this Art and Craft is of chief use in Melancholy affects and fictions, which are often more monstrous and deformed than the *Chimæra* so much mentioned in the fables of the Ancients; to which purpose, I will not think much to recite two Examples. A certain man troubled with a Melancholick disease, I know not by what errour of opinion, had strongly perswaded himself that he was without a head; the Physitians omitted nothing, by which they might hope to take this mad opinion out of his mind. But when they had in vain tryed all medicines, at length they devised this crafty, but profitable device, they fastened and put upon his head a most heavy helmet, that so by the pain and trouble of his head nodding and drawn down by that weight, he might be admonished of his error. Examples.

It is reported, another molested by the obscurity and darkness of the same disease, did verily beleeve, that he had horns upon his head; neither could he be drawn or diverted from that absurd and monstrous opinion, until that binding up his eyes, they miserably bruised and scratched his forehead with the bony roughness of the lower parts of an oxes horns, that so he begun to believe by the painfull drawing of the blood that ran down his face, that those bloody horns were forcibly plucked from him. Ingenious Chirurgeons in imitation of these examples may in like cases do the like. For that case requires a man of a quick apprehension and advice, who may give manifest proof of his diligence and skill by medicinall stratagems, as who forthwith can politickly devise stratagems of divers sorts. A Physitian should be of a quick apprehension.

But, now coming to the end of this our tract of Indications, we must chiefly and principally observe; That of Indications some are indicative; which absolutely and of themselves command this to be done; other conindicative, which indicate the same with the Indicative, and joyntly shew it to be done, but in some sort secondarily and not primitively; some are repugnant, which of themselves and their own nature perswade quite contrary to that the indicative primitively did perswade us; other correpugnant, which give their voice after the same form and manner with the repugnant against the indicative, as the coindicative consent to and maintain them. Let this serve for an example of them all. Indications indicative. Coindicative. Repugnant. Correpugnant.

A *Plethora*, or plenitude of humors of its own nature, requires and indicates bloodletting, the Spring time perswades and coindicates the same, but to this counsell is quite opposite and repugnant, a weak faculty, and childhood is correpugnant.

Wherefore these four must be diligently weighed and considered when we deliberate what is to be done, and we must rather follow that which the indicative, or repugnant shew and declare, as what the diseases and strength of the Patient require, than that which the coindicative, or correpugnant shall perswade, because they have a weaker and but secondary power of indicating, and not essentiall & primitive. But because the kinds of Indications are so many and divers, therefore that the knowledge of them may be more perspicuous and less confused, I have thought good to describe and distinguish them by this following scheme:



A Table of Indications.

An Indication is a certain plain and compendious way which leads the Chirurgeon to a certain, determinate and proposed end for the cure of the present diseases, of which there are three kinds.

The first is drawn from things naturall which indicate their preservation by their like, of this kind are many other which are drawn, either

- From the strength and faculties of the patient. — For whose preservation, oftentimes the proper cure of the disease must be neglected; for where these fail, it is impossible the Chirurgeon should perform what he desires and expects.
- From the temperament, as if the Patient shall be — Sanguine, Cholerick, Flegmatick, Melancholick. — Of preservation of which the Chirurgeon must have care, and if they swarve from equality, to reduce them to that which formerly they naturally were.
- From the habit of the body, as the patient shall be — Dainy and delicate. Slender and weak. Low of stature. Rare, or else dense and compact.
- From the native condition of the hurt or affected part, in which we consider, either
  - The substance thereof, as for as much as it is similar, we consider whether it be hot, cold, moist, dry, or as it is organicall, and then whether it be a principall and noble part, or a subordinate and ignoble part.
  - Or the sense, whether quick, or dull, by reason whereof the eye cannot endure such sharpe and acrid medicines, as simple flesh can.
  - Or the form, figure, magnitude, number, site, connexion, action, use.
- From the Age, for each age yeelds his peculiar Indications, hence you may observe most diseases to be incurable in old men, which are easily cured in young, others which in youth admit of no cure, unless by the change of age and the ensuing temperament.
- From Sex, for medicines work upon women far more easily than upon men.
- From the time of the year, for some meats and medicines are fit in Winter, some in Summer.
- From the Region, for as there are diversities of situations and habits of places, so also there are motions of humors, and manners of diseases: hence it is that wounds on the head at Paris, and sore shins at Avignion are more difficult to be cured.
- From the times of diseases, for some things in the beginning, others in the increase, state and declining of the disease, are more convenient.
- From the manner of diet, for this, as the proper temper, must be preserved. Wherefore such must be fed otherwise who live daintily, than those who lead their lives sparingly and hardly. Hereunto add certain peculiar natures, which by a certain hidden property are offended at this, or that kind of meat. For there are some which not onely cannot concoct Fitsen, Apples, Soles, Partridge, Water and such like, but can scarce behold them without nauseousness.

The second is drawn from things not naturall, which one while indicate their preservation by their like, another while their change by their contraries; for so

- If the Air, have as it were conspired with the disease by a certain similitude of qualities to the destruction of the Patient, it must be corrected by its contraries, according to Art.
- But if by the disagreement of qualities it resist the disease, it must be kept in the same temper.

The third from things contrary to nature, which shew, they must be taken away by the use of their contraries, as

The disease, the Indication being drawn from these,

The greatness / The complication or commixtion with other; so

In implicit, or mixed diseases we may draw Indications from these three heads.

From that which is most urgent / From the cause / and From that, without which the disease cannot be taken away:

such are

Bitterness of pain, a defluxion into a part, a Varix, or big swollen vein, a distemperature, if they be joyned with a disease.

Cause of the disease / Symptome, — which two often indicate and require medicines contrary to the disease.

CHAP. XXIII.

Of certain wonderfull and extravagant ways of curing Diſeaſes.

AS monſters ſometimes happen in nature, ſo alſo in diſeaſes, and in the events and cures of diſeaſes. I underſtand by monſters certain marvailous ſucceſſes in diſeaſes, or certain ways of curing them, which ſwerve from Art, and happen beſides reaſon, nature, and common uſe. Monſtrous diſeaſes.

Alexander ab Alexandro, and *Peter Gilius* tell, that in *Apulia* a part of *Italy* they have a certain kind of Spider very frequent; the natives call it *Tarantula*, *Petrus Rhodius* cals it *Phalangium*; The inhabitants find theſe Spiders in the firſt heat of Summer ſo venenate and deadly, that whomſoever they touch with their virulent biting, he preſently, without he have ſpeedy remedy, deprived of all ſenſe and motion fals down, or certainly if he eſcape the danger of death, he leads the remnant of his life in madneſs. Experience hath found a remedy by Muſick for this ſo ſpeedy and deadly a diſeaſe: Wherefore as ſoon as they can they fetch Fidlers and Pipers of divers kinds, who by playing and piping may make muſick; at the hearing whereof, he which was fallen down by reaſon of the venemous bite, riſes cheerfully, and dances ſo long to their meaſures and tunes, untill by the painfull and continued ſhaking and agitation of the whole body, all the malignity is diſſipated by tranſpiration and ſweats. The wonderfull force of the bite of a certain Spider. Muſick the remedy thereof.

Alexander adds, that it happened once in his ſight, that the Muſicians their wind and hands failing them ceaſed playing, and then the Dancer preſently fell down as if he had been dead; but by and by the Muſick beginning anew, he riſe up again and continued his dancing till the perfect diſſipation of the venome. And that it hath happened beſides, that one not ſo perfectly healed, certain reliques of the diſeaſe yet remaining, when a long time after he heard by chance a noiſe of Muſicians, he preſently fell a leaping and dancing, neither could he be made to leave before he was perfectly cured.

Some affirm according to the opinion of *Aſclepiades*, that ſuch as are frantick are much helped with a ſweet and muſicall harmony. *Theophraſtus* and *Aulus Gellius* ſay, that the pain of the Gout and Sciatica are taken away by Muſick. And the ſacred Scripture teſtifies, that *David* was wont by the ſweet ſound of the Harp to refreſh and eaſe king *Saul* when he was miſerably tormented by his evil ſpirit. *Herodotus* in *Clio* tels, that *Cræſus* the king of *Lydia* had a Son, which of a long time could not ſpeak, and when he came to mans eſtate was accounted dumb: but when an enemy with his drawn ſword invaded his father (overcome in a great fight, and the City being taken in which he was) not knowing that he was the King, the young man opened his mouth endevouring to cry out, and with that ſtriving and forcing of the Spirit, he broke the bonds and hinderances of his tongue, and ſpoke plainly and articulately, crying out to the enemy that he ſhould not kill King *Cræſus*. So both the enemy with-held his ſword, and the king had his life, and his ſon had his ſpeech always after. *Plutarch* in his book, Of the benefit to be received from our enemies, tels, That a *Theſſalian* called *Proteus*, had a certain inveterate and incurable Ulcer in a certain part of his body, which could not be healed, before he received a wound in a conflict in the ſame place, and by that means the cure being begun afreſh, the wound and ulcer were both healed. Muſick gives eaſe to pain. A ſtrong perturbation of the mind helps by moving the ſpirits.

Quintus Fabius Maximus, as *Livie* writes, was long and very ſick of a quartain Agüe, neither could have wiſhed ſucceſs from medicins adminiſtred according to Art, untill ſkirmiſhing with the *Allobroges*, he ſhaked off his old feaveriſh heat, by a new heat and ardent deſire of fighting. It was credibly reported to me of late by a Gentleman of the Lord of *Lanſackes* Chamber, that there was a French Gentleman in *Polonia*, who was grievouſly tormented with a quartain Feaver, who on a time walking upon the bank of the river *Wixell*, to take away the irkſomneſs of his fit, was thruſt in jeſt into the River by a friend of his that met him by chance, by which (although he could ſwim, as he alſo knew that thruſt him in) he conceived ſo great fear, that the Quartain never troubled him after. King *Henry* the ſecond commanded me to go from the Camp at *Amiens* to the City *Dorlan*, that I might cure thoſe that were hurt in the conflict with the Spaniards, the Captain *S. Arbin*, although at that time he had a fit of a Quartain ague, yet would he be preſent at the fight, in which being ſhot through the ſide of his neck with a Bullet, he was ſtrucken with ſuch a terror of death, that the heat of the Feaver was aſſwaged by the cold fear, and he afterwards lived freed from his Ague. Chance ſometimes exceeds Art.

Franciſcus Valeriola the famous Phyſitian of *Arles*, tels, That *John Berlam* his fellow Citizen troubled with a Palſey of one ſide of his body for many years, his houſe taking fire, and the flame coming near the bed in which he lay, he ſtrucken with a great fear, ſuddenly raiſed himſelf with all the force he had, and preſently recovering the ſtrength of his body, leaps out at the window from the top of the houſe, and was preſently *Obſerv. 4. lib. 2.*

cured of his diſeaſe, ſenſe and motion being reſtored to the part, ſo that afterward he went upright without any ſenſe of pain, who lay unmovable for many yeers before. He tells the like in the ſame place of his couſen *John Sobiratius*; hee was a long time lame at *Avignion*, by reaſon that the Nerves of his hams were ſhrunk and drawn up, ſo that he could not go; being moved with a vehement and ſodain paſſion of anger againſt one of his ſervants whom hee endevoured to beat, he ſo ſtirred his body that forthwith the Nerves of his hams being diſtended and his knees made pliant he began to go and ſtand upright without any ſenſe of pain, when he had been crooked about the ſpace of ſix years before, and all his life after he remained ſound.

Cap ult. lib. de cur. rat per ſanguinis miſs.

Galen tels he was once fetched to ſtanch the bleeding, for one who had an Artery cut neer his Anckle, and that by his means he was cured without any danger of an *Aneuriſma* (i) a relaxation of a veinous veſſell; and beſides by that accidentall wound he was freed from moſt grievous pain of his hip, with which he was tormented four yeers before: but although this eaſing of the pain of the Sciatica happened according to reaſon by the evacuation of the conjunct matter, by the artery of the anckle of the ſame ſide being opened; yet becauſe it was not cut for this purpoſe, but happened only by chance, I judged it was not much diſſenting from this argument.

Galen by a dream cures the *Sciatica*.

Pliny writes that there was one named *Phalereus*, which caſting up blood at his mouth, and at the length medicines nothing availing, being weary of his life, went unarmed in the front of the battell againſt the enemy, and there receiving a wound in his breaſt, ſhed a great quantity of blood, which gave an end to his ſpitting of blood, the wound being healed, and the vein which could not contain the blood being condenſate.

At *Paris*, *Anno* 1572. in *July*, a certain Gentleman being of a modeſt and curteous carlage fell into a continuall Feaver, and by that means became Frantick, moved with the violence of which he caſt himſelf headlong out of a window two ſtories high, and fell firſt upon the ſhoulder of *Vaterra* the Duke of *Alenzons* Phyſitian, and then upon the pavement; with which fall he cruelly bruiſed his ribs and hip, but was reſtored to his former judgment and reaſon. There were preſent with the Patient beſides *Valterra*, witneſſes of this accident theſe Phyſitians, *Alexis*, *Magnus*, *Duretus*, and *Martinus*. The ſame happened in the like diſeaſe, and by the like chance to a certain *Gaſcoyn* lying at the houſe of *Agrippa* in the Paved ſtreet.

Othomannus Doctor of Phyſick of *Mompelier* and the Kings Profeſſor, told me that a certain Carpenter at *Broquer* a village in *Switzerland*, being frantick caſt himſelf headlong out of an high window into a river, and being taken out of the water was preſently reſtored to his underſtanding.

The cauſe of the laſt recited cures.

But if we may convert caſualties into counſel and Art, I would not caſt the Patient headlong out of a window. But would rather caſt them ſodainly and thinking of no ſuch thing into a great ciſtern filled with cold water; with their heads foremoſt, neither would I take them out untill they had drunk a good quantity of water, that by that ſodain fall and ſtrong fear, the matter cauſing the Frenzy might be carryed from above downwards, from the noble parts to the ignoble; the poſſibility of which is manifeſt by the forecited examples, as alſo by the example of ſuch as bit by a mad Dog, fearing the water are often ducked into it to cure them.

CHAP. XXIV.

Of certain juggling and deceitfull wayes of Curing.

HEre I determine to treat of thoſe Impoſtors, who taking upon them the perſon of a Chirurgeon, do by any means either right or wrong, put themſelves upon the works of the Art; but they principally boaſt themſelves amongſt the ignorant common ſort, of ſetting bones which are out of joint and broken, affirming as falſly as impudently, that they have the knowledg of thoſe things from their Anceſtors;

Sciences are not hereditary.

as by a certain hereditary right; which is a moſt ridiculous fiction; for our minds when we are born, is as a ſmooth table, upon which nothing is painted. Otherwiſe what need we take ſuch labour and pains to acquire and exerciſe ſciences? God hath endued all brute beaſts with an inbred knowledg of certain things neceſſary for to preſerve their life, more than man.

But on the contrary he hath enriched him with a wit furniſhed with incredible celerity and judgment, by whoſe diligent and laborious agitation he ſubjects all things to his knowledg. For it is no more likely, that any man ſhould have skill in Chirurgery becauſe his father was a Chirurgeon, than that one who never endured ſweat, duſt nor Sun in the field, ſhould know how to ride and govern a great horſe, and know how to

carry

carry away the credit in tilting, only becauſe he was begot by a Gentleman and one famous in the Art of War.

There is another ſort of Impoſtors far more pernicious and leſs ſufferable, boldly and inſolently promiſing to reſtore to their proper unity and ſeat, bones which are broken and out of joint, by the only murmuring of ſome conceited charms, ſo that they may but have the Patients name and his girdle. In which thing I cannot ſufficiently admire the idleneſs of our Country-men ſo eaſily crediting ſo great and pernicious an error; not obſerving the inviolable law of the ancient Phyſitians, and principally of Divine *Hippocrates*, by which it is determined, that three things are neceſſary to the ſetting of bones diſlocated and out of joynt; to draw the bones aſunder; to hold the bone receiving, firmly immoveable with a ſtrong and ſteddy hand; to put the bone to be received into the cavity of the receiving. For which purpoſe the diligence of the Ancients hath invented ſo many engines, Gloſſocomies and Bands, leſt that the hand ſhould not be ſufficient for that laborious work. What therefore is the madneſs of ſuch Impoſtors, to undertake to do that by words, which can ſcarce be done by the ſtrong hands of ſo many Servants, and by many artificiall engines?

A moſt impudent ſort of Impoſtors.

Three things neceſſary for the cure of a Luxation.

Of late years another kind of Impoſture hath ſprung up in *Germany*, they beat into fine powder a ſtone which in their mother tongue they call *Bembruch*, and give it in drink to any who have a bone broken, or diſlocated, and affirm that it is ſufficient to cure them. Through the ſame *Germany* there wander other Impoſtors who bid to bring to them the Weapons with which any is hurt; they lay up in a ſecret place and free from noiſe, and put and apply medicines to it, as if they had the patient to dreſs, and in the mean time they ſuffer him to go about his buſineſs, and impudently affirm that the wound heals by little and little by reaſon of the medicine applyed to the weapon.

But it is not likely that a thing inanimate which is deſtitute of all manner of ſenſe, ſhould feel the effect of any medicine; and leſs probable by much, that the wounded party ſhould receive any benefit from thence. Neither if any ſhould let me ſee the truth of ſuch juggling by the events themſelves and my own eyes, would I therefore beleeve that it were done naturally and by reaſon, but rather by charms and Magick.

In the laſt aſſault of the Caſtle of *Hiſdin* the Lord of *Martigues* the elder was ſhot through the breaſt with a Musket bullet. I had him in cure together with the Phyſitians, and Chirurgeons of the Emperour *Charles* the fift and *Emanuel Philibert* the Duke of Savoy, who becauſe he entirely loved the wounded priſoner, cauſed an aſſembly of Phyſitians and Chirurgeons to conſult of the beſt means for his cure. They all were of one opinion, that the wound was deadly and incurable, becauſe it paſſed through the midſt of his lungs, and beſides had caſt forth a great quantity of knotted blood into the hollowneſs of his breſt.

There was found at that time a certain *Spaniard*, a notable Knave, and one of thoſe Impoſtors, who would pawn his life, that he would make him ſound; wherefore this Honorable Perſonage being in this deſperate caſe was committed unto his care. Firſt of all hee bid they ſhould give him the Patients ſhirt, which he tore into ſhreds and peeces, which preſently framing into a Croſs, he laid upon the wounds whiſpering ſome conceived or coined words, with a low murmure. For all other things he wiſhed the Patient to reſt content, and to uſe what diet he pleaſed, for he would do that for him, which truly he did. For he eat nothing but a few prunes, and drunk nothing but ſmall beer, yet for all this the wounded Prince died within two days; the *Spaniard* ſlipt away, and ſo ſcaped hanging. And whileſt I opened the body in the ſight of the Phyſitians and Chirurgeons to embalm him, the ſigns and accidents of the wound did evidently and plainly appear to be as we had pronounced before.

And there be alſo other Jugling companions of this tribe, who promiſe to cure all wounds with lint, or Tents, either dry, or macerated in oyl or water, and bound to the wound, having murmured over ſome charm or other, who have had ſometimes good ſucceſs, as I can witneſs. But the wounds upon which tryall was made were ſimple ones, which only required union, or cloſing for to perfect the cure. So verily the bones of beaſts when they be broke, grow together by the only benefit of nature. But when the affect ſhal be compound by diverſity of Symptomes, as a wound with an ulcer, inflammation, contuſion and fracture of a bone, you muſt hope for no other from Tents or Lints, nor charms than death. Therefore the common ſort who commit themſelves to theſe Impoſtors to be cured do not only injure themſelves, but alſo hurt the Common-wealth, and the common profit of the Citizens; for whoſe good and juſtice ſake a prudent Magiſtrate ought to deprive Impoſtors of all freedome in a free and Chriſtian common-weal.

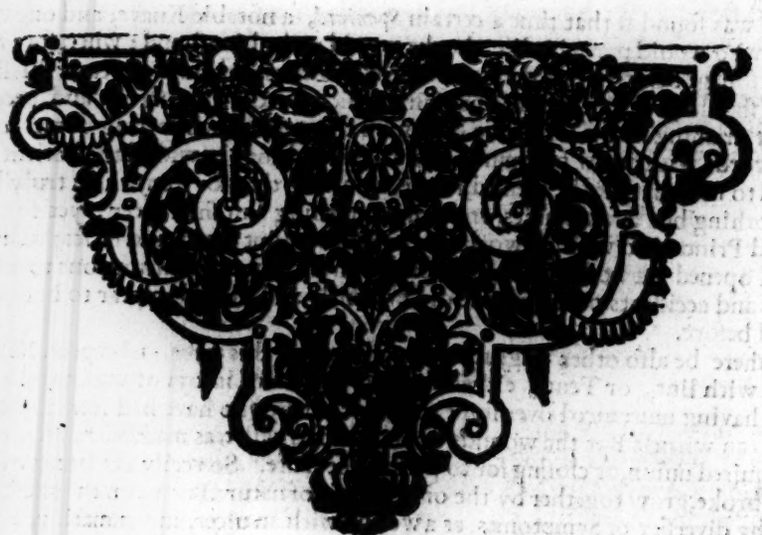
What wounds may be cured only by lint, or by teats and Water.

Witches, Conjurers, Diviners, Soothſayers, Magicians, and ſuch like, boaſt of curing many diſeaſes; but if they do or perform any thing in this kind, they do it all by ſleights, ſubtilties and forbidden Arts, as Charms, Conjurations, Witcheries, Characters, Knots, Magicall Ligatures, Rings, Images, Poyſons, laces tyed acroſs, and other damnable tricks, with which they pollute, pervert and defame the prime and ſacred Art of

Phyſick, and that with the danger of mens lives. Who certainly are to be baniſhed by the laws of our Countrey, eſpecially ſeeing it is decreed in *Moſes* law, *Let none be found among you that uſeth witchcraft*, or a regarder of times, or a marker of the flying of Fowls, or a Sorcerer, or a Charmer, or that counſelleth with Spirits, or a Soothſayer, or that asketh counſell at the dead; for all that do ſuch things, are abomination to the Lord, and becauſe of theſe abominations the Lord thy God doth caſt them out before thee. But the Miracles of our Lord Jeſus Chriſt the Son of God, and of his Saints and Apoſtles in curing diſeaſes beyond nature and all Art, are of another kind, which we ought to beleeve ſo firmly and conſtantly, that it ſhould be counted an impiety for a Chriſtian to doubt of them. All holy Writings are full of theſe; as to give ſight to the blinde, hearing to the deaf, power to go to thoſe ſick of the Palſie, to drive forth Devils, to cure the Leproſie, to give fruitfulneſs to women, to raiſe the Dead, and perform by the holy Ghoſt other Miracles which exceed the condition and law of Nature; whom here we earneſtly intreat to free and proteſt us from unclean Devils, and the ſpirits of diabolicall deceit, and to give us the mind that we may will and be able always to aſpire to Heaven, and faſten the hope, ſafety, and anchor of all our fortunes in God alone. *Amen.*

Deut. 18.

The End of the firſt Book.



The second Book, OF LIVING CREATVRES, And of the Excellency of MAN.

BEfore I come to speak of the Anatomy of Mans body, I have thought fit to say a little of the nature of brute Beasts. There is between Beasts a great deal of difference by nature; for of these, some are hardy and bold, others fearfull; some wilde and savage, others tame; some walking in herds, others wandring alone; some covered and defended with shels and scales, as the Crocodile, the Tortois, and many kinds of fish; others have stings and prickles. The difference of brute beasts.

The Horse hath his hard and strong hoofs, his crest (as being a generous beast) beset with a thick and harsh mane. The defence of the magnanimous Lion, are his teeth, his crooked paws and tail. Buls are formidable by their horns. The Boar by his tusks standing out, as it were naturall hunting spears. The Hare being a timerous creature, is naked and unarmed; but in recompence thereof Nature hath made her nimble and swift of foot. For what the more noble and courageous beasts have in arms, is supplyed in the fearfull by nimbleness and celerity. Infinite are the other endowments of brute beasts, and such as can hardly be imagined or described. For if we diligently search into their nature, we shall observe the impressions and shadows of many vertues, as of magnanimity, prudence, sortitude, clemency, and docility: for they entirely love one another, follow those things that are good, shun those that are hurtfull, and gather and lay up in store those things that are necessary for life and food. Lastly, they give undoubted presages of the weather and air. They have taught men many things, and are of a most exquisit and quick sense; of rare art in vocall musick, prudent and carefull for their young, and faithfull lovers of their native soil. They are religiously observant of the rights of friendship and chastity. They have their weapons whereby they are prepared, both to invade, and to defend themselves being invaded. They submit themselves to the discipline of man, practise and imitate his speech, and mutually prattle and chant one to another. They have a kind of weal-publick amongst themselves, and know how to preserve their present welfare, and to depell the contrary, being in this their own counsellors, and not tutored by man. Yea, man is beholden to them for the knowledg of many wholsome things. The consideration of which bred so great a doubt amongst the ancient Philosophers, that it was a question amongst them, whether beasts had use of reason, or no? Therefore also the wise *Solomon* sends us for examples of parsimony and diligence unto the Ant or Pismire; and *Esaias* in exprobration of the people of Israel for their ingratitude and rebellion against God, sends them to the Ox and Ass; for they do not only know, but reverence their masters. Some shadow of vertue in beasts.

But from whence is the knowledg of these Medicins, wherewith the Art of Physick is so richly adorned, but from brute beasts, as *Pliny* affirmeth? The infallible vertue of the herb *Dictamus*, in drawing darts out of the flesh, was taught us by the Hart, who wounded with the Huntsmans darts or arrows, by means hereof draws out the weapons which remain sticking in her. Which is likewise practised by the Goats of *Candie*, as *Aristotle* writeth. The wonderfull effect which *Celandine* hath upon the sight, was learnt by the practise of Swallows, who have been observed with it to have besmeared, and so strengthened the eys of their young. Serpents rub their ey-lids with fennell, and are thought by that means to quicken and restore the decaying sight of their eys. The Tortois doth defend and strengthen her self against the biting of Vipers, by eating of savorie. Bears by eating of Pismires, expell that poison that they have contracted by their use of Mandrakes. *Lib. 8. cap. 27.*

Mandrakes. And for correction of that drouzineſs and ſloth which growes upon them by their long ſleep in their dens, they eat the hearb of *Aron* (i.) Cuckopint. But the Art they uſe in the enticing and catching of Piſmires is very pretty, they go ſoftly to the holes or hils of the Piſmires, and there lay themſelves all their length upon the ground, as if they were dead, hanging out their tongue wet with their foam, which they draw not again into their mouth, before they feel them full of Piſmires, which are enticed by the ſweetneſs of the foam: And having taken this as a purging medicine, they expell by the guts, thoſe ill humors wherewith they were offended. We ſee that Dogs give themſelves a vomit, by eating a kind of graſs, which is from thence called Dog-graſs. Swine, when they find themſelves ſick, will hunt after ſmalt, or river lobſters. Stockdoves, Blackbirds, and Partridges, purge themſelves by Bay leaves. Pigeons, Turtles, and all ſort of Pullen, disburden themſelves of groſs humors, by taking of Pellitory of the wall. The bird Ibis (being not much unlike the Stork) taught us the uſe of Clyſters. For when he finds himſelf oppreſſed with a burden of hurtfull humors, he fills his bill with ſaltwater, and ſo purgeth himſelf by that part, by which the belly is beſt diſcharged. The invention of the way of removing the Cataract of the eye, we muſt yeeld unto the Goat, who by ſtriking by chance againſt the thorny buſhes, pulls off the Cataract which hinders the ſight, and covers the ball of the eye, and ſo recovers his ſight. The benefit of Phlebotomie, we owe unto the Hippotamus or River-horſe, being a kind of horſe, and the Inhabitant of the River *Nilus*; who being a great devourer, when he finds himſelf ſurcharged with a great deal of blood, doth by rubbing his thigh againſt the ſharp ſands on the bank ſide, open a vein, whereby the ſuperfluous blood is diſcharged, which he ſtoppeth likewiſe when it is fit, by rowling himſelf in the thick mud. The Tortois having chanced to eat any of the fleſh of a Serpent, doth make origanum and marjoram her Antidote. The Ancients found help from brute beaſts, even againſt the dreadfull and non-ſparing force of lightning; for they were of opinion that the wings of an Eagle were never ſtruck with lightning, and therefore they put about their heads little wreaths of theſe feathers. They were perſwaded the ſame thing of the Seal, or Sea-calf, and therefore were wont to encompaſs their bodies with his skin, as a moſt certain ſafeguard againſt lightening. It were a thing too long, and laborious, to ſpeak of all thoſe other muniments of life and health (obſerved here and there by *Ariſtotle* and *Plinie*) which we have learnt of brute beaſts. I will therefore end this Chapter, after that I have firſt added this; That we are beholding to beaſts not only for the skill of curing diſeaſes, and of preſervation of health, but for our food, our rayment, and the ornament and beautifying the bodies.

The craftineſs of Bears.

The bird Ibis the firſt inventer, or ſhewer of Clyſters.

The invention of removing a Cataract.

The invention of Phlebotomy.

A preſervative againſt thunder.

Of the Faculty of brute Beaſts in preſaging.

THe firſt knowledg and skill of Prognoſtication, and obſervation of weather by the Air, was firſt delivered unto us from beaſts of the land and water, and from fowl. For we ſee in dayly obſervation, that it is a ſign of change of weather, when Lambs and Rams do butt at one another with their horns, and playing wantonly do kick, and keep up their heels. The ſame is thought to be preſaged when the Oxe licks himſelf againſt the hair, and on the ſodain fils the Air with his lowing, and ſmels to the ground, and when he feeds more greedily than he uſed to do. But if the Piſmires in great multitudes fetch their prey ſo haſtily, that they run and tumble one upon another in their narrow paths, it is thought a ſign of rain; As is alſo the buſie working of Moals, and the Cats rubbing and ſtroaking of her head and neck, and above her ears, with the bottome of her feet. Alſo when Fiſhes play and leap a little above the water, it is taken for a ſign of rain. But if the Dolphins do the ſame in the ſea, and in great companies, it is thought to preſage a ſodain ſtorm and tempeſt. Whereby the Mariners forewarned, uſe all care poſſible for the ſafety of themſelves and their ſhips, and if they can caſt Anchor. And it is ſufficiently known what the louder croaking of Frogs than ordinary portends.

What the butting of Rams ſignifies.

Preſages of rain.

The ſign at ſea of a ſtorm at hand.

But the facultie of birds in this kind of preſaging is wonderfull. If Cranes flie through the air without noiſe, it is a ſign of fair weather, and of the contrary, if they make a great noiſe and flie ſtragglingly. As alſo if Sea fowl flie far from the Sea, and light on the land. The cry or ſcrieching of Owls portends a change of the preſent weather, whether foul or fair. *Plutarch* ſaith, that the loud cawing of the Crow betokens winds and ſhowers, as alſo when he flaps his ſide with his wings. Geeſe and Ducks, when they dive much, and order, and prune, and pick their feathers with their beaks, and cry to one another, foretell rain; and in like manner Swallows, when they flie ſo low about the water, that they wet themſelves, and their Wings. And the Wren, when he is obſerved to ſing more ſweetly than uſuall, and to hop up and down. And the Cock when he chants, or rather crows preſently after the ſetting of the Sun. And Gnats, and fleas, when they bite more than ordinary. If the Hern ſoar aloft into the air, it betokeneth fair weather, if on the contrary he flie cloſe by the watter, rain. If Pigeons come late home to the Dove-houſe, it is a ſign of rain. If Bats flie in the evening, they foreſhew wet weather. And laſtly the Crocodile layes her egs in that place, which muſt be the bounds of the overflowing of the River *Nilus*; And therefore he that firſt meets with

The Crocodile by laying her egs, ſhews the bounds of the increaſe of the River *Nilus*.

with theſe eggs, tels the reſt of the Countrey people, and ſhews them how high the flood will riſe, and what inundation it will make upon their grounds: A thing moſt worthy of admiration, that in this monſter there ſhould be that ſtrong faculty of preſaging.

Of the induſtry of Fiſhes.

MAny ſea-Fiſhes, when they feel a tempeſt coming, do gravell or balaſt themſelves, to the end they may not be toſſed up and down at the pleaſure of the waves. Others when the fury of the ſea is at the height, hide themſelves in the holes of rocks. But in that they ſwim againſt the ſtream, they do it for this cauſe and reaſon, that the force of the ſtream and the flood may not take from them, and ſtrike off their ſcales, and that their gills may not fill with water which would hinder their ſwimming, and intercept their reſpiration. As by the ſame advice Cranes fly againſt the wind; whereas if they ſhould fly down the wind, their feathers would be diſplaced and broken, and they would not be able to fly.

How Fiſhes provide for their ſafety againſt a ſtorm.

How they ſwim againſt the ſtream.

Of the induſtry of Birds in the building of their Neſts.

THe induſtry of Birds in the building of their neſts is ſuch, that it doth far exceed the art and skill of all Maſons and Architects. From whence it is become a Proverb, *That men know, and can do all things but make Birds-neſts.* They are built within with wooll and feathers, and ſuch kind of ſoft things, which are as a kind of a pallet for the young ones. Swallows build their neſts in a round form, that they may be the more firm, and leſs ſubject to be hurt by any thing that ſhall ſtrike againſt them, and likewiſe more capacious. They chooſe their matter out of dirt and chaff, (interlacing it with many ſtraws) as it were their plaſter or lime. Thoſe that build in trees, do make choice of the ſoundeſt boughs, as if they meant to have them as a ſure foundation for the building which they ſhould erect thereon. The Cock and the Hen do by turns ſit over their eggs, and likewiſe fetch their meat, interchanging each others labor; neither do they ever forſake their young, before they are able to get their own living. I had at my houſe a great number of Sparrows neſts in earthen pots; and when the young ones begun to wax pretty big, and to be covered with feathers, I made the whole neſt be taken down and ſet upon the ground, that I and my friends might delight our ſelves in beholding the care of the old ones in the feeding of their young; for they feed them every one in order, skipping none, neither will they (to the wrong of the reſt) give one two parts, although he gape, and be importunate for it; dividing moſt juſtly to every one his own ſhare, according to the exact rule of diſtribution. And oftentimes for experiment, I would make triall with a ſtrange Sparrow of the ſame age, laid near, or put among the reſt of the young ones, whether the old ones would feed the ſtranger, as if it were legitimate. But this as a ſtranger and a baſtard they would ſuffer to ſtarve, skipping it when it gaped after the meat. And in like manner Lambs and young Kidds do in the fields, in the midſt of a great flock, run every one to his own dam; who being moſt certainly able to diſtinguiſh between the legitimate and a baſtard, will not ſuffer her ſelf to be ſuckt but by her own young.

Of what things birds build their neſts.

In what ſhape.

With what care Sparrows feed their young.

Of the induſtry of Spiders.

THe Spider ſpins her web with wonderfull artifice, hanging and faſtening it to every tack or ſtay that is nigh, drawing of his thread, and running upwards and downwards, and every way. And although the diligence of the chamber-maid beats down and mars this pendulous and new-begun work, yet her ſeat and her hold, the Spider keeps ſtill, neither is ſhe, or will ſhe deſiſt from the work ſhe hath begun, but in a very ſhort time weaves a great deal more unto the ruins of her former work, than can be unweaved again with much labor. So that from hence all cloth and linnen Weavers, all Embroiderers and workers with the needle (you will eaſily think) have learnt their Arts, if either you obſerve the exactneſs of the weaving, the fineneſs of the thred, or the continuation and indiſſoluble knitting together of the whole web; for being abrupt, and troubled with no ends of threds at all, it reſembles a thin membrane, anointed with a kind of glew, wherewith, when the prey is entangled, the Spider runs preſently in, and, as it were, draws her nets, and infolds, and takes the captive after the manner of huntſmen. If this were not daily ſeen with our eys, it would be thought fabulous.

How the Spiders weave.

How they catch their prey.

Of Bees.

I Cannot paſs in ſilence the great induſtry of Bees: For having eſtabliſhed a kind of Weal-publick, they make election of a King, who is ſuch a one, as in procerity of body, and excellency of feature exceeds all the reſt. He is remarkable by his ſhort wings, his ſtreight legs, his grave gate; and in ſtead of a Diadem or regall Crown, either he hath no ſting, or elſe doth not uſe it, which is the Artillery of the reſt. He never goeth unattended out of the hive, but always invironed with a Princely retinue, the reſt of his train following after neither goes he at any time abroad, but upon urgent affairs which concerns

Bees chooſe themſelves a King.

concerns the whole ſtate. His progreſs is forewarned by the voice and ſound of trumpets, and as it were with ſinging, and they all draw nigh. Every one gets as near to his perſon as he can, and when he is weary with flying, they all bear him up with their own bodies.

Their pitching their tents.

On what place ſoever he alighteth, there they forthwith pitch their tents. If he chance to die, they go not abroad to feed, but ſtand all mourning round about the corpſe; then

Their obſequies for their dead King.

carry him out of the hive, and (as it were) follow his hearſe and bury him: and laſtly, having with ſolemnity performed all the ſeverall rites and obſequies, they chooſe themſelves another King, for without a King they cannot live. He then taketh care of all things, having his ey every where, whilſt that the reſt intend the performance of the work. And ſuperviſing all, giveth them encouragement, and chaſtiſeth negligence. For their time of going forth for food, they chooſe a clear and fair day; for they have a naturall faculty of preſaging of the weather. They are ſuch obſervers of juſtice and equity, that

Their juſtice.

never, either with their ſting, or by any other way, do they moleſt any creature, neither do they exerciſe and prepare their ſpears againſt any, but for the ſafegard of themſelves and their hives.

Of the care of Bees.

Their watch.

THey manage and order their affairs in this manner; in the day-time they appoint before their gates a ſtation of watchmen and guarders. In the night they reſt from their labors, ſo long, till that one (who is appointed to this charge) by one or two

Their divers employments.

hums, as by a ſound of a Trumpet, rowſeth all the reſt. Then come they together to obſerve what is the ſtate of the weather, which if they foreſee will be fair, then abroad go they into the fields and paſtures. Some therefore bring into the hive little faſcicles of flowers on their thighs; others water in their mouth, and others a dewie moiſture gathered on their bodies. Theſe are met by others, who receive their burdens, which they diſpoſe in their due and proper places. Thoſe that are ſent out into the fields for food, are the youngeſt and the ſmalleſt; And therefore if the wind chance to riſe any thing high, they expect untill it ceaſe, and that the force and violence thereof be over. But if it continue violent, then do they ballaſt themſelves with a little ſtone flying cloſe by the ground, to prevent their being driven to and fro by the force of the wind. They are exceeding diligent in all their buſineſs, and do puniſh the ſloth of the laziе oftentimes with death. Some of them are the builders, others poliſh the building, and the reſt bring in their materials.

The building in their arched hives is with wonderfull artifice, being made with two doors, one to come in, and the other to go out at. They have all things alike, leſt that the inequality, either of their food or labor, ſhould give occaſion of diſſention. Their care is, that their houſes may ſhew both ſtate and handſomneſs. Idle drones, born for nothing but to eat, and conſume the fruits of their labors, they chaſe from their hives.

They puniſh ſloth with baniſhment.

Thoſe that chance to loſe their ſtings, are utterly diſabled, and in a ſhort time their guts come out that way, and they die. They bring to their owners wonderfull increaſe of wax and honey.

Ariſtomachus a diligent obſerver of Bees.

Ariſtomachus the Philoſopher doth boaſt, that for fifty eight years together, he had with great care been a nouriſher of Bees, only that he might the better attain to the knowledg of their ſtate and condition.

Of Piſmires and Ants.

NEither truly is the induſtry, diligence, and experience of the Piſmire leſs worthy of admiration, than that of the Bees. Inſomuch as that *Solomon* bids the ſluggard to take an example of diligence from the Piſmire. Truly, if experience did not witneſs it, it would ſeem incredible, that ſo ſmall a creature ſhould be able to ſtore up ſuch abundance of corn, to diſpoſe and manage her affairs in that good order that we ſee ſhe doth.

Lib. 11. *&* 30.

Pliny ſaith, that they have among them the form of a wel-govern'd and wel-order'd Common-weal. For how pretty a ſight is it to ſee them, when they ſeiſe upon a grain they have a mind to carry away, how they ſet to it, and lift it with head and ſhoulders.

Wonderfull care.

And how leſt the corn which they carry to their ſtore-houſe, ſhould put forth and grow, they bite it at one end. If it be ſo bigg that they cannot carry it into their little hole, they divide it in the middle. If it be dampiſh, they lay it out to dry in the Sun and open air. When the Moon is at the full, they follow their work in the night, when ſhe doth not ſhine, they take their reſt, whereby they ſhew themſelves to have ſome knowledg of heavenly things. *Pliny* affirmeth that they have their ſet Fairs and Markets, whither they come in great companies, and where they uſe to eſtabliſh leagues of amity and friendſhip one with another. And when one marks them well, would he not think that they were in conference one with another, and that they did diſcourſe among themſelves of their buſineſs? Do we not ſee that the often trampling of their little feet doth wear a path even upon hard flint ſtones?

There is nothing but may be attained by diligence.

From whence we may note, what in all kind of things is the effect of aſſiduity. They ſay alſo that they perform the rites of buriall one unto another, after the manner of men.

What

What words ſhall I uſe (ſaith *Plutarch*) to expreſs ſufficiently the diligence and induſtry of the Piſmires? There is not among all the great things in nature, a ſight of greater wonder than theſe: For in the Piſmires are ſeen the marks of all vertue. Their great meetings argue that they maintain a kinde of friendſhip.

Their alacrity in the undergoing of their labors, ſeems to ſhew their fortitude and magnanimity; and laſtly, they are eminent examples of temperance, providence, and juſtice. Their mutuall charity appeareth in this, that if one of them that is not loaden meets another, (in one of their narrow paths) that is, he will give him the way, that he may the better go on in his intended journey. They ſay that the firſt entrance into their hole, is not ſtreight, but full of many diverticles and crooked paths, which all end, which will bring you to three little cels; in one of which they have their conventicles; in the other, they lay up their proviſions; and in the third they bury the carkaſſes of their dead. This doth *Plutarch* ſpeak concerning Piſmires.

The ſorms of all vertues expreſt in Piſmires.

Of Silk-Worms.

WIth the induſtry of theſe creatures, I ſhall not unfitly joyn that of the Silk-worms, of whoſe pains and care, both in the making of their neſts, and the ſpinning of their thred and bottoms (wherewith Kings are ſo magnificently adorned) Philoſophers have written very ſtrange things.

And who can chuſe but wonder at thoſe great endowments of skill and knowledg, and that exceeding induſtry, (the mother of ſo much wealth) in the little body of ſo ſmall a creature? The providence therefore of God, doth not only appear in this, that he hath adorned each creature with a peculiar and proper endowment, but in this eſpecially, that on the leaſt creatures of all, he hath beſtowed the greater portion of skill, induſtry, and ingenuity to ſupply their defect of bodily ſtrength.

Diligence the mother of wealth.

Of the love of Beaſts one towards another, and to their young.

Plutarch writeth, That all kind of creatures bear a ſingular love, and have a kind of care of thoſe that are generated of them, and the induſtry of the Partridges this way is much commended; for during the time that their young ones are weak and unable to fly, they teach them to lye upon their backs, and to hide themſelves among the clods on the ground, that ſo being almoſt of the ſame colour, they may not be diſcerned by the Faulkoner. But if notwithſtanding, they ſee any body coming, and that he is near them; they do with a hundred dodges and ſtoopings of themſelves, as if they were weary with flying, entice him away from their young to follow after them, and when they have their purpoſe, they then, as if they had recovered ſome freſh ſtrength, fly quite away: who can but wonder at this both affection and ſubtilty?

The induſtry of Partridg in preſerving their young.

In *Florida* part of the *Weſt-Indies*, they have a beaſt, which for the variety and deformity of it I cannot paſs over in ſilence; the natives call it *Suarath*, the Canibals, *Su-*

It keeps for the moſt part about the rivers, and the ſea-ſhore, and lives by prey. When he perceiveth that he is purſued by the Huntſman, he gets his young ones upon his back, and with his tail, which is very long and broad, he covereth them, and ſo flying, provideth both

both for his own and their ſafety; neither can he be taken by any other way but by pits, which thoſe ſavage men uſe to dig in the places near which he is to run, into which at unawares he tumbles headlong. This picture of him here, I drew out of *Thevets* Coſmographie.

Tom. 2. lib. 23. cap. 1.

How Hares provide for themſelves and their young, for fear of hunters.

Neither are thoſe things leſs wonderfull that are reported of Hares, for when they would go to their ſeat, they ſever their young, and commit them to the truſt of divers places, it may be two acres aſunder one from another, leſt peradventure a Huntſman, a dog, or any man ſhould chance to come that way, and they might be in danger to be loſt at once. And then after they have traced up and down, hither and thither, and every way that the dogs may not trace them, nor the huntſman prick them, they take a leap or two, and leap into their forms.

Nor inferior to this is the craft of the Hedghog, for when the Fox purſueth him, and is now at his heels, he rowls himſelf up in his prickles like a cheſnut in the outward ſhell, ſo that every part being rounded and encompaſſed with theſe ſharp and dangerous pricks, he cannot be hurt: and ſo ſaves himſelf by this trick. For his young he provides in this manner:

The care of the Hedghog to provide for her young.

In the time of Vintage he goes to the vines, and there with his feet he ſtrikes off the boughs and the grapes, and then rowling his body makes them ſtick upon his prickles, and ſo doth (as it were) take his burthen upon his back, and then returns to his hole; you would think that the grapes did move of themſelves; the prey he divides between himſelf and his young.

Of the affection of Birds, and of Dogs towards their Maſters.

The piety of Storks.

THe young Stork provides for the old, which is diſabled by age; and if any one of their equals come to any miſchance, that he is not able to fly, they will give him their aſſiſtance, and bear him on their backs and wings. And therefore this affection and piety towards the old ones, and (as it were) brotherly love towards their equals, is commended in the Stork.

The Hen in any kind of danger gathers her chickens under her wings, and (as it were) with that guard, defends them as well as ſhe can. For their ſake ſhe expoſeth her ſelf to the cruelty of the fierceſt beaſts; and will fly in the eys of a Dog, a Wolf, or a Bear, that by chance offers to meddle with her chickens.

The fidelity of Dogs.

But who is there that doth not admire the fidelity and love of dogs towards their Maſters, whereby they recompence them for their keeping? A Dog will never forſake his Maſter, no, if he be never ſo hardly uſed. For there is no man can find a ſtick hard enough to drive that Dog clean away from him which hath once taken a love to him. There is no kind of creature that doth more certainly and readily remember his maſter; he will know the voice of all the houſhold, and of thoſe which frequent the houſe. There cannot be a truſtier keeper, (as *Cicero* himſelf ſaith) than a Dog is; I ſpeak not of their faculty of ſmelling, whereby they follow their Maſters by the foot, and find them, neither do I ſpeak of thoſe infinit examples of the fidelity of Dogs, which were too long to rehearſe.

Doves free from adultery.

Pigeons, as well the cock as the hen, although they are all very venereous, yet they know no adultery; yea, and the Hen will bear with the frowardneſs of the cock, neither will ſhe ever leave him, but reconciling him unto her by her officious diligence, bring him to his wonted dalliance and kiſſes, neither is the love of either of them leſs towards their young.

Turtles never couple twice.

There is the like mutuall bond of love between Turtles; for if one of them die, the ſurviver never ſolicits Hymen more, neither will he ever chuſe other ſeat than a dry withered bough.

Of the ſtrength, piety, docility, clemency, chaſtity, and gratitude of Elephants.

AMong the beaſts of the field, there is none more vaſt, more ſtrong, or more to be feared than the Elephant. His ſtrength is ſufficiently ſhown by thoſe towred Caſtles of armed men which he carries, and fiercely ruſheth with into the battail. The *Roman* ſouldiers, being otherwiſe of undaunted ſpirits, yet in that battail which they fought againſt *Pyrrhus*, being terrified with the vaſtneſs and immanity of theſe bodies, which they had never before ſeen, preſently turned their backs and fled; which notwithſtanding, it is a wonderfull thing what Stories naturall Philoſophers tell of the vertues of the Elephant.

Lib. 8. cap. 1.

Plinie writeth, that an Elephant cometh very near to the underſtanding that men have, and that he hath a rude kind of knowledg of language; that his facility and obſequiouſneſs is wonderfull, that his memory in the performance of his wonted duties, is no leſs wonderfull. And for Religion (*Plutarch* ſaith) that they pray unto the gods, and ſprinkle and purge themſelves with ſalt water, and that with great reverence they worſhip the Sun at his riſing, lifting their trunks up towards heaven for want of hands. *Plinie* addeth, that they do with the like reverence worſhip the Moon and the Stars. For it is related in the

The religion of the Elephant.

the Hiſtories of the *Arabians*, that at a new Moon the Elephants go by troops down unto the rivers, and there waſh themſelves with water; and being thus purged, kneel down and worſhip the Moon, and then return to the woods, the eldeſt going firſt, and the other following after according to their age.

Plutarch reporteth, that it hapned once, that among the Elephants which were taught at *Rome*

Rome againſt the Panegyrick ſhews, there was one that was ſomething dull, and not ſo docile as the reſt, which made him be deſpiſed by his fellows, and often beaten by his maſter. But that this Elephant, that he might ſupply by diligence what he wanted in wit, was oftentimes obſerved in the night, by the light of the Moon, to be practiſing and conning what he had learnt of his maſter in the day-time. For they were wont to be taught to make letters, and alſo to preſent garlands to the ſpectators, and other ſuch like tricks. But they can never be brought to go aboard a ſhip, to be carried over the ſea into any ſtrange land, unleſs their maſter give them his word to aſſure them that they ſhall return again to their own native ſoil. They never hurt any one that doth not firſt provoke them. They never gender but in private out of ſight, an argument of their modeſty.

Plin. lib. 8. cap. 5.

Of the Lamprey.

LEſt that the heat of affection may ſeem to lie quenched under the waters, let us by one example, (it were an infinit thing to ſpeak of all) ſee in what kind of mutuall love the creatures of the water come ſhort of thoſe of the land. The Lamprey of all the creatures of this kind doth worthily bear the praiſe for its piety towards thoſe of whom it was generated, its affection towards thoſe that are generated of her; for firſt ſhe breeds eggs within her, which in a ſhort time after are ſpawned. But ſhe doth not as ſoon as her young ones are formed and procreated, bring them ſtraight-way forth into the light after the manner of other fiſhes, that bring forth their young alive, but nouriſheth two within her, as if ſhe brought forth twice, and had a ſecond brood. Theſe ſhe doth not put forth before they are of ſome bigneſs, then ſhe teacheth them to ſwim and to play in the water, but ſuffers them not to go far from her; and anon gapes and receives them by her mouth into her bowels again, ſuffering them to inhabit there, and to feed in her belly ſo long as ſhe thinks fit.

The ſavage or brute beaſts may be made tame.

Coſmograph. Tom. 2. lib. 19. cap. 7.

THevet reporteth, that the Emperor of the Turks hath at *Caire* (it was once called *Memphis*) and at *Conſtantinople*, many ſavage beaſts kept for his delight, as Lions, Tigers, Leopards, Antilopes, Camels, Elephants, Porcupines, and many other of this kind. Theſe they uſe to lead about the City to ſhew. The maſters of them are girt with a girdle hung about with little bels, that by noiſe of theſe bels the people may be forewarned to keep themſelves from being hurt by theſe beaſts. But in hope of reward and of gifts, they ſhew them to Ambaſſadors of ſtrange nations, before whom they make theſe beaſts do a thouſand very delightfull tricks, and in the interim they play their countrey tunes and muſick upon their pipes and other inſtruments, and make many ſports in hope of gain.

That Fiſhes alſo may be tamed.

BUt it is far more wonderfull, that the creatures of the water ſhould be made tame, and be taught by the art of man. Among which, the chiefeſt are held to be the Eel. The ſame things alſo are reported of the Lamprey. For we have it recorded, that *Marcus Craſſus* had a Lamprey in his Fiſh-pool, that was ſo tame, and ſo well taught, that he could command her at his pleaſure. Therefore as a domeſticall and tame beaſt he gave her a name, by which when he called her, ſhe would come. And when this Lamprey died, he mourned for her in black, as if ſhe had been his daughter. Which when his colleague *Cneus Domitius* objected to him by way of reproach, he replying, told him, That he had buried three wives, and had mourned for none of all them three.

Of the Lion, the Ichneumon, and thoſe other beaſts which are not eaſily terrified.

The providence of the Lion in his going.

THe Lion when he goes, hath his claws always clutched, and (as it were) put up in their ſheaths, not only becauſe he would leave no mark of his feet, whereby he may be traced and ſo taken, but becauſe by continuall walking he ſhould wear off, and blunt the points of his claws. Buls when they fight charge one another with their horns, and like valiant ſouldiers, provoke and animate one another to the battail.

The greateſt are terrified by the leaſt.

The Ichneumon ſeems to imitate the moſt valiant ſouldier in his preparation and acceſs to battail; for he bedawbs himſelf with mud, and doth (as it were) buckle and make tite his armor, eſpecially when he is to encounter with the Crocodile; who although he bee a vaſt beaſt, is put to flight by this little creature. And this truly hath been obſerved to be by the ſingular providence of Nature, that the moſt vaſt creatures are terrified by the leaſt things, and ſuch from whence there can ariſe no danger; ſo they ſay the Elephant doth ſtartle at the grunting of an Hog; and the Lion, at the crowing of a Cock; although it be reported of the Lion, that no fear can make him turn his face. Theſe kind of fears, terrors, and affrightments, ariſing upon light and moſt ridiculous occaſions, we find as well in the ancient as modern Hiſtories of our times, to have diſperſed and put to flight mighty legions of ſouldiers, and moſt potent armies.

That men were taught by Beaſts to poliſh and to whet their weapons, and to lye in ambuſh.

SOuldiers are carefull to keep their weapons from ruſt, and therefore they carry them to the Armorers to be poliſhed. But in this care, many beaſts are nothing inferior unto

to them; for Boars whet their tusks against they fight. And the Elephant knowing that one of his teeth is doubled with digging at the roots of trees to get meat, keepeth the other sharp, and touches nothing with it, preserving it for his combat with the *Rhinoceros* his

The craft of the Rhinocerot about to fight with the Elephant.

enemy; but the craft of the Rhinocerot is very remarkable, that being in continuall enmity with the Elephant, at the time when he prepares for the battail, he whets his horn against a rock, as if it were with a whetstone; nor (if he can chuse) will he strike any other part of the Elephant but the belly, because he knows that part of the Elephant is so tender, that it may be easily pierced. This beast is in length equall to the Elephant, but in height he is inferior unto him, by reason of the shortness of his feet; he is of a palish yellow colour, and full of many spots.

Of Cocks.

Cocks are kingly and martiall Birds.

COcks are kingly Birds, and therefore Nature hath adorned them with a comb, as with a princely Diadem; and whersoever they come, their magnanimity and courage makes them kings. They fight with their beaks and their spurs, and with their martiall voice they fright the Lion, who is otherwise the king of beasts.

Of Conies.

Conies have taught us undermining.

COnies have taught us the art of Undermining the earth, whereby the most lofty Cities and structures reaching the very skies, are by taking away their foundation levelled with the ground.

Marcus Varro writes, that in Spain there was a town, and that no mean one, which standing on a fandie ground, was so undermined by a company of Conies, that all the houses tumbling and falling down to the ground, the inhabitants were fain to depart aud seek new dwellings.

Of Wolves.

The deceits and ambushes of Wolves.

MEn have learnt the arts of waging War from the Wolves, for they come out by troops, and lye in ambush near the towns which they have appointed, and then one of them runs unto the town and provokes the dogs. And making as if he run away, incites the Dogs to follow him, untill he hath gotten them unto the place where their ambush lyeth, which on a sodain appeareth, and rusheth out upon them. And so they kill and eat all, or as many of the dogs as they are able to catch.

Of the Fox.

The craft of the Fox.

IN subtilty and craft the Fox exceedeth all other beasts: when in the chase the Dogs are at his heels, he berays and bepisses his tail, and swings it in the face and eys of the Dogs that follow him, and so blinding them, in the mean time gets ground of them. To fetch the Hens down from their pearch, he hath this devise, he shakes and swings his tail upwards and downwards, as if he meant to throw it at them; which they fearing tumble down, and he takes up one of them for his prey. His wariness when he passeth over a River that is frozen, is wonderfull; for he goes softly to the bank, and lays his ear to listen, if he can hear the noise of the water running under the ice. For if he can, back he goes, and will not venture to pass over. The knowledg of which thing he could never meerly by his subtilty and craft attain unto, but that of necessity he must have some faculty of reasoning joined with it; which by discourse, and by proving one thing by another,

The Fox seems to reason with himself.

His *Sorites.*

arrives at this Conclusion: whatsoever is liquid and maketh a noise, is in motion; whatsoever liquid is in motion, is not concrete and frozen; that which is not concrete and frozen, is liquid; whatsoever is liquid, will not bear a heavier body; whatsoever will not bear a heavier body, cannot with safety be adventured on; and therefore back again must I go, and not pass over this River.

Of Swine.

SWine, if in the woods, they hear any one of the same kind with them crying out, they straight make a stand; and marshalling their forces, haste all, as if they had been warned by the sound of a martiall trumpet, to the assistance of their fellows.

Of the fishes Scarus *and* Anthia.

The love of Fishes one to another.

Plutarch reports of the *Scari*, that when one of them chances to swallow a hook, and be taken, the rest of the same kind come to his rescue, and shearing the Line with their teeth, set him at liberty. But the readiness of the *Anthia* to the mutuall assistance of one another, is yet more manifest; for by casting the Line upon which the hook hangeth on their back, with the sharpness of their fins they cut it asunder, and so set free themselves and their captived fellows.

Of the Pilot-*fish.*

THere is great kindness between the Pilot-fish and the Whale; For although in bulk of body the Whale so far exceed him, yet he leads the Whale, and goes always before him

him as his Pilot, to keep him from running himself into any straight or muddy place, whence he might not easily get out. And therefore the Whale always follows him, and very willingly suffers himself to be led by him, it being for his own good. And in like manner he gets into the Whales mouth, and there lodging himself, sleeps when he sleeps, and leaves him not either by day or night. The Whales pilot or guide.

Of Cranes.

CRanes when they are to take a long journey into some Countrey cross the seas, put their company in so good order, that no Captain can put his souldiers in better. For before they stir out of any place, they have (as it were) their trumpets to call them together, and encourage them to fly. They come together, and then fly up on high, that they may see afar off, choosing a Captain whom they are to follow. They have their Serjeants to take care of their ranks, and keep their nightly watches by turns. *Plutarch* tels us that the Crane, which is appointed to stand Sentinell for all the rest, holds a stone in her foot, to the end, that if she chance to give way to nature and sleep, she may be waked by the noise of the falling stone. The leader lifting up his head, and stretching out his long neck, looks about him far and wide, and gives warning to the rest, of any danger that may befall them. The strongest lead the way, that they may the better with the flapping of their wings break the force of the air, and this they do by turns. And that they may the easilyer prevail against the force and opposition of the winds, they dispose their company into a wedg in the form of the Greek letter Δ or a triangle; and being skilfull in the stars, they foresee when tempests are coming, and fly down to the ground to keep themselves from the injury of the approaching storm. Cranes order themselves in ranks. The sentinell Crane.

Of Geese.

THe Geese of *Sicilie* do with great wariness take care, that by their keeking and their noise, they do not expose themselves to the rapacity of Birds of prey: for *Plutarch* saith, that when they are to fly over the hill *Taurus*, for fear of the Eagles that are there, they hold stones in their mouths to keep themselves from gagling, untill that they come unto a place where they may be secure. The care of the Geese that their gagling do them no harm.

Of Dragons.

NEither are the Dragons less crafty; for thus do they overcome those vast and otherwise invincible beasts the Elephants. They lye in ambush, and sodainly set upon the Elephants where they fear no such matter, and involve their legs with the twines of their tail, in such sort, that they are not able to go forward; and stop their nostrils with their heads, so that they cannot fetch their breath, they pull out their eys, and whersoever they find the skin most tender, there they bite and suck the blood untill they make them fall down dead. *Pliny* saith, that there are Dragons found in *Æthiopia* of ten Cubits long, but that in *India* there are Dragons of an hundred foot long, that fly so high, that they fetch Birds, and take their prey even from the midst of the clouds. The craft of Dragons fighting against the Elephants. *Lib. 8. cap. 11. & 12.*

Of the Fish called the Fisherman.

THis fish is called the Fisherman, because he hunts and takes other Fishes, which he doth almost by the same cunning which the Cuttell uses; for he hath hanging at his throat a certain bag, like the Wattels of a Turky-cock. This when he listeth he casteth out, and layeth before the little Fishes for a bait, and then by little and little draws it up again, untill he catch for food the little Fishes seising upon it as a prey. The craft of the Fisherman-fish in taking her prey.

Of the Cuttell Fish.

WOnderfull is the craft of the Cuttell-fishes, for they carry a bladder at their neck full of a black juice or ink, which they pour forth as soon as they feel themselves taken; that so they may blind the eys of the Fishermen, as *Plutarch* saith, and as *Aristotle* witnesseth, they with their long fangs do not only hunt and take little Fishes, but oftentimes also Mullets. The craft of the Cuttell to save herself. *Lib. 9. de Hist. animal. cap. 37.*

Of the arms or weapons of brute Beasts.

BRute beasts are naturally so furnished with arms, that they have no need to get, make or borrow in any other place.

And some of them nevertheless are so furnished with such arms, that they captivate those which hold them prisoners; an example of this is the *Torpedo*, which doth not only hurt by touch, but also by the net being between, he breaths such a quality from him, as stupifies the hands of the Fishermen, so that they are forced to let go their nets, and so let him go; moreover if it touch a ship it makes it stay. *Thevet* writes, that the *Persian* bay towards *Arabia*, nourishes a fish equal in length and thickness to a Carp, on every *Cosmogr. univ. l. lib. 10. cap. 16.*

ſide encompaſſed with ſharp and ſtrong pricks, like our Porcupine, with which he fights againſt all kinds of fiſh. If a man chance but to be lightly hurt either with theſe or his teeth, he will die within 24 hours.

Of the fiſh Utelif.

HE ſaith moreover, That as he was carryed by force of tempeſt through the Atlantick Ocean, he ſaw this fiſh, having (as it were) a Saw in his forehead of three foot long, and four fingers broad, armed on each ſide with ſharp ſpikes; they call it *Utelif* in their Countrey ſpeech.

Of the fiſh Caſpilly.

THere is another fiſh to be ſeen in the Arabian-gulf, which the Arabians call Caſpilly, it's two foot long, and as many broad, it hath a skin not much unlike a Dogfiſh, but armed with ſpikes, one whereof he carries in his forehead a foot and half broad, in ſharpneſs and force of cutting not much ſhort of a graver or chiſſell: with this weapon, when ſhe is oppreſt with hunger, ſhe aſſails the firſt fiſh ſhe meets, neither doth ſhe give over, before ſhe carry her as a prey whither ſhe pleaſe, as *Thevet* ſaith he hath ſeen.

Tom. 1. lib. 5. cap. 2.

Of Crabs.

CRabs and Lobſters, though in the quantity of their body they be but ſmall, yet they uſe their forked claws before, not only in feeding but alſo in defending themſelves and aſſailing others.

Of the docility of Beaſts, and firſt of the Dog.

BEaſts are apt to learn thoſe things which men deſire, whereby they ſhew themſelves not wholly void of reaſon. For Dogs, Apes, and Horſes learn to creep through the Juglers hoops, and riſe on their hinder feet, as though they would dance. *Plutarch* tels, that a Jugler had a Dog which would repreſent many things upon the ſtage befitting the occaſion and argument of the Play; amongſt the reſt, he exceeded all admiration in that, that taking a ſopotifick medicin, he excellently feigned himſelf dead; for firſt, as taken with a giddineſs in his head he begun to tremble, then preſently fell down, and lying on the ground, as it were contracted his dying members, and laſtly, as if truly dead he wax'd ſtiff; and moreover ſuffered himſelf diverſly to be fitted according to divers parts of the Theater, the fable ſo requiring. But when he, by thoſe things that were ſaid and done, knew it was time to riſe, he firſt begun to move his legs by little and little, as if he had been wakened from a ſound ſleep; then preſently with his head a little lifted up, he looked this way and that way, to the great admiration of all the beholders; and finally riſe up and went familiarly and chearfully to him he ſhould; the which ſight the Emperor *Veſpaſian* (who was then preſent in *Marcellus* his Theater) never ſaw any which more delighted him.

The wonderfull docility of Dogs.

A ſpectacle full of admiration and truth.

Of the Ape.

AN Ape is a ridiculous Creature, and which makes men much ſport in imitating their actions. There hath been ſeen an Ape which would pipe and ſing, and beſides dance and write, and endevour to perform many other things proper to men. I remember I ſaw in the Duke of *Somes* houſe a great and curſt Ape, who becauſe he much troubled many, had his hands cut off, who ſuffering himſelf to be cured, when the wound was cicatrized, he grew more milde and docile. Wherefore cloathed in a green coat, and girt over his loins with a girdle, he carried hanging thereat a caſe of ſpectacles, a pair of knives, and a childs handkerchief. He was committed to the charge of the Maſter-cook to teach, becauſe he had taken up his lodging in the Chimney-corner, he was taught many tricks and feats. If at any time he ſwerved from his doctrine and precepts, in a trice the whip was upon his back and loins, and much was abated of his daily allowance; for as *Perſius* ſaith, The belly is the Maſter of Arts, and ſharpener of wit. By theſe means he profited ſo in a ſhort time, that he much exceeded all the Apes of his time in the glory of his wits, and there was none counted more skilfull in leaping and dancing to the pipe, running up a pole, and nimbly leaping through his Maſters legs. To conclude, he performed all the actions of a ſtrong Ape, and very reverently carried up diſhes with the waiters and ſerving-men, and made clean the diſhes and platters by licking, and did much other drudgery, ſo that he was commonly called, Maſter *John Do-all*. At dinner and ſupper ſitting in a chair, he ſaid grace, and caſt his eys up towards heaven, and rouled them this way and that way, and ſmote his breaſt with the ſtumps of his hands with much lamentation, and imitated prayer by the gnaſhing or beating together of his teeth. He would turn up his tail to any that offended him, (for his coat ſcarce covered half his buttocks left he ſhould have filed it) he made much other paſtime, always going upright by reaſon of the cutting away of his hands, unleſs at any time through wearineſs he were forced to ſit on his buttocks.

Gal. lib. 1. de uſu partium.

Of

Of the Camels.

THe *Camell* is a very domesticall and gentle beast, and which is easily tamed and taught all kind of obedience and seruice; although some of them are cruel, wilde and

trouble-

Camels both tame and wilde.

troublesome by biting and striking such as they meet, no less than untamed horses. There is no need to house them in the night, for they may be left in the plain fields in the open and free air, feeding upon the grass and trees and cropping the tops of the thistles, neither in the morning do they any whit the worse undergoe or carry their burdens. They

The easie and not chargeable keeping of Camels.

are not put to carry burdens before they be four year old. The *Arabians* geld them young, that they may enjoy their labour the longer, neither being gelt do they rage for love or desire of Venery. At the putting in of the Spring they endure hunger and thirst for eight dayes; they are so dutifull, that at the beck of the Turkish slaves, or but touched on the neck with a twig, they presently kneel on the ground to take up their burden, neither do they lift themselves up before that they find they have a sufficient load laid upon them.

Camels know when they have a sufficient load.

Those that have but one bunch upon their back are of *Africk*; but such as have two bunches are of *Asia*, or *Scythia*. Those kind of Camels that are the bigger are used to carry packs, but the lesser are used to ride upon, as our horses are. They love nothing so well as beans, and yet they live content with four handfuls of beans for a day. The greatest wealth of the *Arabians* consists in Camels, and so they estimate their riches, not by the quantity of silver, or gold, but by the number of Camels. The *Turkish* Emperour (*Thevet* being the reporter) made a Captain over the heards of his Camels, giving him a great troop of *African* and Christian slaves, that they might be the better looked unto. I have heard it reported (saith *Thevet*) by certain *Arabian*, *African* and *Jewish* Merchants who were present, at that time when *Sultan Selim* the first of that name, besieged *Caire* in *Ægypt* (which in former times was called *Memphis*) that there then was in that Emperors army sixty thousand Camels, besides a mighty company of Mules.

Camels both to carry burdens, and to ride upon.

A mighty troop of Camels.

Of ravenous Birds.

The diligence of Falconers in training up their Hawks.

BUt let us take a view of Falconers teaching ravenous Birds, how with swift wings carried aloft into the air, they may seise upon other Birds, and cast them down dead to the ground; in performance whereof, they often too freely soare up to the clouds, so that they carry themselves out of the Falconers sight, with a desire to sun themselves, neglecting in the mean time their designed prey.

The fight of the Hern and Falcon.

The Hern when she sees her self kept under and below the Falcon carried up by his strong wings with a marvailous swiftness, with her beak, which is long and sharp, hid under her wings, and turned upwards, she receives the Falcon blinded with the heat of fight and desire of prey, carelesly flying down and rushing upon him; so that he often strikes him through the gorge, so that oft times they both fall down dead to the ground. But if the Falcon without harm escape the deceits by art, and the happy turning of his body, and the Hern be not cast down, the Faulconer calling her back with never so loud a voice, yet by setting up her Feathers she dares her to the pretended fight.

That Birds have taught us musicall tunes.

To sing like a Nightingale.

THe Nightingales are sweet and excellent singers, tuning their notes with infinite quaverings, and diversities of sounds, so prettily and sweetly, that humane industry can scarce equal the sweetness thereof, by so many musicall instruments; so that we say, he sings like a Nightingale, who varies his voice with much variety. In which thing Birds much excell men, because they have that admirable sweetness of singing from nature it self without any labor of learning; which men can scarce attain to in any school of musick, by having their ears a thousand times pluckt by the hand of a curst master.

That Beasts know one anothers voice.

The voice to beasts is of the same use, as speech is to men.

BEasts know one another by their voice, so that they may seem to talk and to laugh together, whilst flattering with their ears, they pluck in their noses with a pleasant aspect of their eys; and as speech is given to men, so Birds have their naturall voice, which is of the same use to them, as speech is to us. For all Birds of the same species, as men of the same countrey, chant and chirp to one another, when men understand not the speech of other men, unless of the same Nation. Wherefore the Scythian tongue is no more profitable to one living in Egypt, than if he were dumb; nor the Egyptians understand it no more than if they were deaf. Wherefore an Egyptian is dumb and deaf to a Scythian. This those which travail well understand how many dangers, how many troubles they undergo, because they cannot express their minds, and require things necessary for life. Wherefore to the assistance of this unprofitable tongue, we are compelled to call the rest of the members, and to abuse the gestures of the head, eys, hands, and feet. Truly the condition of brute beasts is not so miserable, seeing that all of the same kind whersoever they be, may answer each other with a known voice. Truly if any should hear a German, Briton, Spaniard, Englishman, Polonian, and Greek, speaking amongst themselves in their native tongues, not understanding any of them, he could scarce discern, and certainly judg, whether he heard the voice of men or of beasts.

We are as ill as deaf, when we hear an unknown language.

That

That Birds may counterfeit Mans voice.

Linets, Larks, Pies, Rooks, Daws, Crows, Stares, and other ſuch like Birds, ſpeak, ſing, whiſtle, and imitate the voices of men, and other creatures. In this Parrats excell all other, being wonderous skilfull imitaters of mens voices, and very merry, but ſpecially when they have drunk a little wine. Parrets are wonderfull imitaters of mans voice.

Plutarch reports that there was a Barber at *Rome*, who kept a Pie in his ſhop, which ſpoke exceeding well, and that of her own accord, none teaching her, when ſhe firſt heard men talking together; ſhee imitated the voice or cry of all beaſts ſhee heard, as alſo the ſound of Drums, and the ſound of Pipes, and Trumpets; to conclude, there was nothing which ſhe did not indevour to imitate. There have been Crows that have ſpoken and articulately ſung ſongs and Pſalmes, and that of ſome length. To which purpoſe the Hiſtory of *Macrobius* is notable; for he tels that there was one amongſt thoſe, who went forth for luck ſake to meet with *Auguſtus Cæſar*, returning from the was againſt *Antonius*, who carried a Crow, which he had taught plainly to pronounce this ſalutation, *Salve Cæſar Imperator Auguſtiſſime*, that is, *God ſave thee, O moſt ſacred Emperor Cæſar*. *Cæſar* taken with the novelty of this ſpectacle, bought this obſequious bird with a thouſand peeces of ſilver. *Pliny* and *Valerius* have reckoned up amongſt prodigies, Oxen and Aſſes that have ſpoken. I omit infinit other things recorded by the ancients, *Plato*, *Ariſtotle*, *Pliny*, *Plutarch*, and other Philoſophers of great credit, of the docility of beaſts, and their admirable felicity of underſtanding. Which things, if untrue, theſe learned men would never have recorded in writing, leſt ſo they might brand with vanity, (then which nothing is more baſe) the reſt of their writings to poſterity in all enſuing ages. A talking Pie. *Lib 2. Saturn. cap. 4.*

Of the Sympathy and Antipathy of Living Creatures amongſt themſelves.

HAving briefly deſcribed the underſtanding of brute beaſts, it ſeems not impertinent to ſet down ſome things more worthy of knowledg, happening unto them by reaſon of Sympathy and Antipathy; that is, mutuall agreement and diſagreement, which happens not only to them living, but alſo dead, by a certain hidden property, through occaſion whereof ſome deſire, other ſhun, and others proſecute one another even to death. In teſtimony whereof; The *Lyon* the King of Beaſts excelling all other in courage and magnanimity, fears the Cock, for he is not only terrified by his preſence, but alſo by his crowing being abſent. So an Elephant fears a Hog; but he is ſo afraid of Mice and Rats, that he will not touch the meat that is given him, if he ſmelt that it hath been defiled with ſuch creatures. There is deadly hatred between the Elephant and Rhinocerot; yet when the Elephant is furious and angry, he becomes quiet and calm at the ſight of a Ram. A Horſe is ſo afraid of a Camel, that he cannot indure his ſight. The Dog hates the Wolf, the Hart flies the Dog. The Snake flies from and fears a naked man, and followes him being clothed. There is deadly hatred between the Aſpis and Ichneumon, for he when he hath cowled himſelf in the clay, dries himſelf in the Sun, and ſo being covered over (by) doing thus divers times) as it were with ſhells, or armour, he enters into combat, ſtretching out his tail, and preſenting his back, untill he get opportunity to choak his adverſary, by leaping and faſtening on her jaws, by which ſtratagem he alſo kils the Crocodile. The green Lizard is a capitall enemy to the Serpent, but moſt friendly to man, as *Eraſmus* witneſſeth by many Hiſtories concerning that matter, in his Dialogue of Sympathy and Antipathy. There is a great deal of hatred between a Man and a Wolf, which is moſt manifeſt by this, that if the Wolves firſt ſee a man, his voice is taken away, and his intended cry hindered. If the Weaſell intend to ſet upon the Aſpis that moſt venemous Serpent, ſhee arms her ſelf by eating Rue, as a moſt certain Antidote. The Ape fears the Torpedo, as *Eraſmus* manifeſts by a pleaſant hiſtory in the forementioned Dialogue; where alſo he prettily ſhews the deadly hatred between the ſerpent called Areus and the toad. The like hate is between the Owl and Crows, ſo that the Owl dares not go out, fly abroad, or ſeek her food unleſs by night. The water or River fowl are afraid of the Falcon; that if they but hear her bells, they had rather be killed with ſtaves and ſtones, than take wing to flie into the air. So the Lark yeelds herſelf to be taken by a man, leſt ſhee fall into the talons of the Hobby. The Caſtrill, or Merlin is naturally a terror to Hauks, ſo that they both ſhun his voice and preſence. The Lion fears a cock. A horſe fears a Camell. What foul fear the Falcon.

The Kites are all at perpetual enmity with the Crows, wherefore the Crow alwayes gets away the Kites proviſion. All kind of Pullen fear the Fox. The Chicken fears neither a Horſe, or an Elephant, but ſcarce hatched, it preſently runs away at the voice or ſight of a Kite, and hides it ſelf under the hens wings. The Lambe and Kid flie from the Wolf when they firſt ſee him, neither doth death give an end to that hatred, but it ſupervives their funerall. An Experiment whereof (they ſay) is, that if one Drum be headed with Wolves skins and another with Sheeps, and beaten up togethar, you ſhall ſcarce hear the ſound of the Drum covered with ſheeps skins. And beſides, if you ſtring one Harp with ſtrings made of ſheeps guts, and another with ſtrings of Wolves guts, you cannot bring The enemity between the Kites and Crows. The diſcord between the Lamb and Wolf is not ended by death.

it

it to paſs, by any art, to make them agree and go in one tune. It is reported from the experiments of many men, that if a Wolves head be hanged up on high in the place where Sheep are, that they will not touch the graſs how good and freſh ſoever it be, nor reſt quiet in any place, but tumultuouſly run up and down, untill all ſuch kind of terror be taken away. The hate betwixt Mice and Weaſels appears by this, that if you mix never ſo little of the brains of a Weaſell in the rennet, with which you crudle you Cheeſe, the Mice will never gnaw or touch that cheeſe. The Linnet doth ſo hate the bird *Florus*, that both their bloods put into one veſſel cannot be mixed together. A Wolves head hung up in a dove-houſe, drives away Poll-Cats and Weaſels. The Panther and Hyæna burn with ſo great hatred, that if both their skins be laid one againſt the other, the Panthers will ſhed the hair, the hairs of the Hyæna remaining entire and not moved; which thing, they ſay, happens to the feathers of other birds if any one chance to tye them up in a bundle with the Eagles. Let theſe ſuffice for ſome few examples of many, of the Antipathy amongſt beaſts. But of the Sympathy and conſent of beaſts amongſt themſelves, I think needleſs to write any thing, being it is ſufficiently known to all, that one Jay aſſociates another, and the cruel Bears agree amongſt themſelves; and beaſts of the ſame ſpecies do wonderfully conſent one with another.

How to make cheeſe that Mice will not gnaw.

That Man excells all beaſts.

I Now think it fit to aſſay to write of that excellency of man over beaſts, which I have ſo long intended. Neither would I that Epicures and other too much naturall and materiate Philoſophers, ſo take thoſe things I have written of the endowments of beaſts, as though we ſhould think, there were no difference between man and beaſt. I had no ſuch meaning, no ſuch intention; but only that man ſhould not become too ſtately, or too ingrate in leſs acknowledging God to be the Author of ſo many benefits with which he abounds. For whatſoever we have largely ſpoken of beaſts, yet there is no compariſon between beaſts and man, for there is too great a difference between them. For mans mind is adorned with religion, juſtice, prudence, magnanimity, faith, piety, modeſty, clemency, fortitude, and other vertues as lights, which ſhine much more bright in man than in beaſts. For they are ſometimes all in ſome one man, each whereof are thought great in beaſts. For ſeeing that man is made to the Image of God, it cannot be, how much ſoever he defile himſelf with the pollution of vices, that he can ſo obſcure that inbred light, but that alwaies ſome beam of the divine wiſdome will be inherent & ſhine in him. But although by collation to ſome beaſts, he may ſeem a defective and weak Creature; yet no fortitude nor ſtrength of beaſts can be ſo great as to equall the fortitude of man. For God hath ingraven in man the character of his divine vertue, by the aſſiſtance whereof, he might have all beaſts under and obedient to him. And though by that we have formerly ſaid, beaſts may ſeem to have a certain ſhadow of reaſon, yet that ſmall light is not fit for many and divers uſes, but there is only given them ſo much providence, as ſhould be ſufficient for them and the preſervation of their bodies. But men have reaſon given them to crop or gather the fruits of eternall life, (as *Lactantius* ſaith) whereby it comes to paſs, that man only, amongſt ſo many creatures, hath ſenſe and underſtanding of divine things. Which *Cicero* thought to be known by that, becauſe man only had a certain knowledg of God in his mind. Wherefore he was inriched by God with reaſon, ſpeech and hands as helps for the performance of all his actions; moreover by his ſingular and almoſt divine wit he eaſily excels all brute beaſts. For firſt, reaſon being his guide, he invented things neceſſary for life, fitly impoſed names on the things invented befitting their natures, framed letters and Characters, invented all liberall Arts and handy-crafts, and found means to meaſure the Land and Sea. He hath obſerved and drawn into an Art the ſpaces of the Celeſtiall Globe, the diſtinctions of the Stars, the changes and orders of dayes and nights, of times and ſeaſons, the riſing and ſetting of Stars, and their power and effects over theſe lower bodies. Laſtly, he records in writing to perpetuall memory that which concerns his own nature, or the nature of other things, the precepts and ordinances of life and manners: by which ſingular gift, we can now confer with *Socrates*, *Plato*, *Ariſtotle*, and other Philoſophers of ancient times, as if they were living.

Mans bears Gods image.

Man hath given names to things.

What benefit man hath by reaſon of his native nakedneſs and ignorance.

BUt as Mans body is by nature naked and unarmed, ſo is his mind like a ſmooth table in which nothing is painted, nothing graven; but for help of his nakedneſs he hath hands, and for ſupply of his ignorance, reaſon and ſpeech. And by theſe three being as it were the miniſters of infinite variety of things, he clothes and defends his body with all things needfull: and inriches his mind with the knowledg of Arts and Sciences. Now if he had certain weapons born with him, he ſhould uſe them only; if he ſhould be born skilfull in any Art, he would meddle with none elſe. Therefore becauſe it was more expedient to uſe all ſorts of weapons with the hand, and be skilfull in all Arts; therefore he muſt be born wanting and ignorant of all. *Ariſtotle* very wittily called the hand the inſtrument of inſtruments: in imitation of which ſpeech, one may rightly affirm, that reaſon is the

Gal. cap. 4. lib. 1. de ſa partium.

As the hand is the inſtrument of inſtruments ſo reaſon is the art of arts.

Art

Art of Arts: for as the hand in worth exceeds the other instruments, because it can make, handle and fit them for use; so reason and speech, though names of no Art, yet comprehend and encrease all Arts. Therefore man seeing he hath his mind instructed by Art, that is, by reason; it is fit he should have his body defended with a weapon, or instrument, that is, the hand, which in agility and excellency should excell all other instruments. For so Man hath of his hands in stead of all weapons, which he may use in war and peace as the instruments of all Arts; he wants not the Buls horns, the Boars tuskes, the horses hoofs, nor to conclude, any arms of any other Beast. For by the benefit of his hands he can handle other arms far more profitable and safe, as a Lance, Sword, Spear, halberd; but man also can use at some distance the bow, sling and handgun, when the horn and the hoof cannot be used but neer at hand. But some may say; A Lyon exceeds a man in swiftness of foot; what then? is man therefore inferiour to him? no, for by the means of his hands and the guidance of his reason he bridling and riding upon a horse, out runs the Lyon, and being victor follows him to and again as he himself pleases, or vanquished flies away, and from the horses back as from a tower wounds the Lyon with what weapons he pleases. To conclude, man is abundantly provided with means, to defend himself from the violence of all other beasts. For this purpose he doth not only harness himself as with brasen wals, but also makes ditches and bulwarks, he makes by the ministery of his hands all kind of weapons, weaves himself garments, casts into the water and draws forth nets to catch fish; and to conclude, he performs all things to his own contentment, and having that priviledge granted him by God, he rules over all the earth; all things which lye hid in the bowels of the earth, which go, or creep upon the earth, which swim in the Sea, and flie through the air, or are any where shut up in the compass of the skie, are in mans dominion.

Man under God is the king and Emperour of the world.

How wonderfull God hath shewed himself in making man.

GOds Deity and providence hath principally shewed it self in the creation of man; neither his so admired light hath so shone in the production of other creatures, seeing that God would have them to live and have their being only for mans sake, that they might serve him. Therefore man is, if we diligently consider all his endowments, a certain pattern and rule of the divine majesty and (if I may so say) Artifice. For being made to Gods image, he is as it were his coin, exceeding the capacity of all humane understanding. Which seemed a just reason to the ancient Philosophers, that he should be called *Microcosmos*, or a little world, because the particles of all things contained in the compass of heaven and earth, are contained in his mind and body, that in the mean time I may in silence pass over his soul more great and noble than the whole world.

Man is the end of all mundane things.

Man a little world, yea almost a great world.

Why Nature hath not given Man the faculty of prefaging.

THis seems the reason, that men by the instinct of nature do not foresee the future seasons & dispositions of the heaven & air; because, seeing they have received certain sparks of prudence from God, by whose care and guidance they are led to the knowledg of things by no deceitfull but certain judgment, being not obnoxious to the conditions and changes of times and seasons, as beasts are. Wherefore knowing all these airy changes to be placed under them, that is to say, their minds, according as occasion serves, and their minds desire, they give themselves to mirth when the air is wet, stormy and dark, and on the contrary, in a clear and fair season, to a sincere and grave meditation of things sublime and ful of doubt. But beasts accommodating themselves to that disposition of the air which is present and at hand, are lively, or sad, not from any judgment as men do, according to the temper and complexion of their bodies following the inclinations of the air, and of the humors one while diffused, another while contracted. Neither ought we to blame man, because he can imitate the voice of beasts, but rather much commend him, that he can infinitely wrest and vary one thing, that is, his voice; for men can bark like Foxes and dogs; grunt like hogs; whet and grind their teeth like boars; roare like Lyons; bellow like bulls; neigh like horses; knack their teeth like Apes; houl like Wolves; bray like Asses; bleat like Goats and Sheep; mourn like Bears, Pigeons, and Turtles; barke and gaggle like geese; hiss like Serpents; cry like Storks; caw like a Crow, and crow like Cock; clock like hens; chatter as Swallows and Pies; sing like Nightingales; croak like Frogs; imitate the singing of Waspes, and Humming of Bees; mew like Cats. The singing of Birds scarce seems to merit the name of Musicall, compared to the harmony of men fitted and tuned with infinit variety of voices. For with this they move the ears of Kings and Princes; provoke and temper their wrath, and carry their minds beyond themselves, and transforme them into what habits they please. But if these small beasts have any humanity, they owe it all to man. For he tames Lyons, Elephants, Bears, Tigers, Leopards, Panthers, and such other like.

Man is not obnoxious to the air and starrs.

One man will counterfeit the voices of infinite varieties of beasts.

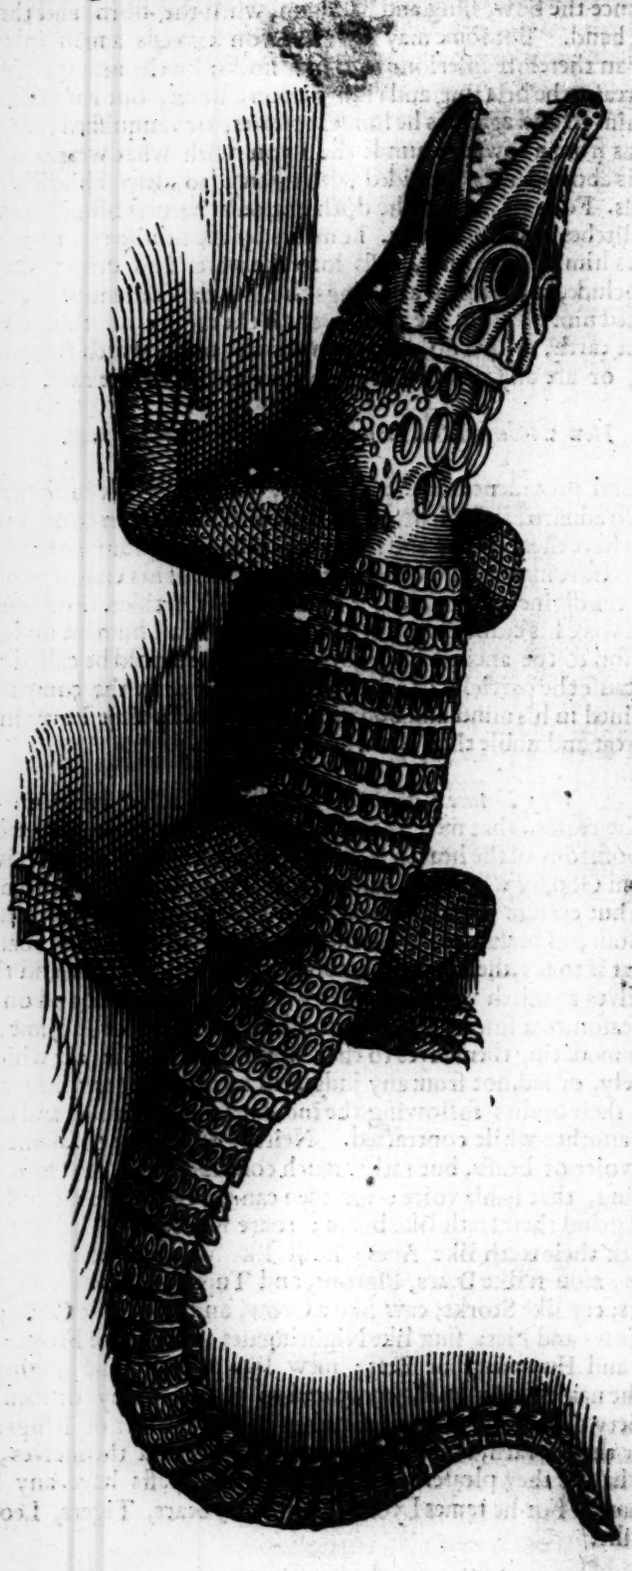
The power of Musick.

of

Of the Crocodile.

A tame Crocodile.

PLutarch reports of the Crocodile (whose figure is delineated) that being tamed, and taught by man, he doth not only hear mans voice, and answers to his call, but suffers himself to be handled, and opening his throat, lets his teeth be scratched and wiped with a towell. How small a part of Physick is that, which beasts are taught by nature? Certainly nothing in comparison of man, who by the study and practise of a few years can learn at his fingers ends all the parts of Physick: and practise them not only for his own, but also for the common good of all men. But why cannot beasts attain unto the know-



ledg of Physick so well as men? I think, because so great an Art as Physick is, cannot be attained unto by the dull capacities of Beasts.

But

But for that I have written of the Religion of Elephants, if I muſt ſpeak according to the truth of the matter, we cannot ſay they worſhip God, or have any ſenſe of the divine Majeſty. For how can they have any knowledge of ſublime things or of God, ſeeing they wholly following their food, know not how to meditate on celeſtiall things? Now for that they behold and turn themſelves to the Moon by night, and to the Sun in the morning, they do not that as worſhipping, or for that they conceive any excellency or divinity in the Sun; but becauſe nature ſo requiring and leading them, they feel their bodies to rejoyce in that light, and their entralls and humors to move and ſtir them to it. Therefore when we attributed religion to Elephants, we ſaid it rather popularly, than truly, and more that we might exhort men to the worſhip of God, than that we thought Elephants had any knowledg of divine worſhip implanted in their minds.

In what ſenſe we ſaid Elephants had religion.

That man may attain unto the knowledg of all voices and tongues.

THe docility of mans wit is ſo great, and facility of the body obeying that divine gift of wit ſuch, that he is not only able to learn to underſtand and ſpeak the tongues of divers nations differing in ſo many peculiar languages; and not only to imitate and counterfeit the voices of all beaſts though ſo much different from man, which many flattering and jugling companions, followers of other mens tables, will do; but alſo may be able to know and underſtand both what they pretend and ſignifie. In confirmation of which thing they cite the Philoſopher *Apollonius* moſt famous in this kind of ſtudy and knowledg. He walking on a time amongſt a company of his friends through the field, and ſeeing a Sparrow come flying and chirping much to divers other Sparrows ſitting upon a tree, is reported to have ſaid to thoſe which were with him: That bird which came flying hither, told the other in her language, that an Aſs laded with corn was fallen down at the City gate, and had ſhed the wheat upon the ground. Wherefore *Apollonius* and all his friends which minds were with him went thither to ſee whether it were ſo, and found that it was ſo, as he had told them, and obſerved that the Sparrows moved thereto by the coming of the other, were eating up the grains of Corn ſhed on the ground.

Man not only the imitater, but the interpreter of the voices of beaſts and birds.

But for Crows and Pies artificially taught to counterfeit mens voyces, it is too ſmall a thing, that for that cauſe they ſhould contend with men. For they have quickly babled all they have learnt with longer coſt and labour, tediouſly ſinging ſtill the ſame ſong: and whatſoever they prate they do it without ſenſe, underſtanding or any reaſon for what they ſay. But man alwayes contemplating ſomewhat more high, ſtill thinks of greater things than theſe preſent, and never reſts. But burning with an infinite and endleſs deſire of knowledg, he doth not only covet to know theſe things which appertain to food and cloathing, but by caſting up his eyes towards heaven, and by the light of his mind, he learns and underſtands things divine. Which is ſo certain an argument of the celeſtiall originall of our ſoul, that he which conſiders thoſe things can no wayes doubt, but that we have our minds ſeaſoned, by the univerſall divine underſtanding. But now it is time for us to ſet thait upon the deſcription of the body, the habitation and inſtrument of al the functions of divne mind.

The unquenchable deſire of learning in man.

The End of the ſecond Book.

The third Book,
TREATING
Of the Anatomy of MANS BODY.

THE Following the cuſtom and the manner of ſuch as before me have written of Anatomy, will firſt, (that I may make the minds of the Readers more attentive and deſirous of theſe ſtudies) declare how neceſſary it is, and alſo how profitable, and then ſhew the order to be obſerved in it, before I come to the particular deſcription of mans body.

The neceſſity of the knowledg of Anatomy.

Furthermore how Anatomy may be defined, and the manner of the definition of the parts. For the firſt, the knowledg of Anatomy ſeems in my judgment very neceſſary to thoſe that deſire to excell, or attain to perfection of Phyſick; that is, whereby they may be able to preſerve the preſent health of the body, and the parts thereof, and drive away diſeaſes. For how can either Phyſitian or Chirurgeon preſerve health by the uſe of the like things, which conſiſts in the temperament, conformation, and naturall union of the parts; or expell the diſeaſe which hurts thoſe three, by the like uſe of their contraries, unleſs he ſhall know the nature and compoſure of the body, and underſtand as by the rule of this knowledg, how much it ſwerves from the nature thereof? Wherefore it is excellently ſaid of *Hippocrates*; that the Phyſitian called to cure the ſick Patient, ought diligently to conſider, whether thoſe things that are in him, or appear to be in him, be like or unlike, that is, whether the Patient be like himſelf and his own nature in all his parts and functions, temperature, compoſure and union; that he may preſerve thoſe which are yet contained in the bounds of nature, and reſtore thoſe that are gone aſtray. Which thing *Galen* hath alſo confirmed, ſpecially where he ſaith, he muſt wel know the nature and ſtructure or compoſure of the bones, who takes upon him to reſtore them broken or diſlocated to themſelves and their proper ſeats or places. Moreover ſeeing that healing doth not only conſiſt in the knowledg of the diſeaſe, but as well in preſcribing fit medicines and like application of them to the body and the parts thereof, all which by their naturall diſſimilitude, do require unlike medicines, according to *Galens* opinion: I prethe tell mee, who can perform this, which is ignorant of the deſcription of the whole and the parts thereof, taught by Anatomy? We may ſay the like of the Apothecary, who ignorant of the ſituation of the parts in the body cannot apply Emplaiſters, Ointments, Cataplaſms, Fomentations, Epithemes, bags to the fit places, as to the ſutures of the skull, to the Heart, Liver, Stomach, Spleen, Reins, Wombe or Bladder. For example, let us imagine the Liver to be troubled with a hot diſtemperature, but on the contrary, the ſtomach with a cold (which commonly happens, ſeeing the Liver hotter than it ought to be, ſends up many vapours to the head, from whence cold humors fall into the ſtomach) if hot things to be applied to the ſtomach by the Phyſitians preſcription, be by the Apothecary making no difference, applied both to the ſtomach and neighboring Liver (which may chance if he be ignorant that the ſtomach bends ſomewhat to the left ſide under the breaſt-blade; but the liver ſo takes up the right ſide of the body that with a great part thereof, it covers almoſt all the ſtomach) will not he much offend by increaſing the hot diſtemper of the liver, and not thereby giving eaſe, or help to the diſeaſe? Shall not by this his ignorance, the Patient be fruſtrated of his deſire, the Phyſitian of his intent, and the medicine of its effect? By theſe examples I think it moſt manifeſt, that the Anatomicall knowledg of the parts of the body is exceeding neceſſary to all Phyſitians, Chirurgeons, and Apothecaries, who will practiſe Phyſick with any praiſe to the glory of God, and the benefit and good of man, for whoſe ſake we have writ theſe things, and illuſtrated them by figures, ſubjecting the parts to the eye, and fitly put them in their proper places.

Initio lib. de Offic. medici.

Lib. de oſſibus.

1. de loc. affect. & lib. 3. Meth.

Why when the liver is hot the ſtomach is commonly cold.

The Knowledg of Anatomy, is commodious four manner of wayes.

But Anatomy is commodious four manner of wayes; the firſt is, becauſe thus we are led to the knowledg of God the Creator, as by the effect to the cauſe; for as we read in St. *Paul*, The inviſible things of God are made manifeſt by the viſible. The ſecond is, that by means hereof we know the nature of mans body, and the parts thereof, whereby we may more eaſily and certainly judg and determine of ſickneſs and health. The third is, that by the knowledg of the body and its parts, and together therewith its affections and diſeaſes, we may prognoſticate what is to come, and foretell the events of diſeaſes. Laſtly, the fourth is, that conſidering the nature of the diſeaſed part, we may fitly preſcribe medicines, and apply them in their due places.

There is a threefold method.

Now we muſt declare in what order Anatomy may be fitly delivered; but firſt we muſt obſerve there is a threefold Method; The firſt is called of Compoſition, being very commodious for the teaching of Arts, which *Ariſtotle* hath uſed in his Works of Logick, and naturall Philoſophy, the order and beginning taken from the leaſt and moſt ſimple to the more compound. The ſecond of Diviſion, fit for the inventing or finding out of ſciences. *Galen* hath followed this order in his Books of Anatomicall Adminiſtrations,

and

and of the use of the parts. The third of Definition, which sheweth the nature and essence of things, as appears by *Galen* in his Book *De Arte Parva*. And because this order doth also prosecute the divisions, therefore it is commonly accustomed to be comprehended in the compass of the second. Therefore I will follow this in my Anatomicall Treatise, dividing mans body into its parts, which I will not only subject to the eye in the way of knowing them, but also to the mind in the faithfull understanding them. For I will adjoyn those things that are delivered of them by *Galen* in his Book of Anatom. Administrations, with those which he hath taught in his Books of the use of the parts. For there he fitly laies the parts of mans body before our eyes, to the sense. But here he teaches to know them, not to see them; for he shews why, and for what use they are made. Having briefly handled these things, we must declare what Anatomy is; that as *Cicero* saith out of *Plato's Phædro*, it may be understood of what we dispute. And because we attain that by definition (which is a short and plain speech, consisting of the *Genus* and difference of the things defined, being the essentiall parts, by which the nature and essence of the thing, is briefly and plainly explained) first we define Anatomy, then presently explain the particular parts of the definition.

The Authors intent.

Wherefore Anatomy, (if you have regard to the name) is a perfect and absolute division, or artificiall resolution of mans body into its parts, as well generall as particular, as well compound as simple. Neither may this definition seem illegitimate, specially amongst Physitians and Chirurgeons. For seeing they are Artizans humiliated to the sense, they may use the proper and common qualities of things for their essentiall differences and forms. As on the contrary, Philosophers may refuse all definitions as spurious, which consist not of the next *Genus* and the most proper, and essentiall differences. But seeing that, through the imbecillity of our understanding, such differences are unknown to us, in their places we are compelled in defining things, to draw into one many common and proper accidents, to finish that definition which we intend, which for that cause we may more truly call a description, because for the matter and essentiall form of the thing, it presents us only the matter adorned with certain accidents. This appears by the former definition, in wich *Division* and *Resolution* stand for the *Genus*, because they may be parted into divers others, as it were into *species*. That which is added over and besides, stands in place of the difference, because they separate and make different the thing it self from all other rash and unartificiall dissections. We must know an artificiall division, is no other than a separation of one part from another, without the hurt of the other, observing the proper circumscription of each of them; which if they perish or be defaced by the division, it cannot be said to be artificiall; and thus much may suffice for the parts of the definition in generall.

What Anatomy is.

How a definition differs from a description.

For as much as belongs to the explication of each word; we said *of Mans body*, because as much as lies in us, we take care of, preserve the health, and depell the diseases thereof, by which it may appear that mans body is the subject of Physick, not as it is mans, or consists of matter and form, but as it is partaker of health and sickness.

The subject of Physick.

We understand nothing else by a part, according to *Galen*, than some certain body, which is not wholly disjoined, nor wholly united with other bodies of their kinds; but so that, according to his opinion, the whole being composed therewith, with which in some sort it is united, and in some kind separated from the same, by their proper circumscription. Furthermore by the *parts in generall*, I understand the head, breast, belly, and their adjuncts. By the particular parts of those, I understand, the simple parts, as the similar, which are nine in number, as a gristle, bone, ligament, membrane, tendon, nerve, vein, arterie, musculous flesh; some add fibers, fat, marrow, the nails and hairs; other omit them as excrements; but we must note that such parts are called simple, rather in the judgment of the sense, than of reason. For if any will more diligently consider their nature, they find shall none absolutely simple, because they are nourished, have life and sense, either manifest or obscure, which happens not without a nerve, vein, and artery.

Gal. lib. 1. de usu part. lib. 1. Meth.

The similar parts are nine.

But if any shall object, that no nerve is communicated to any bone, except the teeth; I will answer, that nevertheless the bones have sense by the nervous fibers, which are communicated to them by the *Periosteum*, as by whose mediation the *Periosteum* is connext to the bones, as we see it happens to these membranes, which involve the bowels. And the bones, by this benefit of the animall sense expell the noxious and excrementitious humors from themselves into the spaces between them and the *Periosteum*, which as indued with a more quick sense, admonisheth us, according to its office and duty, of that danger which is ready to seise upon the bones, unless it be prevented. Wherefore we will conclude according to the truth of the thing, that there is no part in our body simple, but only some are so named and thought, according to the sense; although also otherwise some may be truly named simple, as according to the peculiar and proper flesh of each of their kinds. Those parts are called compound which are made or composed by the mediation, or immediately of these simple, which they term otherwise organicall, or instrumentall; as an arm, leg, hand, foot, and others of this kind.

How the bones come to feel.

The compound, or organicall parts.

And here we must observe, that the parts are called simple and similar, because they cannot be divided into any particles but of the same kind; but the compound are called

dissimilar from the quite contrary reason. They are called instrumentall and organicall, because they can perform such actions of themselves, as serve for the preservation of themselves and the whole; as the eye of it self, without the assistance of any other part, seeth, and by this faculty defends the whole body, as also it self. Wherefore it is called an instrument or organe, but not any part of it, as the coats, which cannot of it self perform that act.

Four particles to be observed in each organicall part.

Whereby we must understand, that in each instrumentall part we must diligently observe four proper parts. One by which the action is properly performed, as the Crystalline humor in the eye; another without which the action cannot be performed, as the nerve and the other humors of the eye. The third, whereby the action is better and more conveniently done, as the tunicles and muscles. The fourth, by which the action is preserved, as the eye-lids and circle of the eye. The same may be said of the hand, which is the proper instrument of holding; for it performs this action, first, by the muscle, as the principall part; Secondly, by the ligament, as a part without which such action cannot be performed; Thirdly, by the bones and nails, because by the benefit of these parts, the action is more happily performed; Fourthly, by the veins, arteries and skin, for that by their benefit and use, the rest, and so consequently the action it self is preserved.

Four sorts of instrumentall parts.

But we must consider, that the instrumentall parts have a fourfold order. They are said to be of the first order, which are first and immediately composed of the simple, as only the authors of some one action, of which kinds are the muscles and vessels. They are of a second which consist of these first simple, and others besides, as the fingers. They are counted of the third rank, which are composed of parts of the second order and some besides, as the hand taken in generall. The fourth order is the most composed, as the whole body, the organ and instrument of the soul. But you must observe, that when we say the muscles and vessels are simple parts, we refer you to the sense and sight, and to the understanding, comparatively to the parts which are more compound; but if any consider their essence and constitution, he shal understand they are truly compound, as we said before. Now it remains, that we understand,

Nine things to be considered in each part.

that in each part, whether simple or compound, nine things are to be considered, as substance, quantity or magnitude, figure, composition, number, connexion, (by which name, we also understand the originall and insertion) temperature, action, and use; that by the consideration of these things, every one may exercise the art of Physick, in preserving health, curing diseases, or foreseeing their events and ends.

Why the three principall parts are so called.

But also we must note, that of the organicall parts, there be three, by whose power the body is governed; which for that cause they call regent and principall, because they govern all the rest; they are the liver, heart, and brain. But they are called principall, not only, because they are necessary for life, (for the stomach, wind-pipe, lungs, reins, bladder, and such like parts perhaps are equally as necessary for life) but because from each of these three, some force, power, and faculty, or also matter necessary for the whole body, flow over all the body, when no such thing proceeds from the rest of the parts. For from the liver a matter fit for nourishment, is distributed by the veins through all the body; from the heart the vitall force diffused by the arteries, imparts life to the whole body; from the brain by the nerves a power or faculty is carried through all the parts of the body, which gives them sense and motion.

Lib. de Arte medica.

Galen would have the Testicles to be of this kind, not for the necessity of the individuall, or peculiar body, but for the preservation of the *Species* or kind. And moreover in his book *de Semine* comparing the Testicles with the Heart, hee makes them the more noble by this reason, that by how much it is better to live wel and happily, than simply and absolutely to live, by so much the testicles are more excellent than the heart, because with them we may live well & pleasantly, but with this simply live, as we see by the example of Eunuches, and such as are gelt, by which the Testicles seem rightly to be accounted amongst the principal parts; for nature seeing it desired, that this its work should be immortal, for the attaining of that immortality which it intends, frames those parts, like as prudent founders of a City, who do not only procure to furnish their City with many Inhabitants, so long as they are in building it, but also that it may remain in the same state and condition for ever, or at least for many ages. And yet notwithstanding of so many cities built in the first memory of

The use and function of the parts serving for generation.

man, there remains none, whose fame and state, together with the builders name, is not decayed and perished. But this humane work of nature, stands yet secure for this many thousand of years, and shal endure hereafter, because it hath found a way, by which every one may substitute another in his place before he depart. Hence it is that all creatures have members fit for generation, and pleasures inserted in those members, by which they might be inticed to mutuall embraces and copulations. But the mind, which hath dominion over those members hath an incredible desire of propagating the issue, by which also brute beasts incited, desire to propagate their kinds for ever. For seeing that nature understands all these her works considered particularly by themselves, are frail and mortall, it hath done what it could to recompence that fatall necessity of dying, by a perpetuall succession of individualls.

Hitherto we may seem to have aboundantly shewed what necessity of knowledg in Anatomy belongs to all Artizans in Physick, and also what order is to be observed in the same.

ſame. And laſtly, how it is defined, and the reaſon of the parts of the definition. Wherefore it remains that we proſecute what we have taken in hand: which is, that we ſhew and declare how to know all and every the parts of mans body, how many, and what they be, and to underſtand wherefore they be. For although the true knowledg of Anatomy may be perfected by the ſight of the ey, and touching and handling each part with the hand, yet nevertheleſs the labor of deſcribing Anatomy is not unprofitable. For by reading, ſuch as have often exerciſed themſelves in the diſſecting of mens bodies, may refreſh and help their memories, and ſuch as have not, may make plain and eaſie the way to the underſtanding of diſſections.

CHAP. I.

The diviſion or partition of mans Body.

BY reaſon the partition of Mans body can hardly be underſtood, if the diſtinction of the proper faculties of the ſoul be not underſtood, for whoſe cauſe the body enjoys that form (which we ſee) and diviſion into divers inſtruments; Therefore I thought good in few words to touch that diſtinction of the faculties of the ſoul, for the better underſtanding of the partition of the body which we intend. Wherefore the ſoul, the perfection of the body, and beginning of all its functions, is commonly diſtinguiſhed, and that in the firſt and generall diviſion, into three faculties, which are the Animall, Vitall, and Naturall. But the Animall is divided into the principall, ſenſitive, and motive; Again the Principall is diſtinguiſhed into the imaginative, reaſonable, and memorative: And the Senſitive into ſeeing, hearing, ſmelling, taſting, and touching: But the Motive into progreſſive and apprehenſive. And the Vital is divided into the dilative and contractive faculty of the heart and arteries, which we know or underſtand by the pulſifick faculty. But the Naturall is parted into the nutritive, auctive, and generative faculties, which three perform their parts by the help and miniſtery of five other faculties, which are, the attractive, retentive, concoctive, aſſimilative, and expulſive.

What the ſoul is, and with how many faculties it is endued.

After the ſelf-ſame manner, the organ or inſtrument of the ſoul, to wit, Mans body, at the firſt diviſion is diſtinguiſhed into three parts, which from their office they call Animall, Vitall, and Naturall. Theſe again, according to the ſubdiviſion of the ſubalternall faculties, are divided particularly into other parts; ſo that any one may know the organ of each faculty, by the property of the function. For while other Anatomiſts divide mans body into four univerſall and chief parts, they diſtinguiſh from the three firſt, thoſe which they call the Extremities; neither do they teach to what rank of the three prime parts each extremity ſhould be reduced. From whence many difficulties happen in reading the writings of Anatomiſts; for ſhunning whereof, we will proſecute, as we have ſaid, that diſtinction of mans body, which we have touched before.

All the parts of mans body are diſtinguiſhed into three.

Wherefore, as we ſaid before, mans body is divided into three principall and generall parts, Animall, Vitall, and Naturall. By the Animall parts, we underſtand not only the parts pertaining to the head, which are bounded with the crown of the head, the collar-bones, and the firſt *Vertebra* of the breaſt, but alſo the extremities, becauſe they are organs and inſtruments of the motive faculty; *Hippocrates* ſeems to have confirmed the ſame, where he writes; Thoſe who have a thick and great head, have alſo great bones, nerves, and limbs. And in another place he ſaith, thoſe who have great heads, and when they ſtoop ſhew a long neck, ſuch have all their parts large, but chiefly the Animall. Not for that *Hippocrates* would therefore have the head the beginning and cauſe of the magnitude and greatneſs of the bones and the reſt of the members; but that he might ſhew the equality and private care or government of nature, being moſt juſt and exact in the fabrick of mans body, as if ſhe hath well framed the head, it ſhould not be unlike that ſhe idly or careleſſly neglected the other parts which are leſs ſeen. I thought good to dilate this paſſage, leſt any might abuſe that authority of *Hippocrates*, and gather from thence, that not only the bones, membranes, ligaments, griſles, and all the other animall parts, but alſo the veins and arteries depend on the head as the originall. But if any obſerve this our diſtinction of the parts of the body, he will underſtand we have a far other meaning.

What parts are here called Animall.

Lib. 6 Epidem.

By the Vitall parts, we underſtand only the heart, arteries, lungs, winde-pipe, and other particles annexed to theſe. But by the Naturall, we would have all thoſe parts underſtood which are contained in the whole compaſs of the *Peritoneum* or Rim of the body, and the proceſſes of the *Erythroides*, the ſecond coat of the Teſticles. For as much as belongs to all the other parts, which we call containing; they muſt be reckoned in the number of the Animall, which notwithſtanding, we muſt thus divide into principall, ſenſitive, and motive; and again, each of theſe in the manner following. For firſt, the principall is divided into the imaginative, which is the firſt and upper part of the brain, with its two ventricles and other annexed particles; into the reaſoning, which is a part of the brain, lying under the former, and (as it were) the top thereof, with its third ventricle; into the memorative, which is the *cerebellum* or afterbrain, with a ventricle hollowed in its ſubſtance. Secondly, the Senſitive is parted into the viſive, which is in the eys; the auditive, in

What parts are called Vitall.

The diviſion of the animall parts.

the ears; the ſmelling, in the noſe; the taſting, in the tongue and palate; the tactive, or touching which is in the body, but moſt exquiſite in the skin which inveſts the palms of the hands. Thirdly, the motive is divided into the progreſſive, which intimates the legs, and the comprehenſive, which intimates the hands. Laſtly, into ſimply motive, which are three parts, called bellies, for the greateſt part terminating and containing; for the vitall, the inſtrument of the faculty of the heart, and dilatation of the arteries, are the direct or ſtreight fibers, but of the conſtrictive the tranſverſe; but the three kinds of fibers together, of the pulſifick; or if you pleaſe you may divide them into parts ſerving for reſpiration, as are the lungs, and weazon, and parts ſerving for vitall motion, as are the heart and arteries, furniſhed with theſe fibers, which we formerly mentioned. The diviſion of the naturall parts remains, which is into the nouriſhing, auctive and generative, which again are diſtributed into attractive, univerſall, and particular; retentive, concoctive, diſtributive, aſſimilative, and expulſive. The attractive, as the gullet and upper orifice of the ventricle; the retentive, as the *Pylorus* or lower paſſage of the ſtomach; the concoctive, as the body of the ventricle, or its inner coat; the diſtributive, as the three ſmall guts; the expulſive, as the three great guts; we may ſay the ſame of the liver, for that draws by the meſaraick and gate veins, retains by the narrow orifices of the veins diſperſed through the ſubſtance thereof; it concocts by its proper fleſh; diſtributes by the hollow vein, expels by the ſpleen, bladder of the gall and kidnies. We alſo ſee the parts in the teſticles divided into as many functions; for they draw by the preparing veſſels; retain by the various crooked paſſages; in the ſame veſſels they concoct the ſeed by the power of their proper ſubſtance and faculty; they diſtribute by the ejaculatory, at the glandules called *Proſtatæ*, and the horns of the wombe, ſupplying the place of proſtates; laſtly, they expell or caſt forth by the proſtates, horns, and adjoining parts. For as much as belongs to the particular attraction, retention, concoction, diſtribution, aſſimilation of each part, that depends of the particular temper, and as they term it, occult property of each ſimilar and ſimple part. Neither do theſe particular actions differ from the univerſall, but that the generall are performed by the aſſiſtance of the three ſorts of fibers, but the ſpecial by the ſeverall occult property of their fleſh, ariſing from their temperature, which we may cal a ſpecifick property. Now in the compoſition of mans body, nature principally aims at three things. The firſt is, to create parts neceſſary for life, as are the heare, brain, and liver. The ſecond, to bring forth other for the better & more commodious living, as the eyes, noſe, ears, arms and hands. The third is, for the propagation and renewing the *ſpecies* or kind, as the privie parts, teſticles, and wombe. And this is my opinion, of the true diſtinction of mans body, furniſhed with ſo many parts, for the performance of ſo many faculties; which you, if you pleaſe, may approve of and follow. If not, you may follow the common and vulgar, which is, into three bellies, or capacities, the upper, middle, lower, (that is, the head, breſt and lower belly) and the limbs or joints. In which by the head we do not underſtand all the Animall parts, but only thoſe which are from the crown of the head to the firſt *vertebra* of the neck, or to the firſt of the back, if according to the opinion of *Galen*, *Lib. de oſſibus*, where he makes mention of *Enarthroſis* and *Arthrodia*, we reckon the neck amongſt the parts of the head. By the breſt, whatſoever is contained from the coller bones to the ends of the true and baſtard, or ſhort ribs, and the midriffe. By the lower belly, the reſt of the trunck of the body, from the ends of the ribs to the ſhare-bones; by the limbs, we underſtand the arms and legs. We will follow this diviſion in this our Anatomicall diſcourſe, becauſe we cannot follow the former in diſſecting the parts of mans body, by reaſon the Animall parts are mutually mixed with the vitall and naturall, and firſt of the lower belly.

The diviſion of the vitall parts.

The diviſion of the naturall parts.

The vulgar diviſion of mans body.

Why the belly is not bony.

Nature would not have this lower belly bony, becauſe the ventricle might be more eaſily dilated by meat and drink, children might grow the better, and the body be more flexible. It is convenient we begin our Anatomical adminiſtration from this, becauſe it is more ſubject to putrefaction than the reſt, both by reaſon of its cold and moiſt temperature, as alſo by reaſon of the feculent excrements therein contained. Yet before we go any further, if the Anatomicall adminiſtration muſt be performed in publick, the body being firſt handſomely placed, and all the inſtruments neceſſary for diſſection made ready, the belly muſt be divided into its parts, of which ſome contain, and other ſome are contained.

The diviſion of the lower belly.

They are called containing, which make all that capacity which is terminated by the *Peritoneum* or Rim of the belly. The upper part whereof is bounded by *Galen* within the compaſs of the direct muſcles, and by a generall name is called *Epigaſtrium*, or the upper part of the lower belly. That again is divided into three parts, that is, into that which is above the navil, and which carries the name of the whole, into that which is about the navil, and is called the umbilicall or middle part; and laſtly, into that which is below the navill, called the *Hypogaſtrium*, or the lower part of the lower belly.

The *Hypochondria*.

In every of which three parts there be two laterall, or ſide parts to be conſidered, as in the *Epigaſtrium*, the right and left *Hypochondria*, which are bounded above and below, in the compaſs of the midriffe, and the ſhort ribs. In the umbilicall the two *Lumbares* (ſome call them *Latera* ſides) which on both ſides from the loweſt parts of the breſt, are drawn to the flanks or hanch-bones; in the *Hypogaſtrium*, the two *Ilia*, or flanks, bounded with

with the hanch and ſhare-bones. Neither am I ignorant, the *Ilia*, or flanks, which the Greeks call Λαγόνες ſignifie all the empty parts, from the ends of the ribs, even to the hanch-bones, whereupon they alſo call them Κενεῶνες, as if you ſhould ſay empty ſpaces, becauſe they are not encompaſſed with any bone. Yet I thought good that this doctrine of dividing the belly ſhould be more diſtinct, to call the parts which are on each ſide the navell *Lumbares*, and thoſe on the lower part of the lower belly *Ilia*, flanks. But we muſt obſerve that the Ancients have been ſo diligent in deciphering the containing parts, that as exactly as might be, they deſigned the bowells contained in the belly, which being divers lie in ſundry places; for the greater portion of the liver lies under the right *Hypochondrium*; under the left almoſt all the ventricle and ſpleen. Under the *Epigaſtrium* the lower orifice of the ventricle, and the ſmaller portion of the liver; In the *Lumbares*, or ſides, in the right and upper part the right kidney, in the lower part towards the flanck, the blind gut; in the middle part thereof the colick and empty guts. In the upper part of the left ſide lies the left Kidney, in the middle part, the reſt of the empty and colick guts. Under the region of the navell, lies the girdle or upper part of the kall, the colick gut thruſting it ſelf alſo through that way. Under the *Ilia*, or flanks, the right and left, lie the greater part of the gut Ileon, the horns of the women big with child, and the ſpermatick veſſels in men and women. Under the *Hypogaſtrium* in the lower part lies the right, or ſtrait gut, the bladder, womb, and the reſt of the kal.

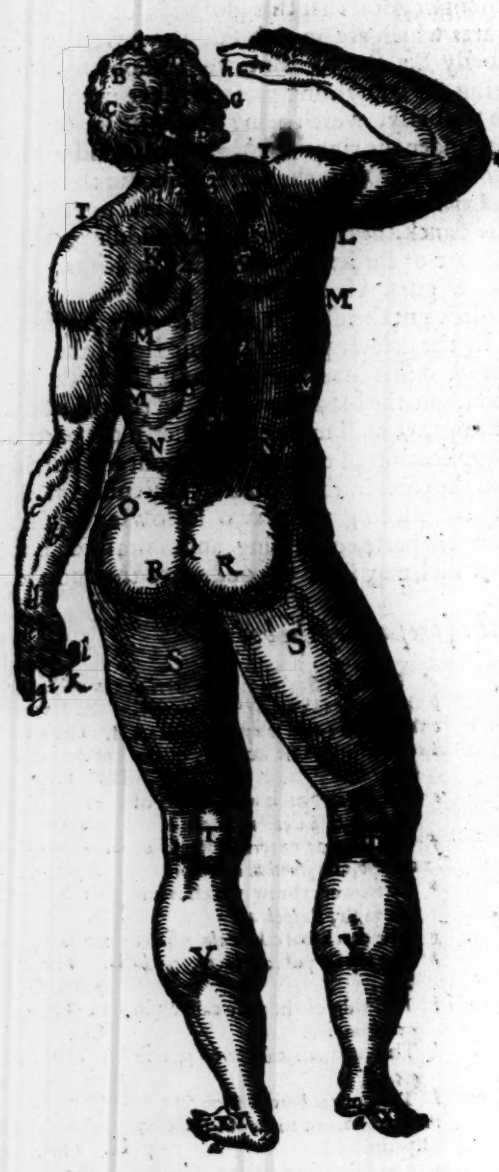
If we know, and well underſtand theſe things, we ſhall more eaſily diſcern the parts affect by the place of the pain, and cure it by fit application of remedies, without the hurting of any part. The diſtinction of ſuch places, and the parts in thoſe places, as ſeeming moſt profitable, I have thought good to illuſtrate by the placing theſe two following figures, in which thou haſt deciphered, not only the foreſaid parts, containing, and contained, but alſo of the whole body, and many other things which may ſeem to conduce to the knowldge of the mentioned parts. The Figures are theſe.

A moſt certain note of the part affected by the place where the pain is.

The Figure ſhewing the foreparts of the body.

A The hairy Scalp, cald τὸ χαιτῶδες.
b the forehead cald *Frons* μέτωπον.
c the temples cald *tempora*, κρόταφοι
From *b* to *d* The compaſs of the face.
e The greater or inward corner of the eyes, cald *Canthus internus*.
f The leſſer or externall angle of the eye, cald *Canthus externus*.
* The lower eybrow which is immovable, *Palpebra*.
g The cheek-bal cald *mala*, μῆλα.
h The cheek-puf cald *buccæ*, γνάθοι;
i The ridg of the noſe cald *Naſus externus*, ῥὶς.
k The noſthrils cald *nares*, μυκτῆρες.
l The outward ear, *auris externa*.
m The mouth made of the two lips, *Os*.
n The chin called *mentum*, γένειον.
o The neck, *collum*, αὐχὴν and τράχηλος.
From *o* to *e* the pillar of the neck, *truncus* and ὄλμος.
pp The hollow of the neck, called *jugulí*, σφαγαὶ.
qq The patel bones, *claves*, κλεῖδες.
r The cheſt, *pectus*, στέρνον.
ſ The right breſt.
ſſ The left breſt: to this Region we apply cordiall *Epithemations* moiſt and dry.
tt The nipples of the breſts, *papillæ*, θηλαὶ.
u The trench of the heart which the Ancient called κοιλία. The Latines *ſcrobiculus Cordis*. This part is anointed for the mouth of the ſtomach.
From *u* to *E*, the lower belly, γαστὴρ.
X The *Epigaſtrium* or upper part of the lower belly.
yy The *Hypochondria* or *Præcordia*.
* The outward Liver-remedies are applied to this place.
z The region of the navill, called *umbilicalis*, or the middle part of the lower belly.
A. The navill *umbilicus*. The root of the belly ὀμφαλὸς.
BB. The ſide *Latera*, πλευραὶ. and in our Author *Lumbi ſeu Lumbaria regio*.
C. *Hypogaſtrium*, the water-courſe, *Aqualiculus*, the lower part of the lower belly, ἧτρον.
DD. The flanks called *Ilia*, and λαγόνες.
E. The Groin called *pubes* or *pectenis* ἅλις κτενὸς.
FF. The Leske cald *inguen* where thoſe tumors are cald *Bubones*.
G. The yard with the fore-skin, *penis cum præputio*.
H. The ſtones or teſticles, with the cod or *ſcrotum*.
II. The ſhoulders, *humeri*, ὦμοι.
KK. The arms *Brachia*, βραχίονες.
L. The bowt of the arm, called *Gibber*, ἀγκὼν.
M. The outſide of the lower part of the arm called *cubitus*, πῆχυς.
N. The wriſt called *Brachiale*, καρπὸς.
O. The after wriſt *poſtbrachiale*, μετακάρπιον.
P. The Palm called *Palma* or *vola manus* θέναρ.
Φ The back of the hand, *Dorſum manus*, ὀπισθέναρ.
QQ. The fore and middle part of the thigh, where we apply cupping-glaſſes to bring down womens courſes. μηρὸν.
RR. The knee, *genu*, γόνυ.
SS. The leg, *tibia*, κνήμη.
TT. The calf of the leg, *ſura*, γαστροκνήμιον.
VV. The inſtep, *tarſus*.
XX. The top of the foot, *Dorſum pedis*, πρόσθιοι πόδες.
YY. The inner Anckles, σφυρὰ.
ZZ. The outward anckles, αα the toes of the feet, ββ the place under the inward anckle, where the vein called *Saphena* is opened.

The figure of the back-parts of a Man.



A. The forepart of the head, *ſinciput*, βρεγμα.
B the top or crown of the head, *vertex*, κορυφη.
C. the hinder-part of the head, *occiput*, ζοτις τῆς ἰνιὸν.
From D. to D. the face, *facies*, ὄψις πᾶν.
E. the eybrows, *ſupercilia*, ὀφρῦς.
F. the upper eylid, βλέφαρον.
G. the tip of the noſe, called *globulus naſi*.
H. the back-part of the neck, called *cervix*, αὐχὴν, and the nuke or nape of the neck. There is a hollowneſs at the top of this *cervix*, where we apply Scarons.
I. the back-part of the ſhoulder top, called *axilla*, ἀμὸς.
KK. the ſhoulder blades, *ſcapula*, ὦμοπλάτη.
1,2,3. On this place we ſet Cupping-glaſſes.
4,5,6,7. the back, *dorſum*, νῶτον.
8, 9. the ridg, *ſpina dorſi*. ῥάχις.
L. the armhole, *ala*, μασχάλη.
* The elbow, *gibber brachii*.
M M M M. the ſides, *latera*.
N N. the loins, *lumbi*, or the region of the kidneys, ὀσφύες.
O O. the place of the hips, *coxendices*, where we apply remedies for the Sciatica.
P. the place of the Holy bone, or *Os ſacrum*, where we apply remedies in the diſeaſes of the right gut.
Q. the place of the rump or *Coccyx*.
R R. the buttocks, νάτες, γλοῦτοι.
S S. the back parts of the thigh, *femora*.
T T. the ham, *poplus*, ὀκλὰς.
V V. the calf of the leg, *ſura*.
X X. the foot, or *parvum pes*, πούς.
Y Y. the outer ankle, *malleolus externus*.
Z Z. the heel, *calx*, or *calcaneus*, πτέρνα.
a a. the ſole of the foot, *plantæ pedis*, πέλμα τοῦ ποδός.
b. the inſide of the lower part of the arm, called *ulna*, ὠλένη.
c. the out ſide of the ſame, *cubitus*, πυγών.
d d. the wriſt, *carpus*.
e e. the back-part of the hand, *dorſum manus*, *f*. the forefinger, *index*, δείκτης. *b*. the thumb, *pollex*, ἀντίχειρ.

CHAP. II.

Of the containing parts of the Epigaſtrium, and the preparation to Anatomicall adminiſtration.

The containing parts of the lower belly.

THe containing parts of the *Epigaſtrium*, are the *Epidermis*, or thin outward skin; the true skin; the fleſhy or fatty Pannicle; the eight muſcles of the *Epigaſtrium*, with their common coat; the Rim of the belly; the five vertebra's of the loins; all the holy-bone, the haunch-bone, ſhare-bone, the white line and midriff. Of theſe parts, ſome are common to the whole body, as the three firſt; the other proper to the parts contained in the *Epigaſtrium* taken in generall. Which that you may ſee in their order, firſt you muſt cut round about the navell, to the upper ſuperficies of the muſcles, that ſo we may keep it, till ſuch time, as occaſion ſhall offer it ſelf, to ſhew the umbilicall veſſels lying in that place, which are one vein, two arteries, and the *Urachus* (if it be there.) Which being done, you muſt draw a ſtreight line from the cheſt, over the breſt-blade, even to the ſhare-bone, which may divide the common-containing parts, even to the white line.

Then preſently it will be convenient to draw two other lines acroſs or overthwart, of the like depth on each hand, from the circumference of the navell, even to the ſides, that ſo on each part we may draw the skin more commodiouſly from the parts lying under it; the ſight of which otherwiſe it would hinder. Theſe things being done, the skin muſt be

be divided from the parts lying under it from the designed circumference left about the navell. We must teach how the skin is twofold, the true and false, and render a reason of the name, which we will every where do, as far as the thing will suffer, and it shall lye in our power. And in doing or examining these things, it will be convenient diligently to enquire into the nine things mentioned in the Preface. We will begin with the Skin, because that part is first obvious to our senses.

CHAP. III.

Of the utmost Skin or Cuticle.

THE skin being the first part, and spred over all the body, is twofold, that is, the true and bastard skin: The true is called by the Greeks, *Derma*, which may almost every where be pulled from the parts lying under it, which it invests; except in the face, ears, the palms of the hands, soles of the feet, fingers, and privities, where it sticks so close that it cannot be separated.

The skin twofold

From what parts the skin cannot be separated.

The bastard (which first of all we will declare, because it first presents it self to our sight) is by the Greeks called *Epidermis*, because it covers the true skin, they term it commonly the Cuticle. The substance of it is excrementitious, and (as it were) a certain dry flouring, or production of the true skin. That it draws not its substance from the seed is apparent by this, that as it is easily lost, so it is easily repaired, which happens not in parts truly spermaticall. This utmost thin skin, or Cuticle, may two manner of ways be made apparent by it self, and separated from the other, as by burning with fire, or ardent heat of the Sun, (in some delicate bodies, and such as are not accustomed to be conversant in Sunshine.) The quantity in thickness is very small, but the extent is most large, because it covers all the skin; the figure of it is round, and long, like those parts which it invests. The composure of it is obscure; yet because this Cuticle is the excrement of the true skin; we say it hath its matter from the excrementitious superfluity of the nerves, veins, arteries, and substance of the true skin.

The matter of the Cuticle.

The quantity.

The figure.

The composure.

It is in number one, like as the true skin which it outwardly covers, that it might be a *medium* between the object and fixed faculty of touching, diffused over all the true skin, which every where lies under it. For the temperature, by the common consent of Physitians, it is in the midst of all excess; for that seeing it is the *medium* between the object and faculty, if it should be hotter, colder, moister, or drier, it would deceive the faculty by exhibiting all objects, not as they are of themselves, but as it should be; no otherwise than as to such as look through red or green spectacles, all things appear red or green. Wherefore for this reason it was convenient the Cuticle should be void of all sense. It hath no action in the body; but it hath use, for it preserves and beautifies the true skin; for it seems to be given by the singular indulgence of nature, to be a muniment and ornament to the true skin. This providence of Nature, the industry of some Artizans (or rather Curtizans) doth imitate; who for to seem more beautifull, do smooth and polish it. By this you may understand, that not all the parts of the body have action, yet have they their use, because, according to *Aristotles* opinion, Nature hath made nothing in vain. Also you must note that this thin skin or Cuticle being lost, may every where be regenerated, unless in the place which is covered with a scar. For here the true skin being deficient, both the matter and former faculty of the Cuticle is wanting.

The number.

The temperature.

The use.

Why the Cuticle cannot be restored in scars.

CHAP. IIII.

Of the true Skin.

THE true skin called by the Greeks *Derma*, is of a spermatick substance, wherefore being once lost, it cannot be restored as formerly it was. For in place thereof comes a scar, which is nothing else but flesh dried beyond measure. It is of sufficient thickness, as appears by the separating from the flesh.

The substance. Magnitude.

But for the extent thereof, it encompasses the whole body, if you except the eys, ears, nose, privities, fundament, mouth, the ends of the fingers where the nails grow, that is, all the parts by which any excrements are evacuated. The figure of it is like the Cuticle, round and long, with its productions, with which it covers the extremities of the parts.

Figure.

It is composed of nerves, veins, arteries, and of a proper flesh and substance of its kind, which we have said to be spermaticall, which ariseth from the process of the secundine, which lead the spermatick vessels even to the navell, in which place each of them into the parts appointed by nature, send forth such vessels as are spred abroad and diffused from the generation of the skin. Which also the similitude of them both, that is, the skin

Composure.

and

and membrane *Chorion* do argue. For as the *Chorion* is double, without ſenſe, encompaſſing the whole infant, lightly faſtened to the firſt coat, which is called *Amnios*; ſo the skin is double, and of it ſelf inſenſible, (for otherwiſe the nerves were added in vain from the parts lying under it) ingirting the whole body, lightly cleaving to the fleſhy Pannicle. But if any object, That the Cuticle is no part of the true skin, ſeeing it is wholly different from it, and eaſily to be ſeparated from it, and wholly void of ſenſe: I will anſwer, theſe arguments do not prevail. For that the true skin is more craſs, thick, ſenſible, vivid, and fleſhy, is not of it ſelf, being rather by the aſſiſtance and admixture of the parts, which derived from the three principall it receives into its proper ſubſtance; which happens not in the Cuticle. Neither if it ſhould happen, would it be better for it, but verily exceeding ill for us, becauſe ſo our life ſhould lye fit and open to receive a thouſand externall injuries, which encompaſs us on every ſide, as the violent aud contrary acceſs of the four firſt qualities.

The skin of it ſelf is void of ſenſe.

The number.

There is only one skin, as that which ſhould cover but one body, the which it every where doth, except in thoſe places I formerly mentioned. It hath connexion with the parts lying under it by the nerves, veins, and arteries, with thoſe ſubjacent parts put forth into the skin inveſting them, that there may be a certain communion of all the parts of the body amongſt themſelves.

Connexion.

Temperature.

It is cold and dry in its proper temper, in reſpect of its proper fleſh and ſubſtance, for it is a ſpermaticall part. Yet if any conſider the ſinews, veins, arteries, and fleſhy threds which are mixed in its body, it will ſeem temperate, and placed (as it were) in the midſt of contrary qualities, as which hath grown up from the like portion of hot, cold, moiſt, and dry bodies. The uſe of the skin is to keep ſafe and ſound the continuity of the whole body, and all the parts thereof, from the violent aſſault of all externall dangers; for which cauſe it is every where indued with ſenſe, in ſome parts more exact, in others more dull, according to the dignity and neceſſity of the parts which it ingirts, that they might all be admoniſhed of their ſafety and preſervation. Laſtly, it is penetrated with many pores, as breathing-places, as we may ſee by the flowing out of ſweat, that ſo the arteries in their *diaſtole* might draw the encompaſſing air into the body, for the tempering and nouriſhing of the fixed inbred heat, and in the *ſyſtole* expell the fuliginous excrement, which in Winter ſuppreſt by the cold air encompaſſing us, makes the skin black and rough. We have an argument and example of breathing through theſe, by drawing the air in by tranſpiration, in women troubled with the mother, who without reſpiration live only for ſome pretty ſpace by tranſpiration.

Uſe.

The reaſon why the skin is blacker and rougher in Winter.

CHAP. V.

Of the fleſhy Pannicle.

After the true skin, follows the membrane, which Anatomiſts call the fleſhy Pannicle, whoſe nature that we may more eaſily proſecute and declare, we muſt firſt ſhew what a Membrane is, and how many ways the word is taken. Therefore it hath the name of the fleſhy Pannicle. A membrane therefore is a ſimple part, broad and thin, yet ſtrong and denſe, white and nervous, and the which may eaſily without any great danger be extended and contracted. Sometimes it is called a coat, which is, when it covers and defends ſome part. This is called the fleſhy Pannicle; becauſe in ſome parts it degenerates into fleſh, and becomes muſculous, as in a man from the collerbones, to the hair of the head, in which part it is therefore called the broad muſcle, whereas in other places it is a ſimple membrane, here and there intangled with the fat lying under it, from whence it may ſeem to take or borrow the name of the fatty Pannicle. But in beaſts (whence it took that name, becauſe in thoſe a fleſhy ſubſtance maketh a great part of this Pannicle) it appears manifeſtly fleſhy and muſculous over all the body, as you may ſee in Horſes and Oxen; that by that means being moveable, they may drive and ſhake off their flies, and other troubleſome things, by their ſhaking and contracting their backs. Theſe things conſidered, we ſay the fleſhy Pannicle in its proper body, is of a nervous or membranous ſubſtance, as that which hath its originall from the coat *Amnios*, (which is next to the infant) dilated near to the navell, and ſtretched forth for the generation of this Pannicle; in which thing I think good to note, that as the membranes *Chorion* and *Amnios* mutually interwoven with ſmall nervous fibers, encompaſs and inveſt the child as long as it is contained in the womb; ſo the skin and fleſhy Pannicle, knit together by ſuch like bands, engirt the whole body.

What a membrane is.

Why it is ſomrimes called a coat, ſomtimes the fleſhy and fatty Pannicle.

Why beaſts have this Pannicle wholly fleſhy or muſculous.

The ſubſtance.

The magnitude and figure.

Therefore the fleſhy Pannicle is equal in magnitude and like in figure to the true skin, but that it lyes under it, and is contained in it, in ſome places mixt with the fat, in others increaſed by the fleſh interwoven with it, and in other ſome is only a ſimple membrane.

Number.

Compoſure.

The compoſition of it is ſuch, as the ſight of it preſents to our ey, that is, of veins, arte-

arteries, nerves, and the proper flesh, some whites mixed and interlaced with fat, and sometimes with musculous flesh. It is but one, by reason of the use we shall presently shew; it is situated between the skin and fat, or common coat of the muscles, annexed to these and the other parts lying under it, by the veins, nerves and arteries ascending from these inward parts, and implanting themselves into the substance thereof, and then into the true skin.

The temperature thereof is diverse, according to the variety of the parts interwoven with it. The use of it is, to lead, direct, and strengthen in their passage, the vessels which are disseminated into the true skin, and the whole superficies of the body. But in beasts it hath another commodity, that is, it gives a shaking or trembling motion to their skin and back, for that cause we formerly touched.

The temperature.
The use.

CHAP. VI.

Of the Fat.

THe Fat coming near the condition of an excrement, rather than of a part (as we said, when we treated of the similar parts) is of an oily substance, bred of the aery and vaporous portion of the blood, which sweating through the pores of the coats, or mouths of the vessels, becomes concrete about the membranes, and nerves, and cold bodies, and turns into fat by the coldness of the place. Whereby we may know, that cold, or a more remiss heat, is the efficient cause of fat, which is manifest by contemplation not only of creatures of divers kinds, but also by those of the same species and sex, if so be that the one be colder than the other.

The Fat is rather an excrement than a part.
The substance.
The efficient causa of Fat.

By which we may understand that the fat is the more or less in quantity, according to the different temper of the whole body, and of its particular parts; for its composition, it consists of that portion of the blood which we formerly mentioned, intermixt with certain membranes, nervous fibers, veins and arteries. The greatest part of it lyes between the fleshy Pannicle, and the common coat of the Muscles. * Otherwise it is diffused over all the body, in some places more, in some less, yet it is always about the nervous bodies, to which it delights to cleave. Most Anatomists enquire whether the fat lye above or beneath the fleshy Pannicle. But me thinks this question is both impertinent and idle; being we often see the fat to be on both sides. a It is of a middle temper between heat and cold, being it ariseth of the more aery portion of the blood; although it may seem cold in respect of the efficient cause, that is, of cold by which it concretes. For the rest, moisture is predominant in the fat. b The use thereof is, to moisten the parts which may become dry by long fasting, vehement exercise, or immoderate heat; and besides to give heat, or keep the parts warm. Although it do this last rather by accident, than of its own nature, as heated by exercise, or by some such other chance; it heats the adjacent parts, or may therefore be thought to heat them, because it hinders the dissipation of the native and internall heat; like as cold heats in winter, whereby the bellies are at that time the hotter. I know some learned Physitians of our time stiffly maintained, that the fat was hot, neither did they acknowledg any other efficient cause thereof, than temperate heat and not cold. But I think it best to leave the more subtil agitation of these questions to naturall Philosophers. But we must note, c that at the joints which are more usually moved, there is another sort of Fat, far more solid and hard, than that which we formerly mentioned, often found mixed with a viscid and tough humor like the whites of Eggs, than so it might be sufficient for a longer time to moisten these parts, subject to be hurt by dryness, and make them slippery, and so fitter for motion, in imitation whereof they usually grease hard bodies, which must be in frequent motion, as Coach-wheels and axletrees. And there is another kind of fat, which is called *Sevum*, seam, in one thing differing from the ordinary fat, that is much dryer; the moister and softer portion of the fat being dissipated by the raging heat of the place. For it is found principally about the midriff, where there are many windings of arteries and veins; and it is also about the reins, loins, and basis of the heart. The Fat is wasted by long fasting; is dryed and hardened by vehement exercise and immoderate heat. Hence it is that it is much more compact in the palms of the hands, and soles of the feet, about the eys and heart, so that it resembles the flesh in density and hardness; because by the continuall motion and strong heat of these parts, the thinner portion being dissipated and diffused, the more grois and terrestriall remain.

The quantity.
The composure.
The site.

I was present at the opening of a body, Feb. 1630. in which the fat in the lower part of the lower belly was in thickness above 8 inches, upon the breast between 4 and 5 inches: which I thought good to remember in this place both for the rarity of the thing, as also because it was encreased by report, and the place mistaken, some saying the *Omentum* or Call was so thick, which was false, for it did not much exceed the quantity of that part, in other fat men.

b The use.
c The solider fat, or seame.

In what parts, and for what cause the fat is more dease.

CHAP.

CHAP. VII.

Of the common coat of the Muſcles.

The ſubſtance. NExt under the Fat, appears a certain coat, ſpred over all the Muſcles, and called the common coat of the Muſcles, it is of a nervous ſubſtance, as all other membranes are. The quantity and breadth thereof is bounded by the quantity of the Muſcles which it involves, and fits it ſelf to, as that which encompaſſes the Muſcles of the *Epigaſtrium*, is of equal largeneſs with the ſame Muſcles. The figure of it is round: it is compoſed of veins, nerves, arteries, and its peculiar fleſh conſiſting of three ſorts of fibers; the beginning of it is from the *Perioſtium*, in that part where the bones give ligaments to the Muſcles; or according to the opinion of others, of the nervous and ligamentous fibers of the Muſcles, which riſing up and diffuſed over the fleſhy ſuperficies thereof, are united for the generation of this coat. But this membrane ariſing from the *Perioſtium* (as every membrane which is below the head takes it originall from the *Perioſtium* either primarily, by the interpoſition of no Medium, or ſecondarily) is ſtretched over the Muſcles by their tendons. But if any object, That this membrane pluck'd from the belly of the Muſcle, may ſeem to end in a ligament. I will anſwer, that it is the condition of every nervous part, ſo to binde or faſten it ſelf to another part of his own kinde as to a ſtay, ſo that it can ſcarce be pluck'd from thence. We ſee the proof hereof, in the *Peritoneum* or Rim in the *Epigaſtrium* or lower part of the lower belly. That which covers the Muſcles of the *Epigaſtrium* is but one, unleſs you had rather part it in two, the right and the left diſtinguiſhed by the interpoſition of the *Linea Alba*, or white Line. It is ſituate betwixt the Fat and Muſcles; for it is faſtened above and below to theſe parts with fibers, which in ſmalneſs and fitneſs exceed the Spiders web. But by its veſſels, it participates with the three principall parts, and is of a cold and dry temper. The uſe of it is, to contain the Muſcles in their naturall union, and to keep them as much as in it lyes, from putrefaction, which may happen to them from *pus* or matter, which is often caſt forth of the ſimilar parts into the empty ſpaces and diſtances of the Muſcles. Wherfore going about to ſeparate the Fat of the *Epigaſtrium* (where thou muſt begin the diſſection of mans body) you muſt have a care that you hurt it not with your knife, but that, before you touch the Muſcles, ſee you artificially take it away, that you may the more eaſily ſeparate the Muſcles lying under it, diſtinguiſhed by a manifeſt ſpace at the white Line, which is made by the meeting together of the proper coats of all thoſe Muſcles.

CHAP. VIII.

What a Muſcle is, and how many differences there be thereof.

What a Muſcle is. A Muſcle is the inſtrument of voluntary motion; and ſimple voluntary motion is performed ſix manner of ways, upwards, downwards, forwards, backwards, to the right hand and to the left; but the compound one way, which is circularly, the which is performed by the continuall ſucceſſion of the motion of the Muſcles ingirting the part. Such a motion Falconers uſe when they ſtretch forth their hand and lure their Hawk. We have ſome parts, which have motion without a Muſcle, but that motion is not voluntary; ſuch parts be the heart, ſtomach, guts, both the bladders, (that is, that of the gall and that of the urine) and divers other which have the motions of attraction, expulſion and retention, by the means of the three ſorts of fibers; for they draw by the right, expell by the tranſverſe, and retain by the oblique. The differences of Muſcles which are many and diverſe, are taken from their ſubſtance, originall, inſertion into the part which they move, form or figure, holes or openings, magnitude, colour, ſite, kinde of fibers, their conjugation or connexion, heads, bellies, tendons, oppoſition in action and office. Some in ſubſtance are nervous, venous, arterious, becauſe they have manifeſt nerves, veins, and arteries, as the Midriff, the Intercoſtall or Epigaſtrick Muſcles, and many more, and that for their difference from other Muſcles, into which neither nerve, nor vein, or arteries are manifeſtly inſerted, although ſecretly they admit them all for ſenſe and motion, life and nouriſhment; ſuch are the Muſcles of the wriſt, the wormy Muſcles of the hands and feet; for if there be any nerves obſerved in them, they are very ſmall. Some had rather make the difference of Muſcles thus, that ſome of them are fleſhy, ſome nervous, others membranous. From their Originall, ſome ariſe from the bones, as theſe which move the hands, arms, and legs; others from griſles, as the Muſcles of the throat; others from membranes which inveſt the tendons, as the wormy Muſcles of the hands and feet; others from ligaments, as the Extenders of the fingers; others from other Muſcles, as the two lower Muſcles of the yard which proceed from the Sphincter Muſcle of the fundament. Others have no originall, as the membrane which we call the fleſhy Pannicle aſſumes fleſh in

How the circular motion is performed.

From whence the differences of Muſcles are drawn.

Differences of Muſcles from their ſubſtance

Differences of Muſcles from their originall.

in certain places, and degenerates into a Muſcle; ſuch are the *Cremaſter* or hanging Muſcles of the teſticles, the large Muſcles of the face, and if you pleaſe the Midriff, as that which is compoſed of two coats, the one encompaſſing the ribs and the *Peritonæum*, hath fleſh in the midſt between the two membranes. And moreover ſome Muſcles have their originall from one only bone, as theſe which bend and extend the Cubit; others ariſe of many bones, as the oblique deſcending, the Dorſall and many Muſcles of the neck, which ariſe together from many ſpondyls and ſides of ſpondyls. There be others, according to the opinion of ſome men, both from the bones and griſles of the *Pubis* as the right or direct Muſcles of the *Epigaſtrium*, yet by their favor I think otherwiſe. Becauſe by the Anatomicall and received axiome, A muſcle is there thought to take his beginning, from whence he receives a nerve; but theſe Muſcles take a nerve from the intercoſtall muſcles, wherefore their originall ought to be referred to the ſides of the breſt-blades, as ſhall be ſhewed in due place. From their inſertion ariſe theſe differences, ſome are inſerted into a bone, as thoſe which move the head, arms and legs; others into a griſle, as thoſe of the Throtle, ey-lids, noſe, and the oblique aſcendent muſcles of the *Epigaſtrium*; ſome into a bone and griſle both, as the right muſcles of the *Epigaſtrium* and the Midriff; ſome into the skin, as the muſcles of the lips; others into the Coats, as the muſcles of the eys; others into Ligaments, as the muſcles of the yard. But theſe differences following may be drawn both from their inſertion and originall. For ſome muſcles ariſing from many parts, are inſerted into ſome one part, as divers of thoſe which move the arm and the ſhoulder, which ariſing from many ſpondyls, are inſerted into the bone of the ſhoulder, and the ſhoulder-blade. Others ariſe from one part, and inſert themſelves into more, as thoſe which ariſe from the bottom of the ſhoulder-blades, are extended and inſerted into ſome eight or nine of the upper ribs, to help reſpiration; and the benders and extenders of the fingers and toes: Others ariſing from many bones, are inſerted into as many, as ſome of thoſe which ſerve for reſpiration, to wit thoſe which we call the hinder Saw-muſcles and the *Semiſpinati*, which ſends a tendon into all the ribs. Others have their originall from many bones, and end in griſles of the ſeven ribs, as thoſe two which lye under the *Sternon*. Moreover alſo theſe differences of muſcles may be drawn from the originall and inſertion, that ſome proceed from bones, and are inſerted into the next bone, to help and ſtrengthen the motion thereof, as the three muſcles of the Hip: Others ariſe from an upper bone and are not inſerted into the next, but into ſome other, as the long muſcles. Some are named from the part they move, as the temporall muſcles, becauſe they move the temples; others from their office, as the grinding muſcles, becauſe they move the skin as a mill, to grinde aſunder the meat. From their form or figure, becauſe ſome are like Mice, other like Lizards which have their legs cut off, for that they imitate in their belly, body or tendon, the belly or tail of ſuch creatures, and from whence the names of *Muſculus* and *Lacertus* are derived. Such are thoſe which bend the wriſt, and which are faſtned to the bone of the Leg, and which extend the foot; others are triangular, as that which lifts up the arm, called *Epomis* or *Deltoides*, and that which draws the arm to the breſt, called the Pectorall muſcle. Others quadrangular, as the Rhomboides, or Lozenge-muſcle of the ſhoulder-blade, and the two hindeſom-muſcles ſerving for reſpiration, and two of the wriſts which turn down the hand; others conſiſt of more than four angles, as the oblique deſcending, and that muſcle which joins it ſelf to it from the ſhoulder-blade; others are round and broad, as the Midriff; others circular, as the Sphincter-muſcle of the fundament and bladder; others are of a pyramidicall figure, as the ſeventh muſcle of the ey, which compaſſes the optick nerve in beaſts but not in men. Others have a ſemicircular form, as that which ſhuts up the ey, ſeated at the leſſer corner thereof; others reſemble a Monks cowl, or hood, as the *Trapezius* of the ſhoulder-blade. Beſides others at their firſt originall are narrow, but broad at their inſertion, as the Saw-muſcle of the ſhoulder, and the tranſverſe of the *Epigaſtrium*; others are quite contrary, as the three muſcles of the Hip; others keep an equal breadth or bigneſs in all places, as the intercoſtall muſcles and theſe of the wriſt; others are long and ſlender, as the long muſcle of the thigh; others are long and broad, as the oblique deſcending muſcles of the *Epigaſtrium*; others are directly contrary, as the Intercoſtall, which are very narrow. From their perforations, for ſome are perforated, as the Midriff which hath three holes, as alſo the oblique and tranſverſe of the *Epigaſtrium*, that ſo they may give paſſage forth to the preparing ſpermatick veſſels, and to the ejaculatory veſſels, the Coat *Erythroides* aſſociating and ſtrengthening them; others are not perforated. From their magnitude, for ſome are moſt large, as the two muſcles of the Hip; others very ſmall, as the eight ſmall muſcles of the neck, and the proper muſcles of the Throtle, and the wormy muſcles. Others are of an indifferent magnitude. From their colour, for ſome are white and red, as the Temporall muſcles, which have tendons coming from the midſt of their belly; others are livid, as the three greater muſcles of the calf of the leg, which colour they have by the admixtion of the white, or tendinous nervie coat with the red fleſh, for this coat by its thickneſs darkning the colour of the fleſh, ſo that it cannot ſhew its redneſs and freſh colour, makes it ſeem of that livid colour. From their ſituation, for ſome are ſuperficiary, as thoſe which appear under the skin and fat; others deep in and hid, as the ſmooth and four twin muſcles; ſome are ſtretched

Where a Muſcle hath its originall.

Differences of muſcles from their inſertion.

Differences of Muſcles taken from their figure.

Differences from their perforations.

From their magnitude.

From their colour.

From their ſite.

ſtretched out, and (as it were) ſpred over in a ſtreight and plain paſſage, as the muſcles of the thigh which move the leg, except the Ham-muſcle; others oblique, as thoſe of the *Epigaſtrium*; otherſome tranſverſe, as the tranſverſe of the *Epigaſtrium*; where you muſt obſerve, that although all the fibers of the muſcles are direct, yet we call them oblique and tranſverſe, by comparing them to the right muſcles, as which by the concourſe of the fibers make a ſtreight or acute angle.

From their Fibers. From the ſorts of fibers; for ſome have one kinde of fiber; yet the greateſt part enjoy two ſorts running ſo up and down, that they either are croſſed like the letter X, as happens in the pectorall and grinding muſcles; or elſe do not concur, as in the Trapezii. Others have three ſorts of fibers, as the broad muſcle of the face.

From their connexion. From their coherence and connexion, or their texture of nervous fibers; for ſome have fibers ſomewhat more diſtant and remote immediatelyat their originall, than in other places, as you may ſee in the muſcles of the buttocks: Others in their midſt and belly, which by reaſon thereof in ſuch muſcles is more big or tumid, their head and tail being ſlender, as happens in moſt of the muſcles of the arm and leg, in which the denſe maſs of fleſh interwoven with fibers, disjoins the fibers in ſo great a diſtance; in otherſome the fibers are more diſtant in the tail, as in the greater Saw-muſcle ariſing from the bottom of the ſhoulder-blade; in others they are equally diſtant through the whole muſcle, as in the muſcles of the wriſt and between the ribs.

From their head. From their head; for in ſome it is fleſhy, interwoven with few fibers, as in the muſcles of the buttocks; in others it is wholly nervous, as in the moſt-broad-muſcle common to the arm and ſhoulder-blade, and in the three muſcles of the thigh proceeding from the tuberoſity of the hucle-bone; in ſome it is nervous and fleſhy, as in the internall and externall muſcle of the arm. Beſides, ſome have one head, others two, as the bender of the elbow, and the externall of the leg; others three, as the Threeheaded muſcle of the thigh. But we muſt note that the word Nerve or Sinew is here taken in a large ſignification, for a ligament, nerve and tendon, as *Galen* ſaith, (*Lib. de Oſſibus*) and moreover we muſt obſerve, that the head of a muſcle is one while above, another while below, otherwhiles in the midſt, as in the Midriff, as you may know by the inſertion of the Nerve, becauſe it enters the muſcle by its head.

From their belly. From their belly alſo, there be ſome differences of muſcles taken; for ſome have their belly immediately at their beginning, as the muſcles of the buttocks; others at their inſertion, as the Midriff; others juſt at their head, as thoſe which put forth the Calf of the leg; in others it is ſomewhat further off, as in thoſe which draw back the arm, and which bend the leg; in others, the belly extends even from the head to the tail, as in the intercoſtall muſcles, and theſe of the wriſt; in others it is produced even to their inſertion, as in thoſe of the palms of the hands and ſoles of the feet; ſome have a double belly diſtinguiſhed by a nervous ſubſtance; as thoſe which open the mouth, and thoſe which ariſe from the root of the lower proceſs of the ſhoulder-blade.

From their Tendons. Moreover the differences of muſcles are drawn alſo from the Tendons, for ſome have none, at leaſt which are manifeſt, as the muſcles of the lips and the ſphincter-muſcles, the intercoſtall and thoſe of the wriſt; others have them in part, and want them in part, as the Midriff; for the Midriff wants a Tendon at the ends of the ſhorter ribs, but hath two at the firſt *Vertebra* of the Loins in which it is terminated: Others have a Tendon indeed. But ſome of theſe move with the bone, ſome not, as the muſcles of the eys; and beſides, ſome of theſe have broad and membranous tendons, as the muſcles of the eys and *Epigaſtrium*, except the right muſcles: In others they are thick and round, as in the benders of the fingers; in others they are leſs round, but more broad than thick, ſuch is the Tendon ariſing from the twin muſcles and *Soleus* of the leg; others have ſhort Tendons, as the muſcles which turn down the hand; otherſome long, as thoſe of the palms of the hands, and ſoles of the feet; beſides others produce Tendons from the end of their belly, which Tendons are manifeſt; others from the midſt, as the Temporall muſcles.

Beſides alſo, others diffuſe many Tendons from their belly, as in the hands the benders of the fingers, and the extenders of the feet. Otherſome put forth but one, which ſometimes is divided into many, as thoſe which bend the third articulation of the foot; otherwhile many muſcles by their meeting together make one Tendon, as the three muſcles of the Calf of the leg, and thoſe which bend the cubit and leg. All Tendons have their originall, when the nerves and ligaments diſperſed through the fleſhy ſubſtance of a muſcle, are by little and little drawn and meet together, untill at laſt carried to the joint, they are there faſtned for the fit bending and extenſion thereof. From the contrariety of their Actions, for ſome parts have contrary muſcles, benders and extenders; other parts have none, for the Cods and fundament have only lifters up. From their function, for ſome are made for direct motions, as thoſe which extend the fingers and toes; others for oblique, as the Supinators of the hand, and the Pronators; others perform both, as the pectorall muſcle, which moves the Arm obliquely upward and downward, as the upper and lower fibers are contracted; and alſo outright, if all the fibers be contracted together, which alſo happens to the *Deltoides* and *Trapezius*. I have thought it good to handle particularly

From their action.

From their function.

larly these differences of muscles, because that by understanding them the prognostick will be more certain; and also the application of remedies to each part; and if any occasion be either to make incision, or suture, we may be more certain whether the part affected be more or less nervous.

CHAP. IX.

Of the parts of a Muscle.

HAving declared the nature and differences of a Muscle, we must note that some of the parts thereof are compound or universall, others simple or particular. The compound are the head, belly, and tail. The simple are ligaments, a nerve, flesh, a vein, artery and coat. For the compound parts, by the head, we understand the beginning and originall of a muscle, which is one while ligamentous and nervous, otherwhiles also fleshy. By the belly, that portion which is absolutely fleshy; But by the tail we understand a Tendon consisting partly of a nerve, partly of a ligament promiscuously comming forth from the belly of the muscle. For as much as belongs to the simple, which are six in number, three are called proper, and three common. The proper are a Ligament from a bone, a nerve proceeding from the Brain or spinall marrow, and flesh compact by the concretion of blood. The common are, a vein from the Liver or trunk arising from thence; an artery proceeding from the Heart, a Coat produced by the nervous and ligamentous fibers spreading over the superficies of the muscle. But for the simple use of all such parts, the nerve is (as it were) the principall part of a Muscle, which gives it sense and motion, the ligament gives strength, the flesh contains the nervous and ligamentous fibers of the Muscle, and strengthens it, filling up all the void spaces, and also it preserves the native humidity of these parts, and cherisheth the heat implanted in them; and to conclude, defends it from all externall injuries; for like a fan it opposeth it self against the heat of the Sun; and is as a garment against the cold; and is as a cushion in all fals and bruises; and as a buckler or defence against wounding weapons. The vein nourishes the muscle, the artery gives it life, the coat preserves the harmony of all the parts thereof, lest they should be any ways disjoined or corrupted by purulent abscesses breaking into the empty or vold spaces of the Muscles, as we see it hapneth in a Gangrene, where the corruption hath invaded this membrane, by the breathing out of the more acrid matter or filth.

The compound and simple parts of a muscle.

What use each simple particle hath in a muscle.

CHAP. X.

A more particular inquisition into each part of a muscle.

HAving gone thus far, it remains, that we more particularly inquire into each part of a muscle, that (if it be possible) nothing may be wanting to this discourse. Wherefore a Ligament properly so called, is a simple part of mans body, next of a bone and grisle, the most terrestriall, dry, hard, cold, white, taking its originall immediatly, or by the interposition of some Medium from the Bones or Grisles (from whence also the Muscles have their beginning) whereby it comes to pass, that a ligament is void of sense, unless it receive a nerve from some other place; (for so the ligaments which compose and strengthen the tongue and yard, are partakers of sense, and it inserts it self into the bone and grisle, that so it may bind them together, and strengthen and beautifie the whole joint or connexion; (for these three be the principall uses of a ligament) then diffusing it self into the membranes and muscles to strengthen those parts. A Nerve, to speak properly, is also a simple part of our body, bred and nourished by a gross and phlegmatick humor, such as the brain, the originall of all the nerves, and also the Spinall marrow endued with the faculty of feeling, and oftentimes also of moving. For there be divers parts of the body which have nerves, yet are destitute of all voluntary motion, having the sense only of feeling, as the membranes, veins, arteries, guts, and all the entrails. A nerve is covered with a double cover from the two membranes of the brain, and besides also with a third proceeding from the ligaments which fasten the hinder part of the head to the *Vertebra's*, or else from the *Pericranium*. We understand no other things by the fibers of a Nerve, or of a Ligament, than long and slender threds, white, solid, cold, strong, more or less, according to the quantity of the substance, which is partly nervous and sensible, partly ligamentous and insensible. You must imagine the same of the fleshy fibers in their kinde; but of these threds some are streight for attraction; others oblique, for retention of that which is convenient for the creature; and lastly, some transverse, for expulsion of that which is unprofitable. But when these transverse threds are extended in length, they are lessned in bredth; but when they are directly contracted, they are shortned in length. But when they are extended all together as it were with an unanimous consent, the whole member

The nature of a Ligament.

The threefold use of a Ligament.

What a nerve is.

What we mean by the nervous and ligamentous fibers.

is wrinkled as contracted into it ſelf, as on the contrary it is extended when they are relaxed. Some of theſe are beſtowed upon the animall parts, to perform voluntary motions; others upon the vitall to perform the agitation of the heart and arteries; others upon the naturall for attraction, retention, and expulſion. Yet we muſt obſerve, that the attraction of no ſimilar part is performed by the help of the foreſaid fibers or threds, but rather by the heat implanted in them, or by the ſhunning of emptineſs, or the familiarity of the ſubſtance. The fleſh alſo is a ſimple and ſoft part, compoſed of the purer portion of the blood inſinuating it ſelf into the ſpaces between the fibers, ſo to inveſt them for the uſes formerly mentioned. This is (as it were) a certain wall and bulwark againſt the injuries of heat and cold, againſt all falls and bruiſes, as it were a certain ſoft pillow or cuſhion yeelding to any violent impreſſion. There be three ſorts of fleſh; one more ruddy, as the muſculous fleſh of perfect creatures, and ſuch as have blood; for the fleſh of all tender and young things having blood, as Calves, and alſo of all ſorts of fiſh, is whitiſh, by reaſon of the too much humidity of the blood. The ſecond kinde is more pallid, even in perfect creatures having blood, ſuch is the fleſh of the heart, ſtomach, weaſond, guts, bladder, womb. The third is belonging to the entrails, or the proper ſubſtance of each entrail, as that which remains of the Liver (the veins, arteries and coat being taken away) of the bladder of the gall, brain, kidneys, milt: Some add a fourth ſort of fleſh which is ſpongy, and that they ſay is proper to the tongue alone.

By what power the ſimilar parts, principally draw or attract.

What and of how many ſorts the fleſh is.

What a vein is.

A Vein is the veſſel, pipe, or channel of the blood, or bloody matter; it hath a ſpermatick ſubſtance, conſiſts of one coat compoſed of 3 ſorts of fibers.

What an artery is.

An Artery is alſo the receptacle of blood, but that ſpirituous and yellowiſh, conſiſting in like manner of a ſpermatick ſubſtance; But it hath two coats with three ſorts of fibers, the utmoſt whereof is moſt thin, conſiſting of right fibers, and ſome oblique: But the inner is five times more thick and denſe than the utmoſt, interwoven with tranſverſe fibers; and it doth not only contain blood and ſpirit, but alſo a ſerous humor, which we may beleeve becauſe there be two emulgent Arteries as well as veins.

Why an artery is more thick and denſe than a vein.

But the inner coat of an Artery is therefore more thick, becauſe it may contain blood which is more hot, ſubtil, and ſpirituous; for the ſpirit, ſeeing it is naturally more thin and light, and in perpetuall motion, would quickly fly away, unleſs it were held in a ſtronger hold. There is other reaſon for a Vein, as that which contains blood groſs, ponderous, and ſlow of motion. Wherefore if it had acquired a denſe and groſs coat, it could ſcarce be diſtributed to the neighbouring parts: God the maker of the Univerſe, foreſeeing this, made the coats of the veſſels contrary to the conſiſtence of the bodies contained in them. The *Anaſtomaſis* of the Veins and Arteries, that is to ſay, the application of the mouths of the one to the other, is very remarkable, by benefit of which they mutually communicate and draw the matters contained in them, and ſo alſo transfuſe them by inſenſible paſſages, although that *anaſtomoſis* is apparent in the Vein and Artery that meet together at the joint and bending of the arm, which I have ſometimes ſhewed in the Phyſick ſchools, at ſuch time as I there diſſected Anatomies.

The mutuall Anaſtomoſis of the veins and arteries. Where it is manifeſt.

From whence a muſcle hath its beginning or head.

But the action or function of a Muſcle is either to move or confirm the part according to our will, into which it is implanted; which it doth when it draws it ſelf towards its originall, that is to ſay, its head. But we define the head by the inſertion of the nerve, which we underſtand by the manner of the working of the Muſcle.

CHAP. XI.

Of the muſcles of the Epigaſtrium, or lower Belly.

NOw ſeeing that we have taught what a Muſcle is, and what the differences thereof are, and what ſimple and compound parts it hath, and what the uſe, action, and manner of action in each part is; it remains that we come to the particular explication of each Muſcle, beginning with thoſe of the lower belly, as thoſe which we firſt meet withall in diſſection.

Eight muſcles of the Epigaſtrium.

Theſe are 8 in number, four oblique, two on each ſide, two right or direct, one on the right, another on the left ſide; and in like manner two tranſverſe. All theſe are alike in force, magnitude and action, ſo mutually compoſed, that the oblique deſcendant of one ſide, is conjoined with the other oblique deſcendant on the other ſide, and ſo of the reſt.

We may add to this number the two little Supplying or Aſſiſting muſcles, which are of a *Pyramidall* form, and ariſe from the Share-bone, above the inſertion of the right muſcles; Of the oblique Muſcles of each ſide the one aſcends, the other deſcends, whereupon it comes to paſs, that they are called the Oblique deſcendant and aſcendant Muſcles. Thoſe oblique which we firſt meet with, are the deſcendant, whoſe ſubſtance is partly ſanguine, partly ſpermatick; for they are fleſhy, nervous, ligamentous, veinous, arterious, and membranous. Yet the fleſhy portion is predominant in them, out of which reſpect *Hippocrates* is wont to expreſs the muſcles by the name of fleſhes; their greatneſs is indifferent be-

The oblique deſcendant. Their ſubſtance. Their greatnes and figure.

between the large and the ſmall muſcles; their figure is three ſquare. They are compoſed of the forementioned parts, they are two in number; their ſite is oblique, taking their beginning from the touching of the great ſaw-muſcle, and from the ſixt and ſeventh true ribs, or rather from the ſpaces between the ſix lower ribs, and rather on the forepart of the muſcles, than of the ribs themſelves, from whence ſhunning the *Vertebra's* of the Loins, the fleſhy parts of them are terminated in the externall and upper eminency of the Haunch-bone, and the membranous end in the lower eminency of the Share-bone and the White-line. Yet *Columbus* diſſenting from this common deſcription of the oblique Muſcles, thinks that they are only terminated in the White-line, and not in the Share-bone. For (ſaith he) wherefore ſhould they be inſerted into the Share-bone which is not moved? But becauſe it would be an infinit labor and trouble to ſet down at large the ſeverall opinions of all Authors of Anatomy; I have thought it ſufficient for me to touch them lightly by the way. Their connexion is with the oblique aſcendant lying under them, and with the direct or right. Their temperament is twofold, the one hot and moiſt, by reaſon of the belly and the fleſhy portion of them; the other cold and dry, in reſpect of their ligamentous and tendinous portion. Their action is to draw the parts into which they are inſerted towards their originall, or elſe to unite them firmly. Yet each of theſe privately and properly draws the hip in an oblique manner towards the *Cartilago Scutiformis* or breſt-blade. Then follow the oblique aſcendant, who have the ſame ſubſtance, quantity, figure, compoſure, number and temper the deſcendant have. They are ſituate between the deſcendant and tranſverſe with whom they have connexion, eſpecially by the veſſels which are brought from the parts beneath. All the fleſhy parts ariſe from the rackbones of the Haunch to the ends of the baſtard ribs, which they ſeem to admit above and below, being fleſhy even to the fourth, and then becoming membranous, they take their way to the White-line, with a double *aponeuroſis*, which paſſes through the right Muſcles above and below, as we may plainly ſee from the navell downwards. In their fleſhy part they draw their original from the ſpine of the Haunch-bones a little lower than the deſcendent end in their fleſhy part. But for their membranous parts, they ariſe before from the ſharebone, but behinde from the ſpondyls of the Holy-bone, and *Vertebra's* of the Loins obliquely aſcending upwards to the White-line, into which they are terminated by an *aponeuroſis* or membranous tendon (which ſeems to penetrate the right Muſcle upwards and downwards, eſpecially under the navell) but by their fleſhy part at the ends of all the baſtard ribs, which they ſeem to receive above and below. And becauſe theſe muſcles are terminated in the White-line, they have alſo another uſe, yet ſuch as is common to all the muſcles of the *Epigaſtrium*, that is, to preſs down the Guts. Their action is (if they perform it together) to draw down the cheſt, and dilate the breſt; but if their actions be ſeparate, they draw the cheſt to the hip with an oblique motion. After theſe follow the right muſcles, ſo called becauſe they deſcend according to the length of the body, and becauſe they have right or ſtreight fibers.

Their compoſure and ſite.

Their action.

The right muſcles of the *Epigaſtrium*.

We will ſay nothing (to ſhun prolixity, which in all other places we will avoid) of their ſubſtance and other conditions, which they have common with the fore-mentioned Muſcles. They are ſituate in the eminenteſt or extuberating region of the belly, bounding the *Epigaſtrium* taken in generall, (or the ſuperficiary belly) they are divided by the manifeſt intercourſe of the White-line, even to the Navell, in which place they ſeem to be united even to the place of their inſertion. They draw their originall not from the Share-bone, as ſome would have it, but according to the inſertion of their nerves from the ſides of the *Cartilago ſcutiformis*, and the ends of the ſixth, ſeventh and eighth ribs; but they end in the Share-bone, where they make a common Tendon ſufficiently ſtrong and ſhort. *Sylvius*, *Veſalius*, and *Columbus* think they ariſe from the Share-bone, becauſe they cannot be inſerted into that bone, becauſe it is unmovable. You may perceive in theſe Muſcles certain nervous and tranſverſe interſections, oftentimes three in number for the ſtrength of theſe Muſcles, (of which *Galen* makes no mention, although they may be ſeen in Apes.) And alſo in the inner ſide of theſe muſcles you may ſee four veins, and as many arteries, of which ſome creep upwards, others run downwards. The upper, called the Mamillary, deſcend from the Axillary by the ſide and lower parts of the *Sternon*, the ſlenderer portions thereof being diſtributed by the way to the *Mediaſtinum*, and about the fourth and fift rib to the Dugs, from whence they take their name.

Their ſite.

Originall.

That which remains breaking out by the ſides of the Breſt-blade, inſerts it ſelf into thoſe muſcles, creeping along, even almoſt to the navell; in which place they are manifeſtly united (that is, the veins with the veins, and arteries with the arteries) with the Epigaſtrick, which aſcend from the upper part of the Ilhacks on each ſide under the ſaid muſcles, untill they meet with theſe four mamillary veſſels. That you may finde this concourſe of the veins and arteries about the navell, you muſt follow both the upper and the lower ſomewhat deep into the fleſh, preſſing the blood on both ſides from above downwards, and from below upward, untill you ſhall finde the exoſculation of theſe veſſels, which will appear by this, That the blood will flow from this into that, and from that into this; otherwiſe you can ſcarce perceive it, by reaſon of the ſmalneſs of ſuch veſſels which want blood.

The meeting together of the Epigaſtrick and mamillary veins and arteries.

But that by the benefit of ſuch concourſe of the veſſels, the matters may be communicated and tranſported both from the womb to the dugs, and again from the dugs to the womb, appears in Nurſes who want their courſes, when the milk comes into their dugs; and on the contrary loſe their milk when their courſes flow plentifully. Otherwiſe to what purpoſe ſhould there be ſuch concourſe between the veſſels of the paps and womb? for there are veins and arteries diffuſed to the ſides of the womb from the root of the Epigaſtricks; for indeed the Epigaſtricks which in their aſcent meet with the mamillary, go not to the womb, though they be next to them, and ariſe from the ſame trunk with the Hypogaſtrick vein of the womb. The action of theſe Muſcles is, to move or draw near together the parts of the Hypogaſtrium to the *præcordia* or Hypochondries. Their uſe, in *Columbus* opinion, is, to draw the breſt downwards ſo to dilate it. At the ends of theſe, nature hath produced two other ſmall Muſcles from the upper part of the Share-bone, of a triangular figure, for the ſafety of the thick and common tendon of the right Muſcles; whereupon they are called *Succenturiati*, or aſſiſters.

Their action.

Their uſe.

The firſt figure of the Lower belly.

FIG. I

FIG. II.

A ABCD. The upper, lower and lateral parts of the *Peritonæum.*

EE. The white Line from the griſle of the Breaſt-bone, called the Breaſt-blade, to the commiſſure or meeting of the Sharebones.

F. The Griſle of the Breaſt-bone, *Cartilago enſi-formis*, or the Breaſt-blade.

G. The Navell, which all the Muſcles being taken away, muſt be kept for the demonſtration of the Umbilicall Veſſels.

H H. The produſtions of the *Peritonæum*, which contain the ſeminary Veſſels on either ſide.

** The hole which giveth way to the ſeminary Veſſels of men.

II. A vein and an artery from the *Epigaſtrick*, which being carried upward under the right Muſcles, do here hang down, and are diſtributed into the lower part of the *Abdomen.*

K K. A Vein and an artery, from the internall Mammary proceeding from under the Bone of the Breaſt, are carried downward through the right muſcles, & are diſſeminated into the upper part of the *Abdomen.*

1, 2. the place wherein the right muſcles ariſe, which being here cut off, do hang down, that their Veſſels may the better be ſeen. 3, 4. The *Anaſtomoſis* or inoculation of the foreſaid Veſſels, making the conſent of the *Abdomen* and the Noſe, and of the Womb with the Breſts, as ſome think. LL. Branches of Veins running into the ſides of the *Peritonæum.* N. The place of the Haunch-bone bared, to which the Obliqué and the Tranſverſe muſcles do grow.

The Pyramidal or aſſiſting Muſcles.

Some (moved with I know not what reaſon) would have theſe two ſmall Muſcles to help the erection of the yard. *Columbus* thinks they ſhould not be ſeparated from the right, and that they only are the fleſhy beginnings of the right. But on the contrary, *Fallopius* manifeſtly proves them different and ſeparate from the right, and ſhews their uſe.

The tranſverſe muſcles of the *Epigaſtrium.*

Their figure and ſite.

The Tranſverſe remain to be ſpoken of, ſo called by reaſon of their fibers, which make right angles with the fibers of the right Muſcles. They have a quadrangular figure ſituate upon the greateſt part of the *Peritonæum*, to which they ſtick ſo cloſe that they ſcarce can be ſeparated. They take their originall from the production of the loins, the eminency of the Haunch-bone, the tranſverſe productions of the *vertebra's* of the loins, and the ends of the baſtard-ribs; contrary to the opinion of many, whom the inſertion of the nerve convinces, but they end in the White-line, as all the reſt do.

Their action.

Their action is to preſs the guts, eſpecially for the expulſion of excrements.

The common uſe and action of the eight muſcles of the *Epigaſtrium.*

But all the eight recited Muſcles, beſides their proper uſe, have another common, that is, they ſtand for a defence or bulwark for all the parts lying under them, and ſerve for the expulſion both of the excrements, infant, and vapors, and alſo for the ſtrengthening

of

of the voice, as experience ſhews in thoſe who ſound Trumpets and Cornets.

Therefore theſe muſcles do equally on every ſide preſs the Belly; but the Midriff, the intercoſtall muſcles aſſiſting it, doth drive from above downwards, from which conſpiring contention follows the excretion of the excrements by the fundament; but unleſs the Midriff ſhould aſſiſt, theſe muſcles would preſs the excrements no more downwards, than upward to the mouth.

Why when the mouth is open the excrements go more ſlowly forth.

Although to this excretion of the excrements, it is not ſufficient that the Epigaſtrick, Midriff, and intercoſtall muſcles preſs the belly, but the muſcles of the throtle muſt be alſo ſhut. For the mouth being open, the excrements never go well forth; becauſe the vapors that paſs out of the mouth, which being reſtrained and driven to the Midriff, by ſtretching it powerfully thruſts down the excrement. Wherefore Apothecaries when they give glyſters, bid the Patient to open his mouth, that the glyſter may eaſilyer go up, which otherwiſe would ſcarcely go up, the mouth being ſhut, becauſe ſo we ſhould have no place empty in us, into which the glyſter might be admitted.

Of the White-line, and Peritoneum or Rim of the belly.

What the White-line is.

THe White-line is nothing elſe, than the bound and extremities of the muſcles of the *Epigaſtrium*, diſtinguiſhing the belly in the midſt into two parts, the right and left. It is called white, both of its own colour, and alſo for that no fleſhy part lyes under it, or is placed above it. It is broader above the navell, but narrower below, becauſe the right muſcles do there grow into one.

What the Peritonæum is.

Now we muſt treat of the Coat or membrane, *Peritoneum* or Rim of the belly; it is ſo called, becauſe it is ſtretched over all the lower belly, and particularly over all the parts contained in the ventricle, to which alſo it freely lends a common coat.

The ſubſtance, and quantity.

It hath a ſpermatick ſubſtance, as all other membranes have; the quantity of it in thickneſs is very ſmall, (for it is almoſt as thin as a Spiders web) yet differing in divers places in men and women; for men have it more thick and ſtrong above the navell, that ſo it may contain the extenſion of the ſtomack, often ſtretched beyond meaſure with meat and drink. On the contrary women have it ſo thick and ſtrong below their navell, that it ſeems double, that ſo they may more eaſily endure the diſtention of their womb, cauſed by the childe contained in it. But above the navell, men and women have the *Peritoneum* of an equal ſtrength, for the ſelf-ſame reaſon. The longitude and latitude of it is known by the circumſcription of the belly.

The figure.

The figure is round and ſomewhat long; it puts forth ſome productions, like fingerſtalls, both for the leading and ſtrengthening the ſpermatick veſſels, and the Cremaſter muſcles of the Teſticles, and beſides it the ejaculatory veſſels, as alſo to impart a coat to the Teſticles and all the naturall parts.

The compoſition.

It is compoſed of ſlender, membranous and nervous fibers, certain ſmall branches of veins and arteries concurring with them, which it receives for life and nouriſhment from the adherent parts.

The number. Lib. de ſem.

This membrane is one in number, and beſides every where one and equal, although *Galen* would have it perforated in that place [illegible] to the Teſticles; But in truth we muſt not think that a hole, but rather a production, as we ſaid before.

The later Anatomiſts have obſerved, the Coat [illegible] is doubled below the Navel, and that by the ſpaces of theſe reduplications the [illegible] to the Navell.

The ſite and connexion.

It is ſituate near the naturall parts, and [illegible] and joined by the coat, which it gives them, as alſo on the ſides, it is joined to the [illegible] of the loins, from whoſe ligaments (or rather Periоſteum) it takes the original. On the lower part, it cleaves to the ſhare-bone, and on the upper to the Midriff, whoſe lower part it wholly inveſts; on the fore or outer part it ſticks ſo cloſe to the tranſverſe muſcles, that it cannot be pluckt from them but by force, by reaſon of the complication and adheſion of the fibers thereof with the fibers of the proper membrane of theſe muſcles, which membrane in *Galens* opinion proceeds from this *Peritoneum*, that ſo it is no marvail that we may more eaſily break than ſeparate theſe two coats. It is of temperature cold and dry, as all other membranes are.

Lib. 6. Meth.

Uſe.

It hath many uſes, the firſt whereof is, to invest and cover all the parts of the lower belly, ſpecially the Kall, leſt it ſhould be ſqueezed by great compreſſures and violent attempts into the empty ſpaces of the muſcles, as it ſometimes happens in the wounds of the *Epigaſtrium*, unleſs the lips of the ulcer be very well united; for then appears a tumor about the wound by the Guts and Kall thruſting without the *Peritoneum* into thoſe ſpaces of the muſcles, from whence proceeds cruel pain.

Another uſe is to further the caſting forth of the excrements by preſſing the ventricle and guts on the foreſide, as the Midriff doth above, as one ſhould do it by both their hands joined together.

The third uſe is, it prohibits the repletion of the parts with flatulency after the expulſion of the excrements, by ſtraitning and preſſing them down.

The fourth and laſt is, that it contains all the parts in their ſeat, and binds them to the back-bone, principally that they ſhould not fly out of their places by violent motions, as leaping and falling from on high.

Laſtly, we muſt know, that the Rim is of that nature, that it will eaſily dilate it ſelf, as we ſee in Dropſies, in women with childe, and in tumors againſt nature.

CHAP. VIII.

Of the Epiploon, Omentum, or Zirbus, that is, the Kall.

The ſubſtance, magnitude, figure.

AFter the containing parts, follow the contained, the firſt of which is the *Epiploon*, (or Kall) ſo called, becauſe it (as it were) ſwims upon all the guts. The ſubſtance of it is fatty and ſpermatick, the quantity of it for thickneſs is diverſe, in divers men according to their temperament. The latitude of it is deſcribed by the quantity of the guts. It is in figure like a purſe, becauſe it is double. It is compoſed of veins, arteries, fat and a membrane, which liding down from the gibbous part of the ventricle, and the flat part of the gut *Duodenum* and ſpleen over the Guts, is turned back from the lower belly to the top of the Colon. It is one as we ſaid covering the Guts. It hath its chief connexion with the firſt *Vertebra's* of the Loins, from which place in beaſts it ſeems to take a coat, as in men from the hollow part of the Spleen, and gibbous of the ventricle, and depreſſed part of the *Duodenum*, from whence doubled it is terminated in the fore and higher part of the Colick-gut. Which moved *Galen* to write, that the upper part of the membrane of the Kall was annexed to the ventricle; but the lower, to the latter part of the Colick-gut. From the veſſels of which parts it borrows his, as alſo the nerves, if it have any. The temper of it in lean bodies is cold and dry, becauſe their Kall is without fat; but in fat bodies it is cold and moiſt by reaſon of the fat. The uſe of it is twofold: The firſt is to heat and moiſten the Guts, and help their concoction, although it do it by accident, as that which through the denſity of the fat hinders the cold air from piercing in, and alſo forbids the diſſipation of the internall heat. Another uſe is, that in want of nouriſhment in times of great famin, for ſometimes it cheriſhes, and (as it were) by its dew preſerves the innate heat, both of the ventricle and neighbouring parts, as it is written by *Galen*. Moreover we muſt obſerve, that in a rupture or relaxation of the *Peritoneum*, the Kall fals down into the *ſcrotum*, from whence comes that rupture we call *Epiplocele*. But in women that are ſomewhat more fat, it thruſts it ſelf between the bladder and the neck of the womb, and by its compreſſion hinders, that the ſeed comes not with full force into the womb, and ſo fruſtrates the conception. Beſides, when by a wound or ſome other chance, any part of it be defective, then that part of the belly which anſwers to it, will afterwards remain cold and raw, by reaſon of the forementioned cauſes.

CHAP. XIIII.

Of the Ventricle or Stomach.

NOw we muſt ſpeak of the Stomach, the receptacle of the food neceſſary for the whole body, the ſeat of appetite, by reaſon of the Nerves diſperſed into its upper orifice, and ſo into its whole ſubſtance. The ſubſtance thereof is rather ſpermatick than ſanguine, becauſe that for one fleſhy membrane, it hath two nervious; The quantity or magnitude of the ventricle is divers, according to the various magnitude of bodies, and gluttony of men. The figure of it is round and ſomewhat long, like a Bagpipe. The ſtomach is compoſed of two proper coats, and one common from the *Peritonæum*, together with veins, ſinews, and arteries; the innermoſt of its proper coats is membranous woven with right fibers, for the attraction of meats, it is extended and propagated even to the mouth thereof, whereby it comes to paſs that the affections of one part may eaſily be communicated to the other by ſympathy, or conſent. This coat hath its originall from the membranes of the brain which accompany the nerves deſcending from the third and fourth conjugation to the mouth thereof. And in like ſort from other productions deſcending by the paſſages of the head, from whence alſo another reaſon may be drawn from that, which they commonly bring from the nerves of the ſixt conjugation; why in wounds of the head, the ſtomach doth ſo ſoon ſuffer by conſent with the brain. The exterior or outer is more fleſhy and thick, woven with oblique fibers, to retain and expell. It draws it originall from the *Pericranium*, which as ſoon as it comes to the gullet, takes unto it certain fleſhy fibers. There be nerves ſent into the ſtomach from the ſixt conjugation of the brain, as it ſhall be ſhewed in its proper place. Veins and arteries are ſpread into it from the *Gaſtrica*, the *Gaſtrepiploides*, the *Coronaria* and ſplenick, from the ſecond, third, and fourth diſtribution of the *Vena porta*, or gate-vein; and the third of the deſcendent artery to the naturall parts, as ſoon as it paſſes forth of the midriffe.

What the ventricle is
The ſubſtance.
The magnitude.
The figure.
The compoſure.

The cauſe of the conſent of the mouth and ſtomach.

It is one in number. The greater part of it is ſituated on the left ſide between the ſpleen, the hollowneſs of the liver, and the guts, that aſſiſted by the heat of ſuch neighbouring parts, it may more cheerfully perform the concoction of the meat. Neither am I ignorant that *Galen* hath written, that a great part of the ſtomach lies on the left ſide. But inſpection it ſelf, and reaſon makes me derogate from *Galens* authority, for becauſe there is more empty ſpace on the left ſide, by reaſon the ſpleen is leſs than the liver, it was fit it ſhould lie more on the left ſide. The more proper connexion of it is with the gullet and guts, by its two orifices; with the brain by its nerves; with the liver and ſpleen by its veins; with the heart by its arteries; and with all the naturall parts by the membrane.

The number.

Lib. 4. de uſu partium.

The connexion.

The temper of the ventricle in men of good habit, is temperate, becauſe it is almoſt compoſed of the equall commixture of ſanguine and ſpermatick parts; or according to *Galens* opinion, it is cold of the firſt kind by the parts compoſing it, and hot by the vicinity of the bowels. But in ſome it is hotter, in others colder, according to the divers temper and complexion of divers bodies. That ſtomach is to be thought well tempered, that powerfully draws down the meat and drink, and embraces and retains them ſo drawn, untill by concoction and elixation, they ſhall be turned into a juice like cream (which the Greeks call *Chylos*;) and laſtly, which doth ſtrongly ſend from it, and repell the excrements of this firſt concoction.

The temper.
Lib. 9. Meth.

The ſtomach is known to be hotter by this, that it better concocts and digeſts courſe and hard meats, as beef, hard egs, and the like, than ſoft meats eaſie of digeſtion, which it corrupts and turns into belchings. For ſo a young chicken, is ſooner burnt than well roſted at a great fire. The ſtomach which is colder, deſires much meat, but is ſlow in concocting them, eſpecially if they be cold and hard of digeſtion, which for that cauſe quickly turn ſowre. The action of a well conditioned ſtomach is twofold, one common, another proper. The common is to attenuate, mixe and digeſt the meats taken in at the mouth, for the nutrition of it ſelf and the whole body, after the liver hath performed its duty, which before it be done, the ventricle only enjoyes the ſweet pleaſure of the *Chylus*, and comforts its ſelf againſt the impurity of the adjacent parts, whereof it is called the work-houſe of concoction. Its firſt action is to attract, retain, and aſſimilate to it ſelf that which is convenient; but to expell whatſoever ſhall be contrary, either in quantity, or quality, or in the whole ſubſtance.

Notes of a hot ſtomach.

The action twofold.

It hath two orifices, one above which they commonly call the ſtomach and heart, the other lower, which is called the *Pylorus*, or lower mouth of the ſtomach. The upper bends to the left ſide neer the back bone; it is far more large and capacious than the lower, that ſo it may more commodiouſly receive meats half chewed, hard and groſs, which Gluttons caſt down with great greedineſs; it hath an exquiſite ſenſe of feeling, becauſe it is the ſeat of the appetite, by reaſon of the nerves incompaſſing this orifice, with their mutuall imbracings; whereby it happens that the ventricle in that part is endued with a quick ſenſe, that perceiving the want and emptineſs of meat, it may ſtir up the creature to ſeek food. For albeit

The two orifices of the ſtomach.

nature

nature hath beſtowed four faculties on other parts, yet they are not ſenſible of their wants, but are only nouriſhed by the continuall ſucking of the veins, as plants by juice drawn from the earth.

The ſite.

This orifice is ſeated at the fifth *Vertebra* of the cheſt, upon which they ſay it almoſt reſts. Yet I had rather ſay that it lies upon the twelfth *Vertebra* of the cheſt, and the firſt of the loins; for in this place the gullet perforates the midriffe, and makes this upper orifice. The lower orifice bends rather to the right ſide of the body, under the cavity of the liver. It is far ſtraiter than the upper, leſt any thing ſhould paſs away before it be well attenuated and concocted; and it doth that by the help or aſſiſtance of, as it were, a certain ring, like to the ſphincter muſcle of the fundament, which ſome have thought a glandule made by the tranſpoſition of the inner and fleſhy membrane of the ventricle into that which is the outer of the guts. I know *Columbus* laughs at this glandulous ring, but any one that looks more attentively ſhall perceive that the *Pylorus* is glandulous. The ſtomach in its lower and inner ſide, hath many folds and wrincles, which ſerve to hold and contain the meats, untill they be perfectly concocted. In the ventricle we obſerve parts gibbous and hollow; the hollow is next to the liver and midriffe; the gibbous is towards the guts. Now we muſt note, that the ventricle when it is much reſolved or looſed, may ſlide down even to the navill near the bladder, the which we have obſerved in ſome bodies diſſected after their death.

The glandulous ring of the *Pylorus*.

The falling down of the ſtomach.

CHAP.

CHAP. XV.

of the Guts.

THe Guts the instruments of distribution and expulsion, are of the same substance and composure with the stomach, but that the fore of the coats of the stomach is contrary to those of the guts. For that which is the innermost coat of the stomach is the outermost of the guts, and so on the contrary. The figure of the guts is round, hollow and capacious, some more, some less, according to the divers bigness. *Their substance.* *Figure.*

But for the quantity of the guts, some are small, some great, more or less, according to the variety of bodies. But they are six in number: for there be three small; the *Duodenum*, the *Jejunum*, or empty gut, and the *Ileon*. Three great, the Blind, the Colick, and the Right gut. All which have had their names for the following reasons; the first, because it is extended the length of twelve fingers, like another stomach, without any turning, or winding; of which greatness it is found in great bodied men, such as were more frequently to be met withall in *Galens* time, than in this time of ours, in which this gut is found no longer than seven, eight, or nine fingers at the most. The cause of this length is, that there may be a free passage to the Gate-vein, coming out of the liver, as also to the artery and nerve which run into it. For seeing that this gut may sometimes rise to the top of the liver, it would possess the space under the bladder of the gall (with which it is often tinctured) if it had any revolutions that way, which is the passage for such like vessels. Others give another reason of this figure, which is, that there should be nothing to hinder the easie and fit distribution of the perfectly concocted *Chylus* to the liver. *Their number* *The Duodenum.*

The second is called *Jejunum*, or the empty gut, not because it is absolutely so, but because it contains little in comparison of the other. There is a triple cause of this emptiness, the first the multitude of the meseraick veins and arteries which are about it, whereupon there is a greater and quicker distribution of the *Chylus*. The second is the vicinity or neighborhood of the liver strongly drawing the *Chylus* contained in it; the third is the flowing down of the chollerick humor from the bladder of the Gall into it, which ever and anon by its acrimony cleanses away the filth, and by continuall flowing solicits it to expulsion. *The Jejunum.*

The third is called *Ileon* because it lies between the *Ilia* or flanks; it differs nothing from the rest in substance and magnitude, but in this one thing, that there is more matter contained in it than in the rest, by reason of the paucity of the vessels terminated in it, that it is no marvell that there can be no exact demonstration made of them. *Ileon.*

The fourth is called *Cæcum* or the blind, because it hath but one passage to send out and receive in the matter. This gut hath a long and strait production, which according to the opinion of some (though altogether erroneous) often falls down into the *Scrotum* in the rupture, or relaxation of the Rim of the Belly; for that production in the lower belly strongly sticks to the *Peritonæum* or Rim, which hinders such falling down. But *Galen* seems by such a blind gut to have meant this long and narrow production, and certainly so thinks the common sort of Anatomists, but here *Vesalius* justly reprehended *Galen*. Wherefore *Sylvius* that he might free *Galen* of this fault, would have us by the blind gut to understand the beginning of the colick gut. *Cæcum.*

The fifth is called *Colon* (or colick gut) because it is greater and more capacious than the rest. The sixt and last, the Right gut, by reason of the rightness or streightness of the passage. This, in beasts especially, hath a certain fatness in it to make the passage slippery, and lest the gut should be excoriated in the passage, by the sharpness of hard and acrid excrements. *Colon.* *Rectum.*

The site of these guts is thus: The *Duodenum* upon the backbone bends to the right hand; the *Jejunum* possesses a great part of the upper umbilicall region, diffuses it self into both sides with windings, like to those of the gut *Ileon*, even to the flanks. The gut *Ileon* is situate at the lower part of the umbilicall region, going with many turnings and windings, even to the hollownesses of the holy-bone above the bladder and side parts of the *Hypogastrium*, they call the flanks. *Their site;*

The Blind bends to the right hand, a little below the kidney, above the first and fourth *Vertebra* of the loins. The Colon or Colick gut is crooked and bent, in the form of a *Scythian* bow, filling all the space from the blind gut, below the right kidney even to the hollowness of the liver, and then it goes by the globous part of the stomach above the small guts, even to the hollowness of the Spleen; from whence sliding under the left kidney, with some turnings, it is terminated upon the *Vertebræ* of the loins.

By all which turnings and windings of the colick gut, it is easie to distinguish the pain of the stone of the kidneys, which remain fixt in one certain place, from the colick wandring through these crooked passages we mentioned. The right gut tends with an oblique site towards the left hand, upon the holy bone even to the very fundament. They have all one and a common connexion; for they are all mutually joined together by their coats, because there is but one way from the gullet even to the fundament, but they are joined to the principall parts by their nerves, veins, and arteries. *The distinction between the colick and the stone in the kidneys.* *Their connexion.*

But a more proper connexion is that, where the *Duodenum* on the upper part of it, is joined

ed with the *Pylorus*; but on the lower part to the *Jejunum*, and the parts lying under it, by the coat of the *Peritonæum*. The *Jejunum*, or empty gut, is joyned to the *Duodenum* and *Ileon*. The *Ileum* with the empty and blind guts. The blind with the *Ileon* and *Colon*, and with the right side of the backbone where it is tied more straitly. The *Colon* with the blind and right guts, and in his middle part, with the kidneys and gibbous part of the stomach; whereby it comes to pass, that being distended with wind in the colick, it overturns and presses the stomach, and so causes vomiting.

Why vomiting happens in the colick.

Lastly, the right gut is annexed with the colick gut and fundament. At the end whereof there is a muscle fastened, of figure round and circular, called the *Sphincter*, arising from the lower *Vertebra's* of the holy bone and rump, by the benefit of which as of a dore or gate, the excrements are restrained at our wil, lest man born for all honest actions, without all shame, in every time and place, should be forced every where to ease his belly. For such as have lost the benefit of this muscle by the palsy, have their excrements go from them against their wills. There is a body situate at the end of the right gut, of a middle substance between the skin and flesh, as it were arising from the mixture of them both, like the extremities of the lips, of the same use with the *Sphincter*, but that it is not altogether so powerfull. But there are also certain veins situate about it called the Hæmorrhoidall, of which we will speak in their place.

The *Sphincter* muscles of the fundament.

Gal. lib. 5. de usu partium. cap. 14.

Besides there are two other muscles that descend to the end of this gut, being broad and membranous on each side, one arising from the side and inner parts of the share and hip-bones, which inserted above the *Sphincter* pull up the fundament falling down, wherefore they are called *Levatores Ani*, or the lifters up of the fundament. Wherefore when as either they are too weak, or resolved, or the fundament oppressed with the weight of flegmatick, salt, cholerick and sharp humors, the gut is scarce restored into its place, that there is need of the help of the fingers for that purpose.

Levatores Ani.

The guts follow the temper of the stomach. Their action is the distributing the *Chylus* by the meseraick veins (which of duty belongs to the three small guts) and the receiving the excrements of the *Chylus*, and retention of them, till a fit time of expulsion, which belongs to the third quarter. Besides, these small guts finish up the work of concoction, begun in the stomach, although they be not altogether made for that use. But nature is often accustomed to abuse the parts of the body for some better use.

The action of the guts.

The fifth figure of the lower belly.

A. The brest blade, *Cartilago, Ensiformis.*
BB. The Rim, with the midriffe and broken ribs bent outwards.
CC. the gibbous part of the liver.
D. a ligament tying the liver to the midriffe.
E. part of the umbilicall vein.
FF. the stomach fild full of meat.
G. a part of the spleen.
H. the blind gut of the late writers, for the Ancients took the top of the *colon* for it.
I. the beginning of the great or thick guts.
I. and so to K. sheweth the passages of the colick gut from the right kidney to the liver. And so the colick and the stone on this side are in one place, and therefore hardly distinguished.
K. to L. the same colick gut lyeth under the whole bottome of the stomach, which is the reason that those which are troubled with the colick cast so much.
L. to M. The passage of the *Colon* from the spleen to the share bone, by the left kidney, a way, which maketh the pain of the stone and the Colick on the left side very hard to distinguish. N. The *Colon* ending in the right gut. O. The beginning of the right gut unto the bladder. P. Q. The sunken or fallen side of the *Colon* at P. and his Chambers or Cels at Q. R. S. T. The lesser guts especially lying under the Navel. *a. a.* The two umbilicall arteries. *b.* The bottome of the bladder. * The connexion of the bladder and the *Peritonæum.*

But

But we must note, that for the composure of the guts, they have only transverse fibers, for expulsions sake, unless that at the beginning of the *Colon*, and the end of the right gut, you may see certain right fibers added to the transverse to strengthen them, lest these guts should chance to be broken and torn by the passage of hard excrements, and the laborious endeavour of expulsion (specially in brute beasts.) Their fibers.

But if any aske, how they have retention, being they want oblique fibers; he may know that the *faces* are retained in the right gut, by the force of the *Sphincter* muscle, but oft times in the blind, by their hardness and abundance, whereby they stick in the passage; but in the rest, by reason of their conformation into many windings and turnings. The length of the guts, is seven times more than the length of the whole body; to this length they have windings, lest the nourishment should quickly slide away, and lest men should be withdrawn by gluttony from action and contemplation. For so we see it comes to pass in most beasts, which have one Gut, stretched streight out from the stomach to the fundament; as in the Lynx and such other beasts of insatiable gluttony, alwayes, like plants, regarding their food. How the guts become fit to retain. Their length.

CHAP. XVI.

Of the Mesentery.

After the Guts followes the Mesentery, being partly of a fatty and partly of a spermatick substance. The greatness of it is apparent enough, although in some it be bigger, and in some lesser according to the greatness of the body. It is of a round figure and not very thick. It is composed of a double coat arising from the beginning and root of the *peritonæum*. In the midst thereof it admits nerves from the Costall of the sixt conjugation, veins from the *Vena Porta* or Gate vein; Arteries from the descendent artery, over and besides a great quantity of fat and many glandulous bodies, to prop up the division of the vessels spred over it, as also to moisten their substance. It is in number one, situate in the middle of the guts, from whence it took its name. Yet some divide it into two parts, to wit, into the *Meseraon*, that is, the portion interwoven with the small guts, and into the *Mesocolon* which is joyned with the Great. It hath connexion by its vessels, with the principall parts, by its whole substance with the guts, and in some sort with the kidneys, from whose region it seems to take its coats. The substance. Magnitude. Figure. Composure. Number. The connexion.

It is of a cold and moist temper, if you have respect to his fatty substance; but if to the rest of the parts, cold and dry. The temper.

The action and use of it is, to bind and hold together the guts, each in his place, lest they should rashly be folded together, and by the Meseraick veins (which they term the hands of the Liver) carry the *Chylus* to the liver. The action and use.

In which you must note, that all the Meseraick Veins come from the liver, as we understand by the dissection of bodies; although some have affirmed, that there be some veins serving for the nourishment of the guts, no wayes appertaining to the Liver, but which end in certain Glandulous bodies, dispersed through the Mesentery, of whose use we will treat hereafter. All the meseraick veins come from the liver.

CHAP. XVII.

Of the Glandules in generall, and of the Pancreas, *or sweet-bread.*

A Glandule is a simple part of the body, sometimes of a spungy and soft substance, sometimes of a dense and hard. Of the soft Glandules are the *Tonsilla*, or Almonds, like in substance to blanched Almonds; the *Thymus*, *Pancreas*, *Testicles*, *Prostatæ*. But the dense and hard are the *Parotides* and other like. The Glandules differ amongst themselves in quantity and figure, for some are greater than other some, and some are round and others plain, as the *Thymus* and *Pancreas*. Substance of the glandules. Quantity and figure.

Others are compounded of veins, nerves, arteries, and their proper flesh, as the Almonds of the ears, the milky glandules in the breasts and the testicles. Others want nerves, at least which may be seen, as the *Parotides*, the axillary, or those under the armholes and others. The number of glandules is uncertain, by reason of the infinite multitude and variety of sporting nature. You shall find them alwayes in these places, where the great divisions of vessels are made; as in the middle ventricle of the brain, in the upper part of the Chest, in the Mesentery and other like places. Composition. Number.

Although othersome be seated in such places, as nature thinks needfull to generate and cast forth of them a profitable humor to the creature; as the almonds at the root of the tongue, the kernels in the dugs, the spermatick vessels in the *scrotum* and at the sides of the wombe; or where nature hath decreed to make emunctories for the principall parts,

Connexion. as behind the ears, under the armholes, and in the groins. The connexion of glandules is not only with the veſſels of the parts concurring to their compoſition, but alſo with thoſe, whoſe diviſion they keep and preſerve. They are of a cold temper, wherefore Phyſitians

Temper. Action and uſe. ſay the blood *recrudeſcere* (*i*) to become raw again in the dugs, when it takes upon it the form of milk. But of theſe ſome have action, as the almonds, which pour our ſpatle uſefull for the whole mouth, the dugs milk, the Teſticles ſeed; others, uſe only, as thoſe which are

The ſubſtance of the *Pancreas*. made to preſerve, underprop aud fill up the diviſions of the veſſels. Beſides this we have ſpoken of glandules in generall, we muſt know that the *Pancreas* is a glandulous and fleſh-like body, as that which hath every where the ſhape and reſemblance of fleſh. It is ſituate at the

The ſite. flat end of the liver, under the *Duodenum* with which it hath great connexion, and under the gate-vein, to ſerve as a bulwarke, both to it and the diviſions thereof, whilſt it fils up the empty ſpaces between the veſſels themſelves, and ſo hinders, that they be not pluckt aſunder, nor hurt by any violent motion, as a fall or the like.

CHAP. XVIII.

Of the Liver.

HAving gone thus far, order of diſſection now requires, that we ſhould treat of the diſtribution of the gate-vein; but becauſe it cannot well be underſtood unleſs all the nature of the liver from whence it ariſes, be well known, therefore putting it off to a more fit place, we will now ſpeak of the Liver. Wherefore the Liver (ac-

What the liver is. cording to *Galens* opinion, *lib. de form. fœtus*) is the firſt of all the parts of the body, which is finiſhed in conformation, it is the ſhop and Author of the blood, and the originall of the veins; the ſubſtance of it, is like the concrete mud of the blood, the quantity of it is divers,

Its ſubſtance and quantity. not only in bodies of different, but alſo of the ſame ſpecies; as in men amongſt themſelves, of whom one will be gluttonous and fearfull, another bold, and temperate, or ſober; for he ſhall have a greater liver than this, becauſe it muſt conceive and concoct a greater quantity of *Chylus*: yet the liver is great in all men, becauſe they have need of a great quantity of blood for the repairing of ſo many ſpirits and the ſubſtantifick moiſture, which are reſolved

Why cowards have great livers. and diſſipated in every moment by action and contemplation. But there may be a twofold reaſon given, why ſuch as are fearfull have a larger liver. The firſt is, becauſe in thoſe the vitall faculty (in which the heat of courage and anger reſides) which is in the heart, is weak; and therefore the defect of it muſt be ſupplyed by the ſtrength of the naturall faculty. For thus nature is accuſtomed to recompence that which is wanting in one part, by the increaſe and acceſſion of another. The other reaſon is, becauſe cold men have a great appetite, for by *Galens* opinion *In arte parva*, coldneſs increaſes the appetite; by which it comes to paſs that they have a greater quantity of *Chylus*, by which plenty the liver is nouriſhed and grows larger. Some beaſts, as Dogs, and ſwine, have the liver divided into five or more Lobes, but a man hath but one Lobe, or two, or three at the moſt; and theſe not ſo much diſtinguiſhed, as which cheriſh the upper and hollow region of the ventricle, with embracing to help forward the work of concoction. Therefore the liver is almoſt content with one Lobe, although it is alwayes rent with a ſmall diviſion, that the umbilicall vein piercing into the roots and ſubſtance of it, may have a free paſſage; but alſo oftentimes there is as it were a certain ſmall lobe of the liver, laid under that umbilicall vein, as a cuſhion.

The figure. The figure of the liver is gibbous; riſing up and ſmooth towards the Midriffe; towards the ſtomach is the *ſimous* or hollow ſide of it ſomewhat unequall, and rough by reaſon of the diſtance of the Lobes, the original of the hollow vein, and the ſite of the bladder of the Gall.

The compoſure. The veſſels. The compoſition of the liver is of veins, nerves, arteries, the coat and proper ſubſtance thereof which we call the groſs and concrete blood, or *Parenchima*. Veins and arteries come to it from the navill; but nerves immediately from theſe which are diffuſed over the ſtomach according to *Hippocrates*; yet they penetrate not very deep into its ſubſtance, for it ſeems not to ſtand in need of ſuch exact ſenſe, but they are diſtributed upon the coat and ſurface thereof, becauſe this part made for diſtribution over the whole body, keeps to it ſelf no acrid or malign humor; for the perception of which it ſhould need a nerve, although the coat inveſting it, ſends many nervous fibers into its ſubſtance, as is apparent by the taking away of the coat from a boiled liver; we muſt think the ſame of the other entrails. The coat of the liver is from the *Peritonæum*, waxing ſmall from the umbilicall vein, when it divides it ſelf for the generation of the gate and hollow veins, as is obſerved by *Galen*, *Lib. de format. Fœtus*. The liver is only one, ſituate in the greater part on the right ſide, but with the leſſer part on the left, quite contrary to the ſtomach. Its chief connexion is with the ſtomach and guts, by the veins and membranes of the *Peritonæum*; by the hollow vein and artery, with the heart; by the nerve with the brain, and by the ſame ligatures with all the parts of the whole body. It is of a hot and moiſt temper, and ſuch as have it more hot, have large veins and hot blood; but ſuch as have it cold, have ſmall veins, and a diſcoloured

The number and ſite. The connexion. The temper.

hew.

ſhew. The action of the Liver is the converſion of *Chylus* into the blood, the work of the ſecond concoction. For although the *Chylus* entring into the meſeraick veins, receive ſome reſemblance of blood, yet it acquires not the form and perfection of blood, before it be elaborate, and fully concoct in the liver. It is bound and tyed with three ſtrong ligaments, two on the ſides in the midſt of the baſtard ribs, to bear up its ſides, and the third more high and ſtrong, deſcending from the breaſt-blade, to ſuſtain its proper part, which with its weight would preſs the lower orifice of the ſtomach, and ſo cauſe a falling or drawing down of the ſternon and coller bone. And thus much may ſuffice for its proper ligaments, for we before mentioned its common; the veins, arteries, nerves, and coat of the *Peritoneum*, by which it is knit to the loins and other naturall parts. But we muſt note, that beſides theſe three proper ligaments, the liver is alſo bound with others to the baſtard ribs; as *Sylvius* obſerves in his Anatomicall obſervations, and *Hollerius* in his Practiſe, *Cap. de pluritide.*

The action.

The ligaments.

CHAP. XIX.

Of the bladder of the Gall.

NOw we muſt come to the bladder of the Gall, which is of a nervous ſubſtance, and of the bigneſs of a ſmall pear; it is of figure round, with the bottom more large, but the ſides and mouth more narrow and ſtrait. It is compoſed of a double coat, one proper, conſiſting of three ſorts of fibers, the other from the *peritoneum*. It hath a vein from the *Porta* or gate-vein, and an artery from that which is diffuſed into the liver, and a nerve from the ſixt conjugation. It is but one and that hid on the right ſide under the greater lobe of the liver, it is knit with the touching of its own body, and of the paſſages and channels made for the performance of its actions with the liver, and in like manner with the *Duodenum*, and not ſeldome with the ſtomach alſo, by another paſſage; and to conclude to all the parts by its veins, nerves, arteries, and common coat. It is of a cold temper, as every nervous part is. The action of it is to ſeparate from the liver the cholerick humor, and that excrementitious, but yet naturall by the help of the right fibers, for the purifying of the blood, and by the oblique fibers, ſo long to keep it being drawn, untill it begin to become troubleſome in quantity, or quality, or its whole ſubſtance, and then by the tranſverſe fibers, to put it down into the *Duodenum* to provoke the expulſive faculty of the guts. I know *Fallopius* denies the texture of ſo many fibers, to be the miniſter of ſuch action to the gall. But *Veſalius* ſeems ſufficiently to have anſwered him. The bladder of the gall hath divers channells, for coming with a narrow neck, even to the beginning of the Gate-vein, it is divided into two paſſages, the one whereof ſuffering no diviſion is carryed into the *Duodenum*, unleſs that in ſome it ſend another branch into the bottome of the ſtomach, as is obſerved by *Galen*; which men have a miſerable and wretched life, being ſubject to cholerick vomitings, eſpecially when their ſtomachs are empty, with great pains of their ſtomach and head, as is alſo obſerved by *Galen*, *Cap.* 74. *Artis Med.* The other coming out of the body of the liver divides it ſelf into two or three paſſages, again entring the ſubſtance of the liver, is divided with infinite branches, accompanying ſo many branches of the Gate-vein through the ſubſtance of the liver, that ſo the blood unleſs it be moſt elaborate and pure, may not riſe into the hollow vein, all which things Diſſection doth manifeſtly teach.

The ſubſtance, greatneſs, and figure thereof. The compoſition. Number and connexion.

Temper. Actions.

CHAP. XX.

Of the Spleen or Milt.

The ſubſtance.

BUt becauſe we cannot well ſhew the diſtribution of the gate-vein, unleſs the Spleen be firſt taken away, and removed from its ſeat: therefore before we go any further, I have thought good to treat of the Spleen. Therefore the Spleen is of a ſoft, rare, and ſpongious ſubſtance (whereby it might more eaſily receive and drink up the dregs of the blood from the liver) and of a fleſh more black than the liver. For it reſembles the colour of its muddy blood, from which it is generated. It is of an indifferent greatneſs; but bigger in ſome, than in otherſome, according to the diverſe temper and complexion of men.

Magnitude.

Figure.

It hath as it were a triangular figure, gibbous on that part, it ſticks to the ribs and midriffe, but hollow on that part next the ſtomach.

Compoſition.

It is compoſed of a coat, the proper fleſh, a vein, artery, and nerve. The membrane comes from the *Peritonæum*, the proper fleſh from the *fæces* or dregs of bloud, or rather of the naturall melancholy humour, with which it is nouriſhed. The fourth branch of the *vena porta*, or gate vein, lends it a vein; the firſt branch of the great deſcendent artery preſently, after the firſt entrance without the Midriff, lends it an artery. But it receives a nerve, from the left coſtall, from the ſixt conjugation on the inner part, by the roots of the ribs; and we may manifeſtly ſee this nerve, not only diſperſing it ſelf through the coat of the liver, but alſo penetrating with its veſſels the proper fleſh thereof, after the ſelf ſame manner, as we ſee it is in the heart and lungs.

Number and Site.

It is one in number, ſituate on the left ſide, between the ſtomach and the baſtard ribs, or rather the midriffe which deſcends to their roots. For it oft times cleaves to the midriffe, on its gibbous part, by a coat from the *Peritonæum*, as alſo on the hollow part to the ſtomach, both by certain veins which ſends it into the ventricle, as alſo by the kall. It hath connexion, either primarily, or ſecundarily, with all the parts of the body, by theſe its veſſels.

Connexion.

Temper and uſe.

It is of a cold and drie temper; the action and uſe of it is to ſeparate the melancholick humor, which being feculent and droſſie, may be attenuated by the force of many arteries diſperſed through its ſubſtance. For by their continuall motion, and native heat, which they carry in full force with them from the heart, that groſs blood puts off its groſneſs, which the Spleen ſends away by paſſages fit for that purpoſe, retaining the ſubtler portion for its nouriſhment. The paſſages by which it purges it ſelf from the groſneſſe of the melancholy bloud, are a vein aſcending from it into the ſtomach to ſtir up the appetite by its ſourneſſe, and ſtrengthen the ſubſtance thereof by its aſtriction; and alſo another vein, which ſometimes from the Spleen branch, ſometimes from the Gate-vein, plainly under its orifice, deſcends to the fundament, there to make the Hæmorrhoidall veins.

CHAP. XXI.

Of the Vena Porta, *and Gate-vein, and the diſtribution thereof.*

The ſub ſtance and figure. Compoſition. Number and Site.

THe gate-vein, as alſo all the other veins, is of a ſpermatick ſubſtance, of a manifeſt largeneſs, of a round and hollow figure, like to a pipe or quill. It is compoſed of its proper coat, and one common from the *Peritonæum*. It is only one, and that ſituate in the ſimous or hollow part of the liver, from whence it breaks forth (or rather out of the umbilicall vein) into the midſt of all the guts, with which it hath connexion, as alſo with the ſtomach, ſpleen, *ſphincter* of the fundament and *Peritonæum*, by the coat which it receives from thence.

Temper and Action.

It is of a cold and dry temper. The Action of it is, to ſuck the *Chylus* out of the ventricle and guts, and ſo to take and carry it to the Liver, untill it may carry back the ſame turned into blood for the nutriment of the ſtomach, ſpleen and guts.

Diviſion thereof into 6 branches, of which. 4 ſimple.

This gate-vein coming out of the ſimous part of the Liver, is divided into ſix branches, that is, four ſimple, and two compound, again divided into many other branches. The firſt of the ſimple aſcends from the forepart of the trunk to the bladder of the Gall by the paſſage of the Choler (and are marked with *g. g.*) with a like artery for life and nouriſhment, and this diſtribution is knowne by the name of *Cyſticæ gemellæ* or Cyſtick twins. The ſecond is called the *Gaſtrica* or ſtomach vein, ariſing in like manner from the forepart of the trunk, is carried to the *Pylorus* and the ſimous or back part of the ſtomach next to it.

1 *Cyſticæ gemellæ* 2

Gaſtrica.

The third is called *Gaſtrepiplois*, the ſtomach and kall vein, which coming from the right ſide of the gate-vein goes to the gibbous part of the ſtomach next to the *Pylorus* and the right ſide of the kall.

3 *Gaſtrepiplois,*

The fourth going forth from behind and on the right hand of the gate-vein, aſcends above the root of the Meſeraick branch even to the beginning of the gut *Jejunum*, along the gut *Duodenum*, from whence it is called *Inteſtinalis*, or the gut vein. And theſe

4 *Inteſtinalis.*

are

are the foure ſimple branches. Now we will ſpeak of the compound.

To compound.

The firſt is the ſplenick, which is divided after the following manner. For in its firſt beginning and upper part, it ſends forth the *Coronalis*, or crowne vein of the ſtomach, which by the back part of the ſtomach aſcends into the upper and hollow part thereof; to which place, as ſoon as it arrives, it is divided again into two branches, the one whereof climbs up even to its higher orifice, the other deſcends downe to the lower, ſending forth by the way other branches to the fore and back parts of the ſtomach. Theſe engirt and on every ſide incompaſs the body of the ventricle, for which cauſe they are named the crown veins.

1 *Ramus ſplenicus* ſending forth.

I *Coronalis.*

I have ſometime obſerved this comming forth of the trunk, a little above the orifice of the ſplenick branch. But this ſame ſplenick branch on its lower part, produces the branch of the Hæmorrhoidall veins, which deſcending to the fundament above the left ſide of the loines, diffuſes a good portion thereof into the leaſt part of the colick gut, and the right gut, at the end whereof it is often ſeen to be divided into five Hæmorrhoidall veins, ſometimes more, ſometimes leſs.

2 *Hæmorrhoidalis interna.*

Silvius writes that the Hæmorrhoidall branch deſcends from the meſenterick, and truly we have ſometimes obſerved it to have been ſo. Yet it is more ſuitable to reaſon, that it ſhould deſcend from the ſplenick, not only for that we have ſeen with our eyes that it is ſo, but alſo becauſe it is appointed by nature for the evacuation of the excrementitious melancholick humor. But this ſame ſplenick branch out of the middle almoſt of its upper part produces the third branch going to the gibbous part of the ſtomach, and the kall, they terme it the greater, middle and left *Gaſtrepiploïs*. But on the lower part towards the ſpleen it produces the ſimple *Epiploïs*, or kall-vein, which it diffuſes through the left ſide of the kall. Moreover from its upper part, which touches the liver, it ſends forth a ſhort branch called *vas breve*, or *venoſum*, to the upper orifice of the ventricle for ſtirring up the appetite.

3. *Gaſtrepiploïs major ſiniſtra.*

4. *Epiploïs ſimplex.*

5. *Vas breve ſeu venoſum.*

We have oftentimes and almoſt alwayes obſerved, that this veine veſſell, which Galen calls *vas breve*, comes from the very body of the ſpleen, and is terminated in the midſt of the ſtomach on the left ſide, but never pierces both the coats thereof. Wherefore it is ſomewhat difficult to find, how the melancholy juyce can that way be powred, or ſent into the capacitie of the ſtomach. Now the ſplenick branch, when it hath produced out of it thoſe five forementioned branches, is waſted and diſperſed into the ſubſtance and body of the ſpleen.

Lib. 4. de uſu partium.

Then followes another compound branch of the *vena porta*, called the meſenterick, which is divided into three parts; the firſt and leaſt whereof goes to the blind gut and to the right and middle part of the colick-gut, divided into an infinite multitude of other branches. The ſecond and middle is waſted in the *Ileon*; as the third and greater in the *Iejunum* or empty gut. It is called Meſenterick becauſe it is diffuſed over all the Meſentery; as the ſplenick is in the ſpleen. And thus much we have to ſay of the diviſion of the gate vein, the which if at any time thou ſhalt find to be otherwiſe, than I have ſet downe, you muſt not wonder at it; for you ſhall ſcarce find it the ſame in two bodies, by reaſon of the infinite varietie of particular bodies, which (as the Philoſophers ſay) have each their owne, or peculiar gifts. Our judgment is the ſame of other diviſions of the veſſels. Yet we have ſet down that which we have moſt frequently obſerved.

3 *Ramus meſentericus* devided into three parts.

CHAP. XXII.

Of the originall of the Artery, and the diviſion of the branch, deſcending to the naturall parts.

THoſe things being thus finiſhed and conſidered, the guts ſhould be pulled away, but ſeeing that if we ſhould do ſo, we ſhould diſturb and loſe the diviſion of the artery deſcending to the naturall parts; therefore I have thought it better to handle the diviſion thereof, before the guts be pluckt away. Therefore we muſt ſuppoſe, according to *Galens* opinion, that as all the veins come from the liver, ſo all arteries proceed from the heart. This preſently at the beginning is divided into two branches, the greater whereof deſcends downwards to the naturall parts upon the ſpine of the back, taking its beginning at the fifth *vertebra* thereof, from whence it goes into the following arteries. The firſt called the intercoſtall, runs amongſt the intercoſtall muſcles, and the diſtances of the ribs, and ſpinall marrow, through the perforations of the nerves on the right and left hand from the fifth true, even to the laſt of the baſtard ribs.

The originall of arteries. The diviſion of the great deſcendent artery, is into theſe.

1 *Arteria intercoſtalis.*

This in going this progreſs makes 7 little branchings, diſtributed after the forementioned manner, and going forth of the trunk of the deſcendent over againſt each of the intercoſtall Muſcles.

The ſecond being parted into two goes on each ſide to the Midriffe, whence it may be called, or expreſſed by the name of the *Diaphragmatica* or *Phrenica*, (1) the midriffe artery. The third being of a large proportion, ariſing from the upper part of the arterie preſently after it hath paſſed the midriffe, is divided into two notable branches, whereof on goes to the ſtomach, ſpleen, kall, to the hollow part of the liver and the gall; the other is ſent forth to the meſen-

2 *Phrenicæ*

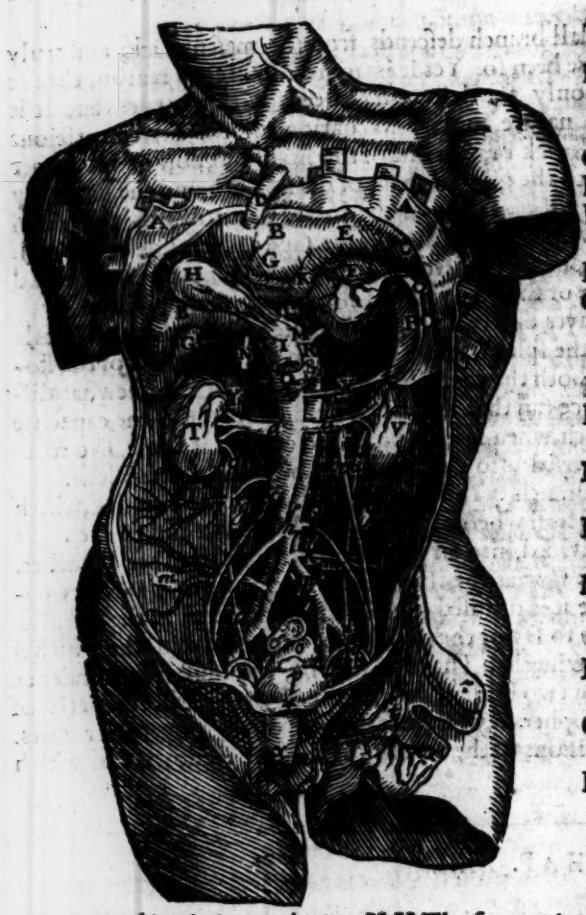
3 *Caliacæ.*

meſentery and guts after the ſame manner, as we ſaid of the meſeraick veins, wherefore it is called the *Cœliaca*, or ſtomach artery. But we muſt note, all their mouths penetrate even to the innermoſt coat of the guts, that by that means they may the better and more eaſily attract the *Chylus* contained in them.

4. *Emulgent.* The fourth is carryed to the reins, where it is named the Reinall or Emulgent, becauſe it ſucks fit matter from the whole maſs of blood.

5. *Spermatica.* The fifth is ſent to the teſticles with the preparing Spermatick veins, whence alſo it is named the Spermatick Artery, which ariſes on the right ſide, from the very trunk of the deſcendent Artery; that it may aſſociate the ſpermatick vein of the ſame ſide, they run one above another, beneath the hollow vein, wherefore we muſt have a great care whilſt we labour to lay it open, that we do not hurt and break it.

The ſeventh figure of the lower Belly.



A, A, The midriffe turned back with the ribs and the *peritonæum*.
BB, The cave or hollow part of the liver, for the liver is lifted up that the hollow part of it may be better ſeen.

E, The hollowneſs in the liver, which giveth way to the ſtomach.
F, The left orifice of the ſtomach.
G G, Certain knubs, or knots, and impreſſions in the hollow part of the liver.
H, The bladder of gall.
I, The Gate-vein, cut off, and branches which go to the bladder of gall.
K, A nerve of the liver coming from the ſtomachicall nerve.
L, An Artery common to the liver and bladder of gall.
M, A Nerve common alſo to them both, coming from the right *coſtall* Nerve of the ribs.
N, the paſſage of the Gall to the Guts cut off.
O O, The hollow of the fore parts of the Spleen.
P, The line where the veſſels of the Spleen are implanted. Q. The trunk of the hollow vein. R, The trunk of the great Artery. S, The *Cœliacall* Artery cut off. T, V, The Kidneys yet wrapped in their membrane. X, Y, The fatty veins called *venæ adipoſæ*. *a*, *b*, The Emulgent veins with the Arteries under them. *c c*, *d d*, The Ureter from either kidney to the bladder. *e*, *f*, The ſpermaticall veins to the teſticles, the right from the hollow vein, the left from the Emulgent. *g*, *g*, Veins coming from the ſpermaticall to the *peritonæum*. *h*, *i*, the ſpermaticall Arteries. *k*, The lower meſentericall Artery. *l*, The aſcending of the great Artery above the hollow vein, and the diviſion of it, and the hollow vein into two trunks. *m*, the Arteries of the loins called *lumbaris*. *n*, The holy Artery called *Sacra*. *o*, A part of the right gut. *p*, The bladder of Urine. * The connexion of the bladder with the *peritonæum*. *q*, A part of the veſſels which lead the ſeed from the Teſticles, is here reflected. *r*, *ſ*, the *ſcrotum*, or cod, that is, the skin that inveſts the yard and teſticles. *t*, The fleſhy pannicle or membrane which is under the cod. *u*, The coat which is proper to the teſticles with his veſſels. *x*, A part of the yard excoriated or flayed, and hanging down.

Hæmorrhoidalis ſeu meſenterica inferior. The ſixth going from the fore and upper part of this deſcendent arterie, deſcends with the Hæmorrhoidall veins to the fundament; preſently from his beginning, ſending forth certain branches alongſt the colick gut, which by *Anaſtomaſis* are united with other branches of the *Cœliacall* Arteries; for whoſoever ſhall look more attentively, he ſhall often obſerve that veins are ſo united amongſt themſelves, and alſo Arteries, and ſometimes alſo the veins with the Arteries. For an *anaſtomaſis* is a communion and communicating of the veſſels amongſt themſelves, by the application of their mouths, that ſo by mutuall ſupplies they may eaſe each others defects. But they call this the lower meſeraick Artery.

7. *Lumbaris.* The ſeventh proceeding from the trunk with ſo many branches as there be *Vertebræ*

in

in the loines, goes to the loines and the parts belonging to them, that is, the ſpinall marrow of that part, and other parts encompaſſing theſe *Vertebra's*, whereupon it is ſtiled the *Lumbaris* or Loine Artery.

The eight maketh the Iliack arteries, untill ſuch time as it departs from the *Peritoneum* where the Crurall Arteries take their originall. This Iliack Artery ſends many divaricati- *Iliacal.*
ons towards the Holy bone where it takes its beginning, and to the places lying neer the Holy bone, which becauſe they run the ſame courſe as the Iliak veins, for brevities ſake, we will let paſs further mention of them, till we come to treat of the Iliack veins.

CHAP. XXIII.

Of the diſtribution of the Nerves to the naturall parts.

IT remains, that before the bowels be taken away, we ſhew the nerves ſent to the entrails and natural parts, that as wiſe and provident men we may ſeem to have omitted nothing. Firſt we muſt know that theſe nerves are of the firſt conjugation, which deſcend as well to the ſtomach all alongſt the Gullet and the ſides thereof, as thoſe at the roots of the ribs on both ſides within. But when they are paſſed through the Midriffe, thoſe which are diſtributed amongſt the naturall parts follow the turnings of the veins and arteries, but ſpecially of the arteries. Wherefore if you have a mind to follow this diſtribution of the nerves, you muſt chiefly look for it in theſe places, in which the artery is diſtributed amongſt the Guts above the loins. *The originall of the nerves which are carryed to the naturall parts.*

Theſe nerves are but ſmall, becauſe the parts ſerving for nutrition, needed none but little nerves, for the performance of the third duty of the nerves, which is in the diſcerning & knowing of what is troubleſome to them. For unleſſe they had this ſenſe, there is nothing would hinder, but theſe bowels neceſſary for life, being poſſeſſed with ſome hurtfull thing, the creature ſhould preſently fall down dead; but we have this benefit by this ſenſe, that as ſoon as any thing troubles and vellicates the bowels, we being admoniſhed thereof may look for help in time. *Their magnitude and uſe.*

And beſides if they were deſtitute of this ſenſe, they might be gnawn, ulcerated and putrefied by the raging acrimony of the excrements falling into and ſtaying in them; but now (by means hereof) as ſoon as they find themſelves pricked, or plucked, preſently by the expulſive faculty they endeavour to expell that which is troubleſome, and ſo free themſelves of preſent and future dangers.

CHAP. XXIIII.

The manner of taking out the Guts.

WHen the Guts are to be taken out, you muſt begin with the right Gut. And you muſt divide it, being firſt ſtraitly tyed in two different places, at a juſt diſtance about four fingers from the end, with a ſharp knife between the two ligatures. Then you muſt ſhew its proper coats, and fibers, and that common one which it hath from the *Peritoneum*. This being done, you muſt in like manner bind the trunk of the gate veine as neer the originall as you can; that ſo all his branches being in like manner tyed there may be no feare of effuſion of blood. you muſt doe the like with the Cœliack Artery at the left Kidney, and in the lower Meſenterick, which deſcends to the right Gut with the Hæmorrhoidall veins. This being done, pull away the guts even to the *Duodenum*, which being in like manner tyed in two places, which ought to be below the inſertion of the *Porus Cholagogus* or paſſage of the Gall, that you may ſhew the oblique inſertion thereof into that gut, for the obliquity of its inſertion is worth obſervation, as that which is the cauſe that the Gall cannot flow back into its bladder, by the compreſſion of this Gut from below upwards. Then all theſe windings of the Guts may be taken away from the body.

CHAP. XXV.

The Originall and diſtribution of the deſcendent Hollow veine.

BEcauſe the reſt of the naturall parts, do almoſt all depend upon the deſcendent Hollow vein, therefore before we goe any further, we will ſhew its originall and diſtribution. We ſaid before that all veins proceeded from the Liver, but yet in divers places. For the gate vein goes out of the hollow part, and the hollow vein out of the Gibbous part of the liver, which going forth like the body of a tree, is divided into two great branches, the leſſer of which goes to the vital & animal parts, *The originall of the hollow veine. It is divided into two trunks.*

and the extremeties of these parts, as we shall shew in their place. The greater descending from the back part of the Liver above the *Vertebra's* of the loins to the parts beneath, goes in the manner following. The first division thereof is to the membranes of the reins, which come from the *Peritoneum*. Wherefore there it produces the *Vena adiposa*, or fatty veins, so called, because they bring forth a great quantity of fat in those places. Of these fatty veins, there is a diverse originall, for the right doth oftentimes arise from the right emulgent, because it is higher; but the left comes from the very trunck of the hollow vein, because the Emulgent on that side is lower, and you shall scarse see it happen otherwise.

The division of the greater branch of the hollow vein.

1. *Adiposa.*

The second being the Kidney or Emulgent veins, go to the Reins, which at their entrance, or a little before, is divided into two branches, like as the Artery is, the one higher, the other lower, and these again into many other through the substance of the Kidneys, as you may learn better by ocular inspection, than by book. They are thick and broad, that the serous humor may without impediment have freer passage. Their originall is different, for the right Emulgent oftentimes comes forth of the hollow vein somewhat higher than the left; that seeing their office and duty is to purge the mass of blood from the cholerick and serous humor, that if any part thereof slide by the one, it may not so scape, but fall as it were into the other. Which certainly would not have happened if they had been placed the one just opposite to the other. For the serous or wheyish humor would have stayed as equally ballanced or poised, by reason of the contrariety of the action and traction, or drawing thereof. But we must remember that in dissecting of bodies, I have oft-times found in such as have been troubled with the stone, seven Emulgent veins and so many arteries; four from the left side coming from divers places, of which the last came from the Iliack; three from the right hand likewise in divers places.

2. *Emulgent.*

The third division is called the Spermatick or seed vein, it goes to the Testicles; the originall thereof is thus, that the right arises on the forepart of the trunck of the hollow vein, but the left most commonly from the Emulgent. Besides you shall sometimes find that these have companions with them, to the right Emulgent; but to the left, another from the hollow vein, in some but on one side, in others on both. But also I have sometimes observed the left emulgent to proceed from the spermatick or seed vein.

3. *Spermatica.*

The fourth because it goes to the loins is called *Lumbaris*; which in his originall and insertion is wholly like the Artery of the loins. But there are 4 *Lumbares* or Loin-veins on each side, that is, one in each of the 4 spaces of the 5 *Vertebra's* of the loins.

4. *Lumbaris.*

The fift division makes the *Iliacæ*, untill passing through the *Peritoneum*, they take the names of Crurall veins; These are first divided into the musculous, so called, because they goe to the oblique ascendent and transverse muscles, and to the *Peritoneum*. Sometimes they have their originall from the end of the Trunk. And then the same *Iliacæ*, are divided into the *Sacræ*, or Holy; which goe to the spinall marrow of the Holy-bone, through those holes, by which the nerves generated of this marrow, have their passage.

5. Iliacæ which are divided into.

1. Musculosæ.

2. Sacræ.

Thirdly, the *Iliacæ* are divided into the *Hypogastricæ*, so called, because they were distributed to all the parts of the *Hypogastrium*, or lower part of the lower belly, as to the right Gut, the muscles thereof, the musculous skin, (in which place they often make the externall Hæmorrhoidall, ordained for the purging of such blood as offends in quantity, as those other, [that is, the inward Hæmorrhoidall] which descends to the right Gut from the Gate-vein by the spleenick branch, serves for cleansing of that which offends in quality,) to the bladder and the neck thereof, even to the end of the yard, to the womb and even to the neck of the wombe and utmost parts of the privities, from whence it is likely the courses break forth in woemen with child and Virgins. But this same vein also sends a portion also without the *Epigastrium* by that perforation which is common to the share and haunch bones, which strengthened by meeting of the other internall Crurall vein descends even to the Ham, but in the mean time by the way it is communicated to the muscles of the thigh called *Obturatores* and other parts within. Fourthly, the *Iliacæ* produce the *Epigastricæ* which on both sides from below ascend according to the length of the right muscles, spreading also by the way some branches to the oblique and transverse muscles and also to the *Peritoneum*. Fiftly, these produce *Iliacæ* the *Pudendæ* or veins of the privities, because they go in women to their privities, and into men to the Cods, where they enter that fleshy coat filled with veins, and go to the skin of the yard, they take their beginning under the *Hypogastricæ*.

3. *Hypogastricæ*, which produce the Hæmorrhoidales externæ.

4. *Epigastricæ.*

5. *Pudendæ.*

CHAP.

CHAP. XXVI.

Of the Kidneys or Reins.

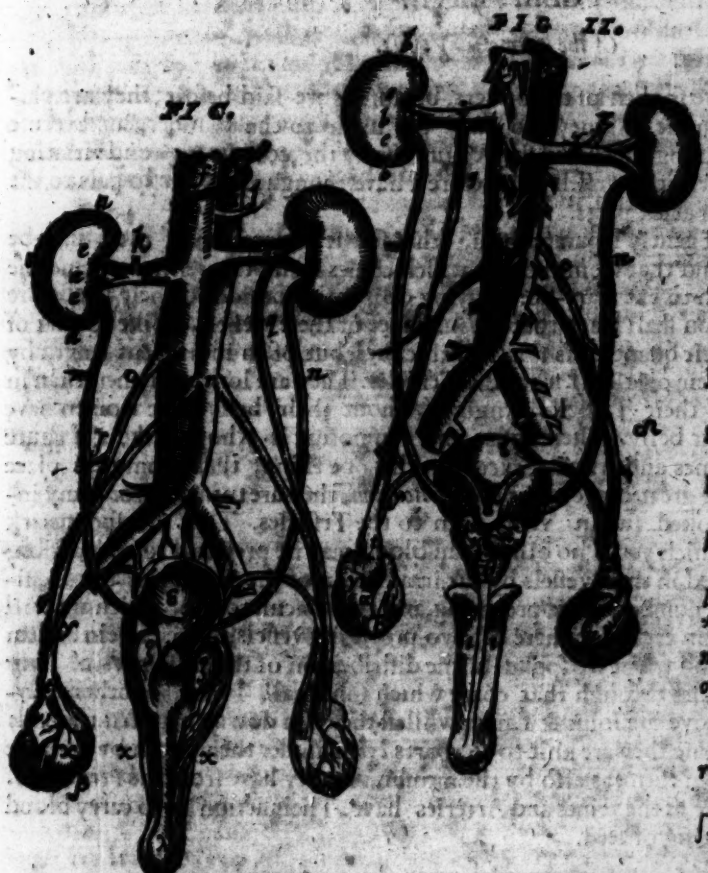
NOw follow the Kidneys, which that they may be more easily seen, (after that you have diligently observed their situation) you shall dispoil of their fat, if they have any about them, as also of the membrane they have from the *Peritoneum*. First, you shall shew all their conditions, beginning at their substance.

The substance of the Kidneys is fleshy, dense and solid, lest they should be hurt by the sharpness of the urine. Their magnitude is large enough, as you may see. Their figure is somewhat long and round almost resembling a semicircle, and they are lightly flatted above and below. They are partly hollow and partly gibbous; the hollow lies next the hollow vein, and on this side they receive the Emulgent veins and Arteries, and send forth the Ureters, their gibbous part lies towards the loins. They are composed of a coat coming from the *Peritoneum*, their own peculiar flesh, with the effusion of blood about the proper vessels, (as happens also in other entralls) generates a small nerve, which springing from the Cossall of the sixt conjugation is diffused to each Kidney on his side into the coat of the kidney it self, although others think it alwayes accompanies the vein and artery.

Their substance. Magnitude. Figure.

Composition.

The ninth and tenth figure of the vessels of seed and urine.



The first figure sheweth the foreside, the second the hinder-side.

a.a.a. 1. The forepart of the right kidney.

b. b. b. 2. The back part of the left kidney.

c. 1. the outside.

The vessels which go unto the yard and neck of the bladder. *λ*, 1. The passage which is common to the urine and seed, cut open. *Υ*, 2. The implantation of the ureters into the bladder.

But *Fallopius* that most diligent Author of Anatomy hath observed, that this nerve is not only oftentimes divaricated into the coat of the kidneys, but also pierces into their sub-

stance.

Number. Site. Connexion. Temper. Action. Their ſtrainer.

ſtance. They are two in number, that if the one of them ſhould by chance be hurt, the other might ſupply thoſe neceſſities of nature, for which the Kidneys are made. They lye upon the loyns at the ſides of the great veſſels, on which they depend by their proper veins and arteries; and they ſtick to them, as it were by a certain ſecond coat, leſt that they might be ſhaken by any violent motions. Wherefore we may ſay that the Kidneys have two coats, one proper adhering to their ſubſtance, the other as it were coming from the *Peritoneum* on that part they ſtick to it. The right Kidney is almoſt alwayes the higher, for thoſe reaſons I gave, ſpeaking of the originall of the Emulgent veſſels. *Columbus* ſeems to thinke the contrary, but ſuch like controverſies may be quickly decided by the Eye. They have connexion with the Principall veſſels by the veins, nerves and arteries, by the coats with the loins & the other parts of the lower belly, but eſpecally with the bladder by the ureters. They are of a hot and moiſt temper, as all fleſhy parts are. Their action is to cleanſe the Maſſe of the blood from the greater part of the ſerous and cholerick humor. I ſaid the greater part, becauſe it is needfull that ſome portion thereof ſhould go with the alimentary blood to the ſolid parts, to ſerve in ſtead of a vehicle, leſt otherwiſe it ſhould be too thick.

Beſides you muſt note that in each Kidney there is a cavity bounded by a certain membrane, incompaſſed by the diviſion of the Emulgent veins and arteries, through which the urine is ſtrained partly by the expulſive faculty of the Kidneys, partly by the attractive of the ureters, which run through the ſubſtance of the Kidneys on the hollow ſide, no otherwiſe than the *Porus cholagogus* through the body of the Liver.

CHAP. XXVII.

Of the ſpermatick Veſſels.

NOw we ſhould have ſpoken of the ureters, becauſe as we ſaid before, they are paſſages derived from the Kidneys to carry the urine to the bladder. But becauſe they cannot be diſtinguiſhed and ſhewed unleſſe by the corrupting and vitiating the ſite of the ſpermatick veſſels; therefore I have thought it better to paſs to the explication of all the ſpermatick parts.

And firſt of all you muſt gently ſeparate them, (that ſo the declaration of them may be more eaſie and manifeſt) and that from the coat which comes from the *peritoneum*, and the fat which inveſts them even to the ſhare-bone, having diligently conſidered their ſite before you ſeparate them. Then you ſhall teach that the ſubſtance of theſe veſſels, is like to that of the veins and arteries. Their quantity is ſmall in thicknes, but of an indifferent length by reaſon of the diſtance of their originall from the Teſticles. They are longer in men than in women, becauſe theſe have their Teſticles hanging without their belly, but women have them lying hid within their belly. Their figure and compoſure is wholly like the figure and compoſition of the veines and arteries, except in this one thing, that from that place where they goe forth of the great capacity of the *Peritoneum*, they are turned into many intricate windings, like crooked ſwoln veins, even to the Teſticles. That the ſpermatick matter in that one tract, which yet is no other than blood, may be prepared to concoction, or rather be turned into ſeed in theſe veſſels, by the irradiation of the faculty of the Teſticles. Theſe veſſels are ſix in number, foure preparing, and two ejaculatory, of which we will ſpeak hereafter. Therefore on each ſide there be two preparing veſſels, that is, a vein and an artery, ariſing as we told you when we ſpoke of the diſtribution of the hallow vein. They are inſerted into the Teſticles through that coate which ſome call *Epididymis*, others *Darton*. Their ſite is oblique above the loins & flanks, whileſt they run downe between the ends of the ſhare and haunch bone, they are knit to the parts lying under them, both by certaine fibers which they ſend from them, as alſo by the membrane they have from the *Peritoneum*. They have like temperature as the veines and Arteries have. Their action is to carry blood to the Teſticles, for generating of ſeed.

Their ſubſtance. Quantity. Figure and compoſure. Number. Site.

CHAP. XXVIII.

Of the Teſticles, or Stones.

THe Teſticles are of a Glandulous, white, ſoft and looſe ſubſtance, that ſo they may the more eaſily receive the ſpermatick matter: their magnitude and figure equall, and reſemble a ſmall pullets Egge ſomewhat flatted; their compoſure is of veins, arteries, coats and their proper fleſh. Their veins and arteries proceed from the ſpermatick veſſels, their nerves from the fixt conjugation, by the roots of the ribs and out of the holy bone. They are wrapped in foure coats, two whereof are common, and two proper. The common are the *Scrotum* or skin of the Cods, proceeding from the true skin; and the fleſhy coat, which conſiſts of the fleſhy Pannicle in that place receiving a great number of veſſels, through which occaſion it is ſo called. The proper coats are firſt the *Erythroris* ariſing from the proceſs of the *Peritoneum*, going into the *Scrotum* to-

Their ſubſtance. Magnitude and figure. Compoſition. The coat *Erythroris*.

gether

gether with the ſpermatick veſſels which it involves and covers; this appears red both by reaſon of the veſſels ayaile of the Cremaſter muſcles of the Teſticles; Then the *Epididymis* or *Dartos* which takes its originall of the membrane of the ſpermatick preparing veſſels. The flesh of the Teſticles it is as it were a certaine effuſion of matter about the veſſels, as we ſaid of other entralls. But your muſt obſerve that the *Erythroi* encompaſſes the whole ſtone, except its head, in which place it ſticks to the *Epididymis*, which is continued through the whole ſubſtance of the Teſticle. This *Epididymis* or *Dartos* was therefore got about the ſtones, becauſe the Teſticles of themſelves, are looſe, ſpongious, cavernous and ſoft, ſo that they cannot ſafely be joined to the ſpermatick veſſels, which are hard and ſtrong. Wherefore Nature that it might join extreams by a ſit *Medium* or mean, formed this coat *Epididymis*. This is ſcarce apparent in women by reaſon of its ſmalneſſe. The two forementioned common coats, adhere or ſtick together by their veſſels not only amongſt themſelves, but alſo with the *Erythroi*. You muſt beſides obſerve the Cremaſter muſcles are of the ſaid ſubſtance with other muſcles, ſmall and thin, of an oblique and broad figure, ariſing from the membrane of the *Peritonæum*, which (as we ſaid before) aſſumes fleſh from the flanks. Their compoſition is like that of other muſcles. They are two, on each ſide one. They are fixed from the ends of the flanks even to the ſtones. They have connexion with the proceſſe of the *Peritonæum* and Teſticles. Their temper is like that of other muſcles. Their action is to hang and draw up the Teſticles towards the belly, whence they are called hanging muſcles. The Teſticles are moſt commonly two in number, on each ſide one; ſometimes there be three, ſometimes one alone, as it happens alſo in the Kidnies, for ſome have but one Kidney. They lie hid in the *Scrotum* at the very roots of the ſharebone, connexed to the principall parts of their veſſels, with the neck of the bladder and yard, but by their coats they adhere to the parts from whence they have them. They are of a cold and moiſt temper, becauſe they are glandulous, although they may be hot by accident, by reaſon of the multitude of the veſſels flowing thither. Thoſe whoſe teſticles are more hot are prompt to venery, and have their privities and the adjacent parts very hairy, and beſides their teſticles are very large and compact. Thoſe on the contrary that have them cold are ſlow to venery, neither do they beget many children, and thoſe they get are rather female than male, their privities have little hair upon them, and their teſticles are ſmall, ſoft and flat.

The Epididymis, or Dartos;

The Cremaſter muſcles.

Temper.

The action of the teſticles is to generate ſeed, to corroborate all the parts of the body, and by a certain manly irradiation to breed or encreaſe a true maſculine courage. This you may know by Eunuchs or ſuch as are Gelt, who are of a womaniſh nature, and are oftentimes more tender and weak than women. As *Hippocrates* teaches, by example of the *Scythians*, *lib. de aere, locis & aquis.*

Action.

CHAP. XXIX.

Of the varicous bodies or Parallat's, and of the ejaculatory veſſels, and the glandulous or Proſtates.

THe varicous *Paraſtate* are nervous and white bodies, like as the nerves wound and cloſe woven amongſt themſelves, they are ſtretched even from the top to the bottom of the teſticles, from whence preſently by their departure they produce the *Vaſa ejaculatoria*, or leading veſſels. But unleſs we doe very well diſtinguiſh their names, they ſhall ſcarce ſhun confuſion. For that which I call *Paraſtate*, that is, as it were the head of the teſticle, being as it were like another ſtone, is called *Epididymis* by *Galen. lib. 1. de ſemine.* But I by the example and authority of many Anatomiſts, underſtand by the *Epididymis* the proper coat of the teſticles, of which thing I thought good by the way to admoniſh you of. Their Action is by their crooked paſſages to hinder the ſeed from departing out of the preparing into the leading veſſels before it ſhall bee moſt perfectly laboured and concocted in theſe veſſels by the power and force of the teſticles. For in the firſt windings, the blood lookes pure; but in the laſt it is not ſo red, but ſomewhat whitiſh For Nature commonly doth thus delay the matter in its paſſage either by ſtraitneſs, or obliquity, which it deſires to make more perfect and elaborate by any new concoction; this we may learn by the foldings of the *Rete mirabile*, the windings of the Guts, the wrinkles in the bottome of the ſtomach, the ſtraitneſſe of the *Pylorus*, the capillary veins diſperſed through the body of the Liver, certainly nature hath intended ſome ſuch thing in the making of the ſpermatick veſſels. Their quantity is viſible, and figure round, tending ſomewhat to ſharpneſſe. They are compoſed of veins, nerves, and arteries, which they enjoy from the veſſels of the teſticles, from the *Epididymis*, or the coat, from the *Peritonæum* and their proper ſubſtance. Their temper is cold and dry. They bee two in number, one to each teſticle. But theſe varicous bodies are called *Paraſtate*, Aſſiſters, becauſe they ſuperficially aſſiſt, and are knit to the teſticles according to their length, or long wayes. Out of the *Paraſtate* proceed the *Vaſa ejaculatoria*, or leading veſſels, being of the ſame ſubſtance as their Progenitors; that is, ſolid, white and as it were nervous. Their quantity is indifferent, their figure round, and hollow, that the ſeed may have a free paſſage through them, yet they ſeem not to bee perforated by any manifeſt paſſage, unleſs

Their ſubſtance.

Here the author ſpeaks otherwiſe then *Galen.*

Action.

Their quantity figure, and compoſure.

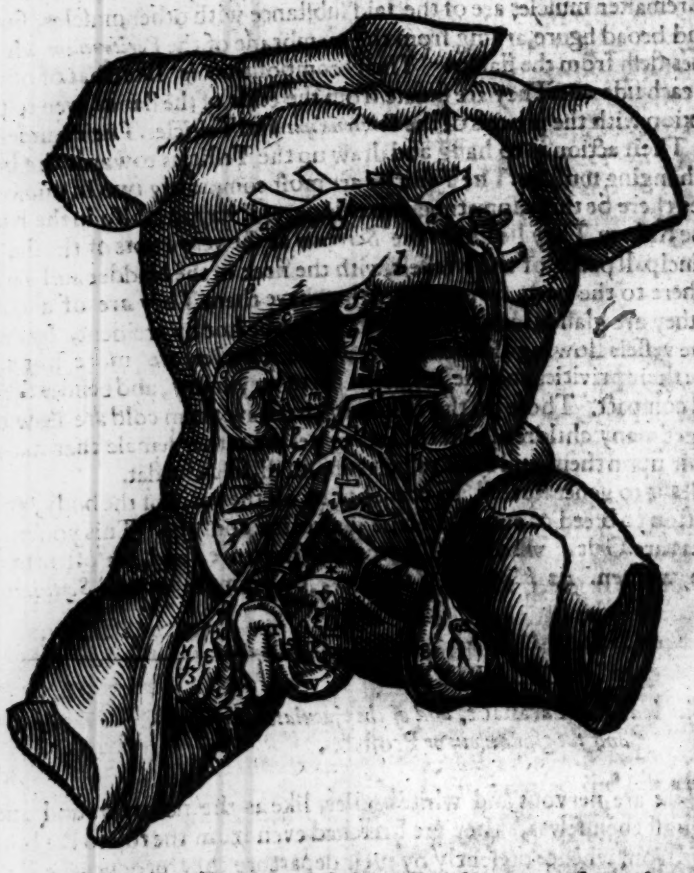
Their temper and number.

Vaſa ejaculatoria, the ejaculatory or leading veſſels

unleſs by chance in ſuch as have had a long *Gonorrhœa*. They have like temper as the *Paraſtates*, between which and the *Proſtates* they are ſeated, immediately knit with them both, as both in the coat and the other veſſels with the parts from whence they take them.

But we muſt note, that ſuch like veſſels coming out of the *paraſtates* aſcend from the bottom of the ſtones even to the top, in which place meeting with the preparing veſſels, they riſe into the belly by the ſame paſſages, and bind themſelves together by nervous fibers, even to the inner capacity of the belly, from whence turning back, they forſake the preparing, that ſo they may run to the bottom of the ſhare-bone, into the midſt of two glandulous bodies which they call *proſtates*, ſituate at the neck of the bladder, that their meeting together they may grow into one paſſage.

The tenth figure, wherein thoſe things ſhewed in the former figure, are more exactly ſet forth.



aa, A part of the Midriffe and of the *Peritonæum* with the ribs broken.
bb, *cc*. The Convex or gibbous part of the Liver marked with *bb*. the hollow or concavous part with *cc*.
d, *e*, The right and left ligaments of the Liver.
f, The trunk of the gate vein.
g, The trunk of the hollow vein.
h, *l*, The fatty veins both left and right.
i, The aſcent of the great artery of above the hollow vein, and the diviſion thereof.
k, The *Caliacall* artery.
m, *n*, The emulgent veſſels.
oo, *pp*, The fat tunicles or coats torn from both the kidneys.
qq, The ureters that go unto the bladder.
r, *u*, The right ſpermaticall vein which ariſeth near to *u*. *x*, *y*, The double originall of the left ſpermaticall vein. *x*. from the emulgent. *y*, from the hollow vein. *z*, The originall of the ſpermaticall arteries. *β*, Certain branches from the ſpermatick arteries which run unto the *Peritonæum*. *γ*, The paſſage of the ſpermaticall veſſels through the productions of the *Peritonæum*, which muſt be obſerved by ſuch as uſe to cut for the Rupture. *δ*, The ſpiry bodden bodies entrance into the teſticle, it is called *Corpus varicoſum pyramidale*. *ε*, The *Paraſtate*. *ζ*, The ſtone or teſticle covered with his inmoſt coat. *η*, The deſcent of the leading veſſell called *Vas deferens*. *V y*, The Bladder. * The right gut. *ξ*, The glandules called *proſtatæ* into which the leading veſſels are inſerted. *ρ*, The muſcle of the bladder. *στυ*, Two bodies of the yard, *σ*, and *τ*, and *υ*, his veſſels. *φχ*, The coat of the Teſticle. *ψω*, The muſcle of the Teſticle *ψ*, hit veſſels.

For thus of three paſſages, that is, of the 2 leading veſſels, and 1 paſſage of the bladder, there is one common, one in men for the caſting forth of ſeed and urine. A Caruncle riſing like a creſt at the beginning of the neck of the bladder argues this uniting of the paſſages; which receiving this ſame paſſage which is ſufficiently large, is oft-times taken by ſuch as are ignorant in Anatomy for an unnaturall Caruncle, then eſpecially when it is ſwoln through any occaſion. Theſe leading veſſels are two in number, on each ſide one. Their action is to convey the ſeed made by the teſticles to the Proſtats, & ſo to the neck of the bladder, ſo to be caſt forth at the common paſſage. But if any ask whether this common paſſage made by the two leading veſſels between the two glandulous bodies be obvious to ſenſe or no: We anſwer, it is not manifeſt, though reaſon compell us to confeſs that that way is perforated by reaſon of the ſpermatick, groſs and viſcous matter carried that way. But peradventure the reaſon why that paſſage cannot be ſeen is, becauſe in a dead carcaſe all ſmall paſſages are cloſed and hid, the heat and ſpirits being gone, and the greſs appear much leſs, by

Their number and action.

by reaaſon all the perforations fade, and fall into themſelves. Yet certainly theſe paſſages muſt needs be very ſtrait, even in a living man, ſeeing that in a dead they will not admit the moint of a needle. Wherefore we need not fear, leſt in ſearching, whilſt we thruſt the *Catheter* into the bladder, it penetrate into the common paſſage of the leading veſſels which runs within the Caruncle, unleſs peradventure by ſome chance, as a *Gonorrhœa*, or ſome great *Phlegmon*, it be much dilated beſides nature. For I have ſometimes ſeen ſuch paſſages ſo open, that they would receive the head of a Spathern; which thing ſhould admoniſh us, that in ſearching we take great care, that we do not raſhly hurt this Caruncle, for being ſomewhat raſhly handled with a *Catheter* it caſts forth blood, eſpecially if it be inflamed. But alſo the concourſe of the ſpirits flowing with great violence together with the ſeed, much helps forward ſuch ejaculation thereof performed through theſe ſtrait paſſages by the power of the imaginative faculty in the Act of generation.

This Caruncle muſt be obſerved and diſtinguiſhed from a *Hyperſarcoſis* or fleſhy excreſcence.

After the leading veſſels follow the *Proſtatæ*, being glandulous bodies of the ſame ſubſtance and temper that other Glandules are. Their quantity is large enough, their figure round, & ſomewhat long, ſending forth on each ſide a ſoft production of an indifferent length. They are compoſed of veins, nerves, arteries, a coat (which they have from the neighbouring parts) and laſtly their proper fleſh, which they have from their firſt conſormation. They are two in number, ſituate at the root of the neck of the bladder, ſomewhat ſtraitly bound or tyed to the ſame, to the leading veſſels, and the parts annexed to them. But alwayes obſerve, that every part which enjoyes nouriſhment, life and ſenſe, either firſt or laſt hath connexion with the principall parts of the body, by the intercourſe of the veſſels which they receive from thence.

The Proſtatæ. Their quantity and figure.

Number and ſite.

An anatomicall axiome.

The uſe of the Proſtates is, to receive in their proper body the ſeed laboured in the teſticles, and to contain it there, untill it be troubleſome either in quantity or quality, or both. Beſides they contain a certain oily and viſcid humor in their glandulous body, that continually diſtilling into the paſſage of the urine, it may preſerve it from the acrimony & ſharpneſs thereof. But we have obſerved alſo on each ſide other Glandules, which *Rondeletius* calls *Appendices glandulosæ*, Glandulous dependences to ariſe from theſe proſtates, in which alſo there is ſeed reſerved.

Their uſe.

Rond in meth. med. ad morbos.

CHAP. XXX.

Of the Vreters.

NOw it ſeems fit to ſpeak of the *Vreters*, bladder and parts belonging to the bladder. Therefore the Ureters are of a ſpermatick, white, denſe and ſolid ſubſtance, of an indifferent bignes in length and thickneſs. Their figure is round and hollow. They are compoſed of two coats, one proper, conſiſting of right and tranſverſe fibers, which comes from the emulgent veins and arteries; the other common, from the *Peritonæum*; beſides they have veins, nerves and arteries from the neighbouring parts.

The ſubſtance, magnitude, figure and compoſure of the Ureters.

They be two in number, on each ſide one, they are ſituate between the Kidneys (out of whoſe hollow part they proceed) and the bladder. But the manner how the Ureters inſert or enter themſelves into the bladder, and the *Porus Cholegogus* into the *Duodenum*, exceeds admiration; for the ureters are not directly but obliquely implanted neer the orifice of the bladder, and penetrate into the inner ſpace thereof; for within they doe as it were divide the membrane or membranous coat of the body of the bladder, and inſinuate themſelves into that, as though it were double. But this is opened at the entrance of the urine, but ſhut at other times, the cover as it were falling upon it, ſo that the humor which is faln into the capacity of the bladder cannot be forced or driven back, no not ſo much as the aire blown into it can come this way out, as we ſee in ſwines bladders blown up and filled with aire.

Number and ſite.

For we ſee it is the Aire contained in theſe which fills them thus, neither can it be preſſed forth but with extraordinary force.

For as this skin or coat turned in by the force of the humor gives way, ſo it being preſſed out by the body contained within, thruſts its whole body into the paſſage as a ſtopple; like to this is the inſertion of the *Porus Cholegogus* into the Guts.

The ureters have connexion with the above mentioned parts, with the muſcles of the loins; upon which they run from the Kidneys to the bladder.

Connexion.

Wherefore nothing hinders, but that the ſtone ſliding through the ureters into the bladder, may ſtupefie the thigh as much as it did when it was in the Kidney. They are of a cold and dry temper.

Their uſe is, to ſerve as paſſages, or channels for carrying the urine into the bladder.

Temper and uſe.

CHAP. XXXI.

Of the Bladder.

THe bladder is of the ſame ſubſtance that the ureters, that is, nervous, that ſo it may be the more eaſily dilated.

The ſubſtance.

It is of a large proportion, in ſome bigger, in ſome leſſe, according to the difference of age, and habit of body. It is of a round figure and as it were Pyramidall.

Figure.

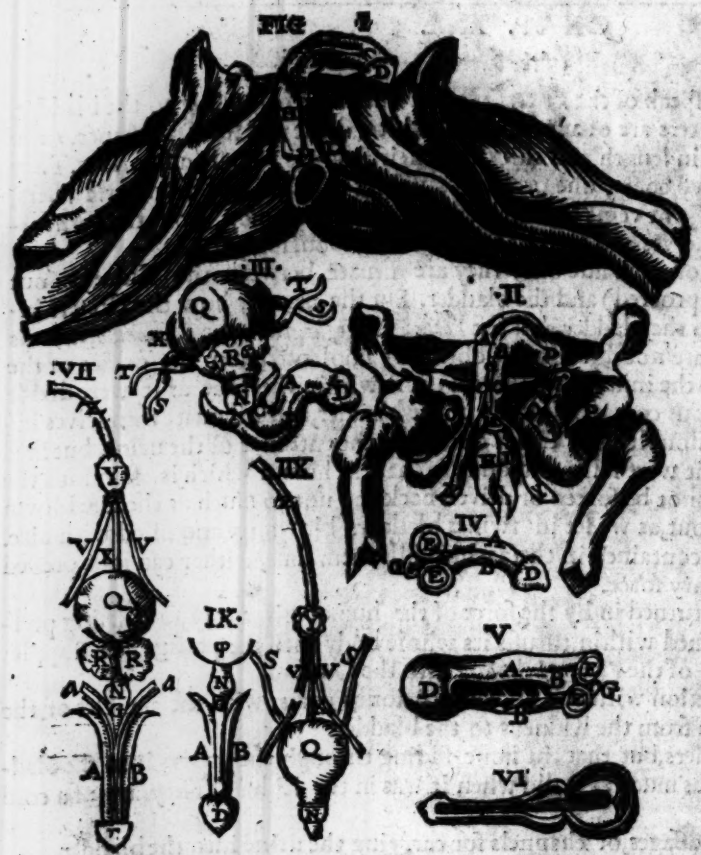
Compoſition. It is compoſed of the two coats, one proper, which is very thick and ſtrong, compoſed of the three ſorts of fibers, that is, in the inner ſide of the direct; without of the tranſverſe; and in the midſt of the oblique. The other common Coat coming from the *Peritonæum* hath veins and arteries on each ſide one, from the *Hypogaſtrick* veſſels above the holy-bone, alſo it hath nerves on each ſide from the ſixt conjugation mixt with the nerves of the holy-bone. For theſe nerves deſcend from the brain even to the end of the holy-bone.

It is but one and that ſituate in men in the lower belly upon the right gut and below the ſhare-bone, but in women between the womb and that bone, to which it cleaves with its membranous ligaments, as it doth to the yard by its neck, and to the right gut by its common coat and proper veſſels. It is of a cold and dry temper.

Temper, uſe or action. The uſe and action thereof is by the fibers continually to draw the urine, and contain it as long as need requires, and then to expell it by the neck, partly by compreſſion either of it ſelf, or rather to the muſcles of the *Epigaſtrium* and midriffe, becauſe this motion, ſeeing it is voluntary cannot be performed unleſs by a muſcle which the bladder wants; partly by the dilatation and relaxation of the Sphincter muſcle compoſed of tranſverſe fibers, like the ſphincter of the fundament, after the ſame manner to ſhut up the orifice of the bladder, that the urine flow not out againſt our will. But the bladder as it fils is dilated, but as it is emptyed, it is contracted like a purſe. You may eaſily obſerve this Muſcle in a Sows bladder, it is ſtretched from the orifice of the bladder and beginning of the urinary paſſage even to the privities even in women; but in man it is terminated in the *Peritonæum* as ſoon as it hath left the right Gut. Beſides, this muſcle is thus far ſtretched forth, that the urine by its compreſſion ſhould be wholly preſſed out of the bladder, which by too long ſtay would by its acrimony do ſome harm. This is the common opinion of Anatomiſts concerning the Sphincter of the bladder, which nevertheleſs *Fallopius* allows not of. For (ſaith he) if this muſcle ſhould be ſituate beneath the glandulous bodies, the ſeed in copulation could never be caſt forth without ſome ſmall quantity of urine. Wherefore he thinks that this muſcle is ſituate above the *Proſtats*, and that it is nothing elſe but the beginning of the neck of the bladder, which becomes more fleſhy whilſt it is woven with tranſverſe fibers.

Their Sphincter of the bladder.

The eleventh figure of the Bladder and Yard.



AB, 1, 2, 3, 4, 5, 7, 9, the two bodies which make the yard.

CC, 2, 3, the place where theſe two bodies do firſt ariſe.

D, 1, 2, 3, 4, 5, 7, 9, the nut of the yard called *glans penis*.

EE, 4, 5, the fungous and red ſubſtance of the bodies of the yard.

F, 4, 5, the mutuall connexion of the bodies of the yard, and the nervous outward ſubſtance of the ſame, compaſſing round about the former fungous ſubſtance.

G, 1, 2, 3, 4, 5, 7, 9, the paſſage of the Urine, or common pipe running under the yard all along his length.

H, I, 1, 2, the firſt pair of Muſcles of the yard, which in the firſt figure do yet grow to it, but in the ſecond they hang from their originall.

K, L, 1, 2, the ſecond pair of Muſcles of the yard, in the firſt figure growing, in the ſecond hanging from their inſertion. M, 1, 2, the Sphincter of the right gut. N, 3, 7, 8, 9, the round ſphincter Muſcle of the bladder. OO, 2 Membrane which is over the holes of the ſhare-bone. P, 2, a round Ligament from the meeting of the ſhare-bones un the head of the thigh. Q, 3, 7, 8, the body of the bladder. RR, 3, 7, the *Proſtate*, which into ſeed when it is perfectly laboured, is [illegible]. SS, 3, 8, Portions of the ureters. TT*3, Portions of the veſſels, which lead down the ſeed. VV, 7, 8, the umbilicall arteries. X, 7, 8, the ligament of the bladder cald *Urachus*. Y, 7, 8 the navil or *umbilicus*. Z, 7, 8, the umbilicall vein. *aa*, 7, the vein and artery of the yard. *b*, 5. the artery diſtributed through the body of the yard.

For

For the neck of the bladder it differs nothing in substance, composure, number, and temper from the bladder, but only in quantity, which is neither so large, nor round in figure, but somewhat long; together with the yard representing the shape of the letter S. It is placed in men at the end of the right Gut and *Perinæum*, rising upwards even to the roots of the yard, and with it bending it self downwards; in women it is more broad, and straight, ending at the orifice of the neck of the Womb between the nervous bodies of the *Nymphæ*. The neck of the bladder.

In men it hath connexion with the bladder, the ejaculatory vessels, the right gut and yard, but in women only with the neck of the wombe and privities. The use of it is in men to cast forth seed and urine, in women only urine. But we must note that the share-bones must be divided and pulled asunder in that part where they are joyned, that so you may the more exactly observe the situation of these parts. Besides you must note that by the *Perinæon* we understand nothing else in men and women, then that space which is from the fundament to the privities, in which the seam is called *Taurus*. The connexion and use thereof.

CHAP. XXXII.

Of the Yard.

NOw follows the declaration of the Privy parts of men and women, and first we will treat of mens. The yard is of a ligamentous substance, because it hath its originall from bones, it is of an indifferent magnitude in all dimensions, yet in some bigger, in some less; the figure of it is round, but yet somewhat flatted above and beneath. The substance, quantity and figure of the yard.

It is composed of a double coat, nerves, veins, arteries, two ligaments, the passage of the urine, and four muscles. It hath its coats both from the true skin, as also from the fleshy pannicle, but the veins and Arteries from these of the lower part of the lower belly which run on the lower part of the Holy-bone into the yard, as the seminary vessels run on the upper part. Composure.

The ligaments of the yard proceed on both sides from the side and lower commissure of the share-bones; wherefore the yard is immediately at his root furnished with a double ligament, but these two presently run into one spungy one. The passage of the urine situate in the lower part of the yard comes from the neck of the bladder between the two ligaments. The ligaments.

For the four muscles, the two side ones composing or making a great part of the yard, proceed from the inward extuberancy of the Hip-bone, and presently they are dilated from their originall, and then grow less again. The two other lower arise from the muscles of the fundament and accompany the urinary passage the length of the *perinæum* untill they enter the yard; but these two muscles cleave so close together, that they may seem one having a triangular form. The muscles.

The action of these four muscles in the act of generation is, they open and dilate this common passage of urine and seed, that the seed may be forcibly or violently cast into the field of nature; and besides they then keep the yard so stiffe, that it cannot bend to either side. Their Action.

The yard is in number one, and situate upon the lower parts of the share-bone, that it might be more stiffe in erection. It hath connexion with the share-bone and neighbouring parts; by the particles of which it is composed. It is of a cold and dry temper. The action of it is to cast the seed into the womb, for preservation of mankind.

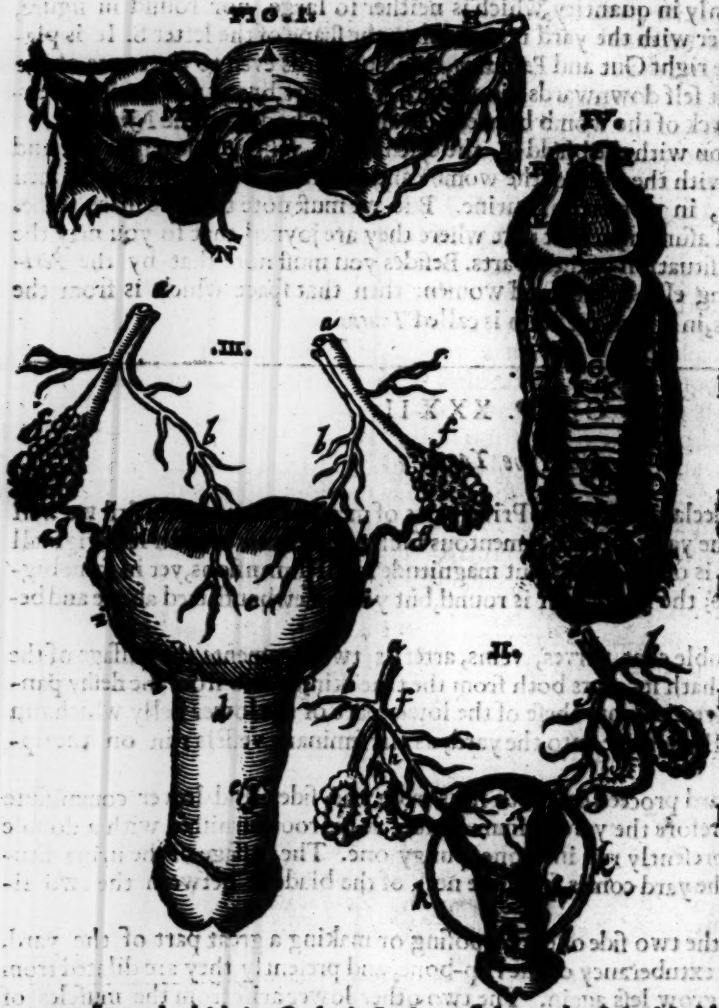
The head of it begins where the tendons end, this head from the figure thereof is called *Glans* and *Balanus*, that is, the Nut, and the skin which covers that head is called *Præputium*, that is, the foreskin. The flesh of this *Glandule* is of a middle nature between the glandulous flesh and true skin. But you must note that the Ligaments of the yard are spongy contrary to the condition of others, and filled with gross and black blood. But all these stirred up by the delight of desired pleasure, and provoked with a venereall fire, swell up and erect the yard. The Nut. The *Præputium*, or foreskin.

CHAP. XXXIII.

Of the spermatick vessels and testicles in women.

NOw we should treat of the Privy parts in women, but because they depend upon the neck and proper body of the womb, we will first speak of the womb, having first declared what difference there is between the spermatick vessels and testicles of men and women. Wherefore we must know that the spermatick vessels in women do nothing differ from those in men in substance, figure, composure, number, connexion, temper, originall and use; but only in magnitude and distribution, for women have them more large and short. In what the spermatick vessels in women differ from those in men.

The twelfth Figure, of the Womb.



A. The bottome of the womb laid open without any membrane.
BB. the neck of the womb turned upward.
CD. a part of the bottom of the womb like the nut of the yard, swelling into the upper part of the neck of the womb, in the middle whereof the orifice appeareth.
EE. a membrane knitting the womb to the *Peritoneum*, & holding together the vessels thereof.
F. the left testicle.
G. the spermaticall vein and artery.
H. a part of the spermaticall vessels reaching unto the bottom of the womb.
I. one part of the vessels coming to the testicles *a vessell leading the seed unto the womb.
K. the coat of the testicle with the implication of the vessels. L. the cavity of the bladder opened. M. the insertion of the Ureters into the bladder. N. the Ureters cut from the kidnies, O. the insertion of the neck of the bladder into the lap or privity.

The second Figure.

aa. The spermaticall vein and artery. *bb.* branches distributed to the *Peritoneum* from the spermatical vessels. *c.* the bottom of the womb. *d.* the neck of the womb. *e.* certain vessels running through the inside of the womb, and the neck thereof. *ff.* vessels reaching to the bottom of the womb produced from the spermaticall vessel. *gg.* the leading vessell of the seed called *Tuba*, the Trumpet. *hh.* a branch of the spermaticall vessel compassing the Trumpet. *ii.* the testicles. *kk.* the lower ligaments of the womb, which some cal the Cremasters or hanging muscles of the womb. *l.* the lap or privity into which the Cremasters do end. *m.* a portion of the neck of the bladder.

The third Figure.

aa. The spermaticall vessels. *bb.* a branch from these spermaticall vessels to the bottom of the womb. *cc.* the body or bottom of the womb. *d.* the neck of the same. *e.* the neck of the bladder ending into the neck of the womb. *ff.* the testicles. *gg.* the leading vessels, commonly though not so well called the ejaculatory vessels. *hh.* the division of these vessels, one of them determining into the horns at double *kk. ii.* the other branch ending in the neck, by which women with child avoid their seed. *kk.* the horns of the womb.

The fourth Figure.

AB. The bosome of the bottom of the womb, at whose sides are the horns. CD. a line like a suture or seam, a little distinguishing that bosome. EE. the substance of the bottom of the womb, or the thickness of his inner coat. F. a protuberation or swelling of the womb in the middle of the bosom. G. the orifice of the bottom of the womb. HH. the coat or second cover of the bottom of the womb, coming from the *Peritoneum*. IIII. a portion of the membranes which tie the womb. KK. the beginning of the neck of the womb. L. the neck of the bladder inserted into the neck of the womb. *m.* the *Clitoris* in the top of the privity. *n.* the inequality of the privity where the *hymen* is placed. *o.* the hole or passage of the privity in the cleft. *p.* the skinny caruncle of the privity.

Why womens spermatick vessels are larger, but shorter then mens.

It was fit they should be more large, because they should not only convey the matter fit for generation of young and nourishment of the testicles, but also sufficient for the nourishment of the womb and child; but shorter, because they end at the testicles and womb within the belly in women. Where you must note that the preparing spermatick vessels,

ſels, little before they come to the Teſticles are divided into two unequall branches, of which the leſſer bended, after the ſame manner as we ſaid in men, goes into the head of the teſticle, through which it ſends a ſlender branch into the coats of the teſticles for life and nouriſhment, and not only into the coats but alſo into leading veſſels. But the bigger branch deſcends on each ſide by the upper part of the wombe between the proper coat and the common, from the *Peritonæum* where it is divided into divers branches. By this difference of the ſpermatick veſſels you may eaſily underſtand why women caſt forth leſs ſeed than men.

In what their teſticles differ from mens.

For their Teſticles, they differ little from mens but in quantity; For they are leſſer and in figure more hollow and flat, by reaſon of their defective heat which could not elevate or lift them up to their juſt magnitude. Their compoſure is more ſimple, for they want the *ſcrotum* or cod, the fleſhy coat, and alſo according to the opinion of ſome the *Erythroides*, but in place thereof they have another from the *Peritonæum* which covers the proper coat, that is, the *Epididymis*, or *Dartos*. *Silvius* writes that womens Teſticles wants the *Erythroides*; yet it is certain that beſides their peculiar coat *Dartos*, they have another from the *peritonæum*, which is the *Erythroides*, or as *Fallopius* cals it the *Elythroides*, that is as much as the *vaginalis* or ſheath. But I think that this hath ſprung from the miſ-underſtanding that place in *Galen* where he writes, that womens teſticles want the *Epididymis*. For we muſt not underſtand that to be ſpoken of the coat, but of the varicous paraſtats (as I formerly ſaid). They differ nothing in number, but in ſite; for in men they hang without the belly at the ſhare bone above the *Peritonæum*; women have them lying hid in their belly, neer the bottome at the ſides of the wombe, but yet ſo as they touch not the body of the wombe.

Lib. 14. de uſu part.

Site.

Connexion.

But theſe teſticles are tyed to the womb both by a coat from the *Peritonæum*, as alſo by the leading veſſels deſcending to the horns of the wombe, but to the reſt of the body by the veſſels and the nerves ariſing from the holy bone and Coſtall nerves. They are of a colder Temper than mans. The ejaculatory, or leading veſſels in women differ thus from mens, they are large at the beginning, and of a veiny conſiſtence, or ſubſtance, ſo that you can ſcarce diſcern them from the coat *Peritonæum*, then preſently they become nervous, and waxe ſo ſlender, that they may ſeem broken or torn, though it be not ſo; but when they come nearer to the horns of the wombe, they are again dilated; in their other conditions, they agree with mens, but that they are altogether more ſlender and ſhort. They have a round figure, but more intricate windings than mens; I beleeve, that theſe windings might ſupply the defect of the varicous Paraſtats. They are ſeated between the teſticles and wombe, for they proceed out of the head of the teſticle, then preſently armed with a coat from the *Peritonæum*, they are implanted into the wombe by its horns.

Temper.

Their ejaculatory veſſels.

Why they have more intricate windings.

Their ſite.

CHAP. XXXIIII.

Of the Wombe.

Where in the privy parts in women differ from thoſe in men.

THe Wombe is a part proper only to women, given by nature in ſtead of the *Scrotum*, as the neck thereof, and the annexed parts in ſtead of the yard; ſo that if any more exactly conſider the parts of generation in women and men, he ſhall find that they differ not much in number, but only in ſituation and uſe. For that which man hath apparent without, that women have hid within, both by the ſingular providence of nature, as alſo by the defect of heat in women, which could not drive and thruſt forth thoſe parts, as in men. The womb is of a nervous and membranous ſubſtance, that it may be more eaſily dilated and contracted, as need ſhall require.

The ſubſtance and magnitude of the wombe.

The magnitude thereof is divers, according to the diverſity of age, the uſe of venery, the flowing of their courſes, and the time of conception. The wombe is but ſmall in one of unripe age, having not uſed venery, nor which is menſtrous; therefore the quantity cannot be rightly defined.

Figure.

The horns of the wombe.

Compoſure.

The veins and Arteries.

The figure of the wombe is abſolutely like that of the bladder, if you conſider it without the productions, which *Herophilus* called horns, by reaſon of the ſimilitude they have with the horns of Oxen at their firſt coming forth. It conſiſts of ſimple and compound parts. The ſimple are the veins, arteries, nerves, and coats. The veins and arteries are four in number, two from the preparing ſpermatick veſſels, the two other aſcend thither from the *Hypogaſtrick*, after this manner.

Firſt, theſe veſſels before they aſcend on each ſide to the wombe, divide themſelves into two branches, from which otherſome go to the lower part of the wombe, otherſome to the neck thereof, by which the menſtruous blood, if it abound from the conception, may be purged.

Nerves.

Nerves come on both ſides to the wombe, both from the ſixt conjugation, deſcending by the length of the back bone, as alſo from the holy bone, which preſently united and joyned together, aſcend and are diſtributed through the wombe, like the veins and arteries.

The Coat.

The utmoſt or common coat of the wombe, proceeds from the *Peritonæum*, on that

part it touches the holy bone; but the proper it hath from the first conformation, which is composed of the three sorts of fibers, of the right on the inside of the attraction of both seeds; the transverse without to expell, if occasion be; the oblique in the midst for the due retention thereof.

No cels in the wombe.

The wombe admits no division, unless into the right and left side, by an obscure line or seam, such as we see in the *scrotum*, but scarce so manifest; neither must we after the manner of the ancients, imagine any other cels in the wombe. For by the law of nature, a woman at one birth can have no more than two. An argument hereof is, they have no more than two dugs. If any chance to bring forth more, it is besides nature, and somewhat monstrous, because nature hath made no provision of nourishment for them.

The site.

Nature hath placed the wombe at the bottome of the belly, because that place seems most fit to receive seed, to carry and bring forth the young. It is placed between the bladder and right gut, and is bound to these parts much more straitly by the neck, than by the body thereof; but also besides it is tyed with two most strong ligaments on the sides, and upper parts of the sharebone, on which it seems to hang; but by its common coat from the *Peritonæum*, chiefly thick in that place, it is tied to the hollow bone, and the bones of the haunch and loins.

The temper and action.

By reason of this strait connexion, a woman with child feeling the painfull drawings back, and as it were convulsions of those ligaments, knows her self with child. It is of a cold and moist temper, rather by accident, than of it self. The action thereof is to contain both the seeds, and to cherish, preserve, and nourish it, so contained, untill the time appointed by nature; and also besides, to receive, and evacuate the menstruous blood. The compound parts of the wombe are, the proper body and neck thereof. That body is extended in women big with child, even to the navell, in some higher, in some lower.

The *Cotyledones*.

In the inner side the *Cotyledones* come into our consideration, which are nothing else than the orifices and mouths of the veins, ending in that place. They scarce appear in women, unless presently after child-bearing, or their menstruall purgation; but they are apparent in sheep, Goats, and Kine, at all times like wheat corns, unless when they are with young, for then they are of the bigness of hasell nuts: but then also they swell up in women, and are like a rude peece of flesh of a finger and a half thick, which begirt all the naturall parts of the infant shut up in the wombe; out of which respect this shapeles flesh, according to the opinion of some, is reckoned amongst the number of coats investing the infant, and called *Chorion*, because, as in beasts, the *Chorion* is interwoven with veins, and arteries, whence the umbilicall vessels proceed; so in women this fleshy lump is woven with veins, and arteries, whence such vessels have their originall. Which thing, how true and agreeable to reason it is, let other men judg.

Columbus justly reproved.

There is one thing whereof I would admonish thee, that as the growth of the *Cotyledones* in beasts are not called by the name of *Chorion*, but are only said to be the dependents thereof, so in women such swollen *Cotyledones* merit not the name of *Chorion*, but rather of the dependences thereof.

The orifice of the wombe.

This body ends in a certain straitness which is met withall, in following it towards the privities, in women which have borne no children, or have remained barren some certain time; for in such as are lately delivered, you can see nothing but a cavity and no straitness at all. This straitness we call the proper orifice of the wombe, which is most exactly shut after conception, especially untill the membrane, or coats incompassing the child be furnished, and strong enough to contain the seed, that it flow not forth, nor be corrupted by entrance of the air; for it is opened to send forth the seed, and in some the courses and serous humors, which are heaped up in the wombe in the time of their being with child.

The proper orifice of the wombe is not alwayes exactly shut in women with child.

The neck of the wombe.

From this orifice the neck of the wombe taking its originall, is extended even to the privities. It is of a musculous substance, composed of soft flesh, because it might be extended and contracted, wrinckled, and stretched forth, and unfolded, and wrested, and shaken at the coming forth of the child, and after be restored to its former soundness and integrity. In process of age it grows harder, both by use of venery, and also by reason of age, by which the whole body in all parts thereof becomes dry and hard. But in growing, and in young women, it is more tractable and flexible for the necessity of nature.

Its magnitude. Composition.

The magnitude is sufficiently large in all dimensions, though divers, by reason of the infinite variety of bodies. The figure is long, round, and hollow. The composition is the same with the wombe, but it receives not so many vessels as the wombe; for it hath none but those which are sent from the *Hypogastrick* veins, by the branches ascending to the wombe. This neck on the inside is wrinckled with many crests, like the upper part of a dogs mouth, so in copulation to cause greater pleasure by that inequality, and also to shorten the act.

Number and site.

It is only one, and that situate between the neck of the bladder and the right gut, to which it closely sticketh, as to the wombe by the proper orifice thereof, and to the privities by its own orifice; but by the vessels to all the parts from whence they are sent.

Temper.

It is of a cold and dry temper, and the way to admit the seed into the wombe, to exclude the infant out of the wombe, as also the menstruall evacuation. But it is worth observation,

vation, that in all this paſſage there is no ſuch membrane found, as that they called *Hymen*, which they feigned to be broken at the firſt coition. Yet notwithſtanding *Columbus*, *Falloppius*, *Wierus*, and many other learned men of our time think otherwiſe, and ſay, that in Virgins a little above the paſſage of the urine, may be found and ſeen ſuch a nervous membrane, placed overthwart as it were in the middle way of this neck, and perforated for the paſſages of the courſes. But you may find this falſe by experience; it is likely the ancients fell into this error through this occaſion, becauſe that in ſome a good quantity of blood breaks forth of theſe places at the firſt copulation.

No *Hymen*,

But it is more probable, that this happens by the violent artrition of certain veſſels lying in the inward ſuperficies of the neck of the wombe, not being able to endure without breaking ſo great extention as that nervous neck undergoes at the firſt coition. For a maid which is mariageable, and hath her genitall parts proportionable in quantity and bigneſs to a mans; ſhall find no ſuch effuſion of blood, as we ſhall ſhew more at large in our Book of Generation.

From whence the blood proceeds that breaks forth in ſome virgins at the firſt coition.

The thirteenth Figure, ſhewing the parts of women different from theſe in men.

A.B.C.D. The *Peritonæum* reflected or turned backward, above and below.

E.F. the gibbous part of the liver E, the cave or hollow part F.

G. the trunk of the gate-vein.

H. the hollow vein.

I. the great artery.

K. the roots of the *Cœliacall* artery which accompanieth the gate-vein.

L.M. the fatty vein going to the coat of the kidneys.

N. O. the fore-part of both the kidneys.

T. V. the emulgent veins and arteries.

aa. the right ureter at the loweſt *z*, cut from a part which neer to *b*, ſticketh yet to the bladder, becauſe the bottome of the bladder is drawn to the left ſide.

c. the left ureter inſerted into the bladder neer to *r*.

dd. the ſpermatick vein which goeth to the left teſticle marked with *i*.

ee. the ſpermatick vein which goeth to the left teſticle with *i*, alſo. *f.* the trunk of the great artery from whence the ſpermatical arteries do proceed. *gh.* the ſpermatical arteries.

ii. the two teſticles. *ll*, a branch which from the ſpermatick veſſels reacheth unto the bottome of the wombe. *mm.* the leading veſſel of the ſeed which *Falloppius* calleth the *tuba* or trumpet, becauſe it is crooked and reflected. *n.* a branch of the ſpermatick veſſel, compaſſing the leading veſſel. *oo.* a veſſell like a worm which paſſeth to the wombe, ſome call it *Cremaſter*. *p.* the bottome of the wombe called *fundus uteri*. *q.* a part of the right gut. *r. ſ.* the bottome of the bladder whereto is inſerted the left ureter, and a vein led from the neck of the wombe neer unto *r*. *t.* the neck of the bladder. *u.* the ſame inſerted into the privity or lap. *x.* a part of the neck of the wombe above the privity. *yy.* certain skinny Caruncles of the privities, in the midſt of which is the ſlit, and on both ſides appear little hillocks.

The Figures belonging to the Dugs and Breaſts.

aa. The veins of the Dugs which come from thoſe, which deſcending from the top of the ſhoulder, are offered to the skin. *b.* the veins of the dugs derived from thoſe which through the arm-hole are led into the hand. *c.* the body of the Dug or Breaſt. *dd.* the kernels and fat between them. *ee.* the veſſels of the dugs deſcending from the lower part of the neck called *jugulum*, under the breaſt bone.

This neck ends at the privities, where its proper orifice is, which privy parts we muſt treat of, as being the productions and *appendices* of this neck. This *Pudendum*, or privity, is of a middle ſubſtance, between the fleſh and a nerve; the magnitude is ſufficiently large, the figure, round, hollow, long. It is compoſed of veins, arteries, nerves, deſcending to the neck of the wombe, and a double coat proceeding from the true skin and fleſhy pannicle; both theſe coats are firmly united by the fleſh coming between them; whereupon it is ſaid, that this part conſiſts of a muſculous coat. It is one in number, ſituate above the *Peritoneum*. It hath connexion with the fundament, the neck of the wombe and bladder by both their peculiar orifices.

It hath a middle temper, between hot, and cold, moiſt and dry. It hath the ſame uſe as a mans *Præputium* or fore-skin, that is, that together with the *Nymphæ* it may hinder the entrance of the air, by which the wombe may be in danger to take cold. The lips of the privities called by the Greeks πλευρίτιδες, by the Latines *Alæ*, contain all that region which is inveſted with hairs; and becauſe we have faln into mention of theſe *Nymphæ*, you muſt know that they are as it were productions of the muſculous skin, which deſcend on both ſides, from the upper part of the ſhare-bone downwards; even to the orifice of the neck of the bladder, oft times growing to ſo great a bigneſs, that they will ſtand out like a mans yard. Wherefore in ſome they muſt be cut off in their young years, yet with a great deal of caution, leſt if they be cut too raſhly, ſo great an effuſion of blood may follow, that it may cauſe, either death to the woman, or barreneſs of the wombe by reaſon of the refrigeration by the too great effuſion of blood. The latter Anatomiſts, as *Columbus* and *Fallopius*, beſides theſe parts, have made mention of another particle, which ſtands forth in the upper part of the privities, and alſo of the urinary paſſage, which joyns together thoſe wings we formerly mentioned. *Columbus* cals it *Tentigo*, *Fallopius*, *Cleitoris*, whence proceeds that infamous word *Cleitorizein*, (which ſignifies impudently to handle that part.) But becauſe it is an obſcene part, let thoſe which deſire to know more of it, read the Authors which I cited.

Alæ. πλευρίτιδες.

Cleitoris, tentig.

CHAP. XXXV.

Of the Coats containing the Infant in the wombe, and of the Navell.

THe membranes or coats containing the Infant in the wombe of the mother, are of a ſpermatick and nervous ſubſtance, having their matter from the ſeed of the mother. But they are nervous that ſo they may be the more eaſily extended, as it ſhal be neceſſary for the child. They are of good length and bredth, eſpecially near the time of deliverance, they are round in figure like the wombe.

Their ſubſtance, magnitude, figure, and compoſure.

Their compoſition is of veins, arteries, and their proper ſubſtance. The veins, and arteries, are diſtributed to them (whether obſcurely or manifeſtly, more or fewer) from the wombe by the *Cotyledones*, which have the ſame office, as long as the child is contained in the wombe, as the nipples or paps of the nurſes after it is born. For thus the wombe brings the *Cotyledones*, or veins, degenerating into them through the coats like certain paps to the infant ſhut up in them.

The number.

Theſe coats are three in number according to *Galen*; one called the *Chorion*, Secundine, or afterbirth; the other *Allantoides*; the third *Amnios*. I find this number of coats in beaſts, but not in women, unleſs peradventure any will reckon up in the number of the coats, the *Cotyledones* ſwollen up, and grown into a fleſhy maſs, which many skilfull in Anatomy do write, which opinion notwithſtanding we cannot receive as true. I could never in any place find the *Allantoides* in women with child, neither in the infant born in the ſixth, ſeventh, eight, or in the full time, being the ninth month, although I have ſought it with all poſſible diligence, the Midwives being ſet apart, which might have violated ſome of the coats.

But thus I went about this buſineſs, I divided the dead body of the mother croſwiſe upon the region of the wombe, and taking away all impediments which might either hinder, or obſcure our diligence, with as much dexterity as was poſſible, we did not only draw away that receptacle or den of the Infant, from the inward ſurface of the wombe, to which it ſtuck by the *Cotyledones*, but we alſo took away the firſt membrane which we called *Chorion*, from that which lies nextunder it, called *Amnios*, without any rending or tearing; for thus we powred forth no moiſture, whereby it might be ſaid, that any coat made for the containing of that humor, was rent or torn. And then we diligently looked, having many witneſſes and ſpectators preſent, if in any place there did appear any diſtinction of theſe two membranes, the *Allantoides* and *Amnios*, for the ſeparating the contained humors, and for other uſes which they mention.

But when we could perceive no ſuch thing, we took the *Amnios* filled with moiſture on the upper ſide, and having opened it, two ſervants ſo holding the apertion, that no moiſture might flow out of it into the circumference of the *Chorion* or wombe, then preſently with

with ſpunges we drew out by little and little all the humidity contained in it, the infant yet contained in it, which was fit to come forth, that ſo the coat *Amnios* being freed of this moiſture, we might ſee whether there were any other humor contained in any other coat beſides. But having done this with ſingular diligence and fidelity, we could ſee no other humor, nor no other ſeparation of the membranes beſides.

He ſhews by three ſeverall reaſons that there is no Allantoides.

So that, from that time I have confidently held this opinion, that the infant in the womb, is only wrapped in two coats, the *Chorion* and *Amnios*. But yet not ſatisfied by this experience, that I might yet be more certain concerning this *Allantoides*, having paſſed through the two former coats, I came to the infant, and I put a quil into its bladder, and blew it up as forcibly as I could, ſo to try, if by that blowing I might force the air into that coat which we queſtioned, as ſome have written. But neither thus could I drive any air from hence, through the navell into the controverted coat, but rather I found it to fly out of the bladder by the privities. Wherefore I am certainly perſwaded that there is no *Allantoides*. Moreover I could never finde nor ſee in the navell that paſſage called the *Urachus*, which they affirm to be the beginning and originall of the coat *Allantoides*. But if it be granted, that there is no ſuch coat as the *Allantoides*, what diſcommodity wil ariſe hereof? ſpecially ſeeing the ſweat and urine of the infant may eaſily, and without any diſcommodity be received, collected, and contained in the ſame coat, by reaſon of the ſmall difference which is between them. But if any object, That the urine by its ſharpneſs and touching will hurt the infant: I will anſwer, there can be no ſo great ſharpneſs in the urine of ſo ſmall an infant; and that, if that there be any, it is tempered by the admixture of the gentle vapor of ſweat.

Beſides, if you conſider, or have regard to the uſe of ſuch an humor (which is to hold up the child, leſt by its weight it break the ties, by which it is bound to the womb;) we ſhall finde no humor more fit for this purpoſe than this ſerous, as which by its thickneſs is much more fit to bear up a weight, than the thin and too liquid ſweat. For ſo we ſee the ſea or ſalt-water carries greater weights without danger of drowning than freſh rivers do. Wherefore I conclude that there is no need, that the urine ſhould be kept and contained in one coat, and the ſweat in another. The Ancients who have writ otherwiſe, have written from obſervations made in beaſts. Wherefore we make but only two coats, the *Chorion* and *Amnios*; the one of which, ſeeing it contains the other, they both ſo encompaſs the child, that they veſt it on every ſide.

Fallopius in ſome ſort ſeems to be of this opinion; for he only makes two coats, the *Chorion* and *Amnios*; but he thinks the infant makes the water into a certain part of the *Chorion*, as you may perceive by reading of his Obſervations. Both theſe coats are tyed between themſelves by the intercourſe of moſt ſlender nervous fibers, and ſmall veſſels penetrating from the outer *Chorion* to the inner *Amnios*. Wherefore unleſs you warily handle theſe coats, you may eaſily tear the *Amnios* in ſeparating it. They are of the ſame temper with other membranes. Their uſe is different, for the *Chorion* is made both for the preſervation of the veſſels, which it receives from the womb for the generating of the umbilicall veins and arteries, as alſo to keep whole and ſafe the parts which it inveſts.

Their temper and uſe.

But the *Amnios* is to receive and contain the excrementitious and ſerous humors, which the childe ſhut up in the womb is accuſtomed to evacuate. But this coat is very thin and ſoft, but ſtrong and ſmooth, leſt by its touch it might hurt the infant, whereupon it is called the Lambskin-coat.

CHAP. XXXVI.

of the Navell.

What the Navell is.

THe Navell follows theſe coats; It is a white body, ſomewhat reſembling the wreathen cord, or girdle of the Franciſcan-friers, but that it hath not the knots ſtanding ſo far out, but only ſwelling in certain places, reſembling a knot, only lifted up on one ſide; it ariſes and takes its originall from a fleſhy maſs, which we expreſſed by the name of ſwelling *Cotyledones*, and goes into the midſt of the lower belly of the infant, yea verily into the midſt of the whole body, whoſe root it is therefore ſaid to be. For even as a tree by the root ſucks nouriſhment from the earth, ſo the infant in the womb draws its nouriſhment by the navell. The greatneſs of it in breadth and thickneſs, equals the bigneſs of the little finger. But it is a foot and a half long, ſo that children are brought forth with it, encompaſſing their middle, neck, arms, or legs. The figure of it is round. It is compoſed of two arteries, one vein, and two coats. It hath theſe veſſels from that great multitude of capillary veins and arteries, which are ſeen diſperſed over the *Chorion*. Wherefore the vein entring in at the Navell, penetrates from thence into the hollow part of the Liver, where divided into two, according to *Galens* opinion, it makes the gate and hollow veins. But the arteries, carried by

The Navell is the center of the body.

The figure and compoſure.

Lib. de fœtus formatione.

by themſelves the length of the Navell, caſt themſelves into the *Iliaca*, which they make, as alſo all other, that from thence the vitall ſpirit may be carried by them over all the infant. It hath its two coats from the *Chorion*.

But ſeeing they are mutually woven and conjoined without any *medium*, and are of a ſufficient ſtrength and thickneſs over all the Navell, they may ſeem to make the infants externall skin and fleſhy Pannicle. I know very many reckon two Umbilicall veins, as alſo arteries, and the *Urachus*, by, or through which the urine flows into the coat *Allantoides*. But becauſe this is not to be found in women, but only in beaſts, I willingly omit it, becauſe I do not intend to mention any parts, but ſuch as belong to humane bodies. Yet if there be any, which can teach me, that theſe parts, which I think proper to brute beaſts, are to be found in women, I willingly confeſs, and that to his credit, from whom I have reaped ſuch benefit.

There is only one Vein in a childs Navell, but no Urachus.

The other things that may be required concerning the Navell, as of its number, ſite, connexion, temper and uſe, may eaſily appear by that we have ſpoken before. For we have apparently ſet down the uſe, when we ſaid, the Navell was made for that purpoſe, that the infant may be nouriſhed by it, as the tree by the root, by reaſon of the continuation of the veſſels thereof, with the preparing ſpermatick veſſels made by God for that purpoſe, to whom be honor and glory for ever and ever. *Amen.*

The End of the third Book.

The Fourth Book,

Treating of the Vitall parts contained in the CHEST.

The PREFACE.

HAving finiſhed the firſt Book of our Anatomy, in explanation of the naturall parts contained in the lower belly, now order requires, that we treat of the Breſt; that ſo the parts in ſome ſort already explained (I mean the veins and arteries) may be diſpatched after the ſame order and manner, without interpoſition of any other matter.

And beſides alſo that we may the more exactly and chearfully ſhew the reſt of the parts which remain, as the head and limbs, knowing already the originall of thoſe veſſels which are diſperſed through them. To this purpoſe, we will define what the Cheſt is, and then we will divide it into its parts. Thirdly, in theſe we will conſider which parts contain, and which are contained, that ſo we may more happily finiſh our intended diſcourſe.

CHAP. I.

What the Thorax or the Cheſt is; into what parts it may be divided, and the nature of theſe parts.

THe *Thorax*, or Cheſt, is the middle belly, terminated or bounded above with the coller-bones, below with the Midriff, before with the *Sternum* or breſt, behinde, with the twelve *Vertebra's* of the back on both ſides, with the true and baſtard ribs, and with the intercoſtall and intercartilagineous muſcles. Nature hath given it this ſtructure and compoſition, leſt that being a defence for the vitall parts againſt externall injuries, it ſhould hinder reſpiration; which is no leſs needfull for the preſervation of the native heat diffuſed by the vital ſpirits, and ſhut up in the heart, as in the fountain thereof, againſt internall injuries, than the other fore-mentioned parts againſt externall. For if the Cheſt ſhould have been all bony, verily it had been the ſtronger, but it would have hindred our reſpiration or breathing, which is performed by the dilating and contracting thereof. Wherefore leſt one of theſe ſhould hinder the other, Nature hath framed it, partly bony and griſly, and partly fleſhy. Some render another reaſon hereof, which is, that Nature hath framed the cheſt, that it might here alſo obſerve the order uſed by it in the fabrick of things, which is, that it might conjoin the parts much diſagreeing in their compoſure, as the lower belly, altogether fleſhy, and the head all bony, by a medium partaker both of the bony and fleſhy ſubſtance; which courſe we ſee it hath obſerved in the connexion of the fire and water, by the interpoſition of the air; of the earth and air, by the water placed between them.

The containing parts of the Cheſt.

Why nature hath made the Cheſt partly bony, partly griſly.

The Cheſt is divided into three parts, the upper, lower, and middle; the coller-bones contain the upper, the Midriff the lower, and the *Sternon* the middle. The *Sternon* in *Galens* opinion is compoſed of ſeven bones, I beleeve by reaſon of the great ſtature of the people that lived then. Now in our times, you ſhall oft find it compact of three, four, or five bones, although we wil not deny, but that we have often obſerved it (eſpecially in young bodies) to conſiſt of ſeven or eight bones.

The number of the bones of the Sternon.

Wherefore thoſe who have fewer bones in number in their *Sternon*, have them larger, that they might be ſufficient to receive the ribs. This is the common opinion of the *Sternon*. Yet *Fallopius* hath deſcribed it far otherwiſe; wherefore let thoſe who deſire to know more hereof, look in his obſervations.

At the lower part of the *Sternon*, there is a griſle, called commonly *Furcula*, and *Malum granatum*, or the Pomgranate, becauſe it reſembles that fruit; others call it *Cartilago ſcutiformis*, that is, the breſt-blade.

Cartilago ſcutiformis, the breſt-blade.

It is placed there, to be (as it were) a bulwark or defence to the mouth of the ſtomach, endued with moſt exquiſit ſenſe; and alſo that it ſhould do the like to that part of the Midriff which the Liver bears up in that place, ſituate above the orifice of the ventricle by the ligament coming between, deſcending from the lower part of the ſame griſle into the upper part of the Liver.

The common people think that this griſle ſometimes fals down. But it ſo adheres, and is united to the bones of the *Sternon*, that the falling thereof may ſeem to be without any danger, although oft-times it may be ſo moiſtened with watery and ſerous humidities, with which the orifice of the ſtomach abounds, that (as it were) ſoaked and drunk with theſe, it may be ſo relaxed, that it may ſeem to be out of its place; in which caſe it may be preſſed and forced by the hand into the former place and ſeat, as alſo by applying outwardly, and taking inwardly aſtringent and drying medicines to exhauſt the ſuperfluous humidity.

This Griſle at its beginning is narrow, but more broad and obtuſe at its end, ſomewhat reſembling the round or blunt point of a ſword, whereupon it is alſo called *Cartilago Enſiformis*, or the ſword-like griſle. In ſome it hath a double, in others a ſingle point.

In old people, it degenerates into a bone. Now becauſe we make mention of this griſle, we will ſhew both what a Griſle is, and how many differences thereof there be, that henceforward as often as we ſhall have occaſion to ſpeak of a griſle, you may underſtand what it is.

What a Griſle is. A Griſle is a ſimilar part of our bodies, next to a bone moſt terreſtriall, cold, dry, hard, weighty, and without ſenſe, differing from a bone in drineſs only, the which is more in a bone. Wherefore a Griſle being loſt, cannot be regenerated, like as a bone, without the interpoſition of a *Callus*.

The differences thereof. The differences of theſe are almoſt the ſame with bones, that is, from their conſiſtence, ſubſtance, greatneſs, number, ſite, figure, connexion, action, and uſe. Omitting the other for brevity ſake, I will only handle thoſe differences which ariſe from ſite, uſe and connexion. Therefore griſles, either adhere to the bones, or of, and by themſelves make ſome part, as the griſles of the ey-lids called *Tarſi*, of the *Epiglottis* and throtle. And others which adhere to bones, either adhere by the interpoſition of no medium, as thoſe which come between the bones of the *Sternon*, the coller-bones, the ſhare and haunch-bones, and others; or by a ligament coming between, as thoſe which are at the ends of the baſtard-ribs to the *Sternon* by the means of a ligament, that by thoſe ligaments being ſofter than a griſle, the motions of the Cheſt may be more quickly and ſafely performed. The griſles which depend on bones, do not only yeeld ſtrength to the bones, but to themſelves, and the parts contained in them, againſt ſuch things as may break and bruiſe them. The griſles of the *Sternon*, and at the ends of the baſtard-ribs are of this ſort.

Their twofold uſe. By this we may gather, that the griſles have a double uſe, one to poliſh and levigate the parts to which that ſlippery ſmoothneſs was neceſſary for performance of their duty; and for this uſe ſerve the griſles which are at the joints, to make their motions the more nimble. The other uſe is to defend thoſe parts upon which they are placed, from externall injuries, by breaking violent aſſaults, by ſomewhat yeelding to their impreſſion, no otherwiſe than ſoft things oppoſed againſt cannon-ſhot. We wil proſecute the other differences of griſles in their place, as occaſion ſhall be offered and required.

CHAP. II.

Of the containing and contained parts of the Cheſt.

The diviſion of the Cheſt into its parts. THe containing parts of the Cheſt are both the skins, the fleſhy Pannicle, the fat, the breſts, the common coat of the Muſcles, the muſcles of that place, the forementioned bones, the coat inveſting the ribs, and the *Diaphragma* or Midriff. The parts contained are the *Mediaſtinum*, the *pericardium* or purſe of the heart, the heart, the lungs and their veſſels. Of the containing parts, ſome are common to all the body, or the moſt part thereof, as both the skins, the fleſhy pannicle and fat. Of which being we have ſpoken in our firſt Book, there is no need now further to inſiſt upon. Others are proper to the Cheſt, as its muſcles, of which we will ſpeak in their place, the breſts, the forementioned bones, the membrane inveſting the ribs, and the *Diaphragma* or Midriff.

We will treat of all theſe in order, after we have firſt ſhewed you the way, how you may ſeparate the skin from the reſt of the Cheſt. Putting your knife down even to the perfect diviſion of the skin, you muſt draw a ſtreight line from the upper part of the lower belly, even to the chin; then draw another ſtreight line, overthwart at the coller-bones even to the ſhoulder-blades; and in the places beneath the coller-bones: (if you deſire to ſhun prolixity) you may at once ſeparate both the skins, the fleſhy Pannicle, the fat, and common coat of the muſcles; becauſe theſe parts were ſhewed and ſpoken of in the diſſection of the lower belly.

Yet you must reserve the brests in dissecting of the bodies of women; wherefore from the upper parts of the brests, as artificially as you can, separate only the skin from the parts lying under it, that so you may shew the Panicle which there becomes fleshy and musculous, and is so spred over the neck and parts of the face, even to the roots of the hairs.

CHAP. III.

Of the Brests or Dugs.

THe Brests, as we said, when we spoke of the nature of Glandules, are of a glandulous substance, white, rare, or spongious, in maids and women that do not give suck, they are more solid and not so large.

Their substances.

Wherefore the bigness of the Dugs is different, although of a sufficient magnitude in all. Their figure is round, somewhat long, and in some sort Pyramidall. Their composture is of the skin, the fleshy pannicle, glandules, fat, nerves, veins, and arteries, descending to them from the *Axillaris* under the *Sternon*, betwixt the fourth and fifth, and some unto the sixth of the true ribs.

Magnitude Figure, Composture.

And there they are divided into infinite rivelets by the interposition of the glandules and fat, by which fit matter may be brought, to be changed into milk by the faculty of the dugs.

We will speak no more of the nature of glandules or kernels, as having treated of them before; only we will add this, that some of the glandules have nerves, as those of the Brests, which they receive from the parts lying under them, that is, from the Intercostall, by which it comes to pass, that they have most exquisite sense. Others want a nerve, as those which serve only for division of the vessels, and which have no action, but only this.

Which Glandules have nerves, and which have none.

They be two in number, on each side one, seated at the sides of the *Sternon* upon the fourth, fifth and sixth true ribs.

Wherefore they have connexion with the mentioned parts with their body, but by their vessels with all other parts, but especially with the womb by the reliques of the mammillary veins and arteries, which descend down at the sides of the breast-bone, in which place these veins insinuating themselves through the substance of the muscles, are a little above the navell conjoined with the *Epigastricks*, whose originall is in some sort opposite to the *Hypogastricks*, which send forth branches to the womb. By the meeting of these it is more likely that this commerce should arise, than from other and those almost capillary branches, which are sometimes seen to descend to the womb from the *Epigastricks*.

Their connexion.

How the brests and womb communicate each with other.

They are of a cold and moist temper, wherefore they say that the blood by being converted into milk * becomes raw, flegmatick and white by the force of the proper heat of the dugs. Their action is to prepare nourishment for the new-born babe, to warm the heart from whence they have received heat, and to adorn the breast.

Their temper & Constitution. Their action and use.

By this you may know that some Glandules have action, others use, and some both. At the top of the dugs there are certain hillocks, or eminencies called teats or nipples, by sucking of which the childe is nourished through certain small and crooked passages, which though they appear manifest to the sight, whilst you press out the milk by pressing the dug, yet when the milk is pressed out, they do not appear, nor so much as admit the point of a needle, by reason of the crooked ways made by nature in those passages, for this use, that the milk being perfectly made, should not flow out of its own accord against the nurses will. For so the seed is retained and kept for a certain time in the Prostats.

The Nipples.

CHAP. IIII.

Of the Clavicles, or Coller-bones and Ribs.

IF we should handle these parts after the common order, we should now treat of the Muscles of the Chest which move the arm, and serve for respiration, and which first offer themselves to our sight.

But for that they cannot be fitly shewed, unless we hurt the muscles of the shoulder-lade and neck, therefore I think it better to defer the explanation of these Muscles, untill such time as I have shewed the rest of the contained and containing parts, not only of the Chest, but also of the Head, that having finished these, we may come to a full demonstration of all the rest of the muscles, beginning with those of the head, which we first meet with, and so prosecuting the rest even to the muscles of the feet, as they shall seem to offer themselves more fitly to dissection, that so, as much as lyes in us, we may shun confusion.

Wherefore to return to our proposed task; after the foresaid muscles come the Coller-bones, the *Sternon*, and Ribs.

But

But that these parts may be the more easily understood, we must first know what a bone is, and whence the differences thereof are drawn.

What a Bone is.

Therefore a Bone is a part of our body most terrestriall, cold, dry, hard, wanting all manifest sense, if the teeth be excepted.

A double sense

I said manifest sense, that you may understand that the parts have a double sense of touching, the one manifest, such as resides in the flesh, skin, membranes, nerves, teeth, and certain other parts; the other obscure, yet which may suffice to discern the helping and hurting tactile qualities, such sense the bowels and bones have; for very small fibers of the nerves are disseminated to these parts by mediation of their coat, or membrane, I say, so small, that they can scarce be discerned by the eye, unless (as *Galen* saith) by plucking such coats away from the parts.

Lib. 1. de Locis affectis.

Why the bones have such smal veins.

But it is no marvail if Nature would have these parts in like manner to have such small veins, contrary to the lungs and most part of the muscles, only to yeeld so much nourishment to the part, as should be needfull; for seeing the substance of the bones is cold, hard, dense and solid, it wastes the less.

Wherefore they need not so much blood for their nourishment, as the hot and soft parts; and besides the lesser bones have neither veins nor arteries, but draw fit nourishment, only by the force of the attractive faculty implanted in them.

Whence the difference of bones may be taken.

The differences of bones are taken from many things, as from their *Apophyses*, *Epiphyses*, grisles, necks, heads, solidity, cavity, eminencies, marrow, consistence, bigness, number, figure, site. We will prosecute all these as they shall offer themselves in the demonstration of the bones; to which doctrine we will give a beginning at the Clavicles or coller-bones.

The Clavicles or coller-bone.

The Clavicles are two very hard and solid bones, without any great or notable cavity, situate on each side betwixt the side and upper part of the *Sternon* and top of the shoulder-blade, for the strength and stability of these parts, whence they take the name of *Clavicula* Clavicles, (from the Greek κλὴς, which signifies, a Key or any other Bar or fastning of a door.) They carry the shape of a Surgeons Levatory.

But you must note that the Clavicles seem to be fastned to the *Sternon* by the mediation of a grisly bone. Moreover the space and cavity contained within the coller-bones is called by the Latins *jugulum*, by the French the upper *furcula*, because the jugular veins pass that way; it sticks to the upper process of the shoulder by a Grisle which *Galen* cals the small grisle bone, although it be nothing else but a production of the *Os juguli*.

Lib. 13. de us. part. cap. 11.

For the *Sternon*, which we said is framed of divers bones, as sometimes 3, sometimes 4, 5, 6, 7, and sometimes 8, you must note they are very spongy and full of pores, and of a far softer consistence than the coller-bones, wherefore more subject to corruption; besides they are mutually joined by interposition of muscles. Their use is to be as a shield to defend the vitall parts.

The Ribs.

The Ribs are 24 in number, on each side 12, seven of these are called true or perfect ribs, because they make a circle, at the one end joined to the *Sternon*, on the other to the *vertebra's*; the other are called bastard or short ribs, because they fall short in their way and come not to the *Sternon*; but they are fastned on the fore-side to the *Sternon* by grisles and ligaments, but on the back-part to the transverse *vertebra's* of the back-bone, and to the sides of the said *vertebra's*. But the short ribs are only knit to the *vertebra's*, wherefore that part of the *vertebra's* is called the root of the ribs.

Their consistence.

The exteriour or fore-part of the bastard or short ribs is grisly, that they should not be broken, and that they might be the easier lifted up in the distensions of the stomach filled with meat. They are of a consistence sufficiently hard, yet more towards their root, than at the *Sternon*, where they come nearer together, and are more hardly broken; they are smooth both within and without, but in the midst they have some sign of being double; or hollow to receive the veins and arteries, which nourish their bony substance; they are fashioned like a bow; their use is the same with the *Sternon*, and besides to carry and strengthen the muscles serving for respiration.

CHAP. V.

The Anatomicall administration of the Sternon.

THe coat investing the ribs, which the common Anatomists call *Pleura*, is the last of the containing parts of the Chest, which because it lyes hid in the inner part thereof, it cannot be shown unless by pulling asunder of the *Sternon*; wherefore we must now shew the manner of opening the *Sternon*, that hereby we may not violate the originall or insertion of any of the muscles. Wherefore first you must understand that he which will shew in their proper place their originall and insertion of the pectorall muscles, of the *Mastoides*, of the two muscles of the bone *Hyoïs*, of the muscles *subclavii*, and *intercartilaginei*, ought first of all to separate all the pectorall muscles from the

the *Sternon* and the griſles from the true ribs; then to cut the ligaments, next the bones themſelves, even from the ſixth true rib to the clavicles.

And then ſhewing the *Mediaſtinum* ſtretched under the *Sternon* all the length thereof, he muſt ſeparate the *Sternon* with his knife, and bend it up to the clavicles, and there cut it, reſerving together with it the four muſcles, that is, the two *Maſtoides*, and the two moving the bone *Hyoïs*, becauſe they either wholly or for the moſt part ariſe from the *ſternon*.

Laſtly, the Clavicles being ſomewhat thruſt upwards, the griſles muſt on each ſide be turned outwards towards the arm; that ſo the containing parts of the Cheſt may not only lye open to view, and be eaſily ſhewed, but alſo the muſcles may be contained in their place, untill they come to be ſhewed in their order.

And becauſe the coller-bones muſt be lifted up very high, that the recurrent nerves may be more eaſily ſeen, and the diſtribution of the veins and arteries, the two ſmall ſubclavian muſcles, one on each ſide muſt be ſhown by the way, who have their originall from the inner and fore-part of the Clavicles, and an oblique deſcent to the *Sternon* towards the griſle of the firſt rib.

For the Clavicles cannot be thus ſeparated, but that theſe muſcles muſt be violated and ſpoiled. Alſo you may divide the *Sternon* in the midſt, that you may ſhew the inward pectoral muſcles whole, having ſeparated the muſcles which ariſe from the upper part. All which things being performed as they ought, we muſt come to the coat inveſting the ribs, and then to the *Mediaſtinum*, as ariſing from it.

CHAP. VI.

Of the Pleura, *or coat inveſting the Ribs.*

THe *Tunica ſubcoſtalis*, or coat inveſting the Ribs, being the laſt of the containing parts of the Cheſt, is a large and a broad membrane anſwerable in proportion of uſe and action to the *Peritoneum* of the lower belly. For as the *Peritoneum* generally and particularly covers all the naturall parts, binding and holding them in their places, ſo this coat inveſts all the vitall parts in generall, becauſe it is ſtretched over all the inſide of the Cheſt, but in particular whilſt it gives each a coat from it ſelf. What the membrane inveſting the ribs is.

It hath its original from the *perioſteum* (or as others will have it, from the *pericranium*) inveſting the *vertebra's* of the Cheſt at the roots of the ribs. Wherefore it ſticks very faſt to the ribs, ſcarce to be ſeparated, as alſo to all the parts bounding the Cheſt, and contained in it. Its originall.

Veſalius reprehends *Galen*, becauſe he ſaid, that this was double on both ſides; yet *Columbus* defends *Galen*, and verily it is ſeen to be double in the inner part of the Cheſt, under the ribs and the muſcles of the ribs, that in that ſpace there may be way for the veins, arteries, and nerves.

Some have made it twofold, and divided it into the internal and external; as thoſe which have made two ſorts of Pluriſies, the true and baſtard; placing the external aboye the Ribs and intercoſtal muſcles; but the internal under the ribs, muſcles, *Diaphragma* and *Sternon*. Whether, as there is a two-fold Pluriſie, ſo alſo a double Pleura.

But we, to ſhun ambiguity, intend only to proſecute thoſe things which are manifeſt to the eys; wherefore we ſay, that the ribs are lined on the inſide with a double coat; on which immediatly and firmly ſticks to them on every ſide called the *perioſtium*, which is common to them and other bones.

The other which lyes upon that *perioſteum*, and on the inſide inveſts all the Ribs, whence it is called the *ſubcoſtalis tunica*. The ſubſtance, temper and compoſure are the ſame, as in other membranes. The magnitude in length, as alſo the figure, is the ſame with the compaſs of the inner part of the Cheſt; the thickneſs of it is very little. This coat is commonly called the *Pleura*, from the name of the part which it covers or lines, (for the Greeks call the ribs πλευραι.) and in like manner which happens betwixt the *perioſteum* and this *pleura*, is called either a true or baſtard Pluriſie. The magnitude and figure

CHAP. VII.

Of the Mediaſtinum.

NOw we muſt ſpeak of the parts contained in the Cheſt, ſeeing we have already handled the containing, beginning with the *Mediaſtinum* as being a part which in diſſection firſt preſents it ſelf to our ſight. The *Mediaſtinum* is of the ſame ſubſtance, thicknes, compoſure, number, temper, as the *Pleura*. For the ſubſtance of the *Mediaſtinum* is membranous, and though it be ſtretched al the length of the Cheſt, yet it is of a ſmal thicknes, receiving veins, nerves and arteries from al the parts to which it is knit, like as the *pleura* doth; but eſpecially from the mamillary veſſels, deſcending under the *ſternon*. The ſubſtance and magnitude

It is in number one, but it is made of two membranes produced from the ſubcoſtall, for this aſcending on each ſide by the hollowneſs of the Cheſt to the *ſternon*, and then at right angles it is reflected to the bodies of the *vertebra's*, whence the *pleura* hath its originall.

In that reflection there is ſo much diſtance between each membrane, as may be ſufficient to receive two fingers. For otherwiſe, ſeeing that they cannot penetrate through the heart, it was fit each ſide of the *Pleura* ſhould turn to the *Pericardium*, that ſo they might arrive at the appointed place without offence. Neither yet is that ſpace void and empty, but woven with many ſmall nervous fibers. *Columbus* adds, that that place is often filled with a certain humor beſides nature, which you may draw out or evacuate by opening the *ſternon*.

The figure. Yet I would gladly learn of *Columbus*, by what ſigns we may know that ſuch an humor is contained there. For the figure, the *Mediaſtinum* with the *Pleura* on each ſide, repreſents the figure of a leather bottle, whoſe flat ſide is the *Mediaſtinum*, whoſe other ſide the *Pleura*; the bottom that part of the *Pleura* which is next the Midriff; the mouth the upper part of the *Pleura* at the firſt ribs. We ſhewed the ſite and connexion of the *Mediaſtinum*, when we declared its originall.

The uſe. The uſe thereof is to ſeparate the vitall parts (as it were) into two cels, the right and left, that if peradventure it happen that the one be hurt, the creature may live by the benefit of the other.

And it hath another uſe, which is to prop and hold up the *Pericardium*, that it fall not upon the heart with its weight, but toſſed with the motions of the heart and Cheſt, it may move to this or that ſide.

CHAP. VIII.

Of the Diaphragma *or Midriff.*

What the Midriff is. ALthough the Midriff may ſeem to be accounted rather a part containg than contained, yet for commodities ſake we have deferred the demonſtration thereof till now. Therefore it is a muſcle round and long, terminating the lower part of the Cheſt.

Its ſubſtance, compoſition, &c. It is of the ſame ſubſtance, compoſition and temper, as the muſcles of the *Epigaſtrium*; it is made of two coats, the lower whereof is from the *Peritoneum*, and the upper from the *Pleura*. Which getting to them fleſh, but not there, but in their circumference, by the benefit of the blood brought thither by the veins and arteries diſtributed through it, turn into a muſcle, whoſe middle is nervous and membranous, but the extremities by which it is inſerted, one while fleſhy, as in that part next to the baſtard ribs; another while tendonous, as where it touches the firſt and ſecond *vertebra's* of the loins, for it ends in them by two Tendons manifeſt enough. It is one in number, interpoſed with an oblique ſite betwixt the naturall and vitall parts. Connexion. It hath connexion with the lower part of the *Sternon* and ſhort ribs, and the two firſt *vertebra's* of the loins, but by its coats and veſſels with the parts from whence it received them.

Quantity. The extent thereof is equal to the compaſs of the lower part of the Cheſt. The length of it is from the breſt-blade, even to the firſt and ſecond *vertebra* of the loins. The thickneſs is diverſe, for it is far thicker in its fleſhy extremity, than in its nervous originall.

Action. The Action thereof is to help the expulſion of the Excrements by the mutuall aſſiſtance of the *Epigaſtrick* muſcles, but the chief uſe is for reſpiration, of which it is one of the prime inſtruments. This partition the Ancients called *Phrenes*, becauſe the inflammation thereof cauſed like ſymptomes as the inflammation of the brain, by reaſon of the large nerves on each ſide one, which come to it directly and primarily from the third, fourth, and fifth *vertebra* of the neck. This muſcle differs from other muſcles, ſpecially in figure. It is perforated in three places, to give way or paſſage to the aſcendent Hollow-vein, to the artery *Aorta*, and the Gullet.

Why the *Diaphragma* was called *Phrenes*.

CHAP. IX.

Of the Lungs.

Their ſubſtance. Quantity. The Lobes thereof. THe Lungs are of a ſoft ſubſtance and fleſh, rare and like a ſponge, of a various colour pamered; their quantity is ſufficiently large; for moſt commonly they are divided into four lobes disjoined with a manifeſt and viſible diviſion, on each ſide two, whereby they may be the more eaſily opened and contracted, and the air may the better enter.

Beſides alſo in large bodies, who have a very great Cheſt, there is found a fifth lobe, ariſing from the ſecond lobe of the right ſide, as a cuſhion or bolſter to bear up the Hollow-vein aſcending from the Midriff to the heart.

In little men who have a ſhorter Cheſt, becauſe the heart is ſo near as to touch the *Diaphragma*, this lobe is not ſeen, yet it is always found in Dogs.

Figure. The Lungs repreſent the figure or ſhape of an Oxes foot or hoof, for like it they are thicker

thicker in their baſis, but ſlenderer in their circumference, as you may ſee in blowing them up, by the weazon, with your mouth or a pair of bellows. They are compounded of a coat coming from the *Pleura*, which on each ſide receives ſufficient number of nerves from the ſixth conjugation; and alſo of the *Vena arteriosa* coming from the right ventricle of the heart, and the *Arteria venosa* from the left, as ſhall be ſhewed in the Anatomy of the heart; beſides the *Aſpera arteria* or weazon coming from the throat; and laſtly its own fleſh, which is nothing elſe than the concretion of cholerick blood poured out like foam about the diviſions of the foreſaid veſſels, as we have ſaid of other parts. Compoſition.

The body of the Lungs is one in number, unleſs you will divide it into two, by reaſon of the variety of its ſite, becauſe the Lobes of the Lungs ſtretched forth into the right and left ſide do almoſt involve all the heart, that ſo they may defend it againſt the hardneſs of the bones which are about it, they are tyed to the heart, chiefly at its baſis, but to the roots of the ribs, and their *vertebra's* by the coat it hath from thence; but by the veſſels to theſe parts from whence they proceed. But oft times preſently from the firſt and naturall conformation they are bound to the circumference of the ribs by certain thin membranous productions which deſcend from thence to the Lungs, otherways they are tyed to the ribs by the *Pleura*. The ſticking of the lungs to the ribs.

The nouriſhment of the Lungs is unlike to the nouriſhment of other parts of the body; for you cannot finde a part equally rare, light, and full of rare, which may be nouriſhed with blood equally thin and vaporous. In temper they incline more to heat than to cold whether you have regard to their compoſure of cholerick blood, or their uſe, which is to prepare and alter the air, that it hurt not the heart by its coldneſs. The Lungs is the inſtrument of voice and breathing by the weazon or wind-pipe. For the Lobes are the inſtruments of voice, and the ligaments, of reſpiration. But the *Larinx* or Throtle is the chief inſtrument of the voice; for the Weazon firſt prepares the voice for the Throtle, in which it being in ſome meaſure formed, is perfected in the palat of the mouth, as in the upper part of a Lute, or ſuch like inſtrument, by the help of the *Gargareon* or *uvula* as a certain quil to play withall. Their nouriſhment.

But as long as one holds his breath, he cannot ſpeak; for then the muſcles of the *Larinx*, ribs, the *Diaphragma*, and the *Epigaſtrick* muſcles are preſſed down, whence proceeds a ſuppreſſion of the vocall matter, which muſt be ſent forth, in making or uttering a voice.

Nature would have the Lungs light for many reaſons; the firſt is, That ſeeing they are of themſelves immovable, they might be more obſequious and ready to follow the motion of the Cheſt; for when it is ſtraitned, the Lungs are ſtraitned and ſubſide with it; and when it is dilated, they alſo are dilated, and ſwell ſo big that they almoſt fill up all the upper capacity thereof. Why the lungs are light.

Another cauſe is, That by this their rarity they might more eaſily admit the entring air, at ſuch times as they have much or ſodain neceſſity, as in running a race.

And laſtly, that in Plurifies and other purulent abſceſſes of the Cheſt, the *Pus* or matter poured forth into the capacity of the Cheſt, may be ſuckt in by the rare ſubſtance of the Lungs, and by that means the ſooner ſent forth and expectorated.

The uſe of reſpiration is to cool and temper the raging heat of the heart. For it is cooled in drawing in the breath by the cool air, and in ſending out thereof by avoyding the hot fuliginous vapor. Therefore the Cheſt performs two contrary motions, for whilſt it is dilated it draws in the encompaſſing air, and when it is depreſſed, it expels the fuliginous vapor of the heart; which any one may eaſily perceive by the example of a pair of Smiths bellows. The uſe of reſpiration or breathing.

CHAP. X.

Of the Pericardium *or Purſe of the Heart.*

THe *Pericardium* is (as it were) the houſe of the Heart, which ariſing at the baſis thereof (either the ligaments of the *vertebra's* ſituate there, or elſe the veſſels of the heart yeelding it matter) is of a nervous, thick and denſe ſubſtance without any fibers. It retains the figure of the Heart, and leaves an empty ſpace for the heart to perform its proper motions. Wherefore the bigneſs of the *Pericardium* exceeds that of the heart. Whence it hath its matter.

It conſiſts of a double coat, one proper, of which we have ſpoken; another common, coming from the *Pleura*; and alſo of veins, arteries, and nerves; the veſſels partly coming from the mamillary, partly from the *Diaphragma*, chiefly there where it touches it; the nerves come on each ſide from the firſt conjugation.

It is only one, placed about the heart, and annexed to it at the baſis thereof by its membranes, to the originall of the Lungs, and the *vertebra's* lying under them, and by the veſſels to the parts from whence it received them. It is of a cold and dry temper, as every membrane is. Number and connexion.

The uſe thereof is to cover the heart, and preſerve it in its native humidity, by a certain Uſe.

naturall moiſture contained in it, unleſs you had rather ſay that the moiſture we ſee contained in the *Pericardium*, is generated in it after death by the condenſation and concretion of the ſpirits. Although this ſeems not very likely, becauſe it grows and is heaped up in ſo great quantity in living bodies, that it hinders the motion of the heart, and cauſes ſuch palpitation or violent beating thereof, that it often ſuffocates a man.

From whence the matter of the watery humor contained in the *Pericardium*.

For this Palpitation happens alſo to hearty and ſtout men, whoſe hearts are hot, but blood thin and wateriſh, by reaſon of ſome infirmity of the ſtomach or liver; and this humor may be generated of vapors which on every ſide exhale into the *Pericardium* from the blood boiling in the ventricles of the heart, where kept in by the denſity thereof, they turn into yellowiſh moiſture, as we ſee it happens in an Alembeck.

The Conſiſtence.

Nature would have the *Pericardium* of a denſe and hard conſiſtence, that by the force thereof the heart might be kept in better ſtate; for if the *Pericardium* had bin bony, it would have made the heart like iron by the continuall attrition; on the contrary, if it had been ſoft and fungous, it would have made it ſpongy and ſoft like the lungs.

CHAP. XXX.

Of the Heart.

What the heart is, and of what ſubſtance

THe Heart, the chief manſion of the Soul, the organ of the vitall faculty, the beginning of life, the fountain of the vitall ſpirits, and ſo conſequently the continuall nouriſher of the vitall heat, the firſt living and laſt dying; which becauſe it muſt have a naturall motion of it ſelf, was made of a denſe, ſolid, and more compact ſubſtance than any other part of the body.

The three ſorts of fibers of the heart.

The fleſh thereof is woven with three ſorts of fibers, for it hath the right in the inner part deſcending from the baſis into the point, that they might dilate it, and ſo draw the blood from the Hollow vein into the receptacles thereof, and the breath or air from the lungs by the *Arteria venoſa*; it hath the tranſverſe without, which paſs through the right at right angles, to contract the Heart, and ſo drive the vitall ſpirits into the great Artery *Aorta*, and the cholerick blood to the Lungs by the *Vena arterioſa* for their nouriſhment; it hath the oblique in the midſt to contain the air and blood drawn thither by the forementioned veſſels, untill they be ſufficiently elaborate by the heart.

All theſe fibers do their parts by contracting themſelves towards their originall, as the right from the point of the heart towards the baſis, whereby it comes to paſs that by this contraction of the fibers the heart dilated becomes ſhorter, but broader, no otherwiſe than it is made more long and narrow by the contraction of the tranſverſe, but by the drawing of the oblique, it is leſſened in that part which looks towards the *vertebra's*, which chiefly appears in the point thereof.

The magnitude.

It is of an indifferent bigneſs, but yet in ſome bigger, in ſome leſs, according to the diverſe temper of cold or hot men, as we noted in the liver.

Figure.

The figure thereof is pyramidall, that is, it is broader in the baſis, and narrower at his round point.

Compoſition.

It is compoſed of the moſt denſe fleſh of all the body, by the affuſion of blood at the diviſions and foldings of the veſſels, and there concrete, as it happens alſo to the other entrails. For the blood being there a little more dryed, than that which is concrete for the making of the Liver, turns into a fleſhy ſubſtance more denſe than the common fleſh, even as in hollow ulcers, when they come to a cicatrize.

The proper veſſels.

It hath the Coronall veins and arteries, which it receives either on the right ſide from the Hollow vein, or on the left from the baſis at the entrance of the artery *Aorta*. You cannot by your ey diſcern that the heart hath any other nerves than thoſe which come to it with the *Pleura*.

The Nerves.

Yet I have plainly enough obſerved others in certain beaſts which have great hearts, as ſwine; they appeared ſeated under the fat which covers the veſſels and baſis of the heart, leſt the humid ſubſtance of theſe parts ſhould be diſſolved and diſſipated by the burning heat of the heart. Whereby you may perceive that the heat of the heart is different from the Elementary heat, as that which ſuffers fat to grow about this entrail, where otherwiſe it doth not concrete unleſs by cold or a remiſs heat, which thing is chiefly worth admiration.

Number and ſite.

The Heart is one alone, ſituate moſt commonly upon the fourth *vertebra* of the Cheſt, which is in the midſt of the Cheſt. Yet ſome think that it inclines ſomewhat to the left ſide, becauſe we there feel the motion or beating thereof; but that happens by reaſon of its left ventricle, which being it is filled with many ſpirits, and the beginning of the arteries, it beats far more vehemently, than the right. It required that ſeat by the decree of Nature, becauſe that region is the moſt ſafe and armed, and beſides it is here on every ſide covered (as it were) with the hands of the Lungs.

Connexion.

It hath connexion with the fore-mentioned *Vertebra's*, but by the parts compoſing it, with thoſe parts from whence it hath them; with the Lungs by the *Vena arterioſa*, and

and the *Arteria venoſa*; and laſtly, with all the parts of the body by the Arteries, which it ſends to them all.

It is of a hot and moiſt temper, as every fleſhy part is. The action thereof is, firſt to prepare the blood in its right ventricle, for the fit nouriſhment of the Lungs, for from hence it is that *Galen* ſaith, This right ventricle was made for the neceſſity of the Lungs. Secondly, to generate the vitall ſpirits in its left ventricle for the uſe of the whole body. But this ſpirit is nothing elſe than a certain middle ſubſtance between air and blood, fit to preſerve and carry the native heat, wherefore it is named the Vitall, as being the author and preſerver of life. In the inner parts of the heart there preſent themſelves to our conſideration the ventricles and the parts contained in the ventricles and between them; ſuch are the *Valvulæ*, or valves, the veſſels and their mouths, their diſtribution into the Lungs, the wall or partition, and the two productions or Ears of the heart; which becauſe they are doubtfull, whether they may be reckoned amongſt the externall or internall parts of the heart, I will here handle in the firſt place.

Temper and action.

What the vitall ſpirit is.

Therefore theſe *Auricule* or Ears are of a ſoft and nervous ſubſtance, compact of three ſorts of fibers, that ſo by their ſoftneſs they might the more eaſily follow the motions of the heart, and ſo break the violence of the matter entring the heart with great force when it is dilated. For otherwiſe by their violent and abundant entrance they might hurt the heart, and (as it were) overwhelm and ſuffocate it; but they have that capacity which we ſee given by nature, that ſo they might (as it were) keep in ſtore the blood and air, and then by little and little draw it forth for the uſe or neceſſity of the heart. But if any enquire, if ſuch matters may be drawn into the heart by the only force of the *Diaſtole, ad fugam vacui*, for avoyding of emptineſs; I will anſwer, That that drawing in or attraction is cauſed by the heat of the heart, which continually draws theſe matters to it, no otherwiſe than a fire draws the adjacent air, and the flame of a candle the tallow which is about the weik for nouriſhments ſake. Whilſt the heart is dilated it draws the air, whilſt it is drawn together or contracted it expels it. This motion of the heart is abſolutely naturall, as the motion of the lungs is animall. Some add a third cauſe of the attraction of the heart, to wit, the ſimilitude of the whole ſubſtance. But in my judgment, this rather takes place in that attraction which is of blood by the *venæ coronales* for the proper nouriſhment of the heart, than in that which is performed for attraction of matters for the benefit of the whole body.

The *Auriculæ Cordis*, or ears of the heart.

Theſe Ears differ in quantity, for the right is far more capacious than the left, becauſe it was made to receive a greater abundance of matter. They are two in number, on each ſide one, ſituate at the baſis of the heart: The greater at the entrance of the hollow vein into the heart, the leſs at the entrance of the veinous and of the great Artery, with which parts they both have connexion. We have formerly declared what uſe they have, that is, to break the violence of the matters, and beſides to be ſtays or props to the *Arteria venoſa* and great Artery, which could not ſuſtain ſo rapid and violent a motion as that of the Heart, by reaſon of their tenderneſs of ſubſtance.

Their magnitude and number.

Their uſe.

Of the ventricles of the Heart.

The partition between the ventricles of the heart.

THe Ventricles are in number two, on each ſide one, diſtinguiſhed with a fleſhy partition ſtrong enough, having many holes in the ſuperficies, yet no where piercing through.

Why the right ventricle is more capacious & leſs compact.

The right of theſe Ventricles is the bigger, and encompaſſed with the ſofter and rarer fleſh; the left is the leſſer, but is engirt with a threefold more denſe and compact fleſh; for the right Ventricle was made for a place to receive the blood brought by the hollow vein, and for diſtributing of it, partly by the *Vena arteriosa* into the Lungs for their nouriſhment, partly into the left Ventricle, by ſweating through the wall or partition, to yeeld matter for the generation of the vitall ſpirits.

Why the right ventricle is more capacious & leſs compact.

Therefore becauſe it was needfull there ſhould be ſo great a quantity of this blood, it was likewiſe fit that there ſhould be a place proportionable to receive that matter. And becauſe the blood which was to be received in the right ventricle was more thick, it was not ſo needfull, that the fleſh to contain it ſhould be ſo compact; but on the contrary, the arterious blood and vital ſpirit have need of a more denſe receptacle, for fear of waſting, and leſt they ſhould vaniſh into air; and alſo leſs room, that ſo the heat being united, might become the ſtronger, and more powerfully ſet upon the elaboration of the blood and ſpirits.

The action of the right ventricle.

Therefore the right Ventricle of the heart is made for the preparation of the blood appointed for the nouriſhment of the Lungs, and the generation of the vitall ſpirits, as the Lungs are made for the mitification or qualifying of the Air. Which works were neceſſary if the Phyſicall Axiome be true, *That like is nouriſhed by like*, as the rare and ſpongious Lungs with more ſubtil blood; the ſubſtance of the heart groſs and denſe, with the veinous blood as it flows from the Liver, that is groſs.

And it hath its Coronall veins from the Hollow vein, that it might thence draw as much as ſhould be ſufficient.

The action of the left ventricle.

But the left Ventricle is for the perfecting of the vitall ſpirit, and the preſervation of the native heat.

Of the Orifices and Valves of the Heart.

The uſes of the four orifices of the Heart.

THere be four Orifices of the heart, two in the right, and as many in the left ventricle; the greater of the two former gives paſſage to the vein, or the blood carried by the hollow vein to the heart; the leſſer opens a paſſage to the *vena arterioſa*, or the cholerick blood carried in it for the nouriſhment of the lungs.

The larger of the two other makes a way for the diſtribution of the Artery *Aorta*, and the vitall ſpirit through all the body; but the leſſer gives egreſs and regreſs to the *Arteria venoſa*, or to the air and fuliginous vapors. And becauſe it was convenient that the matters ſhould be admitted into their proper ventricles by theſe orifices, by the *Diaſtole*, to wit, into the right ventricle by the greater orifice, and into the left by the leſſer; and becauſe on the contrary it was fit that the matters ſhould be expelled by the *Syſtole* from their ventricles, by the fore-mentioned orifices;

The Valves.

Therefore nature to all theſe orifices hath put eleaven valves, that is to ſay, ſix in the right ventricle, that there might be three to each orifice; five in the left, that the greater orifice might have three, and the leſſer two, for the reaſon we will preſently give.

How they differ.
Action.
Site.
Figure.
Subſtance.

Theſe valves differ many ways: Firſt, in action; for ſome of them carry in matter to the heart, others hinder that which is gone out, that it come not back again. Secondly, they differ in ſite, for thoſe which bring in, have membranes without, looking in; thoſe which carry out, have them within looking out. Thirdly, in figure, for thoſe which carry in, have a pyramidall figure, but thoſe which hinder the coming back again, are made in the ſhape of the Roman letter C. Fourthly, in ſubſtance, for the former for the moſt part are fleſhy, or woven with fleſhy fibers into certain fleſhy knots ending towards the point of the heart; The latter are wholly membranous.

Number.
Motion.

Fiftly, they differ in number, for there be only five which bring in, three in the right ventricle at the greater orifice, and two in the left at the leſſer orifice; thoſe which prohibit the coming back, are ſix in each ventricle, three at each orifice. Laſtly, they differ in motion; for the fleſhy ones are opened in the *diaſtole*, for the bringing in of blood and ſpirit, and contrariwiſe are ſhut in the *ſyſtole*, that they may contain all or the greater part of that they brought in. The membranous on the contrary are opened in the *ſyſtole* to give paſſage forth to the blood and ſpirits over all the body, but ſhut in the *diaſtole*, that that which is excluded might not flow back into the Heart. But you ſhall obſerve that nature hath placed only two valves at the orifice of the *Arteria venoſa*, becauſe it was needfull that this Orifice ſhould be always open, either wholly or certainly a third part thereof; that the air might continually be drawn into the heart by this orifice in inſpiration, and ſent forth by exſpiration in the contraction of the heart. Whereby we may gather this, that there is but one third part of that air we draw into the heart in breathing, ſent forth again in the form of vapor in exſpiration, becauſe nature would have but one third part of the orifice to lye open for its paſſage out. Therefore the exſpiration or breathing out, and the *ſyſtole* of the heart and arteries, is ſhorter than the inſpiration, ſo that we may truly ſay, that the inſpiration, or drawing the breath in, is equally ſo long as the exſpiration is together with the reſt, which is in the midſt between the two motions.

Why there be only two Valves that *Arteria venoſa*.

CHAP. XII.

Of the diſtribution of the Vena arterioſa, and the Arteria venoſa.

HAving hitherto ſhewed the originall of each of the veſſels of the Heart, we muſt now ſpeak of their diſtribution. The *Vena arterioſa*, or the Arterious vein; and the *Arteria venoſa*, or the Veinous artery, each proceeding out of his proper ventricle, that is, the right and left, are divided into two large branches; one of which goes to the right and the other to the left hand, the one lying croſs-ways over the other, the vein always riding over the artery, as you may underſtand better by the ſight of your eys, than by reading of books. Theſe branches at their entrance of the lungs are divided into two other large branches, and each of them go to his peculiar Lobe of the lungs; and theſe again run almoſt into infinit other branches, diſperſed in three places over the Lungs.

The artery always lyes under the vein.

A twofold reaſon why the Vein was made arterious or like an artery.

Theſe veſſels have acquired their names by reaſon of that tranſmutation of conſiſtence, whereby the compoſure of a vein degenerates into an artery, and that of an artery into a vein, for the commodity of life. For this is a miracle of prudent Nature to change the coats of the veſſels of the lungs; producing a vein which in its body ſhould imitate an artery, and an artery which ſhould repreſent a vein: for if the *vena arterioſa* ſhould have retained its proper conſiſtence, the arterious blood which is carried by it from the heart to nouriſh the lungs, might by reaſon of its ſubtilty penetrate through, and flow away by reaſon of the rarity of the veinous texture: and ſo nature ſhould never have attained her con-

ceived

ceived end, that is, to nouriſh the Lungs, by reaſon of the continuall motion of their contraction and dilatation.

For nouriſhment cannot be aſſimilated to the part, unleſs it be put and cleave to it. Wherefore it was fit, that nature ſhould make the body of this vein ſolid, that it might be immoveable, unſhaken and ſtubborn (in reſpect of a vein which by its ſoftneſs would have been too obſequious and yeilding to the agitation of the Lungs) that ſo it might have nouriſhment, which might be diffuſed into all parts thereof, and which might neither be drawn by its *diaſtole*, nor driven back into the heart by its *ſyſtole*. But the artery hath the conſtence of a vein, that by that veinous ſoftneſs according to the neceſſity of nature it might be the more readily contracted and dilated, to bring the air in and carry the vapours forth of the heart. Here we meet with a difficulty, which is, by what way the blood is carryed out of the right into the left ventricle of the heart.

Why the Artery was made like a Vein.

Galen thinks that there be certain holes in the partition made for that purpoſe; and verily there are ſuch, but they are not perforated. Wherefore *Columbus* hath found out a new way, which is, that the blood is carryed to the lungs by the *vena arterioſa*, and there attenuated; and carried from thence together with the air by the *Arteria venoſa* to the left ventricle of the heart; this he writes truly very probablely. *Botallus* in his treatiſe *de Catarrho* hath found out a third way, to wit, a vein, which he cals *Arteriarum nutrix*, that is, The nurſe of the arteries, which creeps a little above the Coronall to the right ear of the Heart, and then goes into the left ear thereof. But yet I am very much afraid, that this vein obſerved by *Botallus*, is that veſſel obſerved by *Fallopius*, whereby the *Vena arterialis* is joyned to the *Aorta*, and by which all the vitall blood is carried for the forming and nouriſhment of the lungs whilſt the infant is yet in the womb. Of which alſo *Galen* makes mention, but it had lain hid from his time to this day, but that *Fallopius* raiſed up the memory of it again.

By what way blood may paſs out of the right into the left ventricle.

The vein called the nurſe of the arteries.

Fallop. initio obſer. Arteriarum. Gal. lib. 15 de uſu part. cap. 6.

CHAP. XIII.

The diſtribution of the aſcendent Hollow vein.

THe Hollow vein riſing out of the gibbous part of the Liver, and reſembling (according to *Galen*) the body of a tree, is divided into two notable branches, but not of a like bigneſs. For the greater, by the hind part of the Liver upon the back bone & by the way, receives certain other branches from the ſubſtance of the Liver which entred not into the great trunck with the reſt. You may often ſee this deſcendent branch even to the back bone upon which it lies in this its deſcent, covered with the ſubſtance of the liver, ſo that it may ſeem that branch proceeds not from that common trunck together with the aſcendent, although indeed it always doth. But the leſſer branch aſcends to the upper parts, and is diſtributed after this manner following. For firſt ariſing into the midriffe it beſtows two ſmall veins upon it, on each ſide one, which from that part are called *Phrenicæ*. But from thence when it arrives at the right Ear of the Heart, it makes the *Coronales*, the Coronall or Crown veins, which compaſs the *baſis* of the heart in manner of a Crown. Thirdly, entring ſomewhat more deeply into the right Ear, in its greater part it produces the *vena arterioſa*. Fourthly, lifted up above the heart, on the right ſide it produces the vein *Azygos* or *ſine pari* (that is, without a fellow) which deſcending to the fourth rib, (reckoning from above downwards) nouriſheth the intercoſtall muſcles and alſo the membranes of the eight lower ribs, on both ſides, ſending a branch into each of the muſcles at the lower part of the rib, which may be ſufficient for their nouriſhment. Beſides alſo oftentimes, eſpecially in little men, this vein *Azygos* nouriſhes all the ſpaces between all the ribs by the like branches, which it ſends in the ſame manner to the four upper ribs. Moreover alſo this *Azygos* ſometimes, though but ſeldome, is found double, that is, on each ſide one. Here you muſt chiefly obſerve, that this vein after it hath nouriſhed the ſpaces between the lower ribs, in its remainder deſcends under the *Diaphragma* and is joyned on the left ſide to the Emulgent vein; by which it is manifeſt how an Abſceſs may be critically evacuated by the urine, in a pluriſie. But this ſame *Azygos* is more depreſſed on the right ſide, and meets with the *Vena lumbares*, but eſpecially with one of them, which goes down to the thigh, whereby *Fallopius* gathers that it is very convenient in the beginnings of Pluriſies to open the *vena poplitis*, the vein of the Ham. Fifthly above the *Azygos* (when it is wanting there) it ſends forth the branch called *Intercoſtalis* to the other ſpaces between the upper ribs; although this is ſometimes ſeen to come from the *Axillares*, which *Sylvius* cals the *ſubclavia*. Sixthly, it brings forth the *Mammarie*, ſo called, becauſe in their greater part they run to the dugs between the fourth and fifth ribs, for the uſes formerly mentioned; men and women have on each ſide one of theſe coming from the *Subclavia*. They are ſometimes found to proceed by a certain common orifice from the hollow vein, before it be divided into the *Subclavian* branches, but it is rather in beaſts than in men; theſe veins deſcending by the ſides of the *ſternon* yeild nouriſhment to the two inner muſcles of the cheſt, to the ſeven intercoſtall muſcles of the true ribs, to the *ſternon* it ſelf and

Mammaria.

to its ligaments and griſtles, as alſo to the *Mediaſtinum* & the upper part of the right muſcles, and the adjacent parts. Seaventhly, it produces the *Cervicalis*, which on both ſides through the holes of the productions of the *Vertebra's* of the neck, aſcends to the head, ſending many ſmall branches into the ſpinall marrow through the holes by which the nerves paſs, and alſo into the membranes, ligaments, griſtles, bones, and neighbouring muſcles. Eightly, the *Muſculoſa* or muſculous, which alſo ariſing out of the *Subclavia* is divided into two other branches, the one whereof goeth upon the breſt to the paps nouriſhing the foremoſt muſcles; wherefore in a baſtard pluriſie cupping-glaſſes may be fitly applied in this place.

Cervicalis.

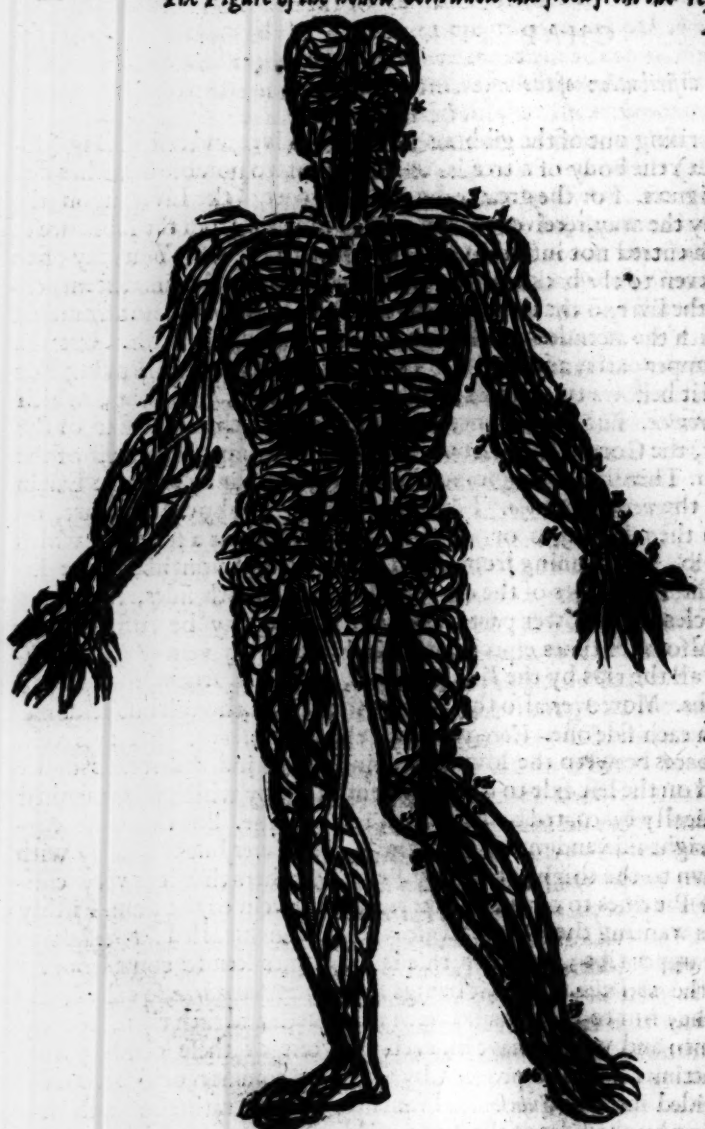
Muſculoſa. In what place cupping glaſſes may be fitly applyed in a baſtard pluriſie.

The other branch deſcends to the upper muſcles of the cheſt, but ſpecially to that which is called *Latiſſimus*. The tenth is the *Axillaris*. The eleventh the *Humeralis*, of which we will treat in their place. The twelfth and laſt is the *Jugularis* properly ſo called, which is two-fold, the internall and externall. The internall being the leſſer doth preſently on both ſides from this very beginning aſcend by the ſides of the *Aſpera Arteria* or weazon even to the mouth and skull, yeilding nouriſhment to the parts by which it paſſes, as to the next membranes and nerves. But when it comes to the *baſis* of the *Cranium* it is divided into two branches, the greater whereof going back along the *baſis* of the *Cranium* to the hind part thereof, ſending a branch to the long muſcle ſituate upon the *œſophagus*, it enters the *Cranium* with the ſmall *Carotides* through the hole of the nerves of the ſixt conjugation, where they become one common veſſell. The leſſer ſending a ſlip to the organ of hearing by the hole called *Cæcum* (or the blind) alſo enters the *Cranium* and is ſpent in the thicker *meninx* neer to the hole of the third and fourth conjugation of nerves. The externall Jugular vein being greater and fairer, moſt commonly ſimple, yet ſometimes double, either preſently at his beginning, or a little after, aſcends ſuperficially on both ſides of the neck, between the broad muſcle, or fleſhy pannicle, being there eaſie to be diſcerned, and other muſcles ſituate at the ſides of the neck, into which as alſo into the skin it ſends certain branches for nouriſhment.

Axillaris.
Humeralis.
Jugularis interna, externa.
Into what parts the *Jugularis interna* goes.

Into what parts the *Jugularis externa* goes.

The Figure of the hollow vein whole and freed from the reſt of the body.



A, The trunk of the hollow vein. The lower *AA*, At this place of the Liver, is ſeated the left part of the vein, and diſtributeth branches to the left ſide.

B. Sheweth how the trunk of the hollow vein in the cheſt (to give way to the heart) is curved or bowed to the right hand.

Betwixt A. and B. that part of the hollow vein which is betwixt the gibbous ſide of the Liver and the Midriffe.

C. The left midriffe vein called *Phrenica ſiniſtra*, from which ſurcles do run in a man unto the purſs of the heart, for the midriffe and it do grow together.

D. The orifice of the hollow vein which groweth unto the heart.

E. the crown-vein called *coronaria*, which like a crown compaſſeth the baſis of the heart, and ſprinkleth his ſurcles on the outſide thereof as far as to the cone or point.

FF. The trunk of the vein *Azygos* or *non paril*, deſcending along the right ſide of the rack-bones unto the loins.

GG. the lower intercoſtal veins, to the branches of the vein *Azygos*, which go unto the diſtan-

ces

ces betwixt the ribs, and afford ſurcles unto the muſcles which lie upon the ribs and the rack-bones, and the membranes of the cheſt. *H.* the diviſion of the hollow vein into two ſubclavian trunks near the Iugulum under the breſt-bone. *II.* the ſubclavian branch tending on either ſide unto the arm; called by ſome *Axillaris*. *K.* the upper intercoſtall vein which commonly ſendeth three ſlips unto the diſtances of the upper ribs, unto which the firſt intercoſtall vein ſent no branches. *LL.* the deſcending mammary vein: this deſcendeth under the breſt-bone unto the right muſcles of the *Abdomen*, and affordeth ſurcles to the diſtances of the griſtles of the true ribs, to the Mediaſtinum, the muſcles that lye upon the breſt and the skin of the *Abdomen*. *M.* the conjunction of the mammary with the Epigaſtrick vein aſcending about the navill under the right muſcles. *N.* the vein of the neck called *Cervicalis*, aſcending towards the skull, which alloweth ſurcles to thoſe muſcles that lie upon the neck. *O.* the vein called *Muſcula*, which is propagated with many ſurcles into the muſcles that occupie the lower parts of the neck and the upper parts of the cheſt. *P.* *Thoracica* ſuperior, the upper cheſt vein which goeth to the muſcles lying upon the cheſt, to the skin of that place and to the dugs. *Q.* the double *Scapularis* diſtributed into the hollow part of the ſhoulderblade and the neighbour muſcles: ſo alſo betwixt *P.* and *R.* ſometimes ſmall veins do reach unto the glandules that are in the arm-holes. *R.* *Thoracica inferior* running downward along the ſides of the cheſt, and eſpecially diſtributed into the muſcle of the arm called *Latiſſimus*. *S.* the inner Jugular vein which entreth into the Scull after it hath beſtowed ſome ſurcles upon the rough artery. *T.* the externall Jugular vein. *V.* the diviſion of this vein under the root of the ear *X.* a branch of the externall Jugular which goeth into the inſide of the mouth, and is diverſly divided into the parts therein contained. *Y.* the exterior branch diſtributed near the *Fauces* into the muſcles of the chops and the hole skin of the head. *Z.* a portion of the branch. *y.* reaching unto the face. *a. a.* the vein of the fore-head. *a.* a portion of it creeping through the temples. *a.** a propagation that goeth unto the skin of the Nowl or *Occiput*. *a. a.* the vein called *Cephalica*, or the externall vein of the arm which others call *Humeraria*. *b*, *Muſcula ſuperior*, a propagation of the *Cephalica* vein which goeth unto the backward muſcles of the neck. Betwixt *b.* and *d.* on the backſide iſſueth a branch from the *Cephalica* which paſſeth unto the outſide of the blade, and a portion thereof runneth betwixt the fleſh and the skin. *d. d.* a vein from the *Cephalica* which attaineth unto the top of the ſhoulder, and is conſumed into the muſcle that elevateth or lifteth up the arm. and into his skin. *e. e.* a ſmall vein from the *Cephalica* diſperſed through the skin and the muſcles of the arm. *f.* the diviſion of the *Cephalica* into three parts. *g.* the firſt branch runneth deep unto the muſcles which ariſe out of the externall protuberation of the arm. *h.* the ſecond branch which goeth to make the *media* vein. *i. i.* the third branch running obliquely above the wand and the outſide of the arm. *k.* from this branch certain circles are divided into the skin, the chief whereof is marked with *k. l.* the third branch at the wriſt which is joyned at *l.* with the branch of the *Baſilica* marked with *x. m.* the *Baſilica* which on the right hand is called *Hepatica*, on the left hand *Lienaris*. *n. n.* a branch of the *Baſilica* going to the heads of the muſcles of the cubit at *n.* and to the muſcles themſelves at *o. p.* a notable branch of the *Baſilica* running obliquely, and beſtowing ſurcles upon the muſcles that iſſue from the externall protuberation. This branch deſcendeth together with the fourth nerve. *q.* diviſion of the *Baſilica* into two branches and that is noted with *q* is ever accompanied with an artery. *ſ.* a branch of this vein beſtowed upon the skin of the arm. *t.* a branch of the *Baſilica* which together with the branch of the *Cephalica* marked with *b.* makes the *media* or middle vein marked with *a. u.* a branch of the *Baſilica* going to the inner head of the arm. *xx.* a branch iſſuing out of the former that creepeth along unto the wriſt and toward the little finger conjoyning it ſelf with a branch of the *Cephalica*. *y.* A vein running out unto the skin at the outſide of the cubit. Upper *u.* a propagation iſſuing out of a branch of the *Baſilica* marked with *t.* lower *z.* a branch of the *Baſilica* vein, going to the inſide of the Arm. *a.* the *Media* or common vein. *a.* the partition of the Media vein above the wriſt: This diviſion ſhould have been made above. *b.* the Externall branch of the partition which goeth to the outſide of the head. *c.* from which iſſueth a ſmall branch to the inſide. *d.* the internall branch under *c.* which toward the middle and the ring finger is eſpecially diſpoſed. *e* the vein of the thumb diſperſed into the mountenet or hillock, which is conjoyned with the branch noted with *d.* the trunk of the hollow vein from which iſſue branches unto the parts ſeated under the liver. *g.* the fatty vein called *Adipoſa ſiniſtra*, which goeth unto the fat of the kidneys. *h.* the two Emulgents which lead whey-y blood unto the kidneys. *i.* the two ſpermaticall veins leading the matter of the ſeed unto the teſticles. *V*, the beginning of the bodden veſſell called *varicoſum*. *k.* the veins of the loins called *Lumbares*, which are ſent in the knots or knees to the rackbones, to the marrow of the back, to the muſcles that lie upon the loins, and to the *Peritonæum*. *l.* the bifurcation of the hollow vein into the Iliack branches, which bifurcation is not unlike. *m*, *Muſcula ſuperior*, a tranſverſe branch going to the muſcles of the *Abdomen*, and to the *Peritonæum*. *n.* the diviſion of the left Iliack vein, into an inner branch at *o.* and an utter at *p.* *Muſcula media* the utter propagation of the branch *p.* diſtributed through the muſcles of the *coxa* and the skin of the buttocks. *q.* an inner propagation of the ſame

branch.

branch ♄, which goeth unto the holes of the holy bone. ♃, the vein called *Sacra*, which goeth to the upper holes of the holy bone. ☽, the vein *Hypogaſtrica* diſtributed to the bladder, to the muſcles of the fundament, and the neck of the womb. ♂, a vein ariſing from the utter branch marked with ♂, which is joyned with ſome branches of the internall vein, near the holes or perforations of the ſhare-bone. ☿ 1. a vein which when it hath paſſed the ſhare-bone diſtributeth one branch into the cup of the *coxendix* and to the muſcles of that place. ♀, another ſmall branch which runneth under the skin at the inſide of the thigh. ☽, the congreſs or meeting of the foreſaid vein, with a branch marked with char. 2. and diſtributed into the leg. 1, the *Epigaſtrick* vein, a propagation of the utter branch ♂, perforating the *Peritonæum*, whereto as alſo the muſcles of the *Abdomen*, and the skin it offereth branches, the chief branch of this vein is joyned with the deſcending mammary above the navill at *M*. ♎, *Pudenda* an inner propagation of the branch. ♂, running overthwart unto the privities. ♋, *Saphæna* or the ancle vein or the inner branch of the crurall trunk, which creepeth through the inſide of the leg under the skin unto the tops of the toes. ♈, the firſt interior propagation of the *Saphæna* offered to the groin. ♓, the utter propagation thereof divided to the foreſide or outſide of the thigh. ♊, the ſecond propagation of the *Saphæna* going to the firſt muſcle of the leg. ♍, the third propagation of the *Saphæna* going to the skin of the whirle-bone, and unto the ham. ♌, the fourth propagation of the *Saphæna* diſperſing his muſcles forward and backward. ♑, branches from this unto the foreſide of the inward ankle, to the upper part of the foot, and to all the toes. ♎, *Iſchias minor*, called alſo *Muſcula interior* the utter branch of the crurall trunk divided into the muſcles of the *coxendix*, and to the skin of that place. 1, 2, and this alſo may be called *muſcula*. 1, the exterior and leſſer which paſſeth into ſome muſcles of the leg. 2, the interior greater and deeper unto the muſcles of the thigh. 3, 4, the vein called *Poplitea*, made of two crurall veins divided under the knee. 5, From this a ſurcle is reached upward unto the skin of the thigh. 6, but the greater part runs by the bent of the knee under the skin as far as the heel. 7, alſo to the skin of the outward ankle. 8, the vein called *Suralis* or calf vein, becauſe it runneth unto the muſcles that make the calf of the leg. 9, The diviſion of the Surall vein into an exterior trunk 9, and an interior 14. 10, 11, the diviſion of the exterior trunk under the knee into an externall branch, which along the brace attaineth unto the muſcles of the foot. 11, and an internall. 12, 13, 12, 13. which deſcending along the outſide of the leg to the upper part of the foot is cloven into divers branches, and in the back of the foot mixeth it ſelf with *Poplitea*, or the ham vein. 20. 14. the interior branch of the Surall vein which runneth into the backſide of the leg. 15, a branch hereof deſcending to the inſide of the heel and the great toe, and is divided into divers ſurcles. 17, *Iſchias major* iſſuing out of the internall trunk at 14, and running through the muſcles of the calf. 18, a propagation hereof derived unto the upper part of the foot, and affording two ſurcles to every toe. 19, the remainder of the inner trunk. 14. behind the inner ankle, approacheth to the bottom of the foot and is conſumed into all the toes. 20, the commixion of the vein *Poplitea* with the ſmall or calf-branch at 13.

Where the externall jugular vein may be fitly opened in inflammations of the parts of the mouth.

But when it arrives to the baſis of the lower part of the head, it is divided into more branches, one whereof is carried to the muſcles of the bone *Hyois*, the *Larinx*, the tongue and the lower part of the tongue (in which place it is commonly opened in the ſquinances, and other inflammations of the mouth) and to the coat of the noſe. Another is carried to the *Dura mater*, paſſing on both ſides through a hole ſituate under the bone *maſtoides*, and beſides, aſcending to the bone of the back part of the ſcull, it comes obliquely to the upper part of the future *lambdoides*, where theſe branches meeting together, paſs into the reduplication of the *Dura mater*, dividing the fore-part of the brain, that ſo joined and united, they may make the *torcular*; the third aſcendent is diſtributed upon the back-part and baſis of the lower jaw, to the lips, the ſides of the noſe, and the muſcles thereof; and in like manner to the greater corner of the eyes, to the fore-head and other parts of the face, and

Vena recta.

at length by meeting together of many branches, it makes in the forehead the vein which is called *vena recta* or *vena frontis*, that is, the forehead vein. The fourth aſcending by the glandules behind the ears, after it hath ſent forth many branches to them, is divided into two others, one whereof paſſing before, and the other behind the ear, are at length

Vena pupis.

ſpent in the skin of the head. The fifth and laſt wandring over all the lower part of the head, going to the back part thereof, makes the *vena pupis*, which extended the length of the head by the ſagitall ſuture, at length goeth ſo far, that it meets with the *vena frontis*, which meeting is the cauſe, that a vein opened in the forehead, is good in griefs of the hinder part of the head, and ſo on the contrary. But we muſt obſerve that in the *Cranium* of ſome, the *vena pupis* by one or more manifeſt paſſages ſends ſome portion thereof to the inner part of head, ſo that the *vena pupis* being opened may make revulſion of the matter which cauſeth the internall pains of the head.

CHAP.

CHAP. XIIII.

The diſtribution of the Nerves, or ſinews of the ſixth conjugation.

BEcauſe the diſtribution of the arteries cannot be well ſhewed, unleſs we violate thoſe nerves which are carryed over the Cheſt, therefore before we ſhew the diſtribution of the arteries, we will as briefly as we can, proſecute the diſtribution of theſe nerves. Three pair of nerves of the ſixt conjugation.

Now the ſixth conjugation brings forth three pair of nerves; for paſſing out of the ſkul, as it comes down to the Cheſt, it by the way ſends forth ſome branches to certain muſcles of the neck, and to the three aſcendent muſcles of the *Larinx* on each ſide of the *Sternon* and upon the clavicles. Then the remainder deſcending into the Cheſt, is divided on each ſide into theſe three pair. The firſt pair makes the *Ramus coſtalis*. The ſecond, the *Ramus recurrens*. The third pair, the *Ramus ſtomachicus*. The *Ramus coſtalis*, or coſtall branch is ſo called, becauſe deſcending by the roots of the ribs, even to the holy bone, and joining themſelves to theſe which proceed from each of the *Vertebra's* of the ſpine, they are carryed to all the naturall parts. *Ramus Coſtalis.*

The *Recurrens*, or recurrent is alſo called, becauſe as it were ſtarting up from the cheſt, it runs upward again, but theſe two Recurrent nerves do not run back from the ſame place; but the right from below the artery, called by ſome the axillary, by others Subclavian, and the left from beneath the great artery, deſcending to the naturall parts. But each of them on each ſide aſcending along by the weazon, even to the *Larinx*, and then they inſinuate themſelves by the wings of *Cartilago ſcutiformis*, and *Thyroides* into the proper muſcles, which open and ſhut the *Larinx*. *Recurrens.* An anatomical *Axiome.*

By how much the nerves are nearer the originall, to wit, the brain, or ſpinall marrow, they are by ſo much the ſofter. On the contrary, by how much they are further abſent from their originall, they are ſo much the harder and ſtronger, which is the reaſon that Nature would have theſe recurrent nerves to run back again upwards, that ſo they might be the ſtronger to perform the motions of the muſcles of the *Larinx*. But the *Stomachicus* or ſtomach-branch is ſo called, becauſe it deſcends to the ſtomach or ventricle. For this branch deſcending on both ſides by the ſides of the gullet, ſends many branches from it into the inner ſubſtance of the lungs, into the coat thereof, into the *Pericardium* and heart; and then coming into the upper orifice of the ſtomach, it is ſpent in many branches, which folded after divers manners and wayes, chiefly make that mouth of ſtomach, which is the ſeat of the Animall appetite (as they term it) and hunger, and the iudges of things convenient or hurtfull for the ſtomach. But from thence they are diverſly diſtributed over all the body of the ventricle. Why nature would have the vocall nerves recurrent. *Ramus ſtomachicus.*

Moreover the ſame branch ſends forth ſome ſmall branches to the liver and bladder of the gall, giving each part by the way, ſo much ſenſe as ſhould be ſufficiently neceſſary for it. Here you muſt note, the ſtomach branch deſcends on each ſide one, knit to the gullet, and by the way they divide themſelves into two branches, each of which goes to the oppoſite ſide, that it may there join it ſelf to the nerve of that ſide. To which purpoſe the right is carried above the gullet, the left below it, ſo that theſe two ſtomatick become four, and again theſe four preſently become two.

CHAP. XV.

The Diviſion of the Arteries.

THe Artery ariſing forth of the left ventricle of the heart, is preſently (the two Coronall Arteries being firſt ſpred over the ſubſtance of the heart) divided into two unequall branches. The greater whereof deſcends to the lower parts, being diſtributed, as we formerly mentioned in the third book, and 22. Chapter. The leſſer aſcending to the upper parts, is again divided into two other unequall branches, the leſſer of which aſcending towards the left ſide, ſends forth no artery from it, untill it arrive at the rib of the Cheſt, where it produces the ſubclavian artery, which is diſtributed after the manner following. The left branch of the aſcendent artery is leſs then the right. The diſtribution of the left ſubclavian artery into the;

Firſt, it produces the intercoſtall, and by it imparts life to the three intercoſtall muſcles of the four upper ribs, and to the neighbouring places. 1 *Intercoſtalis.*

Secondly, it brings forth the Mammillary branch, which is diſtributed as the Mammillary vein is. 2 *Mammaria.*

Thirdly, the *Cervicalis*, which aſcends along the neck by the tranſverſe productions to the *Dura mater*, being diſtributed as the *Vena Cervicalis* is. 3 *Cervicalis.*

Fourthly, paſſing out of the Cheſt, from the back part of the Cheſt, it ſends forth the *muſculoſa*, whereby it gives life to the hind muſcles of the neck, even to the back part of the head. 4 *Muſculoſa.*

Fiftly,

5 *Humeraria duplex.*

Fiftly, having wholly left the Cheſt, it ſends forth the two *Humeriæ*, or ſhoulder arteries, the one whereof goes to the muſcles of the hollow part of the ſhoulder blade, the other to the joynt of the arm and the muſcles ſituate there, and the gibbous part of the ſhoulder blade.

6 *Thoracica duplex.*

Sixthly and laſtly, it produces the *Thoracica*, which alſo is twofold, for the one goes to the fore muſcles of the Cheſt, the other to the *Latiſſimus*, as we ſaid of the vein, the remnant of it makes the *Axillaris* of that ſide.

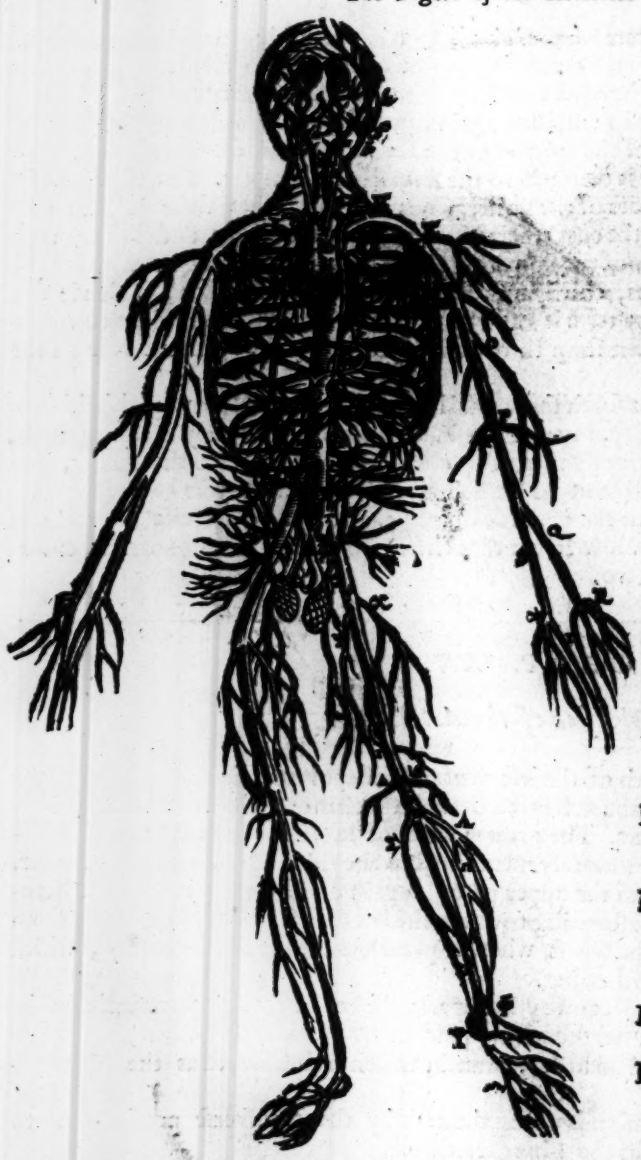
The diſtribution of the right ſubclavian artery.

The other greater branch likewiſe aſcending by the right ſide, even to the firſt rib of the Cheſt, makes alſo the ſubclavian of that ſide, which beſides thoſe diviſions it makes on this ſide, like thoſe of the left ſide, hath alſo another which makes the right and left *Carotides* or ſleepy arteries; which aſcending undivided with a nerve of the ſixth conjugation and the internall jugular vein, by the ſides of the *Aſpera Arteria* or windpipe, when they come to the *Pharinx*, they are divided on each ſide into two branches, the one internall, the other externall. The internall and greater is ſent to the *Pharinx*, *Larinx*, and tongue; then entring into the head by the long hole and the back part of the upper jaw, it ſends many branches to the noſe, eyes, the inſide of the temporal muſcles and to the *Craſſa meninx*, or *Dura mater*: the remainder of this branch going by the ſide holes of the ſame, that it might there make the *Plexus admirabilis* as we ſee. And then it is ſpent upon the baſis of the brain abundantly diffuſed over the *tenuis meninx* or *Pia mater*, & then the membrane or *Plexus Choroides*. The external or leſſer branch of the ſleepy arteries goes to the cheeks, the temples, & behind the ears; laſtly, it ſends a branch into the long muſcle of the neck, with which the internal Jugular vein inſinuates it ſelf into the *Dura mater*, entring by the hole of the nerves of the ſixth conjugation.

The diſtribution of the internall branch of the ſleepy arteries.

To what parts the externall branch of the ſleepy artery arrives.

The Figure of the Arteries.



A. The orifice of the great Artery, or the beginning thereof, where it iſſueth out of the heart.

B. *Coronaria*, ſo called, becauſe like a crown it compaſſeth the baſis of the heart.

C. The diviſion of the great artery into two trunks, V. *i.*

D. The left ſubclavian climbing obliquely upward unto the ribs.

E. the upper intercoſtall artery, or a branch which beſtoweth four propagations unto the diſtances of the lower rib.

F. The neck artery which through the tranſverſe proceſſes of the rackbones of the neck, attaineth to the ſcull, beſtowing ſurcles unto the marrow and his neighbour muſcles.

G. The left Mammary artery running under the breſt-bone, and to the navill.

It diſtributeth ſurcles to the *Mediaſtinum*, the muſcles of the breſt, and of the *Abdomen*.

H. *Muſcula*, or a branch attaining to the backward muſcles of the neck.

I. The *Scapular* arteries which go unto the hollowneſs of the blade, and of the muſcles that lie thereon.

K. *Hummeraria* which climbeth over the top of the ſhoulder

L. *Thoracica ſuperior*, ſprinkled unto the forward muſcles of the Cheſt. M. *Thoracica inferior*; which paſſing along the ſides of the Cheſt, attaineth to the *broad* muſcles of the arm. N. the axillarie artery running out into the arm and affording branches unto the muſcles thereof. O. A branch reaching

to

to the outſide of the cubit lying deep. PP. Branches to the joint of the cubit with the arm. Q. The upper branch of the artery running along the *Radius* and offering ſurcles to the thumb, the fore-finger, and the middle finger. *k.* A ſurcle creeping unto the outſide of the hand, and led betwixt the firſt bone of the thumb and that of the after-wriſt, ſupporteth the fore-finger where we uſe to feel the pulſe. S. the lower branch of the artery running along the *Vlna* and communicating ſurcles to the little finger, the ring finger, and the middle finger. * A little branch unto the muſcles about the little finger. T. the diſtribution of the upper and lower branches into the hand and the fingers. V. the trunk of the great artery aſcending to the *Jugulum*, and the diviſion thereof in that place into *X*, *Y*, *Z*. *X*. the left *Carotis* or ſleepy artery. *Y*. *Subclavian dextra* is divided into branches, as the right is divided. *Z*. *Carotis dextra*, called alſo *Apoplectica* and *Lithargica*. *a*. the diviſion of the left *Carotis* in the chops. *b*. the exteriour branch of that diviſion going into the face, the temples, and behind the ears. *c*. the inner branch going to the throttle, the chops, and the tongue. *d*. the diviſion hereof at the baſis of the skull, into two branches which enter the *ſinus* of the *Dura mater*. *e*. a propagation of the branch *b*. unto the muſcles of the face. *f*. the diſtribution of the branch *b*. under the root of the ear. *g*. the fore-branch hereof creeping up the temples. *h*. the back branch running on the backſide of the ear under the skin. *i*. the trunk of the great artery, deſcending unto the ſpondells of the back. *kkk*. the lower *Intercoſtall* arteries which go unto the diſtances of the eight lower ribs, from which are offered ſurcles to the marrow, and to the muſcles that grow to the back and to the Cheſt. *l*. the artery of the midriffe called *Phronica* or *Diaphragmatica*. ζ, *Meſenterica Superior*, but you muſt note that above ζ, the trunk of the *Cœliacall* artery is taken away, leſt the multitude of letters in ſo ſmall a Table ſhould breed obſcurity. *η*, *θ*, the right and left emulgents running from the *Aorta* or great arterie unto the kidnies. *ιι*, ιι, the ſpermaticall arteries on either ſide going to the teſticles. *λ*, the lower Meſentericall artery on the left below *μ*, running eſpecially into the Colick gut on that ſide. *μμ*, the arteries called *Lumbares*, which run overthwart and like knees, affording ſurcles to the muſcles that grow to the loins, and to the *Peritonæum*. *μ*. the lower; *Muſcula ſuperior* running into the ſides of the *Abdomen* and the muſcles. *νν*. the biſurcation of the great artery into two *iliack* trunks, and at the ſides, but ſomewhat inward are branches which make thoſe that are called *Sacræ*. T. the diviſion of the left *Iliack* trunk into an inner branch at ξ and an utter at ο. ξ. the inner *Iliack* branch. *o*, *Muſcula inferior*, the utter propagation of the inner branch going unto the muſcles which cover the branch bone and the *Coxendix*. *π*. *Hypogaſtrica*, the inner propagation of the inner branch going to the bladder, the yard and the neck of the womb. ϱ. the umbilicall artery. *ſ*. the remainder of the branch ξ, aſſuming an addition from the utter branch neer ϱ, and ſo falling through the hole of the ſhare-bone into the leg. *τ*. *Epigaſtrica*, it aſcendeth upward unto the right muſcle of the *Abdomen*, and about the navell is joyned with the mammary artery. *υ*. *Pudenda*, it creepeth overthwart the ſhare-bone. φ. the *Crurall* trunk without the *Peritonæum*. χ. *Muſcula cruralis exterior*, going into the fore muſcles of the thigh. ψ. *Muſcula cruralis interior*, going unto the muſcles of the inſide of the thigh. ω. The conjunction of this artery with the branches. r. *Poplitea*, going to the muſcles on the backſide of the thigh. ΔΔ. which communicateth ſmall branches to the joint of the knee, and the muſcles that make the calfe of the leg. Θ. the diviſion of the *Crurall* artery under the ham into three branches. Λ. *Tibiæa exterior*, it accompanieth the brace-bone, and is conſumed into the muſcles. Ξ. the chief part of the *crurall* artery. Σ. the upper and backer *Tibiæa*. ΠΦ. the lower and backer *Tibiæa* running unto the upper ſide of the foot at Φ. Υ. a propagation of the crurall artery going to the inner and upper ſide of the foot, and ſprinkling a branch unto the ankle. Ω. a propagation unto the lower part of the foot which affordeth ſurcles to each toe.

But we muſt note that there be more veins in a mans body, than arteries, and beſides that the veins are far thicker. For there is no need for preſerving the native heat in the parts themſelves, either of ſo many, or ſo large inſtruments of that kind. Therefore you may often find veins without arteries, but never arteries without veins.

But we underſtand that an artery is a companion to a vein, not only when it touches it, or adheres to it by common membranes, as uſually it happens; but alſo when it is appointed together with the vein for the uſe of the ſame part.

CHAP. XVI.

Of the Thymus.

THe *Thymus* is a glandule, of a ſoft, rare, and ſpongious ſubſtance, of large bigneſſe, ſituate in the furtheſt and higheſt part of the Cheſt, amongſt the diviſions of the ſubclavian or Jugular veins and arteries, as yet contained in the Cheſt, for this uſe; that it might ſerve theſe veſſels for a defence againſt the bony hardneſſe of the Cheſt, and beſides, that as it were by this prop or ſtay, the diſtributions of theſe

What the *Thymus* is.

The uſe.

The magnitude.

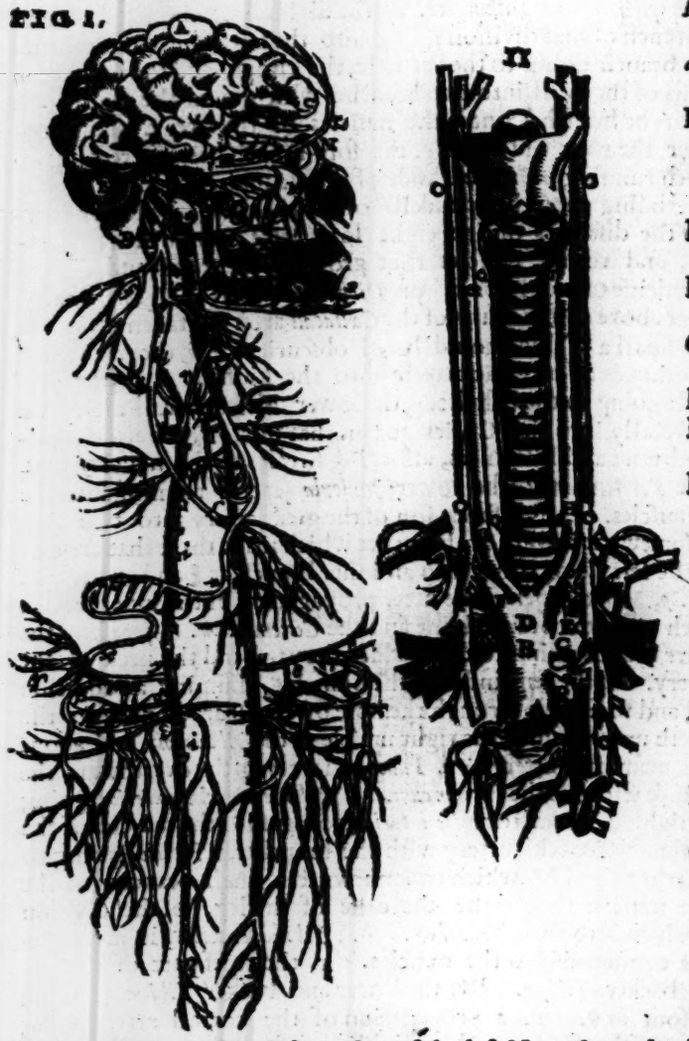
veſſels might become the ſtronger; for ſo we ſee that nature hath provided for others, eſpecially ſuch as are the more noble and worthy. This glandule appears very large in beaſts and young men, but in ſuch as have attained to full growth it is much leſs, and ſcarce to be ſeen.

CHAP. XVII.

Of the Aſpera Arteria, *the rough Artery or Weazon.*

The Figure of the Aſpera Arteria *or Weazon.*

FIG. 1.



A. The orifice of the great artery cut from the heart.
aa. the coronall arteries of the heart.
B. C. D. the diviſion of the great artery in two trunks, the deſcending C. the aſcending D.
E. the left axillarie, or ſubclavian artery.
F. the right axillarie or ſubclavian artery.
G. the right *Carotis* or ſleepy artery.
H. the left *Carotis*.
I. the trunk of the rough artery or weazon.
K.L. The diviſion of the rough artery into two branches, of which the right goes into the right, and left into the left ſide of the lungs; which branches are again ſubdivided into many other.
M. the head of the Rough Artery called the *Larinx* or *Throttle*.
N.N. Certain Glandules or Kernells at the root of it.
OO. the right and liſt nerves of the ſixth and ſeaventh conjugation. P. A revolution of ſmall branches of the right nerve to the right *Axillary* Artery. QQ. The right Recurrent Nerve.
R. A revolution of ſmall branches of the left Nerve unto the deſcending trunk of the great Artery. SS. The left recurrent Nerve.

The ſubſtance.

THe *Aſpera Arteria* or Weazon ſeeing it is the inſtrument of voice and reſpiration, is of a griſtly, ligamentous, and wholly various ſubſtance. For if it had been one rough, and continued body with the *Larinx* or throttle, it could not be neither dilated, nor compreſſed; opened, nor ſhut, neither could it order the voice according to our deſire.

Compoſure.

It is compoſed of veins from the internall Jugular, of arteries ariſing from the *Carotides*, and of nerves proceeding from the Recurrent branch, of a double membrane, of which the externall comes from the *Peritoneum*; the internall, which is the ſtronger and woven with right fibers, from the inner coat of the mouth, the which is common with the inner coat of the *œſophagus* or gullet. And alſo it conſiſts of round griſtles, yet not drawn into a perfect circle, compoſed in manner of a channell, and mutually joyned together in order, by the ligaments that proceed from their ſides and ends.

Why the back part of the Weazon is ligamentous.

Theſe ſame ligaments perfect the remnant of the circle of this *Aſpera Arteria*, on that part next the gullet; which is thought to be done to this end; that that ſoftneſs of a ligament, might then give place, when we ſwallow harder and greater gobbets of meat. Of the two ſorts of ligaments which are annexed to the griſtles of the weazon, ſome tie and faſten together the rings or circles, which give means both to it, and theſe circles

to

to be drawn in length; otherſome bring theſe griſtles into a perfect circle, which alſo yeeld them means of dilatation. Theſe ligaments cover the inner ſuperficies, but the griſtles are placed without, to reſiſt the incurſion of externall injuries. But we muſt note, that by this communion of the inner coats of the weazon and gullet, we reap this benefit in the commodiouſneſs of the action, that one of theſe parts being depreſſed, the other is lifted up, like a rope running in a wheel or pully. For thus whilſt the gullet is depreſt to ſwallow any thing, the weazon is lifted up; and on the contrary when the ſtomach riſes up in vomiting, the weazon is depreſt. It is only one, and that ſeated between the *Larinx* (from which it takes its beginning) and the lungs in which it ends; firſt dividing it ſelf into two large branches, the right and the left, and beſides each of theſe entring into the ſubſtance of the lungs, is again divided into two others; to each of the Lobes one, and to conclude, theſe be ſubdivided into infinite others, through the ſubſtance of the Lobes.

Why the forepart is griſtley.

The number and ſite. The diviſion of the weazon through the Lobes of the Lungs.

All theſe branches are griſtlely even to the ends. They are ſituate between the ends of the *Artera venoſa*, and the *Vena arterioſa*, that the entrance of the air into the heart by the *arteria venoſa* might be ſpeedier, as alſo the paſſage out of the vapour, by the *vena arterioſa*. Thus it hath connexion with theſe in the ends, or utmoſt parts thereof, but by the other parts compaſſing it, with the members from whence it takes them. The temperament thereof is cold and dry. The action is to carry the air to, and vapours from the lungs; that by dilating, but this by preſſing the griſtles together.

The temper and action.

CHAP. XVIII.

Of the Gullet.

The ſubſtance.

THe *OEſophagus*, or Gullet, which is the paſſage of the meat and drink, is of a middle ſubſtance between the fleſh and ſinews; becauſe it conſiſts of one nervous membrane and another fleſhy. The nervous is placed the innermoſt, and is continued to the inner coat of the mouth even to the Lips, (whereby it comes to paſs,) that the Lips tremble in diſeaſes which are ready to be judged by a criticall vomiting, and to the inner part of the *Aſpera arteria*; it conſiſts of right Fibers for the attraction of the meat, which we ſee is ſometimes ſo quick and forcible in hungry people, that they have ſcarce time to chaw it, before they find it, to be plackt down, as it were with a hand. The fleſhy Coat placed without is woven with tranſverſe fibers, to haſten the going of the meat into the ſtomach, and for expulſion in vomiting and breaking of wind. Theſe two coats are continued with the two coats of the ſtomach, and have the like ſite. Beſides, the Gullet hath theſe parts compoſing it, as a vein from the Gate and Hollow aſcendent vein; a nerve from the firſt conjugation, an Artery from that which creeps alongſt the bottome of the ſtomach with the *vena Gaſtrica*, or elſe from the Arteries aſcending the hollow part thereof; but alſo beſides all theſe veſſels it may have a third coat from the membrane inveſting the Ribs, or *Pleura*.

Attractive force thereof.

The compoſiture.

The magnitude of the Gullet is large enough, yet ſome be bigger, ſome leſs, according to the variety of bodies. The figure of it is round, that ſo it might be more large to ſwallow meat, and leſs ſubject to offence. It is placed between the back bone and weazon from the roots of the tongue even to the ſtomach. But as it deſcends alongſt the back bone, when it comes to the fourth *Vertebra* of the Cheſt, it turns to the right ſide, to give way to the great Artery *Aorta* and the deſcendent Artery, then it turns to the left ſide to the ſtomach, or mouth of the ventricle. Nature hath faſtened it to the *Diaphragma* with ſtrong membranous ties, leſt that if it had lain upon the Artery, it ſhould have hindred the paſſage of the vitall ſpirit to the lower parts. It is only one and that tyed to the forementioned parts, both by its veſſels and membranes. It is of temper rather cold than hot, as all thoſe parts, which are more nervous than fleſhy, are. The Action thereof is to draw and carry down the meat, and to caſt forth ſuch things by vomit as trouble the ſtomach. Here you muſt note, that whilſt we ſwallow down, the Gullet is drawn downwards, and the weazon upwards, which is the cauſe that we cannot ſup and blow, ſwallow and breath together at the ſame inſtant; which we muſt think to happen by Gods ſingular providence; to whoſe name be glory for everlaſting, Amen.

The magnitude. The Figure. Site.

Temper and action.

Why we cannot ſup and blow at one time.

The End of the fourth Book.

The Fifth Book,

Of the Animall parts contained in the HEAD.

CHAP. I.

A Generall deſcription of the Head.

HAving hitherto declared two generall parts of mans body, that is, the Naturall and Vital, it is now fit to betake our ſelves to the laſt, that is, the Animall, beginning with the Head.

Wherefore we will firſt define the head, then divide it into its parts; thirdly, deſcribe each of theſe parts; fourthly, demonſtrate them after the order they offer themſelves to our ſight in diſſection.

What the head is.

Why ſeated in the higheſt place.

The head therefore is the ſeat of the ſenſes, the Palace and habitation of reaſon and wiſdome, from whence as from a fountain infinite actions and commodities ariſe. It is ſeated above the reſt of the body, that the Animall ſpirit from thence, as from a tower, may govern and moderate the whole body, and perform all actions according to the præſcript of nature. By the head we underſtand all that which is contained from the Crown of the head to the firſt *vertebra* of the neck.

The figure.

The beſt figure of the head is round, lightly flated on each ſide, *enubereting* ſomething to the fore and hind part thereof. For from hence is taken an argument of the goodneſs of the ſenſes; on the contrary, thoſe which are exactly round, or *acuminate*, and ſharp towards the top, are not thought good. The head is divided into the face, forehead, temples, the forepart, the crown and hind part.

The diviſion thereof.

By the face we underſtand, whatſoever is contained between the Eye-brows and the lower part of the chin. By the forehead, all the ſpace from the eye-brows even to the Coronall Suture. By the temples, whatſoever is hollowed from the leſſer corner of the eye, even to the ears. By the forepart of the head, whatſoever runs in length from the top of the forehead, on the Coronall Suture, even to the Suture *Lambdoides*, and on each ſide to the *Oſſa petroſa*, the ſtony bones, or ſcaly Sutures. By the Crown we ſignifie a certain point exquiſitely in the midſt of the Sagittall Suture, which is ſufficiently known. By the *Occiput* or hind part of the head, that which is terminated by the Suture *Lambdoides*, and the firſt *vertebra* of the neck.

The containing parts of the head.

Of all theſe parts there be ſome ſimple, ſome compound, beſides ſome are containing, ſome contained. Of the containing ſome are common to all the parts of the head, as the skin, the fleſhy pannicle and *periocranium*, others are proper to certain parts, as the fleſhy pannicle to the neck, face, forehead, and skin covering the *Cranium*, the common coat of the muſcles to the fat and face; the skull and both the *Meninges* to the brain.

The parts contained.

The parts contained are the ſubſtance of the brain, the four ventricles, and the bodies contained in them, the nerves, the mamillary proceſſes, the *Plexus Choroides* or *Rete admirabile*, the *Glandula Baſilaris*, and others of which we will ſpeak hereafter.

We muſt now ſpeak of the containing parts beginning with the skin; for the order of teaching requires that we take our *Exordium* from the more ſimple, but firſt we will ſay ſomething of the hair.

What the hair is.

The uſe thereof.

The hair is nothing elſe than an excrement generated and formed of the more groſs and terrene portion of the ſuperfluities of the third concoction, which could not be waſted by inſenſible tranſpiration. The benefit of it is, that conſuming the groſs and fuliginous or ſooty excrements of the brain it becomes a cover and ornament for the head.

This hair of the head and eye-brows have their originall from the firſt conformation of the infant in the womb, the reſt of the hairs of the body ariſe and grow forth as the body grows and becomes more dry, of which ſort are the hairs which cover the chin, armholes, groins, and other parts of our bodies.

CHAP. II.

Of the muſculous skin of the Head, (commonly called the hairy ſcalpe) and of the Pericranium.

THe skin which covers the skull, and is covered with the hair, is far more fleſhy, thick, hard and dry than any other part of the body, eſpecially which wants hair. The skin hath almoſt the like condition of quality as thoſe parts have, which it doth ſimply cover, but is as it were loſt in them, or grown into one with them, as in the lips and forehead with the fleſhy pannicle, wherefore it is there called muſculous; in other places it adheres to the griſles, as on the ſides of the noſtrills and corners of the Eyes, whereupon it is there called griſlely.

What the hairy ſcalp is.

It hath connexion with the *Pericranium*, becauſe joyned to it, it receives nerves from the firſt and ſecond *Vertebra* of the neck, and from the third conjugation of the brain which are diſſeminated through all its ſubſtance, whereby it comes to paſs, that the wounds, contuſions, and impoſthumes, that happen in or upon this skin, are not to be neglected.

Its connexion

The * *Pericranium*, (but I ſuppoſe it ſhould be the *Perioſteum*) is a moſt thin membrane, which next and immediately covers all the bones of the body, and this on the head is called by a peculiar name the *Pericranium* by reaſon of the excellency of the *Cranium* or skull, in other bones it is tearmed the *Perioſtium*: And as the *Pericranium* takes its originall from the *Craſſa meninx* propagating it ſelf by certain ſtrings or threds ſent forth by the ſutures and holes of the skull, ſo all other membranes of the body have their originall either from this *Pericranium*, or *Craſſa meninx*, ſending forth their productions, as well by the holes or paſſages of the head, as by theſe of the ſpinall marrow or back bone it ſelf, even to the Holy bone.

* Our Author with *Fallopius* and *Laurentius* confounds the *pericranium* and *perioſteum*: but *Veſalius Bauhinus* and *Bartholinus* diſtinguiſh them making the *pericranium* thin and ſoft, and the *perioſteum* moſt thin and nervous, and of moſt exquiſite ſenſe.

Why the wounds there of muſt not be neglected.

Of which this is an argument, for in what part ſoever of the body a membrane is hurt, preſently the hurt or ſenſe thereof comes to the *Craſſa meninx*. For ſo thoſe who have but their little Toe hurt when they ſneeſe, or cough, perceive an increaſe of their pain, by the paſſage thereof to the brain.

The *Pericranium* and *perioſteum* of the ſame nature.

The uſe of this *Pericranium* is to cover the skull; and to give notice of things hurtfull, by the power of the quick ſenſe which it is endued withall, and the *Perioſtium* doth the like in other bones. Beſides it ſuſtaines and faſtens by the ſutures the *Craſſa meninx* to the skul; leſt it ſhould fall by reaſon of its weight upon the *Pia mater*, and ſo hurt it, and hinder the pulſation of the brain and arteries that are plenteouſly ſpread through both the *Meninges*. Wherefore the *Pericranium* hath moſt ſtrait connexion with the *Craſſa meninx*, becauſe it takes the originall from thence.

Whence all the membranes proceed.

We muſt think the ſame of the other membranes of the body, which thing is very notable in the ſolution of the continuity of the membranes.

Why when any membranous part is hurt in any part of the body, the head is afflicted be conſent.

The uſe of the *Pericranium*.

CHAP. III.

Of the Sutures.

THe Sutures do ſew or faſten together the bones of the skull; theſe be five in number. Three are true and legitimate, two falſe and ſpurious. The Coronall, the firſt of the true Sutures, is ſeated in the forepart of the head, deſcending downwards overthwart the forepart of the head to the midſt of the temples; it is ſo called, becauſe *Corolle*, that is, wreaths, crowns, or garlands, are ſet upon that place.

Their uſe and number.

The ſecond is called the *Sagittalis*, or right ſuture, as that which running through the crown divides the head into two equall parts, as with a ſtraight line, running the length of it from the Coronall to the *Lambdoides* or hind Suture.

But this third Suture *Lambdoides*, is ſo called becauſe it repreſents this Capitall greek letter Lambda Λ. You muſt underſtand this deſcription of the Sutures, not as alwayes but as for the greater part to be thus. For there be ſome skulls that want the foremoſt Suture, otherſome the hind, and ſometimes ſuch as have none of the true Sutures, but only the falſe and ſpurious. But alſo you ſhall ſometimes find the Sagital to run to the noſe.

Some skulls want Sutures.

And ofe times there be three or four Sutures in the back part of the head, ſo that indeed the number of the Sutures is not certain. Which alſo we find obſerved by *Cornelius Celſus*, where he writes, that *Hippocrates* was deceived by the Sutures by chance, for that he conjectured that the bones of the back part of the head, were broken, becauſe his Probe thruſt to the roughnes of the ſecond ſuture *Lambdoides*, ſtaied as at a cleft made in the bone by a ſtroak.

Celſ. lib. 8. Cap. 4.

The other two are called the falſe, ſkony and ſcaly Sutures, by reaſon they are made by a ſcaly conjunction of the bones, but not by a toothed ſaw or comb-like connexion. But if any ask, why the head conſiſts not of one bone, that ſo it might be the ſtronger: I anſwer

Why the ſcull conſiſts of divers bones.

it is, that ſo it might be the ſafer both from internall and externall injuries. For the skull being as it were the tunnel of the chimney of this humane fabrick, to which all the ſmoky vapours of the whole body aſcend, if it had been compoſed of one bone, theſe vapours ſhould have had no paſſage forth.

In what bodies and by what means the *vena pupis* ſometimes enters into the parts within the ſcull.

Wherefore the groſſer vapours paſs away by the Sutures, but the more ſubtile by the pores of the skull; ſome have their Sutures very open, but others on the contrary very cloſe.

Therefore nature hath otherwiſe compendiouſly provided for ſuch as want Sutures: For it hath made one or two holes, ſome two fingers bredth from the *Lambdoides*, through which the *Vena pupis* enters into the skul, and they are of that largeneſs that you may put a points tag into them, that ſo the vapours may have free paſſage forth, otherwiſe there would be danger of death; thus nature hath been carefull to provide for man againſt internall injuries; and in like manner againſt externall, for it hath made the head to conſiſt of divers bones, that when one bone is broken the other may be ſafe, the violence of the ſtroak being ſtayed in the diviſion of the bones.

In what men one part of the being head ſtricken, the oppoſite is broken.

Whereby you may know, that if the skull chance to be broken in the oppoſite ſide to that which received the blow, that it happens either by reaſon of the defect of ſutures, or elſe becauſe they are unperfect, & too firmly cloſed; otherwiſe it is unpoſſible ſuch fractures ſhould happen by reaſon of the ſeparation of the bones, which breaks the violence of the blow that it can go no further.

Why we muſt not apply a Trepan to the Sutures.

And certainly, as it is rare to find a skull without Sutures, ſo it is rare to find ſuch kind of fractures. Therefore Chirurgeons muſt diligently obſerve the Sutures and ſite of them, leſt they be deceived and take them for fractures, or unawares apply a Trepan to them, whence by breaking the veins, arteries and nervous fibers by which the internall parts communicate with the externall, there may enſue increaſe of pain, a violent defluxion of blood upon the *Craſſa meninx*, and the falling thereof upon the brain, (the fibers being broken by which it ſtuck to the *Pericranium*) and ſo conſequently a deadly interception of the pulſion of the Brain.

CHAP. IIII.

Of the Cranium, *or Skull.*

What the *Cranium* or skul is.

THe *Cranium*, or Skull covering the brain like an Helmet, is compoſed and conſiſts of ſeaven bones, of which ſome are more denſe, thick and hard than other ſome. The firſt is the *Os occipitis*, or Nowl bone ſeated in the back part of the head, more hard and thick than the reſt, becauſe we want hands and eyes behind, whereby we may keep or ſave our ſelves from falling.

Why the nowl bone is harder than the reſt.

This bone is circumſcribed, or bounded by the ſuture *Lambdoides*, and the * *Os baſilare*: The eminencies and as it were heads of this bone are received into the firſt *Vertebra*; for upon this the head is turned forwards and backwards, by the force of fourteen muſcles and ſtrong ligaments, which firmly tye theſe heads of the Nowl bone in the cavities of this firſt *vertebra*.

* My Author means by the *Os Baſilare* in this place the wedg bone: but ſome Anatomiſts make it a *Synonyma* of this *Os occipitis*.

The ſecond bone of the skull is in the forepart, and is called the *Os coronale* or *Os frontis* the forehead bone, it hath the ſecond place in ſtrength and thickneſs. It is bounded by the Coronall ſuture, and the ends of the wedgbone: in this forehead bone there is often found a great cavity under the upper part of the eyebrows, filled with a glutinous, groſs, viſcid and white matter or ſubſtance, which is thought to help to elaborate the air for the ſenſe of ſmelling.

The forehead bone, next to the nowl bone is harder than the reſt.

A Cavity to be obſerved in the forehead bone.

Chirurgeons muſt take ſpecial notice of this cavity, becauſe when the head chances to be broken in that place, it may happen, that the fracture exceeds not the firſt table; wherefore being ignorant of this cavity, and moved with a falſe perſwaſion that they ſee the brain, they may think the bone wholly broken, and to preſs the *Meninges*, whereupon they will dilate the womb, and apply a Trepan and other inſtruments to lift up the ſecond table of the bone, without any need at all, and with the manifeſt danger of the life of the patient.

Oſſa parietalia & Bregmatis.

The third and fourth bones of the skull are the *Oſſa parietalia*, or *Bregmatis*, having the third place of denſity and thickneſs; although this denſity and thickneſs be different in divers places of them. For on the upper part of the head, or crown, (where that ſubſtance turns not to a bone in children untill they have all their teeth, ſo that it feels ſoft in touching, & through it you may feel the beating of the brain) theſe bones are very tender, ſo that oft times, they are no thicker than ones nail, that ſo the moiſt and vaporous excrements of the brain, ſhut up where the greater portion of the brain reſides, may have a freer paſſage by the Brains *diaſtole* and *ſyſtole*. Theſe two ſquare bones are bounded above with the Sagittall ſuture, below with the ſcaly, on the forepart with the coronall, and on the hind part with the *Lambdoides*.

Oſſa petroſa, or the ſcaly bones.

The fifth and ſixth bone of the skull are the two *Oſſa petroſa* ſtony or ſcaly bones, which

are

are next to the former in ſtrength. They are bounded with the falſe or baſtard Suture, and with part of the *Lambdoides*, and wedgbone.

The ſeventh is the *Os ſphenoides*, *baſilare*, or *Cuneiforme*, that is, the wedgbone. It is called *Baſilare*, becauſe it is (as it were) the baſis of the head. To this the reſt of the bones of the head are fitly faſtned in their places. This bone is bounded on each ſide with the bones of the forehead, the ſtony bones, and bones of the Nowl and Palat. The figure repreſents a Bat, and its proceſſes her wings. *Os ſphenoides*, or the wedg-bone.

There is beſides theſe another bone at the baſis of the forehead bone, into which the mamillary proceſſes end, the Greeks call it ἠθμοειδὲς, the Latins *Cribroſum* and *Spongioſum*, the ſpongy bone, becauſe it hath many holes in it not perforated in a direct paſſage, as in a ſive, but winding and anfractuous, that the air ſhould not by the force of attraction, preſently leap or aſcend into the brain, and affect it with its qualities, before it be elaborated by its lingring in the way. There are beſides alſo, ſix other little bones lying hid in the ſtony bones at the hole or auditory paſſage; on each ſide three, that is to ſay, the *Incus* or Anvill, the *Malleolus* or Hammer, and the *Stapes* or ſtirrop, becauſe in their figure they repreſent theſe three things; the uſe of theſe we will declare hereafter. *Os Ethmoides*, or *Cribroſum*. The three bones of the auditory paſſage.

But alſo in ſome skuls there are found ſome diviſions of bones, as it were collected fragments, to the bigneſs almoſt of ones thumb, furniſhed and diſtinguiſhed by their proper commiſſures, or ſutures, which thing is very fit to be known to a Chirurgeon in the uſe of a Trepan.

Verily he may give a conjecture hereof, whilſt he ſeparates the *pericranium* from the skul, for the *pericranium* is with greater difficulty pluckt away from the ſutures, becauſe the *Craſſa meninx* hath ſtraiter connexion therewith by his nervous fibers ſent forth in ſuch places. The skuls in women are ſofter and thinner than in men, and in children more than in women, and in young men more then in men of a middle age. Alſo the Æthioplans or Black-moors, as alſo all the people inhabiting to the South, have their skuls more hard and compoſed with fewer ſutures. By what means a Chirurgeon may conjecture that there are extraordinary Sutures in certain places of the skull. The skuls of ſuch as inhabit the Southern countreys, are more hard and denſe.

Therefore as it is written by *Hippocrates*, ſuch as have their Skuls the ſofter, the ſymptomes in fractures are more dangerous and to be feared in them. But the Skull by how much the ſofter it is, by ſo much it more eaſily and readily yeelds to the perforating Trepan. Moreover in ſome skuls, there be bunches ſtanding out beſides nature, made either round or cornered, which the Chirurgeon muſt obſerve for two cauſes; the firſt is for the better conſideration of a blow or fracture. For in theſe bunches or knots, the ſolution of the continuity cannot be, if it ſeem to be ſtretched in length, but that the wound muſt penetrate to the inner parts. For in a round body there can be no long wound, but it muſt be deep, by the weapon forced the deeper, becauſe as a round body touches a plain but only *in puncto* in a prick or point: ſo whatſoever fals only lightly or ſuperficially upon it, only touches a point thereof. But on the contrary, a long wound muſt be upon a plain ſurface, which may be but only ſuperficiall. We muſt obſerve the extuberancies beſides nature, which are in ſome skuls.

Another cauſe is, becauſe ſuch bunches change the figure and ſite of the Sutures. And the Chirurgeon muſt note that the skull hath two tables, in the midſt whereof the *Diploe* is, which is a ſpongy ſubſtance into which many veins and arteries, and a certain fleſhineſs are inſerted, that the skull ſhould not be ſo heavie, and that it might have within it ſelf proviſion for the life thereof; and laſtly that there might be freer paſſage out for the fuliginous vapors of the brain. The ſite and ſubſtance of the *Diploe*.

The upper table is thicker, denſer, ſtronger and ſmoother than the lower. For this as it is the ſlenderer, ſo it is the more unequal, that it may give place to the internall veins and arteries, (which make a manifeſt impreſſion into the ſecond table on the inſide thereof) from which branches enter into the skull by the holes which contain the eys. Which thing faſtens the *Craſſa meninx* to the skull, and is therefore very worthy to be obſerved.

CHAP. VI.

For in great contuſions when no fracture or fiſſure appears in the skull by reaſon of the great concuſſion or ſhaking of the brain, theſe veſſels are often broken, whence happens a flux of blood between the skull and membranes, and laſtly death. But it is fit the Chirurgeon take good heed to the tender and ſoft ſubſtance of the *Diploe*, thus when he comes to it, having paſſed the firſt table, he may carefully uſe his Trepan, leſt by leaning too hard, it run in too violently, and hurt the membranes lying underneath it, whence convulſion and death would follow. To which danger I have found a remedy by the happy invention of a Trepan, as I will hereafter more at large declare, in handling the wounds of the head. There may be a deadly rupture of the veſſels of the brain without any fracture of the skull. Caution to be had in the uſe of the Trepan.

CHAP.

CHAP. V.

Of the Meninges, that is, the two membranes called Dura Mater *and* Pia Mater.

Why the bone *Ethmoides* is perforated.

THe *Craſſa meninx* is one of the firſt and principall membranes of the body; it goes forth by the ſutures and the holes of the nerves that proceed out of the skull; and it paſſes forth by the bone *Ethmoides* perforated for that purpoſe, to carry ſmels to the brain, and purge it of excrementitious humors. This ſame *Craſſa meninx* inveſts the inner coat of the Noſe; alſo it paſſes forth of the great hole through which the ſpinall marrow paſſes, veſted with this *Craſſa meninx*, with all the nerves and membranes. For which cauſe if any membrane in the whole body be hurt, by reaſon of that continuation which it hath with the *Meninges*, it ſtraight communicates the hurt to the head by conſent.

The conſiſtence of the *Craſſa meninx*.

The *Craſſa meninx* is thicker and harder than all other membranes in the body; whereupon it hath got the name of the *Dura mater*, beſides alſo it begirts, produces, and defends the other membranes.

The uſe.

The uſe of it is to involve all the brain, and to keep it when it is dilated, that it be not hurt by the hardneſs of the skull. For the courſe of nature is ſuch, that it always places ſome third thing of a middle nature, betwixt two contraries. Alſo the *Craſſa meninx* yeelds another commodity, which is, that it carries the veins and arteries entring the skull for a long ſpace. For they inſinuate themſelves into that part, where the duplicated or folded *Meninges* ſeparate the brain from the *Cerebellum*, and ſo from thence they are led by the ſides of the *Cerebellum*, untill they come (as it were) to the top thereof; where being united, they inſinuate themſelves into that other part of the *Craſſa meninx*, where in like manner being duplicated and doubled, it parts the brain at the top into the right and left. Theſe united veins run in a direct paſſage even to the forehead, after the manner of the Sagittall ſuture; They have called this paſſage of the mutually infolded veins, the *Torcular* or Preſs, becauſe the blood which nouriſhes the brain is preſſed and drops from thence by the infinite mouths of theſe ſmall veins. Therefore alſo here is another uſe of the *Craſſa meninx*, to diſtinguiſh the brain by its duplication, being it thruſts it ſelf deep into its body, into two parts, the fore and hind, and preſently to ſeparate the ſame into the right and left; that one part being hurt, the other may remain ſafe and ſound, performing it duty to the creature, as we ſee in ſome that have the Palſey. *Columbus* obſerved that this *Meninx* was double, and verily I have found it true by my own ſight.

What the *Torcular* is.

One part of the brain being hurt the other keeps the creature alive.

The conſiſtence of the *Pia mater*.

The other *Meninx* or membrane of the brain, called *Pia mater*, is moſt ſlender interchaſed with divers veins and arteries, for its own and the brain's nouriſhment and life. This doth not only involve the brain, as the *Craſſa meninx* doth, but alſo more deeply penetrates into the anfractuous paſſages thereof, that it may every where joyn and bind it to it ſelf, not eaſily to be drawn from thence, by many ſmall fibers whereby it deſcends even to the cavities of the ventricles thereof. Wherefore you muſt ſee it abſolutely in the ſite as we have mentioned, and not pluck it away unleſs with the ſubſtance of the Brain.

The ſenſe of the *Meninges*.

Theſe membranes when they are hurt or afflicted, cauſe grievous and moſt bitter torment and pain; wherefore I dare ſay, that theſe membranes are rather the authors of ſenſe, than the brain it ſelf, becauſe in diſeaſes of the Brain, as in the Lethargy, the party affected is troubled with little or no ſenſe of pain.

CHAP. VI.

Of the Brain.

What the brain is.

NOw followeth the Brain, the beginning of the nerves and voluntary motion, the inſtrument of the firſt and principall faculty of the Soul, that is, the Animall and Rationall. Man hath this part in greater plenty then any other Creature, for it almoſt fils the whole skull. But if it ſhould have filled it all, the Brain could not be moved, that is, dilated and contracted in the skull. It

The quantity.

Temper.

is of a cold and moiſt Temperature. The laudable temper of the Brain is known by the integrity and perfection of the internall and externall ſenſes, the indifferency of ſleep and waking, the maturity or ripeneſs of judgment, and conſtancy of opinions, from which, unleſs it meet with better and more probable, it is not eaſie to be moved.

The

FIG. I.

FIG. II.

AA, BB. The *Dura meninx* or thick membrane.
CCC. The third *Sinus* of this membrane.
DD. The course of the veins as they run through the membrane or the second vein of the brain.
EE. The first vein of the brain.
FFF. Certain small veins which perforate the skull and reach to the *Pericranium* or skull-skin.
GGG. Fibers of the *Dura meninx* passing through the Coronall Suture, which fibers make the *Pericranium*.
HH. fibers passing through the sagittall Suture.
II. Others passing through the Lambdall Suture.
K. A knub which useth to grow to the *Sinus* of the Skull.
L. A cavity in the forehead bone.
M. The skull.
N. The *Pericranium* or skull-skin.

AAA. A part of the *Crassa meninx* dividing the brain. *BB.* the third *Sinus* of the same *Crassa* membrane opened. *CC.* the beginning of the vessels out of the third *Sinus* into the *Pia mater*. *DDD.* the propagation or branches of these vessels. *EEE.* the *Pia mater* or thin meninx immediately compassing the brain. *FFF.* Certain vessels running through the convolutions or branches of the brain. *GGG.* Certain branches of veins running through the sides of the *dura meninx*. *HHH.* The thick membrane reflected downward.

You shall know the brain is more hot, by the quickness of the senses and motions of the body, by shortness of sleep, the suddain conceiving of opinions and change of them, by the slippery and failing memory, and lastly, by easily receiving hurt from hot things, as the Sun and Fire. Such as have a cold brain, are slow to learning, and to conceive other things, but they do not easily put away their once conceived opinions. They have slow motion to action, and are sleepy. Those who have a dry brain, are also slow to learn; for you shall not easily imprint any thing in dry bodies, but they are most constant retainers of those things they have once learned; also the motions of their bodies are quick and nimble. Those who have a moist brain do easily learn, but have an ill memory, for with like facility as they admit the species of things and imprint them in their minds, do they suffer them to slide and slip out of it again. So clay doth easily admit what Character or impression soever you will, but the parts of this clay which easily gave way to this impression, going together again, mixes, obliterates and confounds the same. Therefore the senses proceeding from a cold brain are dull, the motions slow, the sleep profound.

The Action. The action of the brain is to elaborate the Animall Spirit and necessary sense serving the whole body, and to subject it self as an instrument to the principall faculties, as to reason. The brain is twofold, the fore and hind. The hind by reason of its situation is call

Number.

called the *Cerebellum*, (the little or After-brain). But the fore by reaſon of its magnitude hath retained the abſolute name of the brain. Again this fore-brain is twofold, the right and left, parted by that depreſſion, which we formerly mentioned, of the *Meninges* into the body of the brain. But this diviſion is not to be here ſo abſolutely taken, as though the Brain were exactly divided and ſeparated into ſo many parts, but in the ſenſe as we ſay the Liver and Lungs are divided a pretty way, whereas at their Baſis they have one continued body. The outward ſurface of the Brain is ſoft, but the inward hard, callous & very ſmooth; when on the contrary, the outward appears indented and unequall with many windings, and creſted as it were with many wormlike foldings.

CHAP. VII.

Of the Ventricles and Mamillary proceſſes of the Brain.

The ſubſtance of the brain is porous and ſweats forth blood.

FOr the eaſie demonſtration of the ventricles of the brain, it is convenient you cut away a large portion thereof, and in your cutting obſerve the blood ſweating out of the pores of it. But beſides, it is fit you conſider the ſpongy ſubſtance by which the excrements of the brain are heaped up, to be preſently ſtrained out, and ſent away by the hollow paſſage. In the ſubſtance of the brain you muſt obſerve four ventricles, mutually conjoyned by certain paſſages, by which the ſpirits endued with the *ſpecies* of things ſenſible may go from one into another. The firſt and two greater, one on each ſide are placed in the upper brain. The third is under them in the middle part of the brain. The fourth and laſt at the fore ſide of the *Cerebellum*, towards the beginning of the ſpinall marrow. The two formoſt are extended the length way of the brain in the form of a ſemicircle, whoſe horns look or bend outwards. They are ſpacious and large, becauſe it was meet the Spirits contained there together with their excrements, ſhould be there purified and cleanſed; but in other ventricles, the pure and already elaborate ſpirits are only received. Theſe ventricles are white and ſmooth in their inner ſuperficies; but that on each ſide they have an extuberancy at the midſt of the ſemicircle, ſituate at the baſis of the Pillar of the middle ventricle towards the noſe under the *Septum lucidum* or cleer partition, ſevering or parting in ſunder theſe two ventricles.

The four ventricles thereof.

The magnitude of the upper ventricles of the brain.

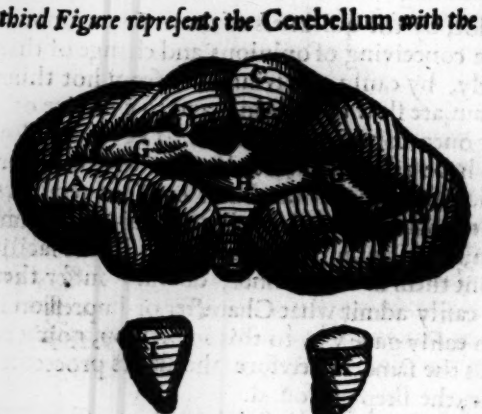
The *Septum Lucidum*.

This *Septum lucidum*, or cleer or thin partition, is nothing elſe than a portion of the brain indifferently ſolid, but very clear, that ſo through this partition the animall ſpirits contained in theſe two ventricles may mutually paſs and be communicaced, and yet no other groſſer ſubſtance may pierce the thin denſity thereof.

Why the Palſy of one ſide is not preſently communicated to the other.

Wherefore it is not to be feared, that the water contained in one of the ventricles may paſs to the other through this partition, as I have oft times obſerved to the great admiration of the ſpectators in the dead bodies of ſuch as dyed of the Palſy, in which I have found the ventricle of that ſide which was taken with the Palſy much dilated, according to the quantity of the water contained therein, the other being either wholly empty and without any; or certainly no fuller than in any other, dead through any other occaſion. For ſome affirm that there is a certain kind of waterish moiſture alwayes to be found in the ventricles, which may be made by the condenſation of the Animall ſpirits by the force of the deadly cold. But theſe two firſt ventricles of the brain go into one common paſſage, as both the bellows of a fornace, whereby the ſpirit inſtructed with the ſpecies of things goes into the under, or middle ventricle from the former. In theſe ſame firſt ventricles the *Plexus Choroides* is to be conſidered, and in like manner the paſſage by which the groſſer excrements are driven or ſent into the pituitary Glandule.

The third Figure repreſents the Cerebellum *with the wormy proceſſes ſeparated from it.*



AB. The right and left part of the After-brain.
CD. The *anterior* and *poſterior* regions of the middle part of the After-brain.
E. The *anterior* wormy proceſſe.
F. The *poſterior* wormy proceſs.
GG. In this place the After-brain did grow to the ſpinall marrow.
H. The cavity in the ſpinall marrow maketh the foruth ventricle. *IK.* The *anterior* and *poſterior* proceſſes of the brain, called *vermi-formes* or the wormy proceſſes.

For

This *Plexus Choroides* is nothing else, but a production of the *Pia mater* diversly folded with the mutuall implication of veins and arteries woven in the form of a net. These vessels are of magnitude and capacity sufficient, both to yeild life and nourishment to that particle to which they are fastened, as also for the generation of the Animall spirits, as which take fit matter from the veins stretched forth into the same *Plexus*, the hind artery and vein *Torcular*; and also from the air entring into the brain by the mamillary processes. But the mamillary processes are certain common wayes for conveyance of the air and smells into the brain, and carrying of excrements from the brain.

The *Plexus Choroides*.

The *Processus Mamillares*.

For thus in them who have the Catarrhe and *Coriza* or pose, neither the air, nor smels can penetrate into the brain; whence frequent sneesings ensue, the brain strongly moving it self to the expulsion of that which is troublesome to it. But of the excrements of the brain, whether bred there, or proceeding from some other part, some are of a fumid and vaporous nature, which breath insensibly through the Sutures of the skull; Others are gross and viscid, of which a great part is expelled by both these productions, or through each of them. For thus in the Pose you may see some who have one of their nostrils stopt, the other running, and some who have both obstructed. The most proper benefit of the two first ventricles of the brain is to entertain the Phantasie as in a convenient seat and habitation, seeing the mind there estimates and disposes in order the species of things brought in from the externall senses, that so it may receive a true judgment of them from reason which rsides in the middle ventricle.

The use of the upper ventricles of the Brain.

The third ventricle is seated between the hindermost extremities of the former ventricles, and the last ventricle of the *Cerebellum*. In this six parts present themselves to our consideration, that is, the *Psalloides* or Arch, the *Conarium*, or pine Glandule, the Buttocks, wormlike productions, the Bason and passage which is from this middle into the last & hindmost ventricle. The *Psalloides* or Arch is nothing else, but the cover of the middle ventricle, resembling a roof borne up with three stayes or pillars, the one whereof is extended to the nose under the *Septum lucidum*, the two other on each side one, look towards the back part of the brain. This is the reason of this figure which is outwardly convexe and inwardly concave, to wit, that there might be free space for that motion which the Animall spirit inwardly produces, and besides that it might more easily sustain the burden of the brain lying upon it. For an arched figure is the most convenient of all other to sustain a weight.

The seat of the third ventricle of the brain. The parts to be considered in it.

What the *Fornix* or Arch is, and the use thereof.

The *Conarium* or Pine glandule, is a small Glandule of the same substance with the brain, round and somewhat long, like a Pine Apple, from whence it hath the name; this Glandule is seated over against a small hole which descends to the lowest ventricle. It hath this use, to strengthen the division of the vessels led thither with the production of the *Pia mater* for the generation of the Animall spirits, and the life and nourishment of the brain.

What the *Conarium* or pine Glandule is.

The *Nates* or Buttocks are subjected or placed under this Glandule, that is, bodies of a solid and white substance drawn out in length like a childs buttocks, especially in beasts, and chiefly in a sheep. These buttocks have such a solid substance, that so they may keep open and free the passage, or channell that runs down from the middle to the lower ventricle, by means of which the Brain participates with the *Cerebellum*.

What the *Nates* or Buttocks are.

The worm is a production of the *Cerebellum* or After-brain, to wit, a portion of the same being in the top or beginning and as it were in the entrance thereof, being like many little circles or wheels mutually knit together by slender membranes; and it is so called because it resembles those thick white worms which are found in rotten wood. It doth as it were perform the office of a porter to the formerly mentioned passage, that it may give way and entrance into the *Cerebellum*, to a necessary quantity of spirits, when need requires; lest that, if they should rush with a sodain violence into the *Cerebellum*, they might confound the imprinted notions of things to be remembred.

What the worm is.

The *Pelvis* or Bason is a passage appointed for the carrying away of the gross excrements by the palate, and is so called because it hath the similitude and use of a Bason or Tunnell: it descends from the third ventricle into the Glandule which is seated between the processes of the wedg-bone called the saddle thereof, as you may perceive by putting in a spathern. Now there remains the last of the six parts proposed to our consideration in the third ventricle, that is, the Channell or passage running from this third ventricle into the fourth, for the use formerly mentioned.

Here the *Pelvis* or Bason is confounded with the Tunnell.

This Channell descending in its originall from the Bason, goes from thence under the buttocks into the last ventricle, the *Meninges* being perforated; which that you may shew, it is fit you put the end of a spathern through it. The benefit of a third ventricle is, that it may be as a Tribunall or Judgment-seat, to the Reasoning faculty, when the mind will draw conclusions from things seen.

The Channell from the third into the fourth ventricle.

The

The fourth ventricle is ſeated in the place we formerly mentioned; it is leſs than the reſt, but more ſolid; leſs as that which was not to receive the ſpirit before it was purified, and clenſed from all impurities; but more ſolid, that it might contain it the ſafer. The uſe thereof is, to be as a treaſury and ſtore-houſe of the opinion, and judgments which reaſon ſhall decree, that when need requires, we may fetch and draw them from thence as laid up in ſtore. I know *Galen* and the Greek Phyſitians have not ſo diſtinguiſhed in places the three fore-mentioned faculties; but have written that they all are all over confuſed through the whole ſubſtance of the brain, which opinion alſo *Fernelius* in his *Pathologia* hath renewed. Yet I had rather follow this opinion, as commonly received and celebrated by the *Arabian* Phyſitians.

The fourth ventricle of the brain.

The Mamillary proceſſes are the inſtruments and paſſages of ſmelling, being of the ſame ſubſtance with the brain, and like nerves, which run out from the hind horns of the upper or foremoſt ventricles of the brain to the *Ethmoides* and ſpongy bones of the noſe, that hence they may receive the divers kinds of ſmells, and carry them into the Brain. But although they be like nerves, yet they are not accounted nerves becauſe they go not out of the skul.

The uſe of the Mamillary proceſſes.

CHAP. VIII.

Of the ſeven conjugations of the Nerves of the Brain, ſo called, becauſe they always ſhew the Nerves conjugated and doubled, that is, on each ſide one.

THe nerves are the wayes and inſtruments of the Animall ſpirit and faculty, as of which thoſe ſpirits are vehicles, as long as they are contained in the brain; they conſiſt of the only and ſimple marrowey ſubſtance of the brain, or ſpinall marrow. But paſſing forth of the brain, they have another membranous ſubſtance which involves them joyned with them from the two membranes of the brain; and according to the opinion of ſome Anatomiſts, they have alſo a third from the ligaments drawn as well from divers others, as from theſe by which they are tyed to the *Vertebra's*; Yet this opinion ſeems abſurd to me, ſeeing ſuch a membrane, as that which is inſenſible, wholly repugnes the condition of a nerve, which is to give ſenſe to the parts to which it is inſerted.

What a Nerve or Sinew is.

Its ſubſtance.

Whether the nerve have a third membrane from the Ligaments of the *Vertebra's*.

The magnitude of the nerves is different, according to the divers neceſſity of ſenſe incident to the parts into which they are inſerted. Their figure is round, and long, like to a conduit pipe to carry water in; the membranes of the brain, with which the nerves are covered, being dilated and ſtretched over them, after the ſame manner that the proceſſes of the *Peritonæon* involves the ſpermatick veſſels, with which they go down to the Teſticles, and take life and nouriſhment by the capillary veins and arteries, which deſcend to them with the membranes. They are made for this uſe, that they may impart ſenſe to the ſenſitive parts, and motion to theſe that are fit to be moved. All the nerves deſcend from the brain either mediately or immediately; their Number is ſeven and thirty pair, or conjugations, whereof ſeven have their originall immediately from the brain, the other thirty from the ſpinall marrow.

Their magnitude.

Their figure.

Their uſe.

Their number.

The firſt conjugation of the nerves of the brain is thicker than all the reſt, and goes to the eyes, to carry the vitive ſpirit to them. Theſe ariſing from divers parts of the brain, in the middle way before they go out of the ſkull meet together crotwiſe like the Iron of a Mill (which is faſtened in the upper ſtone) going into one common paſſage with their cavities not viſible to the eye; that ſo the ſpirits brought by thoſe two nerves may be communicated, and they are mutually joyned and meet together ſo, that being driven back from one eye they may flie back into the other. An argument whereof may be drawn from ſuch as aim at any thing, who ſhutting one of their eyes ſee more accurately; becauſe the force of the neighbouring ſpirits united into one eye, is more ſtrong than when it is diſperſed into both. This conjugation when it comes into the glaſſie humor, is ſpent in the ſtructure of the net-like coat which contains this humor on the back part.

The firſt conjugation of nerves.

The ſecond conjugation goes into many parts, at its paſſing forth of the ſkulls, and in the bottom of the circle of the eye it is diſtributed into the ſeven muſcles moving the eyes.

The ſecond conjugation.

The third is twofold, in the paſſage out of the ſkull it is likewiſe divided into many branches, of which ſome are carryed to the temporall muſcles, into the *Maſſeteres* or grinding muſcles into the skin of the face, forehead and noſe; Otherſome are ſent into the upper part of the cheek, and the parts belonging to it, as into the teeth, gums and the muſcles of the upper lip; and thoſe which are called the round, which incompaſs the mouth on the inſide; the laſt are waſted in the coat of the tongue, to beſtow upon it the ſenſe of taſting.

The third conjugation.

The fourth conjugation is much ſmaller, and is almoſt wholly waſted upon the coat of the Palat of the mouth, to endue it alſo with the ſenſe of taſting.

The fourth conjugation.

The fift at its originall and having not as yet paſſed forth of the ſkul, is divided into two, and

The fift conjugation.

and ſends, the greater portion thereof to the hole of the ear, or paſſage of hearing, that it may ſupport the auditory faculty; and it ſends forth the other leſſer portion thereof to the temporall muſcles by the paſſage next to it; by which the ſecond conjugation paſſes forth.

The fixt conjugation.

The fixt being the greateſt next to the firſt, paſſing entire forth of the skull, imparts ſome ſmall branches to certain muſcles of the neck and throttle, and then deſcending into the cheſt, it makes the recurrent nerves, and diſperſed over all the parts of the two lower bellies, it paſſes even to the bladder and teſticles, as we ſhewed in the former book.

The ſeventh conjugation.

The ſeventh is inſerted and ſpent upon the muſcles of the bone *Hyois*, the tongue, and ſome of the throttle, to give them motion; it paſſes forth of the skull by the hole of the nowl bone at the extuberancies thereof.

The ſeventh figure ſhewing the eighth conjugation of the Nerves of the Brain.

FIG. I.

FIG. II.

AA, 2. The brain.

D 1, the beginning of the ſpinall marrow out of the Baſis of the brain.

F 1, 2. a part of the ſpinall marrow when it is ready to iſſue out of the skull.

FF 1, 2. the mamillary proceſſes which ſerve for the ſenſe of ſmelling.

GG 1, 2. the optick nerves.

H 1. the coition or union of the optick nerves.

II 1, 2. the coat of the eye whereinto the optick nerves are extended.

KK 1, 2. the ſecond pair of the ſinews ordained for the motion of the eyes.

LL 1, 2. the third pair of ſinews, or according to the moſt Anatomiſts, the leſſer root of the third pair.

MM 1, 2. the fourth pair of ſinews or the greater root of the third pair.

N 2. a branch of the third conjugation derived to the muſculous skin of the forehead.

O 2. a branch of the ſame to the upper jaw.

PP 2. another into the coat of the noſtrils.

Q 2. another into the temporall muſcles. *R* 2, a branch of the fourth conjugation crumpled like the tendrill of a vein. *S* 2. a branch of the ſame reaching unto the upper teeth, and the gums. *T* 2. another of the ſame to the lower jaw. *V* 2. a Surcle of the branch *T*, to the lower lip. *XX* 2. another ſurcle from the branch *T*, to the roots of the lower teeth. *YY* 2. the aſſumption of the nerves of the fourth conjugation unto the coat of the tongue. *Z* 1, 2. the fourth pair are vulgarly ſo called which are ſpent into the coats of the palat. *a* 1, 2. the fifth pair of ſinews which belong to the hearing *b*, the *Auditory* nerve ſpred abroad into the cavity of the ſtony bone. *, a hard part of the fift conjugation above, the * which may be counted for a diſtinct nerve. *b* 1, 2. a ſmall branch derived from this harder part of the firſt pair. *c*. 1, 2. a lower branch from the ſame originall. *d* 1, 2. this nerve is commonly aſcribed to the fift pair, but indeed is a diſtinct conjugation which we will cal the Eighth, becauſe we would not interrupt the order of other mens accounts. *e* 1, 2. the ſixt pair of ſinews. *f* 2. a branch from them derived to the neck and the muſcles couched thereupon. *g* 2. another branch to the muſcles of the Larinx or throttle. *h* 1, 2. the ſeventh pair of ſinews. *i* 1. the union of the ſeventh pair with the ſixt. *l* 2. a propagation of the ſeventh pair to thoſe muſcles which ariſe from the Appendix called *Styloides*. *m* 2. Surcles from the ſeventh conjugation to the muſcles of the tongue, the bone *Hyois* and the Larinx. *o p q* 1. three holes, through the hole *o* the phlegm iſſueth out of the third ventricle of the brain to the Tunnell, and at *pq*. Is the paſſage of the *Soporary* arteries to the ventricles of the Brain.

CHAP.

CHAP. IX.

Of the Rete Mirabile, *or wonderfull Net, and of the Wedg-bone.*

THe Animall ſpirit is made of the vitall, ſent from the heart by the internall ſleepy Arteries to the brain. For it was requiſite that it ſhould be the more elaborate, becauſe the action of the Animall is more excellent than that of the vitall; nature hath framed a texture of Arteries in many places running croſs one another, in the form of a Net divers times doubled; (whereupon it had the name of the wonderfull Net) that ſo the ſpirit by longer delay in theſe Labyrinthian or maze-like turnings, might be perfectly concocted and elaborate, and attain to a greater fitneſs to perform the Animall functions.

The exiſtence of the Animall ſpirit.

What the *Rete Mirabile* is.

This wonderfull Net ſituate at the ſides of the *Apophyſes clinoides* or productions of the wedg-bone, is twofold; that is, divided by the pituitary Glandule which is ſituate between the ſaid *Apophyſes Clinoides*, having the wedgbone lying under them, next to the *Craſſa Meninx*, being perforated on the right and left ſide, next to which lye bones as rare as a ſponge even to the Palat, by which the Phlegme is purged by the mouth and noſe; and therehence, I think, that ſpattle flows, which ſuch as have a moiſt brain, continually ſpit out of their mouth.

The ſite and number.

The Eight Figure of the braine.

A, The brain.
B, the *Cerebellum* or after-brain.
C, a proceſs of the brain, but not that which is called *Mamillaris*.
DD. The marrow of the back as it is yet within the skull.
E, the *Mamillary* proceſs or inſtrument of ſmelling.
F, the optick nerve.
G, the coat of the eye into which the optick nerve is ſpread.
H, the nerve that moveth the eye or the ſecond pair.
I, the third conjugation, or the harder and leſſer branch of the nerves of the third conjugation brought forward.
K, the fourth conjugation or the greater and thicker nerve of the third pair bending downward.
L, a branch of the nerve marked with *I*, which goeth to the forehead.
M, another branch of the nerve *I*, reaching to the upper jaw. *NN*, a nerve proceeding from the branch *I*. inrexed or woven with the coat of the noſe. *O*, the nerve of the temporall muſcle iſſuing from the branch *I*. *P*, a nerve contorted of the nerves *K* and *b*. *Q*, a nerve proceeding from the branch *K*, to the ſockets of the upper teeth.
R, a nerve creeping from the nerve *K* to the lower jaw. *S*, a ſuncle of the branch *R*, offered to the lower lip. *TT*, other ſuncles from the branch *R*, attaining to the lower teeth. *VV*, a branch of the nerve *K*, diffuſed into the coat of the tongue. *XX*, the fourth pair of ſinews which go into the coat of the palat. *Y*, the fifth pair of ſinews which are the nerves of hearing. *a*, the membrane of the ear, unto which that fifth nerve goeth. *bc*, two ſmall branches of the fifth conjugation uniting themſelves with the nerve *P*. *d*, the eight conjugation or a nerve of the fifth pair attaining unto the face. *ee*, the ſixt pair of nerves. *f*, a branch from the nerve *e*, reaching to the muſcles of the neck. *g*, ſmall branches derived unto the throttle or *larinx*. *h*, the bifurcation of the nerve into two branches. *iii*, an inner branch hanging to the back bones, and ſtrengthning the *intercoſtall* nerves, and is therefore called *Intercoſtalis*. *kk*, Surcles of the outer branch going to the heads of the muſcles, to the breaſt bone and to the coller-bones. *lm*, branches of the right nerve *l*, making the right Recurrent nerve. *nn*, the inſertion of the recurrent ſinews into the muſcles of the *larinx*. *op*, branches of the left nerve making the left recurrent ſinew *p*. *qq*, branches from the ſixt conjugation going to the coat of the lungs. *r*, ſmall nerves of the heart and of the purſe thereof called the *Pericardium*, as alſo ſome approaching to the coats of the lungs. *ſ*, nerves on either ſide ſent to the ſtomach. *t*, the right ſtomach nerve going to the left orifice of the ſtomach. *uu*, the left ſtomach nerve going to the right orifice of the ſtomach. *x*, a nerve from the branch *u*, paſſing into the hollowneſs of the liver. *y*, the nerve belonging to the right ſide of the kell. *z*, the nerve belonging to the colick gut. *a*, a nerve creeping to the gut called *duodenum* and the

the beginning of the *jejunum* or empty gut. β, a nerve implanted in the right side of the bottom of the stomach. γ, a nerve belonging to the liver & bladder of gall. δ, a nerve reaching unto the right kidney. ε, a branch reaching the *Mesenterium* and the guts. ζ, a branch sprinkled to the right part of the bladder. η, a branch going through the left part of the kel. θ, furcles derived to the colick gut and the kel. ι, small branches inserted into the spleen κλ, a nerve approaching to the left side of the bottom of the stomach. μ, a branch belonging to the left side of the *Mesentery* and the guts. ν, a branch which attaineth to the left kidney. ξ, small nerves creeping through the left side of the bladder. ο, the seven pair of sinews. π, a branch derived from the first conjugation to the muscles which arise from the process called *Styloides*. ρ, a branch of the seventh conjugation which goeth to the muscles of the tongue, of the bone *hyois*, and of the throttle or *larinx*. ς, a conjunction or coition of the 6. and 7. pair into one Nerve.

What the *Apophyses Clinoides* are.

These *Apophyses clinoides* are certain productions of the *Os basilare* or wedg-bone, (called the Saddle thereof,) between which, as I said, the pituitary glandule lies with part of the wonderfull net. There is a great controversie amongst anatomists concerning this part; for *Vesalius* denies that it is in man, *Columbus* admits it, yet he seems to confound it with the *Plexus Choroides*. Truly I have observed it alwayes after the manner, as *Sylvius* alledges against *Vesalius*. It remains, that we recite the perforations of the skull, because the knowledg of these much conduces to the understanding of the insertions of the veins, arteries and nerves.

Whether the *Rete mirabil* differ from the *Plexus Choroides*.

CHAP. X.

Of the holes of the inner Basis of the skull.

IN the first place are reckoned the holes of the bone *Ethmoides*; then those of the optick nerves. Thirdly, of the nerves moving the eyes. Fourthly, of that portion, of the nerves of the fourth conjugation which go to the temporall muscles. Fiftly are reckoned, these holes scarce visible, situate under the pituitary glandule, by which the spettle is evacuated. Sixthly, that hole which is in the wedg-bone made for the entrance of the internall sleepy Arteries, composing the wonderfull Net, and then passing into the brain by a great slit. That perforation which we reckon in the seventh place is commonly double, made for the entrance of one of the branches of the internall Jugular vein. The eight hole is somewhat long, of an ovall figure, by which, part of the third conjugation and all the fourth conjugation passes forth. The ninth are the auditory passages. The tenth are very small holes, and give way to the vein and artery going to the auditory passage, above the *foramen cæcum*. In the eleventh place are reckoned the perforations which yeeld passage forth to the sixth pair of nerves, to part of the sleepy Arteries, and of the internall Jugular. In the twelfth those which yeeld a way out to the seventh conjugation. The great hole of the Nowl-bone through which the spinall marrow passes, is reckoned the thirteenth. The fourteenth is that, which most commonly is behind that great hole, by which the Cervicall veins and arteries enter in.

CHAP. XI.

Of the perforations of the externall Basis of the Brain.

THere is a hole on each side at the Eye-brows, by which passes a small nerve from the third conjugation coming out of the cavity of the Orb of the eye, and going by the forehead bone to the eye-brows, that it may give motion to the two muscles of the upper eye-brow and forehead. Yet oftentimes the hole is but to be seen on one side, oft times there is a cleft in stead thereof, otherwhiles it is not perforated nor cleft at all. The second, is the perforation of the greater corner of the ey, by which a portion of the nerves of the third conjugation descends to the coat of the nose; in this hole the *Glandula Lachrymalis* is seated. The third is seated under the eye, that it may give way to the other portion of the nerves of the third conjugation going to the partt of the face, and the teeth of the upper jaw. The fourth is at the beginning of the palat, amongst the cutting or shearing teeth, through which a vein, an artery and the coat of the palat passes out. In the fifth order are reckoned the perforations of the palat, by which the nerves descend from the fourth conjugation, to give, or cause the taste. In the sixt order are ranked the holes of the palat serving for the respiration, and the flegm falling from the brain by the nostrils. And there is a cleft under the yoak bone ascending into the Orb of the eye, by which there is a way, as wel for the nerves of the third conjugation to the temporall muscles, as also for certain veins and arteries. But also there is noted another hole at the mamillary process, which is not perforated in the judgment of the sense. Besides there is thought to be another at the hind root of the same process, by which a certain small vein passes from the Jugular to the *Torcular*. But I have only noted these three passages by the way, because there is so much variety in them, that nothing can be certainly said of them.

CHAP.

CHAP. XII.

Of the Spinall Marrow, or Pith of the Back.

THe ſpinall Marrow is like a River running from the fountain of the brain. This ſends nerves for ſenſe and motion to all the neighbouring parts under the head, ſpreading its branches as from the body of a tree. Theſe branches, as we ſhall hereafter ſhew, are on each ſide thirty. This ſame ſpinall marrow is covered with the two membranes inveſting the brain, diſtinguiſhed by no diſtance of place, as in the brain. But alſo it hath another membrane added to theſe, being very hard and denſe, which keeps it from being broken and violated by the violent bending of the body forwards and about. The diſeaſes of this marrow do almoſt cauſe the like Symptomes, as the diſeaſes of the brain; For they hurt the ſenſe and motion of all the parts lying beneath them: as for example; If any of the *vertebra's* of the back bone, be moved out of their place, there follows a diſtortion or wreſting aſide of the Marrow; but then eſpecially if it happen that one of the *vertebra's* be ſtrained, ſo ſharp and bitter a compreſſion urges the marrow by reaſon of the bony body of the *vertebra*, that it will either rend it, or certainly hinder the paſſage of the ſpirit by it. But by theſe ſame holes of the *vertebra's* the veins and arteries go to the ſpinall marrow for to give life and nouriſhment to it, as the nerves by them paſs forth into all the lower parts of the body.

What the Spinall marrow is.

The coats of the ſpinall marrow.

The diſeaſes from the hurting of the ſpinall marrow.

Figure 1. *ſheweth the form of the ſpinall marrow properly ſo called, with its membranes, and the nerves proceeding from it.*

Figure 2. *the ſpinall marrow naked and bare, together with its nerves, as moſt part of Anatomiſts have deſcribed it.*

The tenth Figure of the ſpinall marrow.

B. The thickneſs thereof in the ſpondels or rack bones of the loins.

C. The diviſion thereof into ſtrings, or hairy threds.

D. The ſeven nerves of the neck.

From *D.* to *E.* or from 7. to 19. ſhew the nerves of the back.

From *E.* to *F.* the nerves of the loins.

From *F.* to *G.* the nerves of the *Os ſacrum* or holy bone.

H. The end of the marrow.

IKL. Do ſhew how the nerves do iſſue from the marrow in ſtrings.

MM. The knots of the ſinews made of the conjunction of thoſe ſtrings.

NO. The membranes that inveſt the marrow.

Figure 2.

A. The beginning of the ſpinall marrow in the skull.

3,4,5,6,7. theſe Characters ſhew (according to *Veſalius* opinion) how the conjugations of the nerves of the brain do take their originall from the marrow remaining yet within the skull.

B. The egreſs of the ſpinall marrow out of the skull.

C. The cords or ſtrings whereinto it is divided.

D 7. The marrow of the neck and ſeven pair of ſinews. *E* 19. Twelve pair or conjugations of nerves proceeding from the marrow of the Cheſt.

F 24. The marrow of the loins and 5. pair of ſinews. *G* 30. the marrow of the holy bone and 6. pair of ſinews.

H. The extremity or end of the ſpinall marrow.

The End of the Fifth Book.

The Sixth Book,

Treating of the *Muſcles and Bones, and the other Extreme parts of the* BODY.

The Preface.

PEradventure ſome may wonder that I have ended my fifth book of Anatomy, before I have fully deſcribed all the parts of the head, the which ſeemed as it were only appointed for that purpoſe. Therefore I muſt yeeld a reaſon of this my intention. I have a deſire in one Treatiſe and as it were at one breath, to proſecute the Anatomy of the Muſcles. Wherefore becauſe the parts of the head not yet deſcribed, principally conſiſt of the Muſcles, therefore I deſired to comprehend them together with this ſame deſcription of the extreme parts of the body; beginning at the upper part of the face; to wit, the eyes: but having firſt deſcribed the bones of the face, without the knowledg of which it is impoſſible to ſhew the originall and inſertion of the Muſcles. We have formerly noted, that by the face is meant whatſoever lyes from the Eye-browes even to the Chin. In which there is ſuch admirable induſtry of nature, that of the infinite multitude of men you cannot find two ſo like, but that they may be diſtinguiſhed by ſome unlikeneſſe in their faces; alſo it hath adorned this part with ſuch exquiſite beauty, that many have dyed by longing to enjoy the beauty deſired by them. This ſame face albeit it little exceeds halfe a foot, yet it indicates and plainly intimates by the ſeldom changes thereof, what affections and paſſions of hope, fear, ſorrow and delight poſſeſſe our minds; and what ſtate our bodies are in, ſound, ſick, or neither. Wherefore ſeeing the face is of ſo much moment, let us return to the Anatomicall deſcription thereof, which that wee may eaſily and plainly perform we will begin with the bones thereof, whereby, as we formerly ſaid, the originall and inſertion of the Muſcles may be more certain and manifeſt to us.

The deſcription of the bones being unknown, it muſt neceſſarily follow that the originall and inſertion of the muſcles muſt be ſo alſo.

The endowments of the face.

The countenance is the bewrayer of the will.

CHAP. I.

Of the bones of the Face.

THe bones of the face are 16, or 17. in number. And firſt, there be reckoned 6. about the orbs of the eyes, that is 3. to each orb, of which one is the bigger, another leſſer, and the third between both; each of theſe toucht the forehead bone in their upper part. Beſides, the greater is joyned with a ſuture to the proceſſe of the ſtony bone, and ſo makes the *Zygoma*, that is, the *Os Jugale* or yoak bone, framed by nature for preſervation of the temporall muſcle. The leſſer is ſeated at the greater corner of the eye, in which there is a hole perforated to the noſe, and in this is the glandule in which the Ægylops doth breed. The middle is in the bottom, or inner part of the orb, very ſlender and as it were of a membranous thinneſſe: then follow the two bones of the noſe which are joined to the forehead bone by a ſuture, but on the foreſide between themſelves by harmony. But on the back or hind part with two other bones, on each ſide one, which deſcending from the bone of the forehead (to which alſo they are joined by a ſuture) receive all the teeth. Theſe two in *Galens* opinion are ſeldome found ſeparated. But theſe are the thickeſt of all the bones of the face hitherto mentioned, knit by a ſuture with the greateſt bone of the orb, on the back part with the wedg-bone, on the inner ſide with the two little inner bones of the palat, which on the inſide make the extremity thereof, whereby it comes to paſſe, that we may call theſe bones the hinder, or inner bones of the palat. They reckon one of theſe bones the eleventh and the other the twelfth bone of the head; theſe two little bones on their ſides next to the winged productions of the wedge-bone, receive on each ſide one of the nerves of the

Bones in each orb of the Eye.

What the *Zygoma* is, and what uſe it hath.

The *Ægylops*.

The two bones of the noſe.

The two inner bones of the palat.

fourth

fourth conjugation, which in the former book, we ſaid were ſpent upon the membrane of the palat.

And in *Galens* opinion there be other two in the lower Jaw, joined at the middle of the chin; although ſome think it but one bone, becauſe by the judgement of ſenſe there appears no diviſion or ſeparation therein. But you may ſee in children how true this their ſuppoſition is, for in men of perfect growth it appears but one bone; theſe two are reckoned for the thirteenth and fourteenth bones. Now theſe two bones making the lower Jaw, have in their back part on each ſide two productions, as they lye to the upper Jaw, the one of which repreſents the point of a ſword, and is called the *Coronæ*; the other is obtuſe and round; which is inſerted into the cavity ſeated at the root of the proceſſe of the ſtony bone, neer to the paſſage of the ear.

The two bones of the Jaw.

Two productions on each ſide of the lower Jaw.

This may be ſtrained to the forepart by violent gaping, by retraction of the muſcles ariſing from the wing-like proceſſes, and ending at the lower angles of the broader part of the ſame Jaw.

The Luxation of the lower Jaw.

This Jaw is hollow as alſo the upper, eſpecially in the back-part, being filled with a white and glutinous humour, conducing to the growth of the teeth. This humour hath its matter from the blood brought thither by the veſſels, veins, arteries and nerves from the third conjugation entring in here by a paſſage large enough. Whereby it comes to paſſe, that this part is not only nouriſhed and lives, but alſo the teeth receive ſenſe by the benefit of the nerves entring thither with the vein and artery, by ſmal holes to be ſeen at the lower roots of the teeth; and thence it is that a beating pain may be perceived in the tooth-ach, becauſe the defluxion may be by the arteries; or rather becauſe the humour flowing to the roots of the teeth, may preſſe the artery in that place; beſide alſo you may ſee ſome appearance of a nervous ſubſtance in the root of a tooth newly pluckt out.

The lower Jaw filled with a marrowy humour.

How the teeth feel.

Why the teeth have a beating pain.

But alſo you muſt conſider, that this Jaw from its inner capacity produces at the ſides of the chin two nerves of a ſufficient magnitude, over againſt the lower dog-teeth, and the firſt of the ſmaller grinding teeth, as I have noted in the deſcription of the nerves of the third conjugation. I have thought good to put thee in mind of theſe, that when thou ſhalt have occaſion to make inciſion in theſe places, thou maiſt warily and diſcreetly handle the matter, that theſe parts receive no harme.

The nerves of the lower Jaw muſt be obſerved.

There remains another bone ſeated above the palat, from which the griſtly partition of the noſe ariſes, being omitted of all the Anatomiſts, for as much as I know. Now therefore that you may the better remember the number of the bones of the face, I will here make a repetition of them.

The bone of the noſe above the palate, or the partition of the noſe.

There are ſix of the orbs of the eyes, at each three. The ſeventh and eight wee may call the Naſall, or noſe-bones. The ninth and tenth the Jaw-bones. The eleventh and twelfth are called the innee bones of the palat. The thirteenth and fourteenth the bones of the lower Jaw. The partition of the noſe may be reckoned the fifteenth.

Now it remains having ſpoken of theſe bones, that wee treat of the teeth, the Eye-browes, the skin, the fleſhy pannicle, the Muſcles, and laſtly, the other parts of the face.

CHAP. II.

Of the Teeth.

The teeth are bones.

The teeth are of the number of the bones, and thoſe which have the moſt have thirty two, that is, ſixteen above, and ſo many below; of which in the forepart of the mouth there are four above and as many beneath, which are called *Inciſorii* cutting or ſhearing teeth, to cut in ſunder the meat, and they have but one root.

The ſhearing teeth.

To theſe are joyned two in each Jaw, that is, on each ſide of the other one, which are called *Canini dentes*, Dog-teeth, becauſe they are ſharp and ſtrong like dogs-teeth; theſe alſo have but one root, but that is far longer then the other have.

The Dog-teeth

Then follow the *Molares* or Grinders, on each ſide five; that is, ten above, and as many below, that they may grind, chaw, and break the meat, that ſo it may be the ſooner concocted in the ſtomach; for ſo they vulgarly think, that meat well chawed is halfe concocted; thoſe grinders which are faſtened in the upper Jaw, have moſt commonly three roots, and oft-times four. But theſe which are faſtened in the lower, have only two roots, and ſometimes three, becauſe this lower jaw is harder than the upper ſo that it cannot be ſo eaſily hollowed, or elſe becauſe theſe teeth being fixed and firmly ſeated, needed not ſo many ſtayes as the upper, which as it were hang out of their ſeats.

The Grinding teeth.

Why the upper grinding teeth have more roots.

The uſe of the teeth.

The ſhearing teeth cut the meat becauſe they are broad and ſharp; the dog-teeth break it, becauſe they are ſharp pointed and firm; but the grinders being hard, broad and ſharp, chaw and grind it aſunder. But if the grinders had been ſmooth, they could not fitly have performed their duty, for all things are chawed and broken aſunder more eaſily by that which is rough and unequall.

Wherefore they ſharpen their Milſtones when they are ſmoother than they ſhould be,

by

The teeth are faſtened in the Iaws by *Gomphoſis*.

by picking them with a ſharp Iron. The teeth are faſtened in the jawes by *Gomphoſis*, that is, as a ſtake or nail, ſo are they fixed into the holes of their jaws; for they adhere ſo firmly thereto in ſome, that when they are pluckt out, part thereof followes together with the tooth; which I have often obſerved to have been alſo with great effuſion of blood. This adheſion of the teeth faſtened in their jaws, is beſides ſtrengthned with a ligament, which applies it ſelfe to their roots together with the nerve and veſſels. The teeth differ from the other bones, becauſe they have action whilſt they chaw the meat; becauſe being loſt they may be regenerated, and for that they grow as long as the party lives, for otherwiſe by the continuall uſe of chawing they would be worn and waſted away by one another. You may perceive this by any that have loſt one of their teeth, for that which is oppoſite to it becomes longer than the reſt, becauſe it is not worn by its oppoſite. Beſides alſo they are more hard and ſolid than the reſt of the bones, and indued with a quick ſenſe by reaſon of the nerves of the third conjugation which inſert themſelves into their roots; for if you rub, or grind a tooth newly pluckt out, you may ſee the remains of the nerve; they have ſuch quick ſenſe, that with the tongue they might judg of taſtes. But how feel the teeth, ſeeing they may be filed without pain? *Fallopius* anſwers, that the teeth feel not in their upper or exterior part, but only by a membrane which they have within. And the teeth have another uſe, eſpecially the fore-teeth, which is, they ſerve for diſtinct and articulate pronuntiation; for thoſe that want them faulter in ſpeaking, as alſo ſuch as have them too ſhort, or too long, or ill ranked. Beſides, children ſpeak not diſtinctly before they have their fore-teeth. And you muſt note that the infant as yet ſhut up in its mothers womb hath ſolid and bony teeth; which you may perceive by diſſecting it preſently after it is born.

The faſtening of the teeth into the Iaws is to be obſerved.

Wherein the teeth differ from the other bones.

For what uſe the teeth have ſenſe.

The fore-teeth help for the articulation of the voice.

But even as there are two large cavities in the forehead bone at the eye-browes, filled with a viſcous humor, ſerving for the ſmelling; and in like manner, the air ſhut up in the mamillary proceſſes is for hearing; ſo in the jaws there be two cavities furniſhed with a viſcid humour for the nouriſhment of the teeth.

CHAP. III.

Of the Broad Muſcle.

NOw we ſhould proſecute the containing parts of the face; to wit, the skin, the fleſhy pannicle and fat; but becauſe they have been ſpoken of ſufficiently before, I will only deſcribe the fleſhy pannicle, before I come to the diſſection of the eye, that wee may the more eaſily underſtand all the motions performed by it, whether in the face or forehead.

Firſt, that you may more eaſily ſee it, you muſt curiouſly ſeparate the skin in ſome part of the face. For unleſſe you take good heed, you will pluck away the fleſhy pannicle together with the skin, as alſo this broad muſcle to which it immediately adheres, and in ſome places ſo cloſely and firmly, as in the lips, eye-lids and the whole forehead, that it cannot be ſeparated from it, Nature hath given motion, or a moving force to this broad muſcle, that whilſt it extends, or contracts it ſelf, it might ſerve to ſhut and open the eye. It will be convenient to ſeparate the muſcle thus freed from the skin, beginning from the forepart of the clavicles even to the chin, aſcending in a right line, and then turning back as far as you can; for thus you ſhall ſhew how it mixes it ſelf with the skin and the muſcles of the lips.

When thou ſhalt come to the eyes, thou ſhalt teach how the eye is ſhut and opened by this one muſcle, becauſe it is compoſed of the three ſorts of fibers; although by the opinion of all who have hitherto written of Anatomy, thoſe actions are ſaid to be performed by the power of two muſcles appointed for that purpoſe; one of which is at the greater corner on the upper part, the other reſembling a ſemicircle at the leſſer corner, from whence extending it ſelf to the middle of the griſtle *Tarſus*, it meets with the former ending there, but they are in part extended over all the eye-lid, whereby it commeth to paſſe that it alſo in ſome ſort becommeth movable. But although in publike diſſections theſe two muſcles are commonly wont to be ſolemnly ſhewed, after the manner I have related; yet I think, that thoſe which ſhew them know no more of them than I do. I have grounded my opinion from this, that there appears no other muſculous fleſh in theſe places, to thoſe which ſeparate the fleſhy pannicle, or broad muſcle, than that which is of the pannicle it ſelf, whether you draw your inciſion knife from the forehead downwards, or from the cheek upwards.

There are no particular muſcles appointed to open and ſhut the eye, for that is the work of the broad muſcle only. Divers reaſons to that purpoſe.

Beſides, when there is occaſion to make inciſion on the eye-browes, we are forbidden to doe it tranſverſe, leſt this broad muſcle falling upon the eye, make the upper eye-lid unmoveable: but if ſuch a cut be received accidentally, we are commanded preſently to ſtitch it up; which is a great argument that the motion of the upper eye-lid is not performed by its proper muſcles, but wholly depends and is performed by the broad muſcle. Now if theſe ſame proper muſcles which we have deſcribed ſhould be in the upper eye-lid, it ſhould

Why you muſt take heed of making a tranſverſe inciſion upon the eyebrowes.

be

be meet, (because when one of the muscles is in action, the other which is its opposite or Antagonist, rests or keeps holyday:) that when that which is said to open the eye is imployed, the opposite thereof resting, the upper eye-lid should be drawn towards its originall, as we see it happens in convulsions: because the operation of a muscle is the collection of the part which it moves towards its original.

The action of a muscle.

Therefore seeing such a motion or collection appears not any where in the eye-lid, I think it therefore manifest that all the motion of this upper eye-lid depends upon this broad muscle, and that it alone is the author of the motion thereof.

The originall of this broad muscle is from the upper part of the *Sternon*, the clavicles, the shoulder blades, and all the spines of the *vertebræ* of the neck: but it is inserted into all these parts of the head which want hair, and the whole face, having divers fibers from so various an originall, by benefit of which it performs such manifold motions in the face (for it so spreads it self over the face, that it covers it like a vizard) by reason of the variety of the original and the production of the divers fibers of this muscle. But I have not in the description of this muscle prosecuted those nine conditions, which in the first book of my Anatomy I required in every part, because I may seem to have sufficiently declared them in the description of the muscles of the *Epigastrium*. Wherefore hence forward you must expect nothing from me in the description of muscles besides their original, insertion, action, composition, and the designation of their vessels.

The originall of the broad muscle.

The insertion and reason why we expresse so many motions with the face.

CHAP. IV.

Of the Eye-lids and Eye-browes.

BEcause we have fain into mention of the eye-lids, and eye-browes, and because the order of dissection also requires it, we must tell you what they are, of what they consist, and how and for what use they were framed by nature. Therefore the eye-browes are nothing else, than a rank of hairs set in a semicircular form upon the upper part of the orb of the eye, from the greater to the lesser corner thereof, to serve for an ornament of the body, and a defence of the eyes against the acrimony of the sweat falling from the forehead.

What the eye-browes are.

Their use.

But the ey-lids on each side two, one above and another below, are nothing else than as it were certain shuttings appointed and made to close and open the eyes when need requires, and to contain them in their orbs. Their composure is of a musculous skin, a gristle and haires set like a pale at the sides of them to preserve the eyes when they are open, chiefly against the injuries of small bodies, as motes, dust and such like. These hairs are alwaies of equall and like bignesse, implanted at the edges of the gristly part, that they might alwaies stand streight and stiffe out. They are not thick, for so they should darken the eye. The gristle in which they are fastned is encompassed with the *pericranium* stretched so far before it produce the *Conjunctiva*. It was placed there, that when any part thereof, should be drawn upwards or downwards by the force of the broad muscle or of the two proper muscles, it might follow entirely and wholly by reason of its hardnesse. They call this same gristle, especially the upper, *Tarsus*. The upper and lower eye-lid differ in nothing, but that the upper hath a more manifest motion, and the lower a more obscure: for otherwise nature should have in vain encompassed it with a musculous substance.

What the eye-lids are.

Their compositure and use.

What the *Tarsus* is.

CHAP. V.

Of the Eyes.

THe Eyes are the instruments of the faculty of seeing, brought thither by the visive spirit of the optick nerves, as in an aqua-duct. They are of a soft substance, of a large quantity, being bigger or lesser according to the bignesse of the body. They are seated in the head, that they might overlook the rest of the body, to perceive and shun such things as might endanger, or endamage the body; for the action of the eyes is most quick, as that which is performed in a moment, which is granted to none of the other senses. Wherefore this is the most excellent sense of them all. For by this we behold the fabrick and beauty of the heavens and earth, distinguish the infinite varieties of colours, we perceive and know the magnitude, figure, number, proportion, site, motion and rest of all bodies. The eyes have a pyramidall figure whose basis is without, but the Cone or point within at the optick nerves. Nature would have them contained in a hollow circle, that so by the profundity and solidity of the place they might be free from the incursions of bruising and hurtfull things.

What the eyes are.

Their site.

The quicknes and excellency of their action.

Figure.

They are composed of six muscles, five coats, three humours, and a most bright spirit, (of which there is a perpetual influx from the brain) two nerves, a double vein, and one artery,

Composition.

Glandula Lachrymalis.

tery, beſides much fat, and laſtly, a Glandule ſeated at the greater angle thereof, upon that large hole which on both ſides goes to the noſe, and that, leſt that the humors falling from the brain ſhould flow by the noſe into the eyes, as we ſee it fares with thoſe whoſe eyes perpetually weep, or water, by reaſon of the eating away of this glandule, whence that affect is called, the *Fiſtula lachrymalis*, or weeping Fiſtula.

Fiſtula Lachrymalis.

Why fat is placed about the eyes.

But there is much fat put between the muſcles of the eye, partly that the motion of the eyes might be more quick, in that ſlipperineſſe of the fat, as alſo that the temper and complexion of the eyes, and chiefly of their nervous parts, might be more conſtant and laſting, which otherwiſe by their continuall and perpetuall motion would be ſubject to exceſſive dryneſſe. For nature, for the ſame reaſon hath placed Glandules flowing with a certain moiſture, neer thoſe parts which have perpetuall agitation.

CHAP. VI.

Of the Muſcles, Coats and humors of the Eye.

The number, ſite and action of the muſcles.

THere are ſix muſcles in the eye, of which four perform the four direct motions of the eye: they ariſe from the bottom of the orb, and end in the midſt of the eye encompaſſing the optick nerve. When they are all moved with one endevour, they draw the eye inwards. But if the upper only uſe its action, it draws the eye upwards; if the lower, downwards; if the right, to the right ſide; if the left, to the left ſide.

The two other muſcles turn the eye about; the firſt of which being the longer and ſlenderer, ariſes almoſt from the ſame place, from which that muſcle ariſes, which draws the eye to the right ſide to the greater corner. But when it comes to the utmoſt part of the inner angle, where the *Glandula lachrymalis* is ſeated, it ends in a ſlender Tendon, there piercing through the middle membrane which is there, as through a ring; from whence it preſently going back is ſpent in a right angle towards the upper part of the eye, betwixt the inſertions of thoſe two muſcles, of the which one draws the eye upwards, the other directly to the outward corner, as it is obſerved by *Fallopius*, or rather, which I remember I have alwaies obſerved, they turn between the muſcles which move the eye upwards, and to the inner corner.

This fifth muſcle when it is drawn in towards its beginning, ſo draws the eye with its circular tendon, that it carries it to the greater corner.

The ſixt muſcle is contrary to that; for it hath its originall from the lower part of the orb at a ſmall hole, by which a nerve of the third conjugation paſſes forth; and being that it is moſt ſlender, whilſt it aſcends tranſverſly to the outward corner, it involves the eye ſo alſo, that it is inſerted in it by a ſmall Tendon, ſo that the Tendons of them both are oftentimes taken but for one. That thou mayſt truly and accurately obſerve this anatomicall deſcription of the eye; the eye muſt not be pluckt out of its orb, but rather the orb it ſelf muſt be broken and ſeparated.

The 5 coats of the eye.

For thus thou ſhalt certainly and plainly ſee the forementioned original of the muſcles. For the five coats, the firſt which is firſt met with in diſſection, comes from the *Pericranium*, and is extended over all the white of the eye, even to the *Iris* or Rain-bow. The duty of it is to ſtrengthen, bind and contain the eye in its orb, wherefore it had the name *Conjunctiva*, others called it *Adnata*, or *Epipephycos*.

1 *Conjunctiva*, or *Adnata.*

The ſecond is called the *Cornea*, becauſe it reſembles a horn in colour and conſiſtence; this coat differs and varies from it ſelf, for in the forepart, as far as the *Iris* goes, it is clear and perſpicuous, but thick and obſcure in the hind part, by reaſon of the diverſe poliſhing. On the fore-part it is denſe, that it may preſerve and contain the Cryſtalline and wateriſh humor, but withall tranſparent, ſo to give the object a freer paſſage to the Cryſtalline. It hath its originall from the *Craſſa meninx*, proceeding forth from the inner holes of the orb of the eye, for it compaſſes the eye on every ſide.

2 *Cornea*, or the Horny coat.

The third is called the *Vvea* or Grapy coat, becauſe in the exterior part it repreſents the colour of a black grape; it ariſes from the *Pia mater*, and encompaſſes all the eye, except the *pupilla* or apple of the eye, for here being perforated, it adheres to the horny coat by the veins and arteries which it communicates to it for life and nouriſhment. But when it arrives at the *Iris*, then forſaking the *Cornea*, it deſcends deep into the eye, and in ſome ſort is turned about the Cryſtalline humour, to which alſo it moſt firmly adheres, ſo bounding the wateriſh humour, and alſo prohibiting that the Albugineous humor do not overwhelm the Cryſtalline. This grapy coat is as it were dyed on the inſide with divers colours, as black, brown, blew, or green like a rain-bow, and that for theſe enſuing benefits.

3 *Vvea*, or the grapy coat.

Why the grapy coat reſembles divers colours.

The firſt is, if that it had been tinctured with one colour, all objects would have appeared of the ſame colour, as it comes to paſſe when we look through green or red glaſſe. But it muſt be coloured, that ſo it may collect the ſpirits diſſipated by the Sun and ſeeing.

to the horny. *m m* 4, 5. The impreſſion of the grapy coat where it receedeth or departeth from the horny coat. *n n* 4, 5, 6, 7. The *pupilla* or apple of the eye. *o o* 7. The Ciliar or hairy proceſſes. *p* 7. The beginning of the grapy coat made of a thin membrane dilated, but *p* in the 17. figure ſheweth the Ciliar proceſſes ſprinkled through the fore part of the glaſſie humor. *r* 9. The boſome or depreſſion of the glaſſie humor receiving the Cryſtalline. *ſ* 12, 15. The bredth of the coat of the Cryſtalline. *t* 12, 13, 14, 16. The poſterior part of the Cryſtalline humor, which is ſpherical or round. *u* 11, 14, 20. The fore part of the ſame Cryſtalline depreſſed. *x* 10, 20. The amplitude of the glaſſie humor. *y* 10, 16, 19. The amplitude of the watry humor. *z* 19. The place where the glaſſie humour is diſtinguiſhed from the watry by the interpoſition of the *Hyaloides* or coat of the glaſſy humor. *α* 10, 16. The place where the grapy coat ſwimmeth in the watry humor. *β* 18. The cavity or depreſſion of the glaſſie humor which remaineth when the Cryſtalline is exempted or taken from it. *δ* 19. the cavity or depreſſion of the watry humor made by the ſame means.

Thirdly, it was convenient it ſhould be painted with infinite variety of colours for the preſervation of the ſight. For as the extream colours corrupt and weaken the ſight, ſo the middle refreſh and preſerve it, more or leſſe as they are neerer, or further remote from the extremes. It was fit it ſhould be ſoft, that ſo it might not hurt the Cryſtalline humor upon whoſe circumference it ends; and perforated in the part objected to it, leſt by its obſcurity it ſhould hinder the paſſage of the objects to the Cryſtalline, but rather that it might collect by its blackneſſe as a contrary, the great and as it were diffuſed variety of colours, no otherwiſe than we ſee the heat is ſtrengthned, by the oppoſition of cold; ſome call this coat *Choroides*, becauſe it is woven with many veins and arteries, like the coat *Chorion* which involves the infant in the womb.

Amphibleſtroides or *Retiformis*, Net-like coat.

Now followes the fourth coat called *Amphibleſtroides* or *Retiformis*, the Net-like coat, becauſe proceeding from the optick nerve dilated into a coat, it is woven like a net with veins and arteries which it receives from the grapy coat, both for the life and nouriſhment both of it ſelf, as alſo of the glaſſie humor which it encompaſſes on the back part. The principall commodity of this coat is, to perceive when the Cryſtalline humor ſhall be changed by objects, and to lead the viſive ſpirit inſtructed or furniſhed with the faculty of ſeeing, by the mediation of the glaſſie humour, even to the Cryſtalline being the principall inſtrument of ſeeing. It is ſofter than any other coat, leſt the touch of it ſhould offend that humor. Wherein thou wilt admire the ſingular order of nature, which as in other things it paſſes not from one extreme to another unleſſe by a *Medium*, ſo here it hath not fitted the hard horny coat to the ſoft humors, but by interpoſition of divers *media* of a middle conſiſtence. For thus after the harder coats *Adnata* and *Cornea* it hath placed the grapy coat, by ſo much ſofter then theſe two, as the Net-like coat is ſofter then it, that thus it might paſſe from extreme to extreme as it were by theſe degrees of hardnes and ſoftnes.

An Anaromicall Axiome.

5 *Arachnoides, ſive Araneoſa*, the Cobweb-coat.

The fifth and laſt coat is called *Arachnoides*, becauſe it is of the conſiſtence of a ſpiders web. And we may well reſemble this coat, to that skin of an union which exceeds the other in clearneſs, whiteneſs, and thinneſs. This *Araneoſa* or Cobweb-like coat encompaſſes the Cryſtalline humor on the fore ſide, peradventure that ſo it might defend it, as the chief inſtrument of ſeeing, if the other humors ſhould at any time be hurt. It hath its originall from the excrementitious humidity of the Cryſtalline humor, hardned into that coat by the coldnes of the adjacent part; abſolutely like the thin skin which encompaſſes the white of an Egg.

The 3 humors of the eye.

1 *Aqueus*, or watery.

The firſt humor of the eye is called the *Aqueus* or wateriſh, from the ſimilitude of water; it is ſeated between the tranſparent part of the horny coat, the portion of the Cryſtalline humor lying towards the apple of the eye, and that reflection of the grapy coat which comes from the *Iris* to the circumference of the Cryſtalline humor, that filling the empty ſpace it may diſtend the *Cornea*, and ſo hinder the falling thereof upon the Cryſtalline which would ſpoil the ſight: as alſo that by its moiſture it might hinder the drying of the Cryſtalline humor. Peradventure it is made of the whayiſh humor ſweating out of the veſſels of the coats, having their orifices for the moſt part in that place, where this wateriſh humor reſides. The ſecond humor and middlemoſt in ſituation is called the Cryſtalline, becauſe it imitates Cryſtall in the brightnes and colour; if ſo be that we may attribute any colour to it. For indeed it was fit that none of the three humors ſhould be tinctured with any colour, as thoſe which would be the inſtruments of ſight, leſt they might beguile us in ſeeing, as red and green ſpectacles do; for that is true which we have red written by the Philoſopher; That the ſubject or matter appointed for the reception of any form ſhould want all impreſſion thereof. Hence nature hath created a formleſs matter, the humors of the eyes without colours, wax without any figure, the mind without any particular knowledg of any thing, that ſo they might be able to receive all manner of forms. The figure of the Cryſtalline humor is round, yet ſomewhat flatted on the foreſide, but yet more flatted behind, that ſo the objects might be the better retained in that, as it were, plane figure, and that they might not fly back as from a Globe, or round body, in which they could make but ſhort ſtay; leſt it might be eaſily moved from its place by the force of any

2 *Cryſtallinus*, *Cryſtalline*.

A Philoſophicall Axiome.

thing

thing falling or hitting againſt it, becauſe that body which is exactly round touches not a plane body but only in a point or prick. Half this humor ſwims in the glaſſie humor, that ſo it may be nouriſhed from it by tranſpoſition of matter; or rather (ſeeing it is encompaſſed on every ſide with the fift coat, that the matter cannot eaſily be ſent from the one into the other) by the benefit of the veſſels produced even unto it as well by the Net-like coat as by the Grapy, but it is filled with a bright ſpirit on the forepart, which lyes next to the wateriſh humor, and the ſpace of the Apple of the eye.

Of which thing this is an argument, that as long as a man remains alive, we ſee the eye every way full, and ſwoln, but lank and wrinkled when he is dead; beſides alſo one of the eyes being ſhut, the *Pupilla* of the other is dilated by the ſpirit compelled to fly thither. And alſo for the ſame cauſe the horny coat is wrinkled in very old men, and the *Pupilla* is ſtraitned by the wrinkles ſubſiding into themſelves, which is the cauſe that they ſee little, or not at all; for by age and ſucceſs of time the humor is conſumed by little and little, the implanted ſpirit vaniſhes away, and ſmaller quantity of ſpirits flow from the brain, as from a fountain which is alſo exhauſted. The horny coat at his original, that is, in the parts next the *Iris*, ſeemeth to be very nigh the Cryſtalline humor, becauſe all the coats in that place mutually cohere as touching one another, but as it runs further out to the *Pupilla*, ſo it is further diſtant from the Cryſtalline. Which you may eaſily perceive by Anatomicall diſſection, and the operation of touching or taking away a Catarrhact: for whereas a Catarrhact is ſeated between the horny coat, and Cryſtalline humor, the needle thruſt in, is carried about upwards, downwards, and on every ſide through a large and free ſpace, neither touching the horny coat nor Cryſtalline humour, by reaſon theſe bodies are ſevered by a good diſtance filled with ſpirit and a thin humour. The uſe of it is, that it may be like a looking-glaſſe to the faculty of ſeeing carried thither with the viſive ſpirit.

Gal. Cap 5. lib 10. de uſu part.

In what place Catarrhact or ſuffuſion breeds

The third and laſt humor is the *Vitreus* the glaſſie, or rather Albugineous humor, called ſo, becauſe it is like molten glaſſe, or the white of an Egg. It is ſeated in the hind part of the Cryſtalline humor, that ſo it may in ſome ſort break the violence of the ſpirit flowing from the brain into the Cryſtalline humour, no otherwiſe than the watry humor is placed on the foreſide of the Cryſtalline to hinder the violence of the light and colours entring that way. This glaſſie humor is nouriſhed by the Net-like coat.

3 *Vitreus ſeu Albugineus*, that is Glaſſie or like the white of an Egg.

We have formerly ſpoken ſufficiently of the nerves of the eye: Wherefore it remains that we ſpeak of the veins. Some of theſe are internall, carried thither with the coats of the veſſels of the brain; other ſome externall, ſtretched over the externall parts of the eye, as the Muſcles, and coat *Adnata*; and by theſe veins inflammations and redneſs often happen in the externall parts of the eye: for which the *Vena pupis* muſt be opened, and cupping glaſſes and horns muſt be applyed to the nape of the neck and ſhoulders: as in the internall inflammations of the eye, the cephalik vein muſt be opened to avert and evacuate the morbifick humor.

The veins of the eye.

What veins may be opened in what inflammations of the eyes.

CHAP. VII.

Of the Noſe.

THe Noſe is called in Greek *Ris*, becauſe the excrements of the Brain flow forth by this paſſage, thou maiſt underſtand it hath a divers ſubſtance by compoſition. The quantity, figure and ſite are ſufficiently known to all. But it is compoſed of the skin and muſcles, bones, griſtles, a membrane or coat nerves, veins and arteries. The skin and bones both contained and containing, have formerly been explained, as alſo the nerves, veins and arteries. The griſtles of the Noſe are ſix in number; the firſt is double, ſeparating both the noſtrills in the top of the noſe extended even to the bone *Ethmoides*. The ſecond lyes under the former. The third and fourth are continued to the two outward bones of the noſe. The fifth and ſixth being very ſlender and deſcending on both ſides of the noſe, make the wings or moveable parts thereof. Therefore the uſe of theſe griſtles is, that the noſe moveable about the end thereof, ſhould be leſſe obnoxious to externall injuries, as fractures and bruiſes, and beſides more fit for drawing the air in and expelling it forth in breathing. For nature for this purpoſe hath beſtowed four muſcles upon the noſe, on each ſide two, one within, and another without.

The griſtles of the noſe.

The External taketh its original from the cheek, and deſcending obliquely from thence, and after ſome ſort annexed to that which opens the upper lip, is terminated into the wing of the noſe, which it dilates.

The muſcles thereof.

The internall going on the inner ſide from the jaw-bone, ends at the beginning of the griſtles that make the wings, that ſo it may contract them. The coat which inwardly inveſts the noſtrils and their paſſages, is produced by the five-like bones from the *Craſſa meninx*, as the inner coat of the palat, throttle, weazon, gullet and inner ventricle, that it is no mervail, if the affects of ſuch parts be quickly communicated with the brain. This ſame coat on each ſide receives a portion of a nerve from the third con ju-

conjugation, through the hole which deſcends to the noſe by the great corner of the eye.

The temper, action and uſe.

The noſe in al the parts thereof is of a cold and dry temper. The Action and profit thereof is to carry the air and oft-times ſmells to the mamillary proceſſes, and from thence to the four ventricles of the brain, for the reaſons formerly ſhewed. But becauſe the mamillary proceſſes being the paſſages of the air and ſmels are double, and for that one of theſe may be obſtructed without the other, therefore nature hath alſo diſtinguiſhed the paſſage of the noſe with a griſtly partition put between, that when the one is obſtructed, the air by the other may enter into the brain for the generation and preſervation of the animall ſpirit. The two holes of the noſe firſt aſcend upwards, and then downwards into the mouth, by a crooked paſſage, leſt the cold air, or duſt ſhould be carried into the lungs.

Why the noſe was parted in two.

But the noſe was parted into two paſſages as we ſee, not only for the forementioned cauſe, but alſo for helping the reſpiration and vindicating the ſmell from externall injuries; and laſtly, for the ornament of the face.

CHAP. VIII.

Of the Muſcles of the Face.

Their number.

NOw we muſt deſcribe the muſcles of the face pertaining as well to the lips as to the lower jaw. Theſe are 18. in number, on each ſide nine, that is, four of the lips, two of the upper, and as many of the lower. But there belong five to the lower jaw. The firſt of the upper lip being the longer, and narrower, ariſing from the yoak-bone deſcends by the corner of the mouth to the lower lip, that ſo it may bring it to the upper lip, and by that means ſhut the mouth. The other being ſhorter and broader, paſſing forth of the hollowneſs of the cheek, or upper jaw (by which a portion of the nerves of the third conjugation deſcends to theſe two muſcles, and other parts of the face) ends in the upper part of the ſame upper lip, which it compoſes together with the fleſhy pannicle and skin, and it opens it by turning up the exterior fibers towards the noſe, and ſhuts it by drawing the internall inwards towards the teeth.

The firſt of the lower lip being the longer and ſlenderer, entring out of that region which is betwcen the externall perforation of the upper jaw (through which on the inner part of the ſame, a nerve paſſeth forth to the ſame muſcles) and the muſcle *Maſſeter*, (of which hereafter) then aſcending upwards by the corner of the the mouth, it ends in the upper lip, that ſo it may draw it to the lower.

The other broader and ſhorter begins at the lower part of the chin, and the hollowneſs thereof, and ends at the lower lip which it makes, opening it within and without by its internall and externall fibers, as we alſo ſaid of its oppoſite. And that I may ſpeak in a word, nature hath framed three ſorts of muſcles for the motion of the mouth, of which ſome open the mouth, others ſhut it, and otherſome wreſt it and draw it awry; but you muſt note that when the muſcles of one kind jointly perform their functions (as the two upper which we deſcribed in the firſt place, on each ſide one, which draw the lower lip to the upper, and the muſcles oppoſite to them) they make a right or ſtreight motion; but when either of them moves ſeverally, it moves obliquely, as when we draw our mouth aſide. But theſe muſcles are ſo faſtned and fixed to the skin, that they cannot be ſeparated; ſo that it is no great matter whether you call it a muſculous skin, or a skinny muſcle: (Which alſo takes place in the palms of the hands and ſoles of the feet) but theſe muſcles move the lips the upper jaw being not moved at all.

CHAP. IX.

Of the Muſcles of the lower Iaw.

Their number.

WE have ſaid theſe muſcles are five in number, that is, four which ſhut it, and one which opens it, and theſe are alike on both ſides. The firſt and greater of

The Temporall muſcle.

theſe four muſcles which ſhut the Jaw is called *Crotaphita* or Temporall muſcle; it ariſes from the ſides of the forehead and *Bregma* bones, and adhering to the ſame and the ſtony bone, it deſcends under the yoak-bone, from whence it inſerts it ſelf to the proceſſe of the lower jaw which the Greeks call *Corone*, that it may draw it directly to the upper, ſo to ſhut the mouth.

Why the wounds of the temporall Muſcle are deadly.

But you muſt note, that this muſcle is tendinous even to his belly, and that it fils and makes both the temples. It is more ſubject to deadly woumds than the reſt by reaſon of the multitude of nerves diſperſed over the ſubſtance thereof, which becauſe they are neer their originall, that is, the brain, they infer danger of ſodain death by a convulſion which uſually follows the affects of this muſcle, bnt alſo in like manner it cauſes a Feaver, the Phrenſy and *Coma*.

V. V. *The two venters of the fourth muſcle of the bone* Hyoides.
*. *The place where the veſſels paſſe which go to the head, and the nerves which are ſent to the Arm.*

Therefore that it ſhould be leſſe ſubject or obvious to externall injuries, Nature hath, as it were, made it a retiring place in the bone, and fortified it with a wall of bone raiſed ſomewhat higher about it. The other Muſcle almoſt equall to the former in bigneſs, being called the *Maſſeter*, or grinding muſcle, makes the Cheek; it deſcends from the loweſt part of the greateſt bone of the orb (which bends it ſelf as it were back, that it may make part of the yoak-bone) and inſerts it ſelf into the lower Jaw, from the corner thereof to the end of the root of the proceſſe *Corone*, that ſo it may draw this Jaw forward and backward, and move it like a hand-mill. The *Maſſeter* or grinding muſcle.

Wherefore nature hath compoſed it of two ſorts of fibers, of the which ſome from the neck (the cheek in that place under the eyes ſtanding ſomewhat out like an apple ariſing from the concourſe of the greater bones of the orb and upper jaw) deſcend obliquely to the corner and hinder part of the lower jaw, that it may move it forwards. Other ſome ariſe from the lower part of the ſame yoak-bone, and deſcending obliquely interſect the former fibers after the ſimilitude of the letter X, and inſert themſelves into the ſame lower jaw at the roots of the proceſſe *Corone*, that ſo they may draw it back: Truely by reaſon of theſe contrary motions it is likely this muſcle was called the *Maſſeter* or grinder.

The third, which is the round muſcle, ariſes from all the Gums of the upper jaw, and is inſerted into all the gums of the lower, inveſting the ſides of all the mouth with the coat, with which it is covered on the inſide, being otherwiſe covered on the outſide with more fat than any other muſcle. The action thereof is, not only to draw the lower Jaw to the upper, but alſo as with a ſhovell to bring the meat diſperſed over all the mouth under the teeth, no otherwiſe then the tongue draws it in. The round muſcle.

The fourth being ſhorter and leſſe than the reſt ariſing from all the hollowneſs of the winged proceſſe of the Wedge-bone, is inſerted within into the broadeſt part of the lower Jaw, that ſo in like manner it may draw the ſame to the upper. This is the muſcle through whoſe occaſion, we ſaid this lower Jaw is ſometimes diſlocated. The leſſer muſcle of the lower Iaw.

The figure of the Muſcles of the lower Jaw.

to draw this Jaw downwards from the upper in opening the mouth. This muſcle is ſlender and tendinous in the midſt, that ſo it might be the ſtronger, but it is fleſhy at the ends. All theſe muſcles were made by the ſingular providence of nature, and engraffed into this part for the performance of many uſes and actions, as biting aſunder, chawing, grinding and ſevering the meat into ſmall particles, which the tongue by a various and harmleſs motion puts under the teeth. Thus much I thought good to ſay of the parts of the face, as well containing as contained.

The uſe of theſe mentioned muſcles.

CHAP. X.

Of the Ears and Parotides *or kernels of the Ears.*

The nature and compoſition of the ears. What the *Fibra* and *pinna* are. The figure and the reaſon thereof.

THE Ears are the Organs of the ſenſe of hearing. They are compoſed of the skin, a little fleſh, a griſtle, veins, arteries and nerves. They may be bended or folded in without harm, becauſe being griſtly, they eaſily yeeld and give way; but they would not do ſo, if they ſhould be bony, but would rather break. That lap at which they hang pendents and Jewels, is by the ancients called *Fibra*, but the upper part *pinna*. They have been framed by the providence of nature into two twining paſſages like a Snails ſhell, which as they come neerer to the *foramen cæcum* or blind hole, are the more ſtraitned, that ſo they might the better gather the air into them, and conceive the differences of ſounds and voices, and by little and little lead them to the membrane.

The Figure of the ears and bones of the auditory paſſage.

Tab. 10. *ſheweth the ears and the divers internall parts thereof.*

Fig. 9. *ſheweth the Muſcle found out by Aquapendens.*

For the particular declaration ſee *D. Crooks* Anatomy. pag. 577.

This membrane which is indifferently hard hath grown up from the nerves of the

fifth

fifth conjugation, which they call the auditory. But they were made thus into crooked windings, leſt the ſounds ruſhing in too violently ſhould hurt the ſenſe of hearing. Yet for all this we oft find it troubled and hurt by the noiſe of thunder, Guns and Bels. Otherwiſe alſo leſt that the air too ſodainly entring in ſhould by its qualities, as cold, cauſe ſome harm: and alſo that little creeping things and other extraneous bodies, as fleas and the like, ſhould be ſtayed in theſe windings and turnings of the waies, the glutinous thickneſs of the cholerick excrement or ear-wax hereunto alſo conducing, which the brain purges and ſends forth into this part, that is, the auditory paſſage framed into theſe intricate Mæanders.

For what uſe the ear-wax ſerves.

But that we may underſtand how the hearing is made, we muſt know the ſtructure of the organ or inſtrument hereof. The membrane which we formerly mentioned to conſiſt of the auditory nerve, is ſtretched in the inſide over the auditory paſſage like as the head of a Drum. For it is ſtretched and extended with the air, or auditory ſpirit implanted there, and ſhut up in the cavity of the mamillary proceſſe and *foramen cæcum*, that ſmitten upon by the touch of the externall air entring in, it may receive the object, that is, the ſound, which is nothing elſe then a certain quality ariſing from the air beaten or moved by the colliſion and conflict of one or more bodies.

For what uſe the membrane ſtretched under the auditory paſſage ſerves.

What ſound is?

Such a colliſion is ſpred over the air, as the water which by the gliding touch of a ſtone produces many circles and rings one as it were riſing from another. So in rivelets running in a narrow channel, the water ſtrucken, and as it were, beaten back in its courſe againſt broken, craggy and ſteep rocks, wheels about into many turnings: this colliſion of the beaten air flying back divers waies from arched and hollow roofed places, as Dens, Ciſterns, Wells, thick Woods and the like, yeelds and produces a double ſound, and this reduplication is called an Echo. Wherefore the hearing is thus made by the air, as a medium, but this air is twofold, that is, externall and internall.

The cauſe of an echo.

The exteriour is that which encompaſſes us, but the interiour is that which is ſhut up in the cavity of the mamillary proceſſe and *foramen cæcum*, which truly is not pure and ſole air, but tempered and mixed with the auditory ſpirit. Thence proceeds the noiſe or beating of the ears, when vapors are there mixed with the air inſtead of ſpirits, whereby their motion is perturbed and confuſed. But neither do theſe ſuffice for hearing, for nature for the more exact diſtinction of ſounds hath alſo made the little bones, of which one is called the *Incus* or anvill, another the *Malleolus* or hammer, the third the *Stapes* or ſtirrop, becauſe the ſhape thereof reſembles a German ſtirrop. Alſo it may be called *Deltoides*, becauſe it is made in the ſhape of the Greek letter Δ.

The 3 bones of the auditory paſſage.

They are placed behind the membrane; wherefore the anvill and hammer moved by the force of the entrance of the externall air, and beating thereof againſt that membrane, they more diſtinctly expreſſe the difference of ſounds, as ſtrings ſtretched within under the head of a Drum; as for example, theſe bones being more gently moved repreſent a low ſound to the common ſenſe and faculty of hearing, but being moved more vehemently and violently, they preſent a quick and great ſound; to conclude, according to their divers agitation, they produce divers and different ſounds.

Their uſes.

Whence the difference of ſounds.

The Glandules ſhould follow the Ears in the order of Anatomy, as well thoſe which are called the emunctories of the brain, that is, the *Parotides*, (which are placed as it were at the lower part of the ears) as theſe which lye under the lower Jaw, the muſcles of the bone *Hyoides* and the tongue, in which the *Scrophulæ* and other ſuch cold abſceſſes breed. It ſhall here ſuffice to ſet down the uſe of all ſuch like Glandules.

Therefore the *Parotides* are framed in that place by nature, to receive the virulent and malign matter ſent forth by the ſtrength of the brain, by the veins and arteries ſpred over that place. The reſt ſerve to ſtrengthen the diviſion of the veſſels, to moiſten the ligaments and membranes of the Jaw, leſt they ſhould be dryed by their continuall motion. Their other conditions and uſes are formerly handled in our firſt book of Anatomy.

CHAP. XI.

Of the bone Hyoides, *and the Muſcles thereof.*

The ſubſtance of the bone *Hyoides* is the ſame with that of other bones. The figure thereof imitates the greek letter υ from whence it took the name, (as alſo the name ὑοειδὴς; and from the letter λ it is in like ſort called λαμβοειδὴς; by ſome it is ſtiled *os Gutturis* and *os Linguæ*, that is, the Throat-bone and Tongue bone. The compoſition thereof conſiſts of many bones joined into one by the interpoſition of griſtles.

The reaſon of the name.

The compoſition.

This bone is bigger in beaſts and compoſed of more bones, and that not only by the intercourſe of griſtles, but alſo of ligaments. It is ſeated with its baſis (being gibbous on the

The ſite.

forepart for conſtancy, and arched on the inſide that it might receive and contain the root of the tongue) upon the upper part of that griſtle of the throtle which is called *ſcutiformis* or Shield-like, (for this ſeems to prop it up by the ſtrength of two proceſſes riſing at the baſis thereof) and the root of the tongue. From this baſis it ſends forth two horns to the ſides of the tongue on each ſide one, which in men are tyed to the Appendix *ſtyloides* by ligaments ſent from it ſelf. Contrary then it is in beaſts, who have it of many bones united as we ſaid, by the intercouſe of ligaments even to the root of the *ſtyloides*. Wherefore this bone hath connexion with the forementioned parts, and other hereafter to be mentioned. It hath the ſame temper ac other bones have. The uſe of it is, to miniſter ligaments to certain muſcles of the tongue, and inſertion as well to the two foremoſt and upper muſcles of the throtle, as to its own, of which we will now treat.

The temper and uſe.

The muſcles of the bone *Hyoides*, according to the opinion of ſome are eight, on each ſide four; of which there be two, one of which *Galen* refers to the common muſcles of the *larinx* or throtle; and the other to thoſe which move the ſhoulder-blade upwards. Howſoever it be, the firſt of the four before mentioned ariſes from the Appendix *Styloides*, and paſſing over the nervous ſubſtance of the muſcle opening the lower jaw, is inſerted into the horns of the bone *Hyoides*. This muſcle is very thin, yet ſomewhat broad, the which in that reſpect may eaſily be cut, unleſſe you have a care in ſeparating the muſcle which opens the lower Chap. The ſecond aſcends obliquely from the upper part of the ſhoulder-blade neer the production thereof called *Coracoides*, to the beginnings of the horns of the ſaid bone *Hyoides*. This is round and nervous in the midſt that ſo it might be the ſtronger, as that is which we formerly ſaid opens the lower jaw; and it is refer'd by *Galen* amongſt thoſe which move the ſhoulder-blade upwards. The third ariſes from the upper part of the *ſternon*, and is inſerted at the root and baſis of the bone *Hyoides*; yet *Galen* refers it to the common muſcles of the *Larinx*; whoſe opinion takes place rather in beaſts, than in man, ſeeing in man this muſcle cannot be found either to proceed, or be inſerted into the throtle, as it is in beaſts. The fourth and laſt deſcends within from the chin to the root of the bone *Hyoides*. The firſt of theſe muſcles with its companion or partner moves the bone *Hyoides* upwards, the ſecond downwards; the third backwards; and the fourth forwards. I would declare whence theſe muſcles have their veſſels, had I not abundantly ſatisfied that thing, when I treated of the diſtribution of the nerves, veins and arteries.

The muſcles of the bone *Hyoides*.

The action of theſe muſcles.

CHAP. XII.

Of the Tongue.

What kind of fleſh the tongue hath.

THE tongue is of a fleſhy, rare, looſe and ſoft ſubſtance; it enjoyes fleſh of a different kind from the reſt of the fleſh, as chiefly appears when you cut it from the firſt originall of the muſcles thereof; which thing hath moved ſome, that they have made a fourth kind of fleſh proper to the tongue and different from the reſt, *viz.* the fibrous, muſculous, and that of the bowells. The quantity thereof is ſuch that it may be contained in the mouth, and eaſily moved to each part thereof. The figure of it is triangular, which it rather expreſſes in the baſis, which is at the root of the bone *Hyoides*, than in its point, or forepart, where from a triangle it becomes more dilated. It is compoſed of a membrane (which it hath from that which lines all the inſide of the mouth) muſcles 4. nerves two on each ſide, the one whereof is ſent from the third conjugation, into the coat thereof; the other from the ſeventh is ſent into the muſculous ſubſtance even to the end thereof for motions ſake; ſo that thoſe ſenſifick nerves from the third conjugation only give to judg of taſtes, compoſe the coat, and touch or enter not the fleſh. Beſides it is compoſed of veins and arteries on each ſide one, which it receives from the externall Jugular and *Carotides*, running manifeſtly to the end thereof on the lower ſide, that ſo they might be eaſily opened in the diſeaſes of the mouth and throtle; they commonly term theſe the *Venæ nigræ* or black veins.

The quantity.

The figure.

Compoſure.

The nerves.

The muſcles of the tongue, are abſolutely ten, on each ſide five. The firſt narrow at the beginning and broader at the end, deſcends into the upper ſide of the tongue from the Appendix *Styloides*, and together with its copartner draws it upwards. The ſecond hath its originall within from the lower jaw, about the region of the grinding-teeth, and is inſerted into the lower ſide of the tongue, the which with its partner draws it downward. The third proceeds from the inner part of the chin, and goes to the root of the tongne, that when need requires it may put it forth of the mouth. The fourth the greateſt and broadeſt of them all, compoſed of all ſorts of fibers, paſſes forth from the baſis of the bone *Hyoides*, and ends at the lower part of the tongue, which with its companion plucks it back into the mouth. The fift and laſt moſt uſually ariſes from the upper part of the horns of the bone *Hyoides*, and goes to the roots of the tongue between the two firſt, that it may move it to the ſides of the mouth.

The muſcles of the tongue.

mouth. The temper thereof, as of all other fleſh, is hot and moiſt. The firſt action and commodity thereof is, to be the organ of the ſenſe of taſting, wherefore it was made fungous and ſpongy, that by reaſon of the rarity of it, it might more eaſily admit the taſts conjoyned with the ſpettle, as a vehicle. Another to be an inſtrument to diſtinguiſh the voice by articulate ſpeeech, for which it was made movable into each part of the mouth. The third is to be a help to chaw and ſwallow the meat. For which cauſe it is like a ſcoop or diſh with which we throw back the corn into the mill, which hath ſcaped grinding. And becauſe, when the tongue is dry, it is leſs nimble and quick to perform its motions, as appears by thoſe which can ſcarce ſpeak by reaſon of thirſt or a burning Feaver: therefore nature hath placed very ſpongy glandules at the roots thereof, on each ſide one, which like ſponges ſuck and receive, both from the brain and other places, a wateriſh and ſpettlely humor, with which they humect and make more glib, not only the tongue, but alſo the other parts of the mouth, as the throat and jawes; theſe glandules are called the *Tonſillæ*, or Almonds of the throat.

The temper, action, and manifold uſe of the tongue.

The uſe of the glandules placed at the roots of the tongue.

CHAP. III.

Of the Mouth.

THe mouth is that capacity which bounded with the cheeks and lips contains within its precincts the teeth, tongue, and the beginnings of the throtle and gullet. Therefore the uſe of the mouth is to contain the tongue, and ſerve it in the fitter performance of its actions; and although many parts hereof have been formerly handled, as the lips, teeth, jawes, tongue, almonds, and paſſages of the palat coming from the noſe, yet it remains, that we declare what the palat, the *Gargareon*, or Vvulva, the *Pharinx*, and *fauces* or Chops are. The Palat (or as it is commonly called, the Roof of the mouth) is nothing elſe but the upper part of the mouth bounded with the teeth gums and upper Jaw. In which place the coat common to the whole mouth, is made rough with divers wrincles, that the meats put up and down between the tongue and the Palat might be broken and chawed more eaſily by that inequality and roughneſs. If any would find the nerves, which deſcend into the palat from the fourth conjugation, let him ſeparate that coat and caſt it from the fore to the hind part of the mouth; for ſo he ſhall find them at the ſides and hind parts of the bones of the Palat, which incompaſs the Palat, and at the beginning of the inner holes of the mouth, which deſcend from the noſe, and region of the productions of the wedgbone called the Saddle. Theſe holes or paſſages are open, that we may breath the better when we ſleep, and that when the noſe is not well, the excrements which ſeek their paſſage by it, may be eaſilier drawn away by the mouth. This ſame coat is woven with nervous fibers, that like the tongue it might judg of taſts; theſe fibers compoſe a coat that hath a middle conſiſtence betwixt ſoft and hard. For if it ſhould have been any harder, like a bone or griſtle, it would have been without ſenſe, but if ſofter, hard, acrid and ſharp meats would have hurt it.

What it is.

The uſe.

What the palat is.

The nerves thereof.

Why the holes of the palat are open.

What kind of coat the palat hath.

CHAP. XIIII.

Of the Gargareon, *or Vvula.*

BY the *Gargareon* we underſtand a fleſhy and ſpongy body, in ſhape like a pine apple, hanging directly down at the further end of the palat and baſis of the bone *Ethmoides*, where the two holes of the palat come from the noſe, above the entrance of the throtle. This little body is ſituate in this place to break the violence of the air drawn in by breathing, and that by delay it might in ſome ſort temper and mitigate it by the warmneſs of the mouth. Beſides, that it might be as it were the *Plectrum*, or quil of the voice, ſo to diffuſe the fuliginous vapour ſent forth in breathing, that it may be diſperſed over all the mouth, that reſounding from thence it may be articulate, and by the motion of the tongue diſtinguiſhed and formed into a certain voice. Which uſe is not ſmall, when we ſee by experience that ſuch as have this particle cut away, or eaten, or corrupted by any accident, have not only their voyce vitiated and depraved, but ſpeak ill-favouredly, and as they ſay, through the noſe; and beſides in proceſs of time they fall into a conſumption by reaſon of the cold air paſſing down before it be qualified. This ſame particle, is alſo a means to hinder the duſt from flying down through the weazon into the Lungs. By the *Pharinx* and *fauces* is meant the inner and back part of the mouth, ſet or placed before the entrance of the Throtle and Gullet; being ſo called, becauſe that place is narrow and ſtrait, that as it were by theſe ſtraits, the air drawn in by the mouth might be forced down by the Throtle, and the meat into the Gullet.

What the *Gargareon*, or Vvula is.

The fire and manifold uſe thereof.

The diſcommodities that enſue the loſs of the Vvula.

What the *Pharinx* and *fauces* are.

CHAP.

CHAP. XV.

Of the Larinx, *or Throttle.*

What is meant by the *Larinx.*

FIrſt we muſt ſhew what is meant by the *Larinx* and Throttle, then proſecute the other conditions of it after our accuſtomed manner. Therefore by the *Larinx* we underſtand nothing elſe in this place, than the head & extremity of the rough artery, or weazon, which comes neerer to griſtly ſubſtance, than to any other. The quantity thereof is ſufficiently large, yet divers according to the diverſity of bodies. It reſembles in ſhape the head of a *Germane* pipe. The compoſure of it conſiſts of 18. muſcles, on each ſide nine, which as they are like in quantity, ſo alſo in ſtrength and action; of three griſtles, veins, arteries and nerves, as we ſhewed, when we ſpoke of the diſtribution of the veſſels; as alſo of a double coat, the one externall, the other internall, as we ſhewed when we ſpoke of the weazon. Theſe three griſtles are joyned together by certain Ligaments and muſcles; the foremoſt griſtle, which alſo is the greater, is called by the Greeks θυρεοειδὴς, in Latin commonly *Scutiformis*, that is ſhield-like, becauſe it reſembles a ſhield. The ſecond being the hinder and middle in magnitude, wants a name, wherefore it is called the *innominata* or nameleſs griſtle. The laſt and leaſt, which notwithſtanding may be parted into two, ſo lyes upon the edges of the other, that it reſembles the mouth of an oyl pot, or a pitcher, whereupon the Greeks call it *Arytenoides*. Theſe griſtles thus fitted amongſt themſelves utter a diſtinct voice, by the benefit of the *Epiglottis*, or After-tongue; and alſo of the muſcles opening and ſhutting, dilating and compreſſing them, whence proceed infinite varieties of voices. For thus when they are opened and dilated, they yeeld a heavy, or dull ſound; when they are ſhut or drawn together, a quick, or ſharp ſound; and to conclude, they make it infinite wayes different according to the infinite variety of the dilatation, or conſtriction thereof. Therefore becauſe it was fit theſe griſtles ſhould be moveable, eſpecially the *Arytenoides*, and *Thyroides*, nature hath put to them on each ſide 9 muſcles, of which three are common, and ſix proper. The firſt of the common lying hid under the third muſcle of them that move the bone *Hyoides*, ariſes from the root of the ſame bone, and by an oblique deſcent inſerts it ſelf at the baſis of the ſhield-like griſtle, to dilate it upwards and downwards. The ſecond aſcends obliquely from the inner part of the *ſternon* according to the length of the weazon (whence it is called *Bronchius*) to the bottom and ſides of the ſame ſhield-like griſtle, that it may open and dilate it with its wings. This muſcle is ſeen from the firſt original thereof, even a great part of the way ſtraitlty to cohere with the third muſcle of the bone *Hyoides*; therefore under each of the muſcles, there is a glandulous body ſpred about the fore and upper part of the weazon, on that place where it applies it ſelf to the throttle; this body although it reſemble a fleſhy ſubſtance, yet it is a glandule, which being pluckt away by a certain Emperick taking upon him to cure the kings evill, cauſed a defect of voice on one ſide, becauſe he pulled away the recurrent nerve lying upon the glandule as it goes to the throttle, as *Galen* reports, *Lib. de locis affectis*. The third and laſt ariſes from the parts of the *Vertebra's* of the neck lying tranſverſly upon the ſides of the gullet, and ends at the wings and ſides of the ſhield-like griſtle, that it may tye it more ſtraitly to the ſecond griſtle. But theſe three are called common muſcles, becauſe they take their originall from ſome other place than the throttle, that ſo they may be inſerted into ſome part thereof; for they are called the proper muſcles which ariſe from the Throttle it ſelf, which we have ſaid to be ſix on each ſide: the firſt of which ariſing from the fore part of the ſecond griſtle, makes a circle under the baſis of the ſhieldlike griſtle; whilſt aſcending obliquely to the baſis thereof, it is afterwards inſerted in a part of it, ſo to ſtrengthen and dilate it. The ſecond in like manner ariſing from the ſecond griſtle, from that place where it adheres to the firſt, it runs obliquely croſſing the firſt to the inner and forepart of the griſtle *Thyroides* neer to the baſis thereof, that it may joyn it to the ſecond. The third from the hind baſis of the ſecond griſtle aſcends directly to the baſis of the third griſtle *Arytenoides*, that with the ſecond muſcle it may open and ſhut it. The fourth aſcends from the ſides of the ſecond griſtle, neer the originall of the ſecond muſcle, to the ſides of the *Arytenoides*, that with the ſecond muſcle it may open and ſhut it. The fift ariſes from the inner middle of the ſhield-griſtle, and ends in the fore-part of the *Arytenoides* at the inſertion of the fourth muſcle, that ſo it may preſs down the ſaid griſtle.

The magnitude, figure, and compoſuſt.

The deſcription of the 3 griſtles of the *Larinx.*

Whence the infinite variety of voices proceed.

The muſcles of the *Larinx.* Their number.

A notable hiſtory.

Whence the muſcles of the Throttle have their nerves.

The ſixt and laſt aſcends by the hind baſis of the *Arytenoides* to the fore baſis of the ſame, to preſs it down. But you muſt note, that all ſuch muſcles as ariſe from below upwards, receive branches from the recurrent, but eſpecially thoſe who open and ſhut the griſtle *Arytenoides*. But the ſite, temper, connexion, and uſe of the throttle may eaſily be known by that we have ſaid before: Although it be a thing very full of difficulty to ſearch out and demonſtrate all the conditions of the organicall parts, by reaſon of the diverſity of their compoſition. Wherefore hence-forward concerning the ſubſtance, temper, and other circumſtances of ſuch parts as we ſhall omit, you may have recourſe to thoſe things which we have written in the Demonſtration of the ſimple and ſimilar parts, of which theſe organicall

nicall are compoſed; as if any ſhould aſk of what temper the *Larinx* is, you ſhall anſwer, of a cold, dry, and hot, and moiſt, becauſe it conſiſts both of a griſtly and fleſhly ſubſtance. He which reckons up all the parts of the mouth, muſt not omit that griſtly and membranous body which ariſes from the roots of the tongue, which that it might be more quick for motion, that is, whereby it might be more eaſily erected and depreſſed (for thoſe things which are more ſoft do continually ſlide away, but thoſe which are too hard cannot be bended) it was convenient it ſhould be neither too hard nor too ſoft, that it might be erected whileſt we breath, but depreſſed when we ſwallow. It is a principall inſtrument of the voice, for it cannot be well articulated unleſs the way were ſtrait. Therefore it ſtraitens that way, and the paſſage of the griſtles of the throttle, but ſpecially the *Arytenoides*; it is alwayes moiſt by a certain native, and inbred humidity; wherefore if it happen to be dried by a feaver, or any other like accident, the ſpeech is taken away. It is bound on both ſides by the common membrane of the mouth to the ſides of the *Arytenoides* even to the back part thereof, that ſo like a cover it may open and ſhut the orifice of the throttle, that none of the meat and drink in ſwallowing may fall into the weazon, in ſuch aboundance as may hinder the egreſs and regreſs of the air. For we muſt not think that this body doth ſo cloſely ſhut the orifice of the throttle, but that ſome ſmall quantity of moiſture alwaies runs down by the inner ſides, as the walls thereof, to moiſten the lungs; otherwiſe *Eclegma's* ſhould be of no uſe in the diſeaſes of the Cheſt. And becauſe that this little body is partaker of voluntary motion, therefore according to the opinion of ſome there are four muſcles beſtowed upon it, two which may open it and two that ſhut it, on each ſide one. The opening muſcles deſcend from the root of the bone *Hyoides*, and in their inſertion growing into one they are terminated in the root of this body, that is, the *Epiglottis* in the back part thereof. The ſhutting muſcles (in thoſe creatures where they are found) ariſe on the inſide between the coat and griſtle thereof. Truly I could never obſerve and find theſe four muſcles in a man, though I have diligently and earneſtly ſought for them, but I have alwayes obſerved them in beaſts. Therefore ſome have boldly affirmed that this little body in ſwallowing lies not upon the orifice of the Throttle, unleſs when it is preſſed down by the heavineſs of ſuch things as are to be ſwallowed; but that at all other times by reaſon of the continuall breathing it ſtands upright, the Throttle being open. There remain as yet to be conſidered, two ſmall boſomes, or cavities, or rather fiſſures, which nature hath hollowed in the very throttle under the *Epiglottis*, on each ſide one, that if by chance any of the meat or drink ſhould fall, or ſlip aſide in the *Larinx*, it might be there ſtayed and retained. Beſide that, the Air too violently entring, ſhould be in ſome ſort broken by theſe cliſts, or chinks, no otherwiſe then the blood and ſpirit entring into the heart through the *Auricule* or Ears thereof.

The *Epiglottis*, or After-tongue.

Of potable things ſomewhat alwayes falls upon the Lungs.

The muſcles of the *Epiglottis*.

The uſe of the cavities or fiſſures of the Throttle.

CHAP. XVI.

Of the Neck and the parts thereof.

Firſt we will define what the Neck is, then proſecute the parts thereof as well proper, as common, eſpecially thoſe of which we have not as yet treated. For it were ſuperfluous to ſpeak any more of the skin, the fleſhy pannicle, the veins, arteries, nerves, gullet, weazon and muſcles aſcending and deſcending to the parts into which they are inſerted alongſt the neck; wherefore you muſt not expect that we ſhould ſay any thing of the neck, more than to deſcribe the *Vertebra* or rack bones, being the proper parts thereof, and the ligaments as well thoſe proper to the neck, as thoſe which it hath in common with the head; and laſtly the muſcles as well thoſe it hath in common with the head and cheſt, as thoſe of its own. Therefore the neck is nothing elſe, then a part of the head, which is contained between the nowl bone and the firſt *vertebra* of the back. Firſt in the neck the *Vertebra's* muſt be conſidered, and we muſt ſhew what they have proper and peculiar, and what common amongſt themſelves, that we may the more eaſily ſhew the originall and inſertion of the muſcles growing out of them and ending in them. The neck conſiſts of ſeven *Vertebræ* or Rack-bones, in which you muſt conſider their proper body; and then the holes by which the ſpinall marrow paſſes; thirdly the *Apophyſes* or proceſſes of the *Vertebræ*, fourthly the holes through which the nerves are diſſeminated into other parts from the ſpinall marrow, and beſides the perforations of the tranſverſe productions by which the veins, and arteries, which we call *Cervicales*, aſcend alongſt the neck, and laſtly the connexion of theſe ſame *vertebræ* or Rack-bones. For the firſt, by the body of the *vertebra*, we underſtand the forepart thereof upon which the gullet lies. For the hole, that is not alwayes the largeſt in thoſe *vertebræ* which are nigheſt the head, but it is alwayes encompaſſed with the body of the *vertebræ*, and beſides with three ſorts of proceſſes, except in the firſt Rack-bone, that is right, tranſverſe and oblique. By right we underſtand theſe extuberancies in the rack-bones of the neck which are hollowed directly in the upper part of them, and riſe up creſted on each ſide to ſuſtain and receive the baſis of the Rack-bone which is ſet upon it. By the oblique proceſſes we underſtand the bunchings out

What the neck is.

What to be conſidered in the *vertebræ* of the neck.

Which be the right proceſs of the *vertebræ* Which the oblique.

Which the tranſverſe,

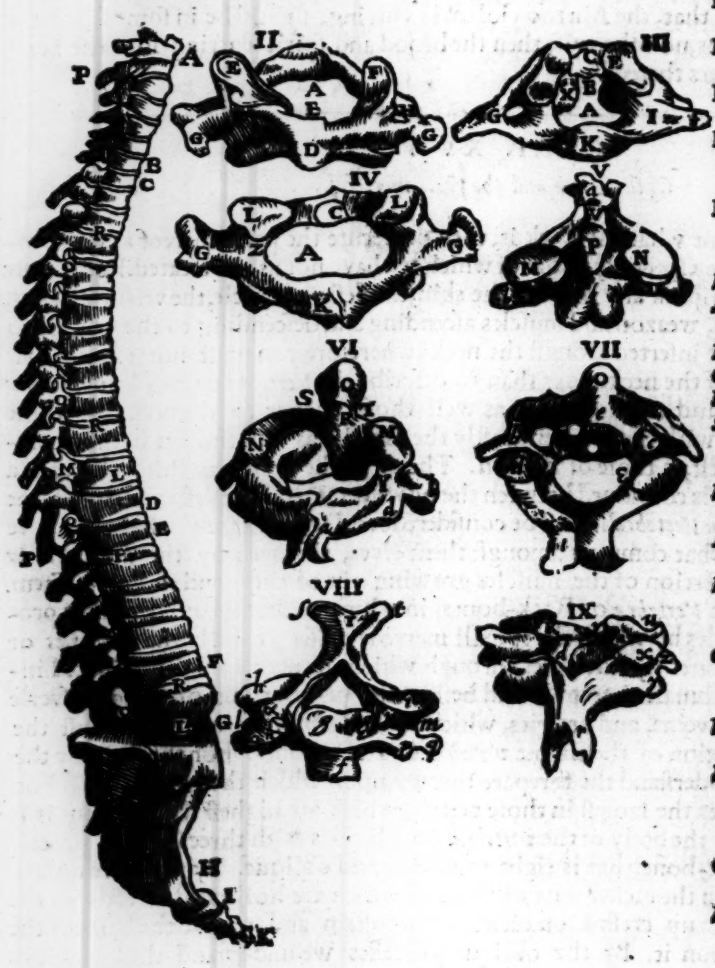
out by which theſe Rack-bones are mutually knit together by *Ginglymos*; theſe are ſeated between the right and tranſverſe proceſſes. By the tranſverſe we underſtand the protuberations next the body, which divide the *vertebra* or Rack-bone in a ſtraight line. Theſe proceſſes are perforated that they may give way to the before deſcribed veins and arteries, which entring the Spinall marrow by the holes of the nerves nouriſh the Rack-bones and parts belonging to them. Beſides you muſt note that the perforations of the Rack-bones of the neck, by which the nerves proceed from the ſpinall marrow to the outward parts, are under the tranſverſe proceſs, that is growing or made by the upper and lower *vertebra*, contrary to all the other which are in the reſt of the Rack-bones. For the connexion of the Rack-bones, you muſt know that all the *vertebræ* of the ſpine have ſix connexions, two in their own bodies, & four in their oblique proceſſes. By the two firſt connexions they are ſo mutually articulated in their own bodies that each are joyned with other both above and below. But by the four other by their oblique aſcendent & deſcendent proceſſes on each ſide two, they are ſo mutually inarticulate, that as the fourth Rack-bone of the neck by its oblique aſcendent proceſſes, is received of the deſcendent proceſſes of the third rack-bone; ſo it receives the oblique aſcendent proceſſes of the firſt, by its oblique deſcendents, for alwayes the oblique aſcendents are received, and the deſcendents receive. Yet we muſt except the firſt Rack-bone of the neck which is contained with four connexions by his lower oblique proceſſes, and by its upper by which it receives the oblique proceſſes both of the nowl-bone, and of the ſecond Rack-bone. The ſecond *vertebra* or Rack-bone muſt alſo be excepted which is holden by five connexions, that is to ſay, four by its oblique proceſſes, and the fift by its own body, by which it is knit to the body of the third *vertebra*. But we muſt note, that whereas nature hath not given a Spine to the firſt Rack-bone, yet it hath given it a certain bunch or extuberancy in ſtead thereof; in like manner, ſeeing it makes no common paſſage with the ſecond *Vertebra* for the paſſing forth of the nerve, it is perforated at the ſides of its body, and it is made very thin on the foreſide, as if it were without body, that it might receive the fore proceſs raiſed in the upper body of the ſecond Rack-bone, which *Hippocrates* calls the tooth, to which the principall Ligament of the head is faſtened, which deſcends within from the hind part of the head under the *Apophyſes clinoides* or proceſſes of the wedg-bone.

The connexions of the *vertebræ* of the neck.

The proceſs called the tooth.

Table 20. *Figure* 1. *Sheweth all the Rack-bones of the back knit together.*
Figure 2. *Sheweth the fore and upper face of the neck, &c. See D.* Crook, pag. 398.

FIG. I



From *A*, to *B*, the ſeven *vertebræ* of the neck.
From *C*, to *D*, the twelve *vertebræ* of the cheſt.
From *E*, to *F*, the five rack-bones of the Loines.
From *G*, to *H*, the *Os ſacrum*, or Holy-bone conſiſting, commonly of 6. *vertebræ*.
From *I*, to *K*, the bone *Coccyx* or the rump-bone according to the late writers.
LL, the bodies of the *vertebræ*.
M, the tranſverſe proceſſes of the *vertebræ*.
N, the deſcendent proceſſes.
OO, the aſcendent proceſſes.
PP, the backward proceſſes.
QQ, the holes that are in the ſides of the *vertebræ* through which the nerves are tranſmitted.
RR, A griſly Ligament betwixt the *vertebræ*.
A, 2, 3, 4, the hole whereout the marrow of the back iſſueth.
B, 2, 3, The cavity which admitteth the root of the ſecond rack-bone.
C, 3, 4, a cavity or *Sinus* in the ſame place cruſted over with a griſtle.
D, 2, a prominence in the outward region of this *Sinus*.
EF, 2, 3, the *Sinus* or cavity of the firſt rack-bone which admitteth the 2. heads of the nowl-bone.
GG, 2, 3, 4, the tranſverſe proceſs of the 1. *Vertebra*.
H, 1, the hole of this tranſverſe proceſs.

I, 3, the *Sinus* which together with the cavity of the nowl-bone marked with *E*, maketh a common paſſage prepared for the nerves.
K, 3, 4, a rough place where the ſpine of the firſt rack is wanting.
LL, 4, two cavities of the firſt rack receiving the 2. bunches of the ſecond rack marked with *MN*.
MN, 5, 6, the 2. bunches of the ſecond rack which fall into the cavities of the firſt. *O*, 7, the appendix or tooth of the ſecond rack. *P*, 5, a knub of this appendix cruſted over with a griſtle. *Q*, 6, the backſide of the tooth. *R*, 6, the *Sinus* or cavity of the ſame, about which a tranſverſe Ligament is rowled containing the ſaid tooth in the cavity of the firſt rack. *ST*, 6, Certain cavities at the ſides of the tooth whence the roots iſſue of the forebranch of the ſecond pair of ſinews. *V*, 5, the point of the the tooth. *X*, 5, an aſperity or roughneſs where is a hole but not thrilled through. *Y*, 6, a cavity of the ſecond rack which together with the cavity marked with *Z*, maketh a hole through which the nerves do iſſue. *Z*, 4, the *Sinus* of the firſt rack. *a*, 5, 6, 7, the double ſpine of the ſecond rack. *b*, 5, 6, 7, the tranſverſe proceſs of the ſecond rack. *c*, 7, the hole of the ſaid tranſverſe proceſs. *d*, 6, 7, the deſcending proceſs of the ſecond rack whoſe cavity is marked with *d*, in the 6. figure. *e*, 6, 7, the place where the body of the ſecond rack deſcendeth downward. *f*, *gg*, 8, the lower ſide of the body of the third rack at *f*, the two eminent parts of the ſame at *gg*. *h i*, 8, the aſcending proceſſes. *l m*, 8, the two deſcending proceſſes. *n o p q*, 8, the tranſverſe proceſſes. *r*, 8, 9, the ſpine or backward proceſs. *ſt*, 8, the two tops of the ſpine. *u*, 9, the deſcending proceſs of the third rack. *x*, 9, the aſcending proceſs. *y*, the tranſverſe proceſs of the third rack. *a*, 8, 9, the hole of this tranſverſe proceſs. *β*, 9, the upper hollowed part of the body of the third rack. *δ*, 9, the *Sinus* or cavity which maketh the lower part of a hole through which the conjugations of the nerves are led. *ε*, 7, the upper part of the ſame hole.

And by this articulation the head is bended forwards and backwards, as it is moved to the ſides by the articulation of the firſt Rack-bone with the ſecond. That proceſs is bound by two Ligaments, the firſt of which being greater and broader is externall, comprehending in the compaſs thereof all the upper articulation, aſcending from the rack-bones to the head, or rather deſcending from the head to them, as any other Ligament going from one bone to another; The other is the ſtronger and alſo incompaſſes the articulation mixing its ſelf with the griſtle, which by its interpoſition binds together all the Rack-bones, the firſt excepted, as you may ſee in pulling aſunder the Rack-bones of a Swine; and the whole Spine or Back-bone is tyed together and compoſed throughout with ſuch Ligaments.

By what articulation the head is bended backwards and forwards.

The Holy bone is compoſed of 4. *Vertebræ* (or rather of five, or ſix, as in the figure following) beſides the Rump-bone, it receives, and holds faſt the *Oſſa Ilium*, or Hanch-bones, and is as a Baſis to all the Rack-bones placed above it, whereby it comes to paſs that the Rack-bones from the Head to the Holy-bone grow ſtill thicker, becauſe that which ſupports ought to bigger than that which is ſupported. There is a certain moiſture, tough and fatty, put between the Rack-bones, as alſo in other joynts, to make them glib and ſlippery, that ſo they may the better move. Whilſt this motion is made, the Rack-bones part one from another.

The *Vertebræ* of the Holy bone.

The commodities or uſes of the Spine are ſaid to be four. The firſt is, that it is, as it were, the ſeat and foundation of the compoſure and conſtruction of the whole body, as the Carkaſs is in a ſhip. The ſecond, that it is a way or paſſage for the marrow. The third is, becauſe it contains and preſerves the ſame. The fourth is, that it ſerves for a wall or bulwark to the entrails, which lye and reſt upon it on the inſide. And becauſe we have fallen into mention of Ligaments, it will not be amiſs to inſert in this place, that which ought to be known of them. Firſt, therefore, we will declare what a Ligament is, then explain the divers acceptions thereof, and laſtly proſecute their differences.

The manifold uſes of the Backbone.

Therefore a Ligament is nothing elſe than a ſimple part of mans body, next to a bone and Griſtle the moſt terreſtriall, and which moſt uſually ariſes from the one or other of them either mediately or immediately, and in the like manner ends in one of them, or in a Muſcle, or in ſome other part; whereby it comes to paſs that a Ligament is without blood, dry, hard, cold, and without ſenſe, like the parts from whence it ariſes, although it reſemble a Nerve in whiteneſs and conſiſtence, but that it is ſomewhat harder.

What a Ligament is.

Why it is without ſenſe.

A Ligament is taken either generally or more particularly; in generall, for every part of the body, which tyes one part to another, in which ſenſe the skin may be called a Ligament, becauſe it contains all the inner parts in one union. So the *Peritonæum* comprehending all the naturall parts, and binding them to the back-bone: ſo the membrane inveſting the Ribs, (that is, the *Pleura*) containing all the vitall parts; thus the membranes of the brain, the nerves, veins, arteries, muſcles, membranes, and laſtly all ſuch parts of the body, which bind together and contain other, may be called Ligaments, becauſe they bind one part to another; as the nerves annex the whole body to the brain, the Arteries faſten it to the heart, and the veins to the liver. But to conclude, the name of a Ligament more particularly taken, ſignifies the part of the body, which we have deſcribed a little before.

What parts may be called Ligaments in a generall ſignification.

The differences of Ligaments are many, for ſome are membranous and thin; others broad, otherſome thick and round, ſome hard, ſome ſoft, ſome great, ſome little, ſome wholly griſtly, others of a middle conſiſtence between a bone and a griſtle, according to the nature of the motion of the parts, which they bind together in quickneſs, vehemency and ſlowneſs. We will ſhew the other differences of Ligaments, as they ſhall preſent themſelves in diſſection.

The differences of Ligaments properly ſo called.

CHAP.

CHAP. XVII.

Of the Muſcles of the Neck.

Their number.

THe Muſcles of the neck as well proper as common, are in number twenty, or elſe twenty two, that is, ten, or eleven on each ſide; of which, ſeven only move the head, or the firſt *vertebra* with the head; the other three or four, the neck it ſelf. Of the ſeven which move the head, and with the head the firſt *Vertebra*, ſome extend and erect it, others bend and decline it, others move it obliquely, but all of them together in a ſucceſſive motion move it circularly, and the like judgment may be of the Muſcles of the Neck.

The fourth Figure of the Muſcles. This Figure ſheweth the cavities of the middle and lower bellies, the bowels being taken out, but moſt part of the bones and muſcles remaining.

AB. The firſt muſcle bending the neck called *Longus.*

CC. The ſecond bender of the neck called *Scalenus.*

DDDD. The outward *intercoſtall* muſcles.

E E E E, The inner *intercoſtall* muſcles.

F F F, The ſecond muſcle of the cheſt called *ſerratus major.*

G, The firſt muſcle of the ſhoulder-blade called *ſerratus minor*, ſeparated from his originall.

H, The firſt muſcle of the arm called *Pectoralis*, ſeparated from his originall.

I. The ſecond muſcle of the arm called *Deltoides.*

K. The bone of the arm without fleſh.

L, The firſt muſcle of the cubit callad *Biceps.*

M. The ſecond muſcle of the cubit called *Brachiæus.*

N. The clavicle or coller-bone bent backward.

O. The firſt muſcle of the cheſt called *ſubclavius.*

P, The upper proceſs of the ſhoulder-blade. *Q.* The firſt muſcle of the head called *obliquus inferior. R.* The ſecond muſcle of the head called *Complexus. S.* The fourth muſcle of the ſhoulder blade called *Levator. T V.* The two bellies of the fourth muſcle of the bone *Hyoïs. X X. a a.* The fift muſcle of the back whoſe originall is at *aa. Y Y. bb. cc.* The fixt muſcle of the thigh called *Pſoæ*, whoſe originall is at *c c.* and tendon at *b b. Z Z.* The ſeventh muſcle of the thigh. *d.* the holy bone. *o o o.* The holes of the holy bone, out of which the nerves do iſſue. *e.* A portion of the fifth muſcle of the thigh ariſing from the ſhare-bone. *f* the ſhare-bone bared. *k.* The ninth muſcle of the thigh or the firſt *circumactor.*

But before I can come to the deſcription of their originall and inſertion, I muſt admoniſh thee, that the 2 Muſcles of the ſhouder-blade muſt firſt be taken away by diſſection; that is, the *Trapezius*, or Table-muſcle, and the *Rhomboides*, or ſquare-muſcle; whoſe originall and inſertion that we may the better demonſtrate, (or rather the action by which we ſeek that originall and inſertion,) they muſt be pulled up, beginning at their inſertion, which is at the ſhoulder-blade (as ſhall be ſhewed in the proper place) turning them up towards their originall, that is, to the Spine. Beſides the leſs *Rhomboides*, the hinder, and upper (called alſo the *Dentatus* or toothed-muſcle) muſt be raiſed from its originall, which is at the three lower Rack-bones of the Neck and the firſt of the back, and turned up to its inſertion, which is at three ſpaces of the lower ribs nigh

nigh to the hind, and upper angle of the Shoulder-blade, as ſhall be ſhewed in fit place hereafter. Theſe muſcles thus raiſed up, the 4 muſcles which erect and extend the head muſt be taken away, and then thoſe two which move it obliquely, and laſtly one which bends, or declines, for thus anatomicall order requires. Yet if you think good, you may, not hurting the other, firſt of all cut away that which is called the *Maſtoides*, which declines or bends the head. For theſe 4, which lift up and extend the head, the firſt from the figure of the ſpleen is called the *Splenius*, it aſcends from the 5, upper ſpines of the back and the 4, lower of the neck, and is obliquely inſerted at the back part of the head and the mamillary proceſs, whence you may raiſe it towards its originall. The ſecond by reaſon of its compoſure is called *Complexus*; this paſſing from the third, fourth and fifth tranſverſe proceſs of the back and often from the firſt of the neck, aſcends directly to the back part of the head, incompaſſing the lower and ſide part of the neck, you may eaſily take it up; if you begin at the ſpine, and ſo go forwards to the tranſverſe proceſſes and mamillary proceſſes of the nowl-bone. This *Complexus* may be divided into two or three muſcles, but that with ſome difficulty, by

The *Splenius*.

The *Complexus*.

The fifth Figure of the muſcles in which ſome muſcles of the Head, Cheſt, Arm, and ſhoulder-blade are deſcribed.

I. The proceſs of the ſhoulder-blade, called the top of the ſhoulder.

O. The fourth muſcle of the arm or *the greater round muſcle*, to which *Fallopius* his right muſcle is adjoined, which ſome call the *leſſer round muſcle*.

Q Q. The ſixt muſcle of the arm or the upper *hade-rider*.

X. The ſecond muſcle of the ſhoulder-blade or the *Levator* or heaver.

Z. The ſecond muſcle of the cheſt or the *greater Saw-muſcle*.

Y. The fift muſcle of the cheſt or muſcle called *Sacrolumbus*.

αβ. His place wherein he cleaveth faſt to the longeſt muſcle of the back.

γγ. The tendons of the muſcle obliquely inſerted into the ribs.

δδ. The firſt pair of the muſcles of the head or the Splinters.

Cb. 8. 9. Their length whoſe beginning at 8 and inſertion at 9.

10. 11. The ſides of this muſcle.

12. That diſtance where they depart one from the other.

13. The two muſcles called *Complexi*, near their inſertion.

θ. The ſecond muſcle of the back or the *Longeſt* muſcle.

ω. The fourth muſcle of the back or the *Semi-ſpinatus*.

ϑ. The ſhoulder-blade bare.

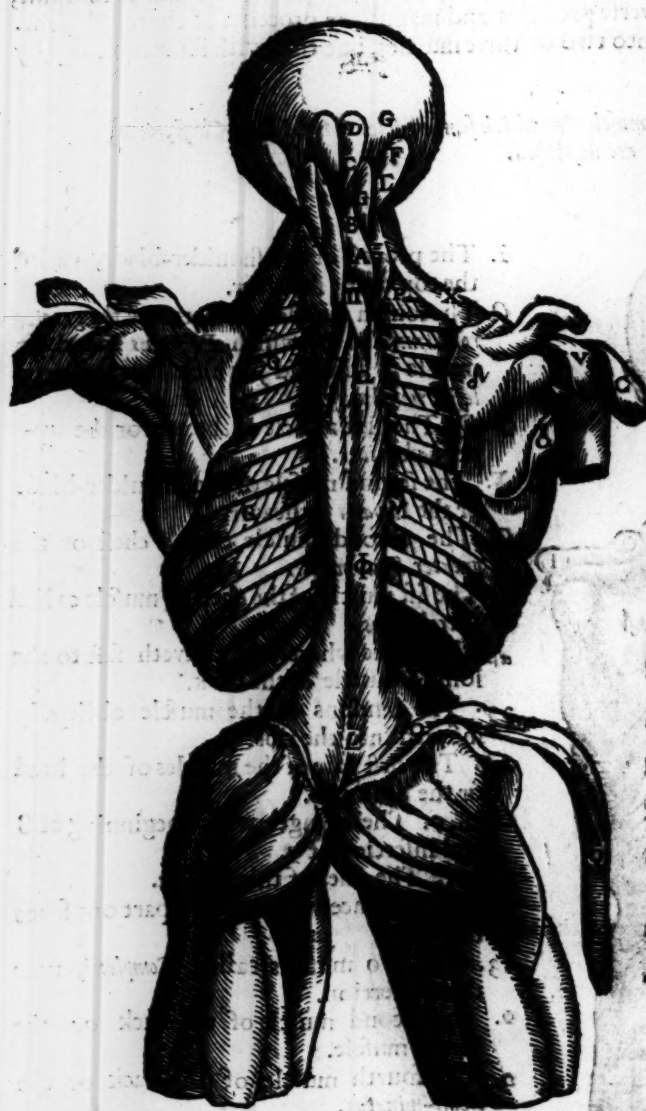
P. A part of the tranſverſe muſcle of the *Abdomen*.

reaſon of its folded texture. The third and fourth, which be two of the eight little muſcles, being four on each ſide, do aſcend ſomewhat obliquely, the firſt truly from the whole ſide of the ſecond *Vertebra*. The ſecond from the whole ſide of the proceſs of the firſt *Vertebra*, which it hath in ſtead of a ſpine; they aſcend to the back part of the head juſt againſt the ſpine; theſe two muſcles by the conſent of all Anatomiſts are called right, or direct muſcles, only moving the head: theſe truly muſt not be pluckt from the places of their originall, nor inſertion, but only bound by a ſtring put under them, that ſo they may be the more eaſily ſhewed. On each ſide follow two oblique muſcles, one whereof only moves the head; the other primarily the firſt *Vertebra*, but ſecondarily, and by

The Recti, or 2 right muſcles.

accident the head it ſelf. For the firſt, contrary to the opinion of ſome, it ariſes from the tranſverſe proceſs of the firſt rack-bone, and then is inſerted, above the inſertion of the firſt right muſcle: the which in like manner you muſt lift up, by ſomething put underneath it, but not ſeparate it. The other entring forth of the ſpine of the ſecond *Vertebra*, is inſerted at the proceſs of the firſt, contrary to the originall of the precedent, although ſome think otherwiſe. It will be convenient in the like manner only, to lift up this with a ſtring, and not pluck him from his place, that ſo you may ſee how all theſe make a perfect triangle. The action of this muſcle is contrary to the action of the precedent, as the contrariety of its originall and inſertion ſhew.

The ſixth Figure of the muſcles, ſhewing ſome of the muſcles of the Head, Back, Cheſt, Shoulder-blade and Arm.



A D. the ſecond pair of the muſcles of the head, or the two *Complexi*, the firſt part is at *A D.*

E C. the ſecond part *E F*, the third part riſing up under *G* and inſerted at *F.*

G. the fourth part of this muſcle or the right muſcle of the head according to *Fallopius*, which *Veſalius* made the 4 part of the 2.

G G. (Betwixt the ribs) the externall *Intercoſtall* muſcles.

L. the originall of the 2. muſcle of the back.

M. His tendons at the rack-bone of the neck.

P the upper *Q* the fourth muſcle of the arm or the *greater round* muſcle.

O O, the lower, the 6 muſcle of the cheſt, or the *Sacrolumbus* hanging from his originall.

R. the firſt muſcle of the arm or the upper *Bladerider* inverted.

V. the third ligament of the joynt of the arm.

X. the fourth muſcle of the ſhoulder blade or the *heaver.*

Z. the ſecond muſcle of the Cheſt, or the greater *Saw muſcle.*

Σ. the three muſcles of the neck called *Tranſverſales.*

Π. the 4 muſcle of the neck called *Spinatus.*

Σ. the firſt muſcle of the back, or the *Square muſcle.*

Φ. the 2. muſcle of the back or the *Longiſſi*, whoſe originall is at *L* and his tendons at the *Vertebra* at *O M M.*

Ω. the fourth muſcle of the back called *Spinatus.*

S. the back of the ſhoulder-blade flayed

Which may be truly called the propet muſcle of the neck.

Wherefore when the firſt oblique moves the head obliquely forwards, the ſecond puls it back by the firſt *Vertebra*, this with his aſſociate of the other ſide, may be truly termed the proper muſcles of the neck, becauſe they belong to no other part; whereas it is contrary in other muſcles. But we muſt note, that the head (according to *Galens* opinion) hath two motions, one directly forwards and backwards, as appears in beckning it forwards, and caſting it backwards; the other circular.

The two motions of the head.

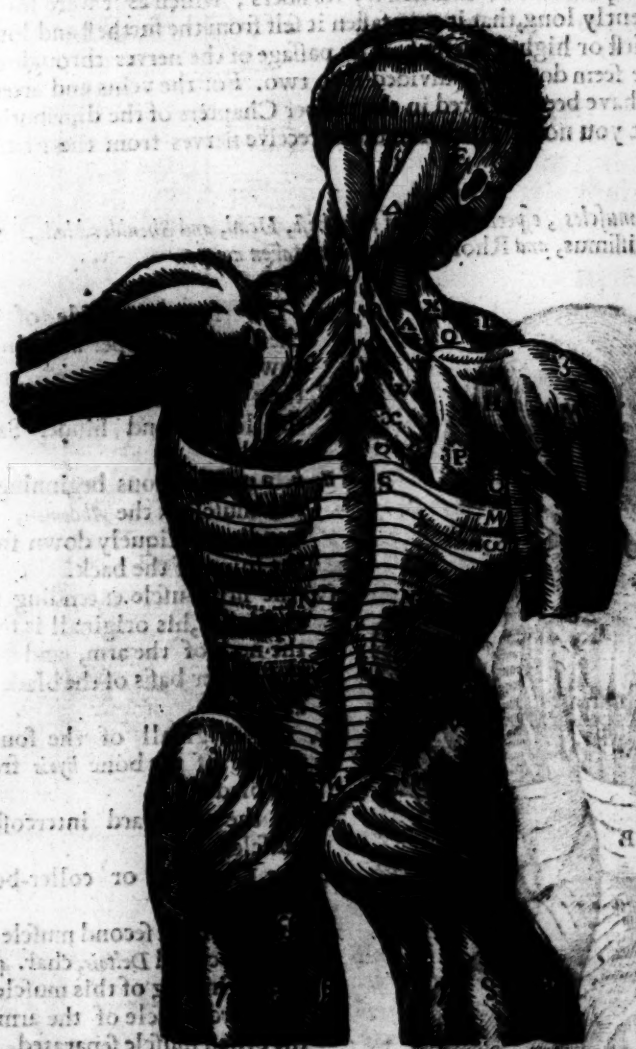
The firſt in *Galens* opinion is performed by the firſt *Vertebra* moved upon the ſecond; the ſecond by the head moved upon the firſt *Vertebra*; for which he is reproved by the latter Anatomiſts, who teach that the head cannot be turned round or circularly upon the firſt *Vertebra* without putting it out of joynt.

The *Maſtoideus.*

For the laſt which bends the head, it aſcends from the upper and fide part of the *Sternon*, and the next part of the clavicle, obliquely to the *Apophyſis Maſtoides* or mamillary proceſs of the hind part of the head, whence it is called the *Maſtoideus.* You may divide this by reaſon of its manifold originall rather into two, than into three muſcles. But it had been better that the head might have been moved every way, equally back-

backwards and to the right and left sides; but thus it would often have been strained to our great damage and danger of life; neither could there have been such facility of motion without a loosnes of the joint. Therefore nature had rather bestow upon the head an harmless faculty of fewer motions, than otherwise furnished with more variety, but with a great deal more uncertainty and danger. Wherefore it hath made this juncture not lax or loose, but stiffe and strong.

The seventh Figure of the muscles; shewing some muscles of the head and Chest; the Trapezius *or Table-muscle being taken away: as also of the blade and arm.*



A. The prominent part of the fourth muscle of the chest called *Serratus posticus superior.*

C. the first muscle of the head called *Splenius.*

E E. the insertion of the second muscle of the head called *complexus.*

I. the coller bone bared.

M. the back part of the second muscle of the arm called *Deltois.*

H. his backward originall.

I. his implantation into the arm.

N N. the fourth muscle of the arm called *Latissimus.*

Z A. his originall from the spines of the rack-bones and from the holy-bone.

a. the connection of this muscle with the haunch-Bone, which is led in the inside from *a* to *a.*

a. the place where it lyeth upon the lower angle of the Basis of the shoulder-blade.

O. the four muscles of the arm called *Rotundus major.*

d. some muscles of the back do here offer themselves.

P. the fift muscle of the arm called *Serratus Angularis Inferior.* *Q.* the first muscle of the arm called *Superscapularis Superior.* *S.* the beginning of the third muscle of the arm called *Latissimus.* *V.* the third muscle of the blade called *Rhomboides.* *X.* his originall from the spines of the rackbones. *a.* his insertion into the basis of the shoulder-blade. *Z.* the fourth muscle of the blade called *Levator.* * a part of the oblique descendent muscle of the *Abdomen.*

After the shewing of these muscles, we must come to three or four of the neck, of which number two (which some reduce to one) extend, another bends, and the last moves side wayes, and all of them with a motion fit for turning each other turn it about as we said of the muscles of the head. The first of these which extend, taking its originall from the six transverse processes of the six upper rack-bones of the back, or rather from the root of the oblique, ascends directly to the spine of the second *vertebra* of the neck, and the oblique proceſs thereof; some call it the *Transversarius*; that is, the transverse-muscle. This, if you desire to take it away, it is best first to separate it from the spine, then to turn it upwards to the transverse proceſs; unless you had rather draw it a little from its part-ner and companion in that place where their originals are distinct, seeing it is the last, and next to the bones. The *Transversarius.*

Marvell not, if you find not this distinction of their originall, so plain and manifest, for it is commonly obscure. For the muscle *spinatus*, as it most commonly comes to pass, arising from the roots of the seven upper spines of the back, and the last of the neck, is inserted into other spines of the neck, so that it might easily be confounded with the former The *Spinatus.*

by *Galen*. The third bends the neck, and ariſing within from the body of the five upper *Vertebræ* of the back (though with a very obſcure originall, ſpecially in lean bodies) it aſcends under the gullet alongſt the neck, even to the nowl-bone, into whoſe inner part it is obſcurely inſerted. Wherefore it is likely that it helps not only to bend the neck, but alſo the head. This muſcle is made of oblique fibers proceeding from the body of the *Vertebræ*, all the way it paſſes to the tranſverſe proceſſes of the other *Vertebra*. But it ſeems with its copartner which is oppoſite to it, to make a certain hollow path upon the bodies of the *Vertebræ*, to the gullet, and it is called the long muſcle. The fourth and laſt, which we ſaid moves the neck to one ſide, is called *Scalenus* from the figure thereof; it aſcends from the hinder and upper part of the firſt rib of the Cheſt, inſerting its ſelf into all the tranſverſe proceſſes of the neck by its fibers, which as it were for the ſame purpoſe, it hath ſufficiently long, that it may faſten it ſelf from the furtheſt and loweſt proceſs of the neck into the firſt or higheſt thereof. The paſſage of the nerves through this to the arm makes this muſcle ſeem double or divided into two. For the veins and arteries pertaining to the neck, they have been declared in the proper Chapters of the diſtributions of the veſſels; it remains that you note, all theſe muſcles receive nerves from the *Vertebræ* whence they ariſe.

The *Longus*.
The *Scalenus*.

The eight Figure of the muſcles, eſpecially thoſe of the Cheſt, Head, and Shoulder blade, the Trapezius, Latiſſimus, *and* Rhomboides, *being taken away.*

A. The fourth muſcle of the cheſt, or the upper and hinder Saw-muſcle.

B. the 5 muſcles of the cheſt, or the lower and hinder Saw-muſcle.

a. b. a membranous beginning of the muſcle of the *Abdomen*, deſcending obliquely down from the ſpine of the back.

C. the firſt muſcle extending the Cubit at *c*, his originall is from the neck of the arm, and from the lower baſis of the blade at *d*.

E. the originall of the fourth muſcle of the bone *hyois* from the blade.

GG. the outward intercoſtall muſcles.

I. the Clavicle or coller-bone bared.

N. the upper, the ſecond muſcle of the arm called *Deltois*, char. 4, 5. the beginning of this muſcle.

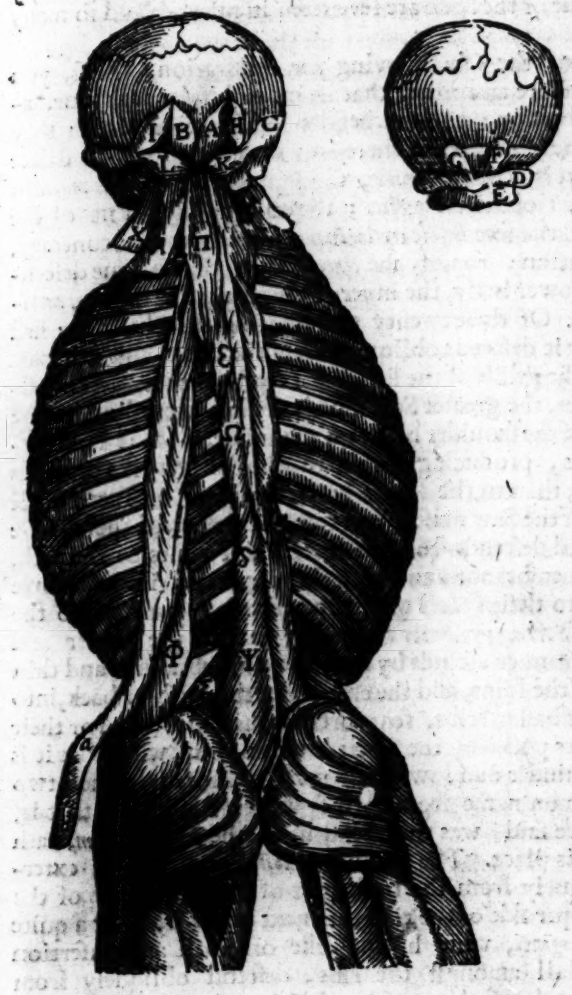
N. the third muſcle of the arm or the broad muſcle ſeparated.

O. the fourth muſcle of the arm or the lower *Super-Scapularis* or blade-rider.

1, 2, 3. Char. His originall at the baſis of the ſhoulder-blade at 12. and his inſertion into the joynt of the arm at 3. *Q.* the firſt muſcle of the arm or the upper *Super-Scapularis*. *X.* the fourth muſcle of the blade called *Levator* or the heaver. *Z.* the ſecond muſcle of the Cheſt or the greater Saw-muſcle. 7. 7. Char. the ribs. *T.* the firſt muſcle of the cheſt, or the muſcle called *Sacrolumbus*. *A.* the firſt muſcle of the head or the ſplinter. *EE.* the ſecond muſcle of the head or the inſertion of the muſcles called *complexi*. *Φ.* the ſecond muſcle of the back or the longeſt muſcle. *Ω.* the fourth muſcle of the back called *Semiſpinatus*.

The

The ninth Figure of the muſcles, ſhewing the muſcles of the Head and Neck.



A B. the third pair of the Muſcles of the head called *Recti Majores.*
C. the Mamillary proceſs.
D. the tranſverſe proceſs of the firſt rackbone.
E, the proceſs of the ſecond rackbone of the neck.
F G, the fourth pair of muſcles of the head called *Recti Minores.*
H I, the fift pair of muſcles of the head called *obliqui Supepeirior.*
K L, the ſixt pair of muſcles of the head called *obliqui inferiores.*
X, the fourth pair of muſcles of the ſhoulder blade.
A, the ſecond muſcle of the neck called *Scalenus*, which *Falopius* maketh the eight muſcle of the cheſt.
Π, the fourth muſcle of the neck called *ſpinatus.*
Ξ, the firſt muſcle of the back called *Quadratus.*
o, the ſecond muſcle of the back called *Longiſſimus.*
a, the *ſinus* or boſom of this muſcle, whereby it giveth way unto the third muſcle of the back, called *Sacer.*
b, his Originall.
c, the third muſcle of the back called *Sacer.* γ, his Originall. δ, his end.
ω, the fourth muſcle of the back called *Semiſpinatus.* ε, his upper end under the fourth muſcle of the neck.

CHAP. XVIII.

Of the Muſcles of the Cheſt and Loyns.

WE muſt now ſpeak of the Muſcles both of the Cheſt which ſerve for reſpiration, as alſo of the Loins. But firſt we muſt know that the hind part of the Cheſt called the *Metaphrenum*, or back, conſiſts of twelve *Vertebræ*, the loins of five, all which differ not from the *Vertebræ* of the neck, but that they are thicker in their bodies than theſe of the neck; neither are they leſſer in holes, neither have they their tranſverſe proceſſes perforated or parted in two as the rackbones of the neck have. Beſides each of theſe rack bones alone by it ſelf, on each ſide in the lower part thereof makes a hole, through which a nerve hath paſſage from the ſpinall marrow to the adjacent parts, when on the contrary in the *Vertebræ* of the neck, ſuch holes or paſſages are not made, but by meeting together of two of them.

In what the *Vertebræ* of the neck and loins agree and diſagree.

Concerning the proceſſes of the Rackbones of the Cheſt, whether tranſverſe, right or oblique, they differ nothing from theſe of the neck (I mean even to the tenth) but that the tranſverſe ſeeing they are not perforated, as we ſaid before, do as it were ſuſtain the ribs, being ſtraitly bound to them with ſtrong ligaments both proper and common; but after the tenth *Vertebra* of the back, the two other of the back, and all thoſe of the loins are different, not only from thoſe of the neck, but alſo from the ten firſt of the back, by reaſon of their oblique proceſſes, becauſe from the eleventh (which is received, as well by that which is above it, as by that under it, for the ſtrength of the whole back, and the eaſier bending thereof without fear of fracture or diſlocation) the above mentioned proceſſes of the lower rack bones which were wont to receive, are received; as on the contrary they receive which were wont to be received. They differ beſides from all the forementioned, by reaſon of their ſpines, becauſe from the eleventh they begin by little and little to look upwards, contrary to the former.

But if any ask, how the tenth *vertebra* of the back may be termed the midſt of the

How the tenth *vertebræ* of the back, may be ſaid to be the middle of the ſpine.

ſpine, being the whole ſpine conſiſts of twenty four *vertebræ*? He may know that this may be true, as thus; if the ſix bones of the holy bone, and the fourth of the Rump (being more griſtly than bony) be numbred amongſt the bones of the Spine; for then from the ſetting on of the head to the eleventh rack bone of the back are ſeventeen in number, and ſo many from thence downwards.

The number of the muſcles of the Cheſt.

But let us return to the muſcles of the Cheſt ſerving for reſpiration. Firſt, you muſt know that theſe Muſcles are fourſcore and nine, that is, on each ſide forty four, alike in ſtrength, thickneſs, ſite, and action; and one beſides in the midſt which they call the *Diaphragma* or midriffe. Of theſe forty four, there are twenty two which dilate the cheſt in drawing in the breath; that is, the *Subclavius*, the *Dentatus*, or *Serratus major* in the opinion of ſome, both the *Rhomboides* or *Serrati poſtici*; the oblique aſcendent of the lower belly, the eleven *Intercoſtales*, and the ſixe *Intercartilaginei externi*. On the contrary, as many contract the breaſt in expiration; to wit, the *Sacrolumbus*, the oblique deſcendent, the Right and tranverſe of the lower belly, the inner Trangular, the ſix *Intercartilaginei*, and the eleven inner *Intercoſtales*. Of theſe twenty two dilating the Cheſt, the firſt from the ſite is called the *Subclavius*, for it deſcends obliquely from the inner and forepart of the *Clavicula* or Caller bone, into the griſtle of the firſt rib, even to the *Sternon*, and dilates it. The ſecond is the *Serratus major*, the greater Saw muſcle ariſing according to the opinion of ſome from the whole *baſis* of the ſhoulder blade on the inſide, and it is tranſverſly inſerted into the nine upper ribs, producing certain toothed or ſaw-like proceſſes running further to the bones of the rib, than to the ſpaces between them, or Intercoſtall muſcles, whereupon it hath the name of the Saw muſcle; yet ſome have referred this muſcle to them of the ſhoulder blade. The third deſcends from the three lower ſpines of the neck, and the firſt of the back, by means of a membranous and moſt thin ligament, into the three or four upper ribs, running further into their ſpaces or Intercoſtall muſcles, than into the ribs themſelves, whereupon it is called *Serratus poſterior & ſuperior*, that is, the hinder and upper Saw muſcle. The fourth in like manner aſcends by means of a membranous and thin ligament from the three upper ſpines of the loins, and the two laſt of the cheſt, or back, into three or four of the lower, or laſt of the baſtard ribs, ſent forth further into them or their bones, than into the Intercoſtall muſcles poſſeſſing the ſpaces between them, wherefore it is called *Serratus poſterior & inferior*, the hinder and lower Saw muſcle. Moreover theſe two laſt muſcles have been called by a common name from their figure the *Rhomboides*, that is, the ſquare muſcles. The fift which we ſaid was the aſcendent of the *Epigaſtrium*, hath already been ſufficiently deſcribed in his place. The eleven *Intercoſtales externi*, or externall Intercoſtall muſcles deſcend obliquely from the back part of the lower ſide of the upper rib, into the forepart of the upper ſide of the rib lying next under it, after a quite contrary manner to the ſix *Intercartilaginei*, who having like originall and inſertion amongſt the griſtles, as the Intercoſtall amongſt the ribs, deſcend obliquely from the forepart backwards. And thus much of the muſcles dilating the Cheſt in inſpiration.

The muſcles dilating the Cheſt.

The muſcles contracting the Cheſt.

The *Subclavius* is the firſt of the muſcles dilating the cheſt.

Serratus major.

Serratus poſterior and *ſuperior.*

The oblique aſcendent of the lower belly.

The eleven *Intercoſtales externi.*

6. *Intercartilaginei.*

But the firſt, of the other muſcles, being as many in number, which contract the Cheſt in expiration, ariſing from the holy-bone, and the oblique proceſſes of the loines, aſcends (firmly and confuſedly adhering with the *Muſculus ſacer*, or holy muſcle; which we ſhall deſcribe hereafter) to the roots of the twelve ribs, imparting in the aſcent a ſmall tendon to each of them, by which it draws theſe ribs towards the tranſverſe proceſſes; and by reaſon of its Originall it is called *Sacrolumbus*, that is, the Holy loine muſcle.

The *Sacrolumbus*, the firſt of thoſe which contract the cheſt.

The second, third, and fourth, which we ſaid were the oblique deſcendent, right, and tranſverſe of the *Epigaſtrium*, have been formerly deſcribed in their place.

The oblique deſcendent, the right and tranſverſe of the *Epigaſtrium.*

But by the way you muſt note that theſe three muſcles of the *Epigaſtrium* help expiration rather by accident, than of themſelves, to wit, by driving back the midriff towards the lungs by the entrails, which alſo they force upwards, by drawing the parts into which they are inſerted towards their Originall. The fift which we called the *Triangulus*, or Triangular, may be called the *compreſſor* of the griſtles, which proceeding from the inner ſides of the *Sternon*, goes to all the griſtles of the true ribs; this is more apparent under the *Sternon* in beaſts, than in men, though it be not very obſcure in them neither. For the internall Intercoſtall muſcles, in my judgment, they ariſe from the lower ſides of the upper rib, & deſcending obliquely from the forepart backwards, are inſerted into the upper ſide of the rib next under it; ſo that they may follow the production of the fibers of the externall *Intercartilaginei*; as the ſix internall *Intercartilaginei* follow the ſite of the externall Intercoſtall proceeding from behind forwards; wherefore as well the Intercoſtall, as the *Intercartilaginei*, every where interſect each other, after the ſimilitude of the letter X. I know ſome have written that the internall muſcles (whether intercoſtall or *Intercartilaginei*) aſcend from the upper ſide of the lower rib forwards, and backwards.

Triangulus muſculus.

Intercoſtales interni.

Intercartilaginei interni.

But if this were true, it would follow that theſe muſcles admitted their nerves in their tail, and not in their head, ſeeing the nerve alwayes goes under the rib, and not above it.

Muſcles alwayes receive their nerves in heir heads.

The

The midriffe, The muſcles of the loins. They are three pair. *Triangulus.*

The laſt muſcle of the cheſt, that is, the *Diaphragma* or Midriffe, is ſufficiently deſcribed before; wherefore it remains we deſcribe the muſcles of the Loins. Theſe are ſix in number, on each ſide three, equall in thickneſs, ſtrength and ſituation; one of theſe bends, and the other two extend the Loins; it is called by reaſon of the figure the *Triangulus*, or Triangular which bends the Loins, it aſcends from a great part of the hind ſide of the Hanch-bone into the tranſverſe proceſſes of the Loins, and the laſt of the Cheſt on the inſide, for which cauſe it is made of fibers ſhort, long, and indifferent, anſwering to the nearneſs or diſtance of the ſaid proceſſes. The firſt of the extenders is called the *Semiſpinatus*, becauſe even to the middle of its body it takes the originall from the ſpines of the Holy bones and Loins; this with its oblique fibers aſcends from all the ſaid ſpines to the tranſverſe proceſſes, as well of the Loins as Cheſt. The other is called *Sacer*, the Holy-muſcle, becauſe it takes its originall from the Holy-bone, or the ſides thereof; it aſcends with its oblique fibers to the ſpines of the Loins, and of the eleaven lower Rack-bones of the Cheſt.

Semiſpinatus.

Sacer.

CHAP. XIX.

Of the Muſcles of the Shoulder-blade.

NOw we muſt deſcribe the muſcles of the extreme parts, and firſt of the Arm; taking our beginning from theſe of the ſhoulder-blade. But firſt, that we may the better underſtand their deſcription, we muſt obſerve the nature and condition of the ſhoulder-blade. Therefore the blade-bone on that part, which lies next unto the ribs, is ſomewhat hollowed; wherefore on the other ſide it ſomewhat buncles out. It hath two ribs, one above, another below: by the upper is meant nothing elſe than a border or right line, which looking towards the temples is extended from the exterior angle thereof under the collar-bone, even to the Proceſſe *Coracoides* which this rib produces in the end thereof: By the lower, the underſide which lies towards the lower belly and the ſhort ribs.

The deſcription of the blade-bone, or ſhoulder-blade.

Beſides, in this ſhoulder-blade we obſerve the *baſis*, head and ſpine. By the *baſis* we underſtand the broader part of the ſhoulder-blade, which looks towards the back-bone. By the head we underſtand the narrower part thereof, in which it receives the head of the Arm in a cavity, indifferently hollow, which it produces both by it ſelf, as alſo by certain griſtles, which there faſtned encompaſſe that cavity. This kind of cavity is called Glene.

The baſis of the blades. The head of the ſhoulders blade.

This receives and contains the bone of the arm, by a certain ſtrong ligament encompaſſing and ſtrengthning the joint, which kind of ligament is common to all other joints; this ligament ariſes from the bottom of the cavity of the ſhoulder-blade, and circularly encompaſſes the whole joint, faſtning it ſelf to the head of the arm; there are alſo other ligaments beſides this, which incompaſſe and ſtrengthen this articulation. By the ſpine is meant a proceſſe, which riſing by little and little upon the gibbous part of the blade, from the *baſis* thereof where it was low and depreſt, becomes higher untill it ends in the *Acromion*, or upper part thereof. Nature hath made two productions in this bone (that is to ſay, the *Acromion* from the ſpine, and the *Coracoides* from the upper ſide) for the ſtrengthning of the articulation of the arm and ſhoulder-blade, that is, leſt the arme ſhould be eaſily drained upward or forwards; beſides, it is faſtned to the clavicle, by the proceſſe *Acromion*.

The ſpine of the blade. The proceſſes *Acromion* and *Coracoides*. The muſcles of the ſhoulder-blade.

The muſcles which move the ſhoulder-blade are ſix in number, of which four are proper, and two common. The firſt of the four proper ſeated in the forepart, aſcends from the bones of five or ſix of the upper ribs, to the *Coracoides*, which it drawes forwards, and is called *Serratus minor*, that is, the leſſer ſaw-muſcle; which that you may plainly ſhew, it is if you pull the pectorall muſcle from the collar-bone, almoſt to the middle of the *Sternon*. The other firſt oppoſite againſt it, is placed on the fore ſide, and draws its originall from the three lower ſpines of the neck, and the three upper of the Cheſt, from whence it extends it ſelf, and ends into all the griſſly baſis of the ſhoulder-blade, drawing it backwards; it is called the *Rhomboides*. The third from its action, is called the *Levator*, or the leaver, or lifter up, ſeated in the upper part, it deſcends from the tranſverſe proceſſes of the four firſt *Vertebræ* of the neck into the upper angle and ſpine of the blade. The fourth called *Trapezius*, or the Table-muſcle, is ſeated in the back-part and is membranous at the originall, but preſently becomes fleſhy: it ariſes from almoſt all the back-part of the head, from all the ſpines of the neck, and the eight upper *Vertebræ* of the cheſt, and then is inſerted by his nervous part, almoſt into the whole baſis of the blade, extending it ſelf above the muſcles thereof, even to the midſt of its ſpine, where being fleſhy it is inſerted even to the *Acromion*, the upper part of the clavicle, and in ſome ſort to the upper rib. This muſcle hath a threefold action, by reaſon of its triple originall. The firſt is to draw the ſhoulder-blade towards its originall, that is, to the nowle, and ſpine of the neck; the other is to draw it towards the back, becauſe of the contraction of the middle or tranſ-

Serratus minor.

Rhomboides.

Levator.

Trapezius.

tranſverſe fibers which lead it directly thither; and the other is to draw it downwards by reaſon of the originall it hath from the fifth, ſixth, ſeventh and eight ſpine of the *Vertebræ* of the Cheſt.

But we muſt note, that theſe divers actions are not performed by this muſcle, by the aſſiſtance of one only nerve, but by more, which come into it by the ſpinall marrow, by the holes of the *Vertebræ*, as well of the neck as the cheſt, from whence it takes the original. For the two other which are the common muſcles of the blade, and arm, or ſhoulder, we will deſcribe them with the muſcles of the ſhoulder or arm: for one of theſe which is called the *Latiſſimus*, that is, the broadeſt, aſcends from the holy-bone to the ſhoulder-blade and arm.

Latiſſimus.

Pectoralis.

The other the named *Pectoralis* comes from the *Sternon* and collar-bone to the ſhoulder-blade and arm.

CHAP. XX.

The deſcription of the Hand taken in generall.

NOw it befits us to deſcribe in order the muſcles of the arm; but firſt we muſt know, what it is that we call the arm. But ſeeing that cannot fitly be underſtood, unleſſe we know what the hand is, ſeeing that the arm is a part of the hand; therefore firſt we muſt define what a hand is, and then divide it into its parts. Therefore the hand is taken two manner of waies, that is, generally and ſpecially.

What is meant by the hand in generall.

The hand generally taken, ſignifies all that which is contained from the joyning of the arm to the ſhoulder-blade, even to the ends of the fingers. But in particular it ſignifies only that which is comprehended from the furtheſt bones of the cubit, or the beginning of the wriſt, to the very fingers ends.

Therefore the hand in generall is an inſtrument of inſtruments, made for to take up and hold any thing. It is compoſed of three great parts, that is, of the Arm, Cubit, and Hand, vulgarly, and properly ſo called; but the hand taken thus in particular is again divided in three other parts, the *Carpus* or *Brachiale*, the wriſt, the *Metacarpium* or *Poſtbrachiale*, the after-wriſt, and the fingers; all theſe parts (ſeeing each of them are not only organicall parts, but alſo parts of organicall parts) are compoſed of all, or certainly of the moſt of the ſimilar parts; that is, of both the skins, the fleſhy pannicle, the fat veins, arteries, nerves, muſcles or fleſh, coats both common and proper, bones, griſtles, and ligaments, all which we will deſcribe in their order.

The differences of the hand from the ſite thereof.

But firſt I think good to admoniſh you of the differences of the hand taken from the ſite thereof, and theſe differences are ſix in number, the fore, the hind, the internal, the external, the upper and lower ſide or part thereof.

By the fore we mean that part which looks directly from the thumb to the ſhoulder: by the hind, we underſtand the part oppoſite to it, which from the little finger looks towards the baſis of the ſhoulder-blade. By the inſide we ſignifie that part which lies next to the ſides of the body, when the hand retains its naturall ſite; by the outſide, the part oppoſite to it. The upper and lower ſide you may know by the very naming thereof.

Why the hand is divided into ſo many fingers

The hand properly ſo called is divided into five fingers, that ſo it may hold and take up bodies of all figures, as round, triangular, ſquare and the like, and gather up the leaſt bodies with the fingers ends, as needles, pins, and ſuch like.

Why the nails are added to the ſoft fleſh of the fingers.

Nature hath beſtowed two hands upon us, that ſo they may help each other, each moving to each ſide. But for the taking up and holding of ſmall bodies it was fit, that the fingers of their own nature ſoft, ſhould be armed with nails, that conſiſting of ſoft fleſh and an hard nail, they might ſerve for all actions; for the nail is a ſtay to the ſoft fleſh, which otherwiſe would turn away in meeting with an hard body; the uſe of the nails is to ſcratch, ſhave, and pull off the skin, to rend, pinch, and pluck aſunder ſmall bodies. They have not bony hardneſſe, that ſo they might not break but bend.

Why the nails grow continually.

Yet other creatures have hard nails to ſerve them in ſtead of weapons. Their figure is round, becauſe ſuch a figure is leſſe obnoxious to externall injuries; and by reaſon they are ſubject to wearing, they grow continually.

Nature hath placed fleſh on the inner and fide part of the fingers, ſo to preſſe more ſtraitly, the things they once take hold of, ſo that by holding them cloſe together we can hold water that it may not run out. The length of the fingers is unequall, that when they are opened and ſtretched forth, they make as it were a circular figure; for ſo it comes to paſſe, that the hand can hold all bodies, but eſpecially round.

It remains that we proſecute the diſtribution of the veins, arteries, and ſinews, which run over al the parts of the hand taken in generall and particular, whereby we may more commodiouſly hereafter handle all the proper parts thereof.

CHAP.

CHAP. XXI.

The distribution of the Subclavian vein, and first of the Cephalica, *or* Humeraria.

TWo large veins descend from the Subclavian, the one from the lower side, the other from the higher. Yet sometimes, and most usually, both these proceed from the same common orifice, as in men of a low stature in the arm. The one of these is called the *Axillaris*, the other the *Humeraria*, or *Cephalik*; therefore this Cephalick passing forth of the Subclavian runs superficially along the foreside, between the muscle *Deltoides*, and the Tendon of the pectorall muscle, and descends in the midst between the common coat of the muscles, and the fleshy pannicle, even to the bending of the cubit, where in lean bodies it is plainly to be seen, whereas in fat bodies it is hardly to be perceived, being as it were buried in abundance of fat. This vein having in its descent, sent forth some small branches, both to the skin, as also to certain muscles over which it runs, is divided into two, a little above the outward protuberation of the arm. One of the branches into which it is divided descending obliquely to the fore part of the cubit, a little below the bending of the cubit, it meets, and is united with the like branch in the same place, as shall be shown hereafter.

The Cephalick vein.

That which arises from this concourse, is called the median vein, because it arises from two branches, and is seated between them. They usually open this median vein in the diseases of the head and liver, which require Phlebotomy; but if it shall not be sufficiently manifest, when you judg it must be opened, for a generall evacuation of the whole body; you may cut one of these branches, by whose concourse it is made, which you shall think the fitter; and because each branch draws from the next parts, according to the straightnesse of the fibers, rather then from the opposite side; if you would evacuate the head, and liver equally, by opening either of these branches, it is convenient that opening that branch (for example) which comes from the Cephalick, you presently lay your thumb upon it, untill you suppose you have drawn a just quantity of blood from the liver, by the *Basilica*, or liver-vein; which done, you may take off your thumb, and suffer the blood to follow freely, by the open branch of the Cephalick, untill you have drawn as much blood as you shall judge requisite; otherwise you will draw it but from one part, to wit, the head. So you shall evacuate it only from the liver, if you open the branch which comes from the *Basilica*, and concurs to the generation of the median.

The mediall vein. How by opening the median vein, you may draw more or lesse blood from the head or liver.

Moreover, when there is need to open the *Basilica*, and it shall be no where conspicuous, the Cephalick or median being easie to be discerned at the same time, you may in stead thereof open the median, or if it be not to be found, the Cephalick, pressing but the trunk thereof with your thumb, as we said before, lest the head should be evacuated in stead of the liver. You may doe the same in the *Basilica*, if when there shall be necessity to open the Cephalick, it shall not appear. Most of those which at this day open a vein, in stead of the median, open that branch of the *Basilica* which ascends together with the Cephalick to make the median. But you must understand that the median descends between the two bones of the cubit, even to the end thereof, and then divided into many branches, it is at length spent on the back of the hand behind the thumb, the fore and middle fingers, or the afterwrist. Sometimes it runs back into the following branch, and then at the wrist it departs from it, to be bestowed upon the forementioned parts. The other branch of the Cephalick, which we may call the fore and outward Cephalick, descending directly down to the midst of the wand, thence wanders overthwart into the hind part of the arm, where encreased with a branch from the *Basilica*, it is distributed over all the back of the hand, which with the median it nourisheth. But the branches of these veins do so run through the forenamed parts, that by the way they yeeld them necessary provision.

CHAP. XXII.

The Description of the Axillary vein.

THe Axillary arising at the insertion of the pectorall muscle, or a little higher, after it hath produced the two *Thoracica* it is divided under the tendon of that muscle into two fair branches, that is to say, into the inner deep Axillary, and the skin or outward Axillary. The deep or inner having still for his companion in his descent, the axillary artery, and the nerves of the third conjugation, after it hath produced the small externall musculous of the arm, it goes into the bending of the elbow, where running somewhat deep with the artery and nerve into the muscles of the cubit, it is divided into three other branches, of which one descending with the wand, slides under the ring into the inner side of the hand, and hath bestowed two small branches on the thumb, two others on the fore, and one upon the middle-finger, so that all of them ascend by the sides of these fingers, the other descending with the artery,

The axillary is divided into the deep-axillary, and outward axillary.

as

as the former alongſt the cubit, ſends branches to the reſt of the fingers, like as the former. The third goes on the foreſide between the two bones even to the wriſt, and the ſquare muſcle.

But you muſt note that the veins of which we now treat, do not only make theſe diviſions mentioned by us, but infinite others beſides, as well in the parts which they goe to, as alſo in the inner muſcles of the hand which they nourith.

And thus much of the internall and deep axillary vein. For the externall or skin Axillary (which firſt appears under the skin, eſpecially in lean bodies, a little above the inward production of the arm) it is divided in that place into two branches, the one whereof deſcending to the bending of the arm meets, and is united with the Cephalick branch, ſooner or later, that ſo it may produce the median, as we formerly mentioned.

The other branch having ſent forth many ſhoots of a different length and thickneſſe, as well into the skin, as into the other neighbouring parts, deſcending alongſt the lower ſide of the bone of the cubit, properly ſo called, is at length ſpent upon the fore and outward Cephalick branch, which we ſaid deſcendended alongſt the wand; and thus united, they run over all the hand, where in the right hand, between the middle and fore finger, they make the *Salvatella*; but in the left, in the ſame place, they produce the *Splenitica*.

The *Salvatella* and *Splenitica*.

But alwaies remember, (if in diſſection you find any thing otherwiſe than we have delivered it) that the diſtribution of the veſſels is ſo various, eſpecially in the hands) that there can no certain rule be delivered thereof.

CHAP. XXIII.

The Diſtribution of the Axillary Artery.

THe Axillary artery from the firſt originall, which is preſently after the two *Thoracicæ*, deſcending between the muſcle called *Biceps*, or the two headed muſcle, and the *Brachiens*, with the deep Axillary vein, diſtributes a large branch amongſt the outward muſcles of the arm, which extend the cubit, and is ſpent in the externall muſcles of the ſame, which ariſe without, from the productions of the arm.

And this is called the *Ramus Muſculus*, or Muſculous branch, as alſo the vein that accompanies this arterie. Then this artery when it comes to the bending of the cubit, thruſting it ſelf into the muſcles bending the fingers, communicates certain branches to the parts pertaining to the dearticulation of the cubit with the ſhoulder, and other parts there ſituate, as it did in the upper parts, by which it deſcended hither. Verily it may be a generall rule; that every veſſell ſends or beſtows certain portions thereof by the way to all the parts by which it paſſes. But if you ſhould ask, why I have not proſecuted theſe productions; I would anſwer, I never intended to handle other than large and fair branches of veſſels, by raſh inciſion of which, there may happen danger of death or a diſeaſe. For it would be both an infinit and needleſs buſineſs to handle all the ſmall devarications of the veins, arterles, and nerves. Therefore this artery ſunk into theſe muſcles, when it comes almoſt to the midſt of the cubit, preſently or a little after it is divided into two large branches, the one of which alongſt the wand, and the other alongſt the cubit is carryed into the hand on the inſide under the Ring. For both theſe branches are diſtributed and ſpent upon the hand after the ſame manner as the branches of the internall Axillary vein; that is, having ſent by the way ſome little ſhoots into the parts by which they paſſe, as the length the branch which deſcends by the Wand of the remainder thereof, beſtows two ſprigs upon the thumb, on each ſide one, and two in like manner on the fore finger, and one on the middle; the other which runs alongſt the Ell, performs the like office to the little and the middle or ring finger, as you may ſee by diſſection.

An Anatomicall Axiome.

CHAP. XXIV.

Of the Nerves of the Neck, Back, and Arm.

NOw we ſhould handle the ſinewes of the Arm, but becauſe theſe proceed from the nerves of the neck and back; I think it fit therefore to ſpeak ſomething of them in the firſt place.

The 7 pair of nerves of the neck.

The firſt pair.

Therefore from the neck there proceeds ſeven pair of nerves, the firſt of which proceeds from the nowl bone, and the firſt *Vertebra* of the neck; as alſo the firſt pair of the Back from the laſt *Vertebra* of the neck, and the firſt of the Cheſt. But all theſe nerves are divided into two or more branches of the firſt pair (that is to ſay, on each ſide) go, the one to the ſmall right muſcle, aſcending from the firſt rack-bone of the neck to the nowl bone, the other to the long muſcle on the foreſide of the neck.

The ſecond pair.

The branches of the ſecond pair are diſtributed, ſome with a portion which they receive from

from the third pair over all the skin of the head; the two others go as wel to the muſcles, which are from the ſecond *Vertebra* to the backpart of the head, and from the ſame to the firſt *Vertebra*, as alſo to the long muſcle before mentioned.

One of the third pair of ſinewes is communicated to the head, as we ſaid before, but o- The third pair.
thers to the Muſcles which extend, or erect the head and the neck; there is alſo one of theſe diſtributed into the neighbouring ſide muſcle and part of the long.

The nerves of the fourth pair go, one to the muſcles as well of the neck as the head, and The fourth pair.
to the broad muſcle; the other after it hath ſent ſome portion thereof into the long muſcle and the ſide muſcles of the neck, it deſcends with a portion of the fift and ſixt pair to the Midriffe. One of the branches of the fift pair is beſtowed on the hind muſcles of the neck The fift pair.
and head, the other upon the long muſcle and midriffe; the third is communicated to the *Levatores*, or Heaving muſcles of the arm and ſhoulder.

One of the nerves of the ſixt pair goes to the hind muſcles of the neck and head, another The ſixt pair.
to the Midriffe, the third with a portion of the ſeventh pair of the neck, and of the firſt and ſecond of the cheſt go to the arms and heaving muſcles of the ſhoulder-blade.

One of the branches of the ſeventh pair runs to the broad muſcle and to the neighbou- The ſeventh pair.
ring muſcles both of the neck and head; another encreaſed with a portion of the fift and ſixt pair of the neck, and a third joyned to the ſecond and third pair of the cheſt deſcending into the arm go to the hand.

But you muſt note that the muſcles which take their original from many *Vertebræ*, whe- ther from above downwards, or from below upwards, admit nerves not only from the *Ver- tebræ* from whence they take their originall, but alſo from them which they come neer in their deſcent, or aſcent.

There paſſe twelve conjugations of nerves from the rack-bones of the cheſt.

The firſt entring forth from between the laſt rack-bone of the neck and the firſt of the The 12. pair of nerves of the cheſt.
cheſt, is divided (that is, on each ſide, each nerve from his ſide) into two or more portions, as alſo all the reſt. Therefore the branches of this firſt conjugation go ſome of them to the The firſt pair.
arms, as we ſaid before, others to the muſcles, as well theſe of the cheſt, as others ariſing there, or running that way.

The branches of the ſecond conjugation are diſtributed to the ſame parts, that theſe of The ſecond pair.
the firſt were.

But the branches of all the other conjugations even to the twelfth, are communicated, The other pairs.
ſome to the intercoſtall muſcles running within under the true ribs even to the *Sternon*, and under the baſtard ribs even to the right and long muſcles; and the coſtall nerves of the ſixt conjugation are augmented by meeting theſe intercoſtall branches by the way as they de- ſcend by the roots of the ribs. Other particles of the ſaid nerves are communicated to the muſcles as well of the cheſt, as ſpine, as the ſame muſcles paſſe forth, or run alongſt by the *Vertebræ*, from whence theſe nerves have either their originall, or paſſage forth.

Having thus therefore ſhewed the originall of the ſinews of the arm, it remains that we The nerves which are carri- ed to the arme.
ſhew their number and diſtribution.

Their number is five or ſix, proceeding from the fifth, ſixth, and ſeventh *Vertebræ* of the neck, and the firſt and ſecond of the cheſt. The firſt of which not mixed with any other from the fifth *Vertebra* of the neck, goes to the muſcle *Deltoides* and the skin which co- vers it.

The other 4 or 5 when they have mutually embraced each other, not only from their firſt originall but even to the ſhoulder, where they free themſelves from this convolution, are diſtributed after the following manner.

The firſt and ſecond deſcending to the muſcle mentioned a little before, and thence ſometimes even to the hand, is by the way communicated to the muſcle *Biceps*, and then under the ſaid muſcle it meets and is joined with the third nerve. Thirdly, it is communi- cated with the longeſt muſcle of the cubit, in the bending whereof it is divided into two branches deſcending alongſt the two bones of the cubit, untill at laſt born up by the fleſhy pannicle it is ſpent upon the skin and inner ſide of the hand.

The third lower than this, is firſt united with the ſecond, under the muſcle *Biceps*; then ſtraightway ſeparated from it, it ſends a portion thereof to the arm which lies under it, and to the skin thereof; laſtly, at the bending of the cubit on the foreſide, it is mingled with the fift pair.

The fourth the largeſt of all the reſt, comming down below the third branch under the *Biceps*, with the internall axillary vein and artery, is turned towards the outward and back- part of the arm; there to communicate it ſelf to the muſcles extending the cubit, and alſo to the inner skin of the arm, and the exterior of the cubit; the remainder of this branch when in its deſcent it hath arrived at the joint of the cubit, below the bending thereof it is divided into two branches, the one whereof deſcending alongſt the cubit is ſpent on the outſide of the wriſt; the other aſſociating the wand is on the outſide in like manner in two branches beſtowed upon the thumb, and in as many upon the fore finger, and by a fift upon the middle finger though more obſcurely.

The fift branch being alſo lower than the reſt, ſliding between the muſcles bending and exten-

extending the cubit, when it comes behind the inner protuberation of the cubit (in which place we ſaid before the third Branch meets with this) it is communicated to the internall muſcles of the ſame, and then divided into three portions, one of which on the outſide alongſt the middle of the cubit goes in two ſprigs to the little finger, and ſo many to the middle finger, and one to the ring finger; the other two, the one without & the other within the ring, goe to the hand, where after each of them hath beſtowed what was requiſite on the muſcles of the hand, they are waſted into other five ſmal portions, of which theſe which are from that portion which deſcends without the ring, ſend two ſprigs to the little, two to the fore, & one to the middle finger; but theſe which come from that which paſſes under the ring, by ſuch a diſtribution communicates it ſelf to other fingers, as two ſprigs to the thumb, two to the fore and one to the middle finger. The ſixth the loweſt and laſt runs between the skin and fleſhy pannicle, by the inner protuberation of the arm, and then is ſpent upon the skin of the Cubit.

CHAP. XXV.

The deſcription of the bone of the Arm, and the Muſcles which move it.

The greatneſſe and figure. The Appendix of the Arm. The proceſſes of the arm.

BEcauſe we cannot perfectly demonſtrate the originall of the muſcles of the arm, (eſpecially of the two arm muſcles) not knowing the deſcription of this bone; firſt therefore we will deſcribe it, then return to the originall of the muſcles ariſing from thence. The bone of the arm is the greateſt of all the bones in the body, except the Thigh-bone; it is round, hollow and filled with marrow, with a great Appendix or head on the top thereof, having an indifferent neck, to which it is knit by *Symphyſis*, for appendices are no otherwiſe united to their bones. In the lower part thereof it hath two proceſſes, or protuberations, one on the fore ſide, another on the hind, between which ſwellings there is a cavity like to half the compaſſe of a wheel, about which the cubit is moved. The extremities of this cavity ends in two holes, of which one is the more externall, the other more internall: theſe cavities receive the heads of the cubit, that is, the fore, or internall receives the fore proceſſe when the arm is bended inwards, but the externall or hinder the exterior as it is extended.

For the head of the arm it hath a double connexion, the one with its own neck by *Symphyſis*; that is, a naturall union of the bones without any motion; the other with the lightly ingraven cavity of the ſhoulder-blade, which we call *Glene*, by that kind of deſarticulation which is called *Arthrodia*; this connexion is made firm and ſtable by the muſcles deſcending into the arm from the ſhoulder-blade, as alſo by the proper ligaments deſcending from the circle and brow of the cavity of the *Acromion* and *Coracoides* to this head of the arm; this ſame head of the arm is, as it were, more cleft and open on the inner ſide, than on the fore ſide, that ſo it may give way to one of the ligaments coming from the ſhoulder-blade to the muſcle *Biceps*. Foraſmuch as belongs to the lower end of the bone of the arm (which we ſaid hath two proceſſes) we may ſay that it is faſtned to the bones of the cubit by two ſorts of articulation; that is, by *Ginglymos* with the Ell or proper bone of the cubit, and by *Arthrodia* with the *Radius* or wand, which in a lightly engraven cavity receives the fore proceſſe of the arm, and is turned about it for the motion of the hand. The hinder proceſſe is chiefly added for the ſafety and preſervation of the veins, arteries and nerves.

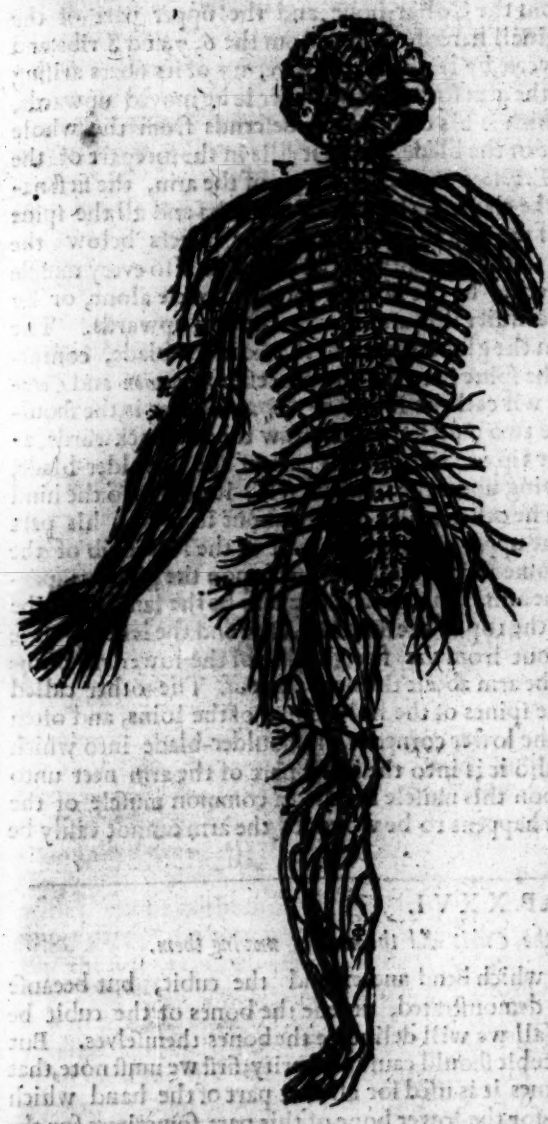
The figure of the arm.

Theſe things thus ſhown, it is worth our labour to know the figure of the arm it ſelf, as it lies between the forementioned appendices and proceſſes; that in the caſe of a fracture, we may know how conveniently to reſtore it; therefore firſt we muſt underſtand, that this bone is ſomewhat bended and hollowed on the inſide under the cleft of the head thereof, but bunching out on the out and fore ſide.

The 8 muſcles thereof.

Wherefore ſeeing it muſt be moveable forwards and backwards, upwards and downwards, nature for the performance of ſo many motions hath furniſhed it with eight muſcles, which are ſix proper and two common with the ſhoulder-blade. Of which number two move it forwards, two backwards, two upwards and downwards. Which muſt not be underſtood ſo, as that theſe two muſcles ſhould move it directly forwards inclining neither upwards, nor downwards; and the other two ſhould move it ſo upwards, as it ſhould incline neither forward nor backwards; but thus, that it cannnot be moved neither to this nor that part unleſſe by the help and proper action of this, or that muſcle. Thus therefore if the pectorall with his aſſociate perform their duty or action, the arm is always moved forwards, as it is lifted up by the action of the *Deltoides* and his companion, and ſo of the reſt.

Table 24. sheweth the brain together with the After-brain, the spinall marrow and the nerves of the whole body.



A, That part of the brain that is next the nostrils.
B, That part which is at the side of the ventricles.
C, The back part of the brain.
D, The *Cerebellum* or After-brain.
E, The mamillary processe in the right side.
F, The originall of the optick nerve.
G, Their conjunctions.
H, The coat into which the optick nerve is extended.
I, The second pair of the sinews of the brain.
K, The lesser root of the third conjugation.
L, The thick root of the same conjugation according to the common opinion.
M, The fourth conjugation of the sinews.
N, The lesser root of the fift pair.
O, The bigger root of the same pair.
P, The small membrane of the ear which they call the *Tympan*.
Q, The lower branch of the bigger root of the fift conjugation.
S, The sixt pair of sinews.
T, The seventh pair.
V, The beginning of the spinall marrow out of the middle of the basis of the brain.
X, The right sinew of the midriffe cut off.
Y, A branch from the fift pair creeping to the top of the shoulder.
Z, The first nerve of the arm, from whence there goeth a branch to the skin.
A, The second nerve of the arm, and a branch therefrom into the first muscle of the cubit.
B, The third nerve of the arm and a branch going to the skin on the outside.
C, A branch from the third nerve to the second muscle of the Cubit.
D, The congresse or meeting of the second nerve with the third.
E, A small branch from the third nerve to the second muscle of the *Radius*.
F, The distribution of the second nerve into two branches.
* The lesser branch of this division lengthned out to the skin as far as the thumb.
a, The place of the spinall marrow where it issueth out of the brain 1, 2, 3, &c. Thirty pair of nerves arising from the spinall marrow are here noted by their Char. that is to say, 7. of the neck, 12. of the Chest, 5. of the loins, and 6. of the holy-bone.
b, The thicker branch of the 2 nerve divided into 2 parts.

c, Branches of the 3. nerve sprinkled here and there.
d, Nerves from the third pair to the thumb, the fore finger and the middle finger.
ee, The 4 nerve of the arm. *f*, The passage here of through the inside of the shoulder.
g, A tripartition of this branch where it toucheth the cubit. *hh*, A branch distributed from the 4 nerve to the outward skin of the cubit. *i*, the upper branch of the division of the 4 nerve. *kk*, A branch of *i*, reaching to the outside of the hand. *ll*, the lower branch of the division of the 4 nerve passing through the backside of the cubit. *m*, the fifth nerve of the arm. *n*, branches of this nerve dispersed here and there. *oo*, A branch of the 5 nerve reaching to the inside of the hand and the fingers. *p*, A sarcle of the branch *o*, derived to the outside of the hand and the fingers. *qq*, the 6 nerve of the arm and the course thereof under the skin. *rr*, the intercostall nerves there cut off where they are together with the ribs reflected forward. *ss*, branches on each side running backward. *tt*, nerves attaining unto the chest. *uu*, the commixation of the nerves. *xx*, with the descending branch of the 6. conjugation of the brain. *xx*, nerves from the loins led unto this place. *y*, A branch going to the testicle here cut off. *z*, A nerve reaching to the 1 muscle of the thigh. *ee*, the 1 nerve of the leg. *aa*, A sarcle of the former nerve derived to the skin at *a*, and inserted into the muscles at *β γ*, the 2 nerve of the leg. *δδ*, A nerve from the former, followed into the skin as low as to the foot, and passing along the inside of the leg. *ζ*, a branch of the 2 nerve running unto the muscles. *ζ*, the 3. nerve of the leg. *η*, a sarcle thereof unto the skin. *θ*, another sarcle unto the muscles. *ι*, the 4 nerve of the leg. *κκ*, the *exterior* propagations of the nerves proceeding from the holy-bone. *λ*, the end of the spinall marrow. *μ*, a branch from the 4 nerve inserted into the muscles arising from the *Coxendix* or hip bone. *ν*, another branch going to the skin of the thigh on the backside. *ξ*, a propagation derived to the 4. muscle of the leg and to the skin of the knee. *oo*, nerves attaining to the heads of the muscles of the foot. *ππ*, the division of the 4 crurall nerve into two trunks *ρ*, a branch from the trunk *ττ*, dispersed into the outward skin of the leg. *υ*, a sarcle of the trunk *τ*, derived to the muscles *υ*, another sarcle to the skin of the leg on the foreside. *φ*, a branch of the trunk *ρ*, to the inside of the leg and of the foot. *χ*, a sarcle of the trunk *ρ*, to the hinder most skin of the leg. *ψ*, a branch of the whole trunk *g*, led along to the forward part of the leg and the foot. *ω*, the descent of the trunk *ρ*, into the foot.

But to come to the originall and insertion of these muscles, the one of these two which move the arm forwards called by reason of his originall, the Pectorall. arising from more than

The originall and insertion of the pectoral muscle.

than half of the Collar bone, and almoſt al the *Sternon*, and the 6, 7, and 8. rib, goes up and faſtens it ſelfe to the *Coracoides*, by a membrane or a membranous tendon ſufficiently ſtrong (for which cauſe it is ſaid to be common to the ſhoulder and arm) and it goes into the arm between the muſcles *Deltoides* and *Biceps* with a ſtrong tendon compoſed of fibers croſſing each other, of which ſome deſcend from the Collar-bone and the upper part of the *Sternon*, others aſcend from the lower originall hereof; that is, from the 6, 7, and 8 ribs: and although the action of this muſcle be diverſe, by reaſon of the diverſity of its fibers ariſing from divers places, yet alwaies it drawes the arm forwards, whether it be moved upwards, downwards, or to the Breſt; the other which is his companion deſcends from the whole lip or brow of the ſinous or hollow part of the blade, which it fills in the forepart of the arm neer the head thereof. For the two *Levatores*, or the lifters up of the arm, the firſt named *Deltoides* deſcends from almoſt halfe the clavicle, the proceſs *Acromion* and all the ſpine of the ſhoulder-blade into the foreſide of the arm the bredth of four fingers below the joint. It hath divers actions according to the diverſity of the fibers, as alſo every muſcle hath; yet howſoever it is contracted, whether by the fibers from the clavicle alone, or by the ſpinall alone, or by both at once, it alwaies lifts and heaves the arm upwards. The other which is his aſſociate deſcends from the gibbous part of the ſhoulder-blade, contained between the upper rib thereof, and the ſpine between the proceſſes *Acromion* and *Coracoides*, to the neck of the arm; and this we wil call the *Epomis* or *Scapularis*; that is, the ſhoulder muſcle. But the firſt and larger of the two muſcles, which draw the arm backwards, ariſes from the greateſt part of the utter lip of the gibbous part of the ſhoulder-blade, which is under the ſpine thereof, and lying upon the blade it ſelf, it goes into the hind part of the arm above the neck thereof. The other which is contiguous to it and his partner in working, but leſſer, paſſes from the upper and exterior part of the lower rib of the ſhoulder-blade, and thence as it were in ſome ſort extending it ſelf upon the gibbous part thereof neer unto that rib, it goes into the arm. This muſcle ſeems to be the ſame with the former, being fleſhy without even above the top of the ſhoulder. One and the leſſer of theſe two which draw downwards, enters out from the ſtreight line of the lower rib of the blade, and goes into the lower part of the arm about the neck thereof. The other called the *Latiſſimus* or broadeſt, aſcends from the ſpines of the holy-bone, of the loins, and often alſo from the nine lower of the cheſt, by the lower corner of the ſhoulder-blade into which is inſerted by a membranous tendon, as alſo it is into the inner part of the arm neer unto neck by another ſtrong tendon; whereupon this muſcle is called a common muſcle of the ſhoulder and arm. But when this muſcle happens to be wounded, the arm cannot eaſily be ſtretched forth, or lifted up.

The *Deltoides*.

The *Epomis* or *Scapularis*.

CHAP. XXVI.

The deſcription of the bones of the Cubit and the muſcles moving them.

After theſe muſcles, follow thoſe which bend and extend the cubit, but becauſe their inſertion cannot be fitly demonſtrated, unleſſe the bones of the cubit be firſt deſcribed; therefore firſt of all we will delineate the bones themſelves. But verily leſt this doubtful word cubit ſhould cauſe obſcurity; firſt we muſt note, that it hath a threefold ſignification, for oftimes it is uſed for all that part of the hand which lies between the arm and wriſt, oft-times for the lower bone of this part, ſometimes for the upper part of this bone which is turned within the orb or cavity of the arm (no otherwiſe than a cord in the wheel of a Pulley) and this is called the *Olecranon*. Here truly we uſe this word Cubit in the firſt ſignification. Wherefore we ſay the cubit is compoſed of two bones, the one of which we cal the *Radius* or wand, or the leſſer *Focile* of the arm; the other we properly cal the Cubit or El. Theſe two bones ſtick together at their ends being firmly bound together by ſtrong ligaments; but the middle parts of them are a prety way diſtant from each other, and chiefly towards their lower ends, for the better ſituation and paſſage of the muſcles and veſſels from the inner ſide to the exterior, as ſhall be ſhewed in fit place. The wand hath two *Epiphyſes* or Appendices, the one at the upper end, the other at the lower. The upper is round and hollowed on the ſurface like a baſon, it receives the fore proceſſe of the bone of the arm, bouud to the ſame by ſtrong ligaments, deſcending as well from that proceſſe of the arm, as the *Olecranon* into the circumjacent parts of this appendix of the wand. This connexion is made for this uſe, that we may turn our hand upwards and downwards by the cubit turned and twined about this proceſs. But the lower appendix of this wand is hollowed on the inſide that ſo it might more commodiouſly receive the bones of the wriſt, but gibbous without, that it might be ſafer; now this wand is ſofter and thicker at the lower end, but leſſer and harder above, where on the inſide it hath a ſwelling out, whereby to receive the muſcle *Biceps*, beſides on the outſide of the middle thereof it is ſomewhat gibbous and round, ſo to become more ſafe from the injuries of external bodies; but it is hollowed, or bended on the inſide for the better taking and holding any thing in the hand. But that ſide which lies next to the Ell is flatted for the fitter originall and ſeat of the muſcles; laſtly, it is ſeated upon the bone of the Cubit, or Ell, juſt againſt the thumb.

What is meant by the Cubit.

What the *Olecranum* is.

The 2 bones of the Cubit.

The two Appendices of the wand.

The figure and ſite of the wand.

But

But the Ell, or bone of the cubit properly and particularly so called, hath in like manner two appendices, the one above, the other beneath. The upper which also is the greater, is fitted to the orb of the arm in which it goes to and again for the extension and bending of the arm, no otherwise than a rope runs in a pulley but that it turns not absolutely and perfectly round, which is caused by the two processes of unequall bignes, the which are therefore stayed in the holes or cavities of the bone of the arm, the greater processe which we called *Olecranon* is letted by the exterior hole that so the extension of the arm can be no further, but the lesser processe by the inner hole, makes the bending thereof the lesse perfect. The composure of these bones is by *Ginglymos*, and it is strengthned not only by common ligaments comming from the muscles, which move the bones themselves, but also by proper ligaments descending from the processes of the arm and the lips of the holes and cavities standing about the appendix of the cubit. The other lower and lesser appendix is in some sort hollow on the inside for the fitter receiving the bones of the wrist, but the outside is round and ends in a point, whence it is called by the Greeks *Styloides*. But now this Ell (contrary in this to the wand) is thicker towards the arm, but slenderer towards the wrist. And besides in the thicker part thereof it is hollowed or bended towards the inside, and in the same place is gibbous or bunching forth on the outside; but it is round and streight, unlesse on that side which lies next the wand, for the rest, it is hollow and full of marrow like the wand. The site of the *Radius* or wand is oblique, but that of the cubit or Ell is right, that the arm might be the better and more easily moved; because the motion by which the arm is extended and bended is according to a right line, but that by which the inside of the hand is turned upwards and downwards, is performed obliquely and circularly. Wherefore it was expedient that the wand should be oblique, and the cubit streight; for the cubit-bone is appointed for to extend and bend the arm, but the wand to perform the wheeling and turning about thereof; and this is the cause that it was fitting there should be a different connexion of these bones with the arm. These things were fitting to be spoken concerning the nature of these bones, that in the cure of fractures we may work the more safely and happily, taking indication from that which is agreeable to nature: wherefore now it remains that we come to the description of the muscles which are seated in the arm, the cubit-bone, or Ell. These are four in number, two extending it, and two bending it. The first of the benders is called *Biceps*, by reason of its two heads, the one whereof descends from the *Coracoides*, that other from the lip of the cavity of the shoulder-blade by the fissure or clift of the head of the bone of the arm. These two heads under the neck of this arm becoming fleshy, are firmly united at the belly and midst of the arm, and thus united are at the length implanted by a strong tendon to the inner protuberation of the wand. The other is called the *Brachiæus*, by reason of the strait coherence thereof with the bone of the arm; this fastned under the *Biceps* descends obliquely on the back and upper part of the bone of the arm into the top of the wand and the inner side of the Ell. But the first of the extenders is called the *longus* or long muscle, this descends from the lower rib of the shoulder, and cleaving to the bone of the arm goes thither (fastned and as it were alwaies most straitly joined with his fellow muscle, specially neer the cubit) where you shall presently hear. The other termed the *Brevis* or short Muscle, being the companion of the long, descends on the hind part of the neck of the bone of the arm, as it were growing to, and lying under the former long muscle, so that making one common broad tendon outwardly fleshy, inwardly nervous, they are inserted into the *Olecranum*, so by mutuall assistance to extend the cubit.

CHAP. XXVII.

The Description of the Bones of the Wrist, Afterwrist and Fingers.

WE said before that the Hand taken more particularly and properly, is divided into the Wrist, Afterwrist, and Fingers, and that the hand in this signification is bounded by the ends of the bones of the cubit and fingers. All the parts of the wrist, which it hath common with the afterwrist, have been already also plentifully explained, this only remains to be noted, that the skin as well of the hands as of the feet, is of a middle nature between pure flesh and pure skin, no otherwise than that which covers the forehead, but that this which covers the palms of the hands and soles of the feet is unmoveable; but it is most thick, especially on the feet, lest it should be easily offended by continuall going. Besides the common parts, the wrist is composed of eight smal bones mutually knit together in a certain order, and by *Diarthrosis* with the two bones of the Cubit, but mutually and amongst themselves by *Synarthrosis*, by interposition of gristles and ligaments as well common, that is, coming from the muscles, as proper, descending alwaies from the upper to the lower. But these same bones are some lesse than othersome; besides, they are hard and without marrow, gibbous on the outside for the security and comlinesse of the hand, but hollow on the inside for to give way to the tendons going into the fingers. These bones are disposed in two ranks.

What the Hand properly so called is.

The firſt rank contains only three, but the ſecond five. The three of the firſt rank are thus arrayed, or placed, that one of them may receive the Appendix *Styloides*, of the cubit; the other the Ell and the wand together, and the third may be received by the wand. But three of the five bones of the ſecond order ſuſtain the four bones of the afterwriſt and are knit to the ſame by *Synarthroſis*, after which manner of connexion they are joined to the bones of the firſt rank; the fourth ſuſtains the firſt bone of the thumb, to which alſo it is coarticulate by *Synarthroſis*; the fift and laſt is ſeated on the inſide againſt the Ell, chiefly above that bone of the firſt order, which receives the Appendix *Styloides* of the cubit, this is the leaſt and weakeſt of them all by reaſon of its griſtly ſubſtance, which makes the ring with certain ligaments running from one of the inner ſides of the wriſt to the other.

What the *Annulus* or ring is.

This ring is placed there, as well for the preſervation of the ſinews, veins, and arteries paſſing under it (leſt when we lean upon our hand or wriſt, theſe parts ſhould be hurt by compreſſion) as alſo for the commodity of the action of the muſcles bending the fingers, which in the performance of their action and the contracting themſelves might deform the hand by their paſſing forth of the cavity of the wriſt. For what attraction ſoever is made by ſtrings, if it be free and not hindred, is according to a ſtreight line.

The bones of the Afterwriſt.

Now follow the bones of the ſecond part of the hand, or of the afterwriſt. Theſe are four in number, gibbous without, but arched within, or hollow in the middle; for hence is the palm of the hand, or certainly the greater part thereof; their ends next the fingers are ſomewhat remote from each other, that in theſe clifts the muſcles *Interoſſes* might find a place and ſeat. But theſe ends have each an Appendix, as you may perceive in the Sceleton of a child. But you muſt note that by the firſt bone of the wriſt or afterwriſt, wee mean that which is in the foreſide of the hand, that is to ſay, that in the wriſt which lies under the thumb, and that in the afterwriſt, which is ſeated under the fore finger, as theſe which keep in order the fingers which exceed the reſt in neceſſity and dignity.

The Figure of the bones of the Hand. The 1. *ſhews the inſide of the right hand, and the* 2. *ſhews the back ſide of the ſame.*

FIG. I.

FIG. II.

The Charact. 1, 2, 3, 4, 5, 6, 7, 8. ſhew the eight bones of the wriſt.

A, 1, 2. The firſt bone of the Afterwriſt lying under the thumb.

I. II. III. IIII. The 4 other bones of the Afterwriſt annexed to the fingers.

B, *C*, The two bones of the thumb.

D, *E*, *F*. 1, 2. The 3 bones of the forefinger which are the ſame in the other fingers.

M, 1, 2. A little bone ſometimes faſtned outwardly at the joint of the eight bone of the wriſt.

N, 1. A proceſſe of the eight bone of the wriſt, ſwelling out into the ball of the hand.

O, 1. A proceſſe of the fift bone of the wriſt, from which a ligament proceeds.

P, 2. An appendix of the bones of the wriſt, by which they are articulated to the afterwriſt.

Q, 2. Another Appendix which with its head entreth into the cavity of the finger.

R, 1, 2. The ſpace between the bones of the afterwriſt.

S, 1, 2. Two little ſeed-bones ſet on the inſide and outſide of the firſt joint.

T, 1. Two ſeed-bones in the firſt of the four fingers.

VV, 1. One ſeed-bone in the ſecond and third joint of the fingers.

The bones of the fingers.

After theſe follow the fifteen bones of the fingers; that is, three in each, which are hollow and fiſtulous, full of a thin and liquid marrow, and not of groſſe and thick, as in the arm and thigh. They are outwardly gibbous, but inwardly hollow and flat for the fitter ſeat of the tendons aſcending alongſt the fingers on the inſide even to the upper joint. The which that nature might the better ſtrengthen and preſerve, it hath produced from the lips of the inner cavities of theſe bones a membranous and ſtrong ligament, which running overthwart from one ſide to the other doth ſo ſtraitly cloſe the tendons to their bones, that they cannot goe forth of their places, or incline to either ſide. They are connexed on the outſide, that they might be more fit to hold any thing. But for the firſt bones of the 4 fingers and thumb, four are joined together with ſo many bones of the afterwriſt by *Synarthroſis*, for the bones of the afterwriſt are moved by no manifeſt motion; the fift is knit to the ſecond rank of the bones of the wriſt, therefore that bone cannot be attributed to the

after-

afterwriſt, as ſome have written, ſeeing it hath manifeſt motion and is knit by *Diarthroſis*, but the bones of the afterwriſt are only faſtned by *Synarthroſis*. For the ſecond and third rank of bones of the fingers, they are knit the ſecond to the firſt, and the third to the ſecond by *Diarthroſis* and *Arthrodia*, becauſe beſides the manifeſt motion they have, they receive each other by a ſuperficiary cavity, as thoſe of the firſt rank, the bones of the afterwriſt, and thoſe of the ſecond rank, them of the firſt; thoſe of the third them of the ſecond. And al the bones of the fingers are larger and thicker at their baſis, but ſmaller towards the ends, and they are bound by ligaments eſpecially proper, which (as we ſaid formerly) deſcend from the firſt to the ſecond; ſo that the laſt bones ſeeing they have not to whom to communicate their nerve, make and produce nails thereof. Wherefore the nails are generated by the fibers of the ligaments, and the excrement of the tendons which are terminated at the bottom of the nails. Now remain the *Oſſa Seſamoidea*, or ſeed-bones: theſe are 19 in number in the inner joints of each of the hands, and as many in each foot, *viz.* two in the firſt joint of the four fingers and in the ſecond of the thumb, and one in each of the reſt. For the inner ſide of the joints, you may for the moſt part obſerve one in each of them; yet in the ſecond joint of the thumb there be two, above the two tendons, which are ſomewhat griſtly.

Whence the nails are generated.

The *Oſſa Seſamoidea*, or ſeed-bones.

They are made for this uſe, that they firm and ſtrengthen the joints, ſo that the bones of the fingers may not be turned awry, or thruſt forth of their places by ſtrong and violent motions, as it ſometimes happens in the whirlebone of the knee. They are called *Seſamoidea* from the reſemblance they have to the ſeed of *Seſamum* which is ſomewhat long and flat.

Their uſe.

CHAP. XXVIII.

Of the muſcles which ſeated in the cubit move the Wand and with it the Hand.

NOw muſt we deſcribe the muſcles of the formerly deſcribed parts; that is, thoſe which are ſeated in the cubit, which are carryed to the inſide of the hand, and thoſe which are called the *Interoſſes*. Now the muſcles of the cubit are 14, ſeven externall and ſeven internall; two of the ſeven externall doe primarily twine or turn up the Wand, and ſecondarily or by accident turn the palm of the hand upwards, whereupon they have called them *ſupinatores* or turners up of the hand; two extend the wriſt, whereupon they are named *Carpitenſores* or the wriſt-extenders; two the fingers, whence they are ſtiled *Digitumtenſores* or fingerſtretchers; to conclude, the ſeventh and laſt is termed *Abductor* or *Obliquator externus*. The firſt of the two *ſupinatores* is called the Long, or Longeſt, becauſe it deſcends from the outſide of the arm above the proceſſes thereof, and is inſerted by a round and ſtrong tendon into the lower Appendix. The other deſcends obliquely from the outward and upper proceſſe of the arm, and is inſerted at the third part of the wand by a membranous and fleſhy tendon before and on the inſide thereof. The upper of the two extenders of the wriſt, deſcending above the wand from the external and upper proceſſe of the arm, is inſerted by two tendons into the firſt and ſecond bone of the afterwriſt, which ſuſtain the fore and middle fingers.

The muſcles of the cubit.

The *Supinatores*.

The *Carpitenſores*.

The *Digitumtenſores*.

The *Obliquator externus*.

The firſt of the *Supinatores*.

The ſecond.

The upper of the *Carpitenſores*.

The other and lower, deſcending from the ſame place as the former, above the cubit is inſerted into the fourth bone of the afterwriſt which bears up the little finger. Theſe muſcles whileſt they move alone, that is, each with his Antagoniſt, to wit, the wriſt-benders, they move obliquely upwards or downwards, the whole hand properly ſo called. The firſt and greater of the extenders of the fingers, or finger-ſtretchers ariſing from the *Olecranum*, or bone of the cubit, deſcends ſuperficiarily between the two bones of the cubit even to the wriſt, in which place it is divided into four tendons, which paſſing under the ring ſeated there end (each diſtinguiſhed by a common ligament above the bone of the afterwriſt) in the laſt joints of the four fingers, adhering nevertheleſſe firmly to the bones, which are above theſe joints.

The lower.

The greater of the *Digitumtenſores*.

The other which is the leſſer, ariſing almoſt in the middle of the wand, goes obliquely to the thumb into which it is inſerted by two tendons; the one thicker which is inſerted into the root thereof, and draws it from the other fingers; the other ſlenderer continued even to the upper joint thereof, and by its action extending the thumb.

The leſſer.

The ſeventh which is the *Abductor* or *Obliquator*, is ſeated at the hind part of the hand; that is, towards the little finger; we have often found this divided iu two, yea verily we have found it trifide, or divided into 3. this year in three or four dead bodies, one portion thereof went to the lower ſide of the ring-finger with two Tendons, the other in like manner to the middle and forefingers, and the third to the thumb.

The *Obliquator* or *Abductor externus*.

And for all that it is thus divided, yet ſome have taken and accounted it for one muſcle, becauſe it hath one originall and action, which is to draw the fingers backwards, ſome have added to this the extender of the thumb by reaſon of their common originall; and thus of four muſcles they have made one divided into ſeven tendons, diſtributed, as is formerly ſhewed. But when the *Obliquator* of the ring-finger is wanting, as it often happens, the extender of the finger ſupplies that defect by certain productions of tendinous ſtrings. But ſome alſo have written, that this muſcle which we ſaid hath ſeven tendons,

is only a production of the deep fore muſcle, which ſhould be ſent through the ſpace between the bones of the cubit; yet I had rather make it a muſcle of it ſelf, by reaſon of its ſtrait adheſion with the bones of the arm and wand. And let thus much ſuffice for the external muſcles of the cubit, which you may comprehend in the number of ſeven, as we have done; or in ſix, if you take away one of the 4. or in nine, if you had rather reſolve it into 4. with *Galen*; or in eight, if you divide this muſcle only into three. For in very deed the *Abductor* or *Obliquator* of the ring-finger is not often found in men.

The muſcles of the inner part of the cubit.

Now muſt we come to the inner muſcles of the cubit, the firſt of which compaſſes the skin of the palme of the hand, whence it is called the *Palmaris*. The ſecond and third joined by the communion of their action turn down or prone the wand, and conſequently the hand, ſo that the palme looks towards the feet, whereupon they are called *Pronatores*.

The *Palmaris*.

The 4. and 5. joined alſo in affinity of action bend the wriſt, wherefore they are named *Carpiflexores*, wriſt-benders. The ſixt and ſeventh are appointed to bend the firſt, ſecond, and third joints of the fingers, wherefore they are termed *Digitumflexores*, *Fingerbenders*. For their originall; the *Palmaris*, the leaſt and uppermoſt of them all, deſcends fleſhy from the hind proceſſe of the inner arm, and a little after ending in a long and ſlender tendon, it is ſpent in the skin of the palm of the hand even to the roots of the fingers. For it was neceſſary that this skin ſhould ſtraitly cohere with the ſubjacent parts, not only for the fitter taking or comprehenſion of any thing, leſt that skin in holding ſhould be wrinckled and drawn away from the palme and fingers, and ſo be an impediment; but beſides that the hand might have a more exact ſenſe to diſtinguiſh of hot, cold, moiſt, dry, ſmooth, equall, rough, ſoft, hard, great, little, and ſuch other qualities. Then follow the two *Pronatores*, of which one called the round, comes obliquely from the inner ſide of the hind proceſſe of the arm almoſt to the middle of the wand, to whith it adheres by a membranous and fleſhly tendon, even to the place appointed for inſertion. The other ſquare three or four fingers broad, yet ſomewhat ſlender, ſeated within under all the muſcles which deſcend on the inſide to the wriſt or fingers, upon the ends of the bones of the cubit, aſcends tranſverſe from below the Ell, unto the top of the wand, where it ends in a membranous tendon.

The *Pronatores*.

The *Carpiflexores*.

Both the *Carpiflexores*, or wriſt-benders, ariſe from the hind, but inner proceſſe, and deſcend obliquely, (the one more, or leſſe than the other) the one alongſt the Ell, but the other alongſt the wand; and that which deſcends alongſt the Ell, is inſerted into the eight bone of the wriſt, which we ſaid made part of the ring; the other which followes the wand is inſerted with his greater part into the bone of the wriſt, and with the reſt into the firſt bone of the after-wriſt which ſuſtains the fore finger.

The *Digitumflexores*.

The *Sublimis Digitumflexor*.

Now remain the *Digitumflexores*, or Fingerbenders, which becauſe they lye upon one another, the upper is called the *Sublimis*, but the lower the *Profundus*. The *Sublimis* or upper, ariſing from the inner part of the hind proceſs of the arm, and from the upper parts of the Ell and wand, deſcends between theſe two bones of the cubit even to the wriſt and ring; divided into 4 tendons it is inſerted into the ſecond dearticulation of the four fingers, which it bends by the force of this his proper inſertion; as alſo the firſt, as well by the power of the common ligament, as by certain fibers coming from it, which it ſends thither by the way in its paſſage. But theſe 4 tendons neer unto this their inſertion are divided into two, ſo to give paſſage and add ſtrength to the tendons of the deep muſcles deſcending into the third and laſt joint of the fingers.

The *profundus Digitumflexor*.

But this ſame *Profundus* or deep muſcle ariſing from the upper and inner parts of the Ell and wand, deſcends between theſe two bones under the *Sublimis*, alſo undivided even to the wriſt, where it is divided into 5 Tendons which it brings forth under the common ligament, and the diviſions of the tendons of the *Sublimis* even to the laſt joint of the fingers, which they bend, by this their proper inſertion, as alſo the bones of the firſt and ſecond joints of the fingers by the means of the common ligament and fibrous productions which they beſtow upon them by the way. Beſides theſe forementioned there is ſeen alſo a certain membranous ligament which engirts the tendons in the compaſſe of the fingers.

CHAP. XXIX.

Of the Muſcles of the inſide of the hand.

The number of the muſcles of the inſide of the hand.

THe muſcles of the inſide of the hand are 7 in number; the firſt is called *Thenar*, becauſe it makes the greater part of the Palme; the ſecond from the ſite is called the *Hypothenar*; the third the externall *Abductor* of the thumb. The four other are called by reaſon of their figure the *Lumbrici* or wormy muſcles, or the *Abductores*, or Drawers of the four fingers to the thumb. Now the firſt called *Thenar*, thicker than the reſt, ariſes from all the bones of the afterwriſt, taking its beginning from that bone which bears up the ring finger, whence aſcending alongſt the Vitall line even to the end thereof at the firſt bone of the afterwriſt ſuſtaining the fore finger, and it is at length inſerted into the laſt joint of the thumb by the longeſt fibers, but by the middle

The *Thenar*.

middle and ſhorteſt fibers almoſt into all the inner part of the firſt bones of two joints, and by reaſon of this, the thumb is drawn to the other fingers, and from them again by his lower originall.

Some divide this muſcle into three, by reaſon of his divers actions, making the firſt to ariſe from the root of the bone of the afterwriſt which bears up the ring finger; but the other from that middle bone of the afterwriſt which ſuſtains the middle finger; but of the third, from the upper end of that bone which underprops the fore finger, and that the inſertion of them all, is, as we formerly mentioned. But the former opinion liked me better, both for ſhunning confuſion, and abbreviating the doctrin of the number of muſcles.

The *Hypothenar* ariſes from the fourth bone of the afterwriſt, and that bone of the wriſt which ſuſtains it, and then with its longeſt fibers, it is inſerted into the ſecond joint of the ring finger, and by the ſhorteſt into the firſt, through which occaſion, as alſo in reſpect of its twofold action, ſome have divided it into two, that the one of them might lead it from the reſt, and the other might draw it to the thumb. *The Hypothenar.*

The third the externall *Abductor* of the thumb, deſcends from the firſt bone of the afterwriſt, into the firſt and ſecond joint of the thumb; wherefore ſome have divided it into two. The *Lumbrici*, or four externall *Abductores* of the fore fingers ariſe from a membrane, inveſting and binding together the tendons of the *Digitum flexores*, or fingerbenders, and at length on the ſides towards the thumb even by a ſmall tendon, running even to the ſecond joint of the four fingers. *The externall Abductor of the thumb. The Lumbrici.*

Now the *Interoſſes* of the afterwriſt, remain to be ſpoken of; theſe are ſix, two in each of the ſpaces between the fingers, one internall, the other externall, of which the internall deſcending with oblique fibers from the ſide of the firſt bone of the afterwriſt, goes alſo into the ſides of the fingers, that ſo it may the more cloſely bind together the bones of the afterwriſt, whoſe action is manifeſted when we thruſt our fingers into a ſtrait glove, or when we bend our hand. Some think that it helps alſo the drawing of the fingers towards the thumb. The externall aſcends alſo by oblique fibers from the ſides of the ſecond bone of the afterwriſt, to the firſt joints of the fingers, interſecting the internall which we now deſcribed after the manner of the letter X, for to extend the palm of the hand, and help the drawing away of the fingers from the thumb. *The Interoſſei.*

Here concluding the deſcription of the muſcles of the whole hand taken in generall, you ſhall note that they are 39. in number, that is, eight appointed to move the arm; four ſet to move the cubit in generall; ſeven ſeated on the outſide of the cubit, and as many on the inſide in the ſame cubit, moving the wand, and with it the hand; ſeven on the inſide of the hand: and laſtly, the ſix *Interoſſes*. Some encreaſe this number, ſaying, there are nine on the externall part of the cubit, and eleven on the inſide of the hand. *The number of the muſcles of the whole taken in generall.*

CHAP. XXX.

A Deſcription of the Leg taken in generall.

After the hand followes the deſcription of the Leg. Wherefore to take away all doubtfulneſſe, we will firſt define the leg; then divide it into the parts more and leſſe compound; thirdly, we will proſecute all things common to all theſe parts; fourthly, thoſe which are peculiar to each; and then, God willing, we will give an end to our Anatomy.

Now this word *Crus*, or leg, is uſed two manner of wayes, that is, either generally or ſpecially, and ſpecially again after two ſorts, that is, either abſolutely and ſimply ſo, or with an adjunct. It is ſimply taken for all that which is between the knee and the foot. But with an adjunct for the greater bone thereof. But the leg taken in generall, is the inſtrument of going, containing all whatſoever is from the hips, to the very ends of the toes. It is divided into three great parts, that is to ſay, the thigh, the leg, or ſhank, and the foot. By the thigh we mean that which lies between the hip and the knee. By the leg, properly ſo called, or ſhank, that which is contained between the knee and the foot. By the foot all from thence to the ends of the toes. *The diverſe acception of the leg. The thigh. The leg or ſhank. The foot.*

Again, they divide the foot into three parts; that is, the *Tarſus* or inſtep, the *Pedion* or top of the foot, and the *Digiti pedum*, or toes. We underſtand by the inſtep, that which is contained in the firſt ſeven bones, which anſwers in proportion to the wriſt of the hand. By the top of the foot, that which is comprehended in the five following bones, which is anſwerable to the afterwriſt. That which remains, we call the toes. But becauſe all theſe parts have other common and proper parts, we will only follow the diſtribution of the veins, arteries, and nerves; ſeeing we have ſufficiently explained the reſt, when we deſcribed the containing parts of the body in generall. *The diviſion of the foot. The inſtep. The top of the foot. The toes.*

CHAP.

CHAP. XXXI.

A Deſcription of the Crurall vein.

The beginning of the Crurall vein.
The two branches thereof.

THe crurall vein begins then, when the hollow vein paſſing forth of the *Peritonæum*, and ſtretched to the hanch bone, and the ſides of the *Pubis* in the groin, is firſt divided into two large branches, the one of which deſcends on the inſide, alongſt the bones of the whole leg, together with the artery and nerve; the other runs down outwardly and ſuperficially alongſt the leg, between the fat lying under the skin, and the muſcles even to the foot, and is ſpent in the skin thereof. This becauſe it is alwaies apparent and manifeſt, is called properly by the Greeks *Saphena* but commonly *Saphena*.

By what veins, the matter cauſing thoſe tumors called *Bubones* flow down.

This vein by the way preſently at its originall is divided into two branches, the one internall, the other externall; of which the internall is ſpent upon the *Bubones*, and other glandules of that place and the skin, and by this branch come the defluxions called *Bubones*; the other branch is waſted in the fore and utter skin of the upper part of the thigh; then a little lower, that is, about the bredth of three or four fingers, it is gathered again into one branch made of many little ones, which is ſpent in the fore and hind skin of this thigh. Thirdly, a little below the middle of the thigh it is again divided into two other branches, of which the one goes into the skin on the foreſide, and the other on the hindſide. Fourthly, it is diſtributed by two other ſmall ſprigs into the skin, on the fore and hind part of the knee; whith oftentimes are not found, eſpecially when the *Poplitea* or ham vein, is ſomewhat larger than ordinary. Fiftly, a little below the knee, it produces two other branches, lying upon each other in their paſſage out into the fore and hind skin of that place. You muſt note, that branch which runs into the skin of the hind part, is carried by a certain other ſprig, which it produces, into a branch of the *Poplitea* paſſing forth of the two twin muſcles. Sixtly, in the bigger part of the calf of the leg, it is divided into two other branches, which in like manner are diſtributed into the skin, as well in the foreſide as the backſide of the leg.

Where and in what diſeaſes, the *Saphena* muſt be opened.

At length after many other diviſions, which for brevitie ſake I omit, when it arrives at the fore and inner ſide of the ankle (where it is commonly opened in the diſeaſes of the parts below the midriffe which require blood-letting) it is parted into two other branches, the leſſer of which deſcends to the heel; the other in many ſprigs is ſpent upon the skin of all the upper and lower part of the foot and toes.

To what places, and by how manifold diviſions the internall branch of the crurall vein goes.

The ſecond branch of this crural vein, which we ſaid deſcends within together with the artery and nerve, even into the foot, is divided; firſt, piercing ſomewhat deep in, it produces four divarications; one internal deſcending below the original of the into *ſaphia* the muſcle called *Obturator externus*, and into certain other external muſcles. The three other run outwardly, the firſt towards the huckle-bone, by which the *Iſchias* is made, the two other into the fore muſcles of the thigh, neither are theſe ſprigs far remote from one another. Secondly, al that branch is divided into two other branches, the one above, the other below, an artery alwaies accompanying it; the lower of which is ſpent upon many of the hinder muſcles of the thigh ending nigh the ham. The upper, beſides, that it beſtows many branches upon the fore and inner muſcles of the thigh; deſcending to the ham, it produces the *Poplitea* or ham vein, made ſometimes of two branches, the one proceeding from above, and the other from below. This *Poplitea* deſcending by the bending of the ham, is ſpent one while upon the skin of the calf of the leg, another while upon the knee, otherwhiles encreaſed with branches of the *Saphena*, it goes on the outſide of the ankle to the skin, on the upper ſide of the foot, and ſometimes on the lower.

Iſchiadica vena.
Muſcula vena.
Poplitea vena.

Thirdly, a little below the original of the ham vein, and under the bending of the knee, it brings forth the *Suralis*, which is beſtowed upon the muſcle of the *Sura*, or calf of the leg, and upon the skin of the inner ſide thereof, and of the foot continued ſometimes even to the inner part of the great toe.

Suralis vena.

Fourthly, under the head of the hinder appendix of the bones of the leg, it produces between theſe two bones, another vein, which nouriſhing the fore muſcle of the leg, is conſumed upon the foot.

Iſchiadica major.

Fiftly and laſtly, it brings forth the *Iſchiadica major* or greater *Iſchias*, which is divided into two branches of an unequall bigneſſe; the larger whereof, from his originall deſcending alongſt the inner part of the leg bone, inſinuates it ſelf under the muſcles of the calf, between this and the heel, into the ſole of the foot, upon which it is waſted, divided into ten ſmall ſprigs, two for each toe; the other being the leſſer deſcending alongſt the *Perone*, or ſhin-bone, is conſumed between it and the heel, yet ſometimes it is produced, not only even to the muſcle the *Abductor* of the toes, but alſo by five ſurcles, even to the fourth toe, and the ſides of the middle toe.

CHAP.

CHAP. XXXII.

The Diſtribution of the Crurall Artery.

THe crurall artery ariſing from the ſame place whence the crurall vein proceeded, and deſcending with the internall crurall vein, is diſtributed as followeth.

Firſt, into the muſcle of the thigh, which ſpreading it ſelf through the muſcles thereof meets with the utmoſt *hypogaſtrica*, deſcending with the vein through the common hole of the huckle and ſhare bone, and is joined with it. *Arteria muſculi.*

Secondly, when it arrives at the ham, between the *Condyles* or proceſſes of the leg, it ſends two branches into the knee.

Thirdly, a little after it produces another branch, which it ſends to the exterior muſcles of the leg, and when it arrives at the middle of the leg, it is divided into two branches, between the twin muſcles and *Soleus*, the one internall, the other externall; the internall, ſome ſurcles communicated by the way to the parts by which it paſſes, but ſpecially to the joint of the ankle, ſtretches it ſelf over the ſole of the foot, between the lower extremity thereof and heel, whither when it arrives, it is divaricated into five ſurcles, of which it beſtowes two on the great toe, two on the next, and one on the middle toe. The externall deſcending in like manner to the ſole of the foot, between the *fibula* and the heel, beſides other ſprigs, which it may ſpread by the way, it produces one without on the joint of the ankle, another in the muſcle, the *Abductor* of the toes, to the wriſt and back of the foot. But the remainder is divided into five portions, of which two are ſent to the fourth, and two to the little toe, and one to the middle.

CHAP. XXXIII.

Of the Nerves of the Loins, Holy-bone and Thigh.

THere ariſe five conjugations of nerves from the loins, divided into externall and internal branches; the external are diſſeminated into the *Rachita* or chin muſcles, the muſcles *Semiſpinatus* and *Sacer* and the skin lying over them. The internall are ſent into the oblique aſcendent and tranſverſe muſcle of the lower belly, into the *Peritonæum*, into the loin and cheſt muſcles ariſing there, but after a different manner; for ſome are abſolutely carried thither, as the nerves of the firſt conjugation of the loins, and oftentimes alſo of the ſecond, but that ſometimes they ſend a ſmall ſprig to the teſticles, when the Coſtall have ſent none thither; but ſome lower are partly diſtributed there, and partly ſent ſome other way; for the greater portions firſt united amongſt themſelves, then preſently with the portions of theſe of the holy-bone, goe into the thigh, as we ſhall ſhew in the diſtribution of the nerves of the holy-bone. *The five conjugations of the nerves of the loins.* *Where the teſticles have their nerves.*

Now from the holy-bone, proceed ſix conjugations of nerves, reckoning that for the firſt which proceeds from the laſt *Vertebra* of the loins, and firſt of the holy-bone, and that the ſixt which proceeds from the loweſt part of the holy-bone, and the firſt of the rump; theſe conjugations of nerves are divided into externall and internall branches. *The conjugation of the nerves proceeding through the holybone.*

The leſſer externall paſſing forth by the externall and hinder holes of the holy-bone, are diſtributed into the parts properly belonging thereto, to wit, the muſcles and skin thereof; for every nerve by the law of nature firſt and alwaies yeelds to the neighbouring parts, that which is needfull, then preſently to others as much as it can. *An Anatomicall axiom.*

Wherefore if thou wouldſt know whence each part hath his veſſels at the next hand, that is, the veins, arteries, and nerves, thou muſt remember the ſite of each part, and the courſe of the veſſels, and to conſider this, that the veins and arteries as ſpeedily and conveniently as they can, inſinuate themſelves into the parts, ſometimes at the head or beginning, ſomewhiles by the middle or extremes thereof, as there is occaſion.

But a nerve principally enters a muſcle at the head thereof, or at leaſt not far from thence, but never by the tail, whereby it may eaſily be underſtood by what branch of each vein, artery, and nerve, each part may have nouriſhment, life, and ſenſe. The other internall branches of the foreſaid conjugations goe, eſpecially the four uppermoſt united from their originall with the three lowermoſt of the loins, into all the leg, as you ſhall preſently hear. But the two lower are conſumed upon the muſcles called *Levatores Ani*, the *Sphincter* muſcle of the ſame place; beſides, upon the muſcles of the yard, and neck of the bladder in men, but in women upon the neck of the womb and bladder.

For theſe parts admit another in their bottom from the coſtall nerve, being of the ſixth conjugation of the brain; theſe thus conſidered, let us come to the nerves of the thigh, which (as we ſaid) from their firſt originall, as it were compacted and compoſed of the greater portion of the three inner and lower branches of the loins, and the four upper of the holybone, are divided in the thigh into four branches, of which the firſt and higher deſcending from above the *Peritonæum*, to the little *Trochanter*, is waſted upon the inward and ſuperficiary muſcles of the thigh, and the skin which covers them a little above the thigh.

The

The ſecond, deſcending with the crurall vein and artery by the groin, is divided into two branches like as the vein, the one internall, the other externall, of which the internall deſcending with the vein and arterie is ſent into the inner and deep muſcles of the thigh, ending above the knee. But the externall deſcending ſuperficially with the *Saphæia*, even into the foot, gives branches by the way to the skin which covers it.

The third ſeated under theſe former, paſſing by the hole common to the ſhare and hanch-bone, ſends certain branches to the groins, to the muſcles called *Obturatores*, to the *Tricipites*, and ſometimes to the muſcles of the yard, and it ends at the midſt of the thigh.

The fourth, which is the thickeſt, ſolideſt and hardeſt of al the nerves in the body, deſcending wholly from the productions of the holy-bone, and deſcending outwardly, between the lower part of the ſame bone, and the *Os Ilium*, or Hanch-bone to the thigh, beſtows certain ſprigs to the hind muſcles thereof proceeding from the protuberation of the *Iſchium* or huckle-bone, and in like ſort it gives otherſome to the skin of the buttocks, and alſo to the skin covering the forementioned muſcles.

A little after, it is parted into two branches deſcending undivided even to the bending of the knee, they both are communicated by divers ſurcles of the muſcles of the leg; yet ſo as the leſſer produces another branch from the reſt of the portion thereof deſcending on the fore part of the leg, alongſt the ſhin-bone unto the top of the foot, where it is divided into ten ſurcles ſcarce apparent to the ſight, two running to each of the toes. The other greater deſcending in like manner in the remainder of its portion by the hind part of the leg into the ſole of the foot, caſts it ſelf with the veins and arteries between the heel and leg bone, were firſt divided into two branches, each of which preſently parted into five, ſend two ſprigs to the ſides of the toes. And theſe are the moſt notable and neceſſary diſtributions of the veſſels and nerves; we purpoſely omit others which are infinite, and of which the knowledge is impertinent.

CHAP. XXXIV.

Of the proper parts of the Thigh.

HAying explained the common parts of the leg in generall; now we muſt come to the proper, beginning at the Thigh. The proper parts of the Thigh, are muſcles, bones, and ligaments. But becauſe the demonſtration of the muſcles is ſomewhat difficult, if we be ignorant of the deſcription of the bones from whence they ariſe, and into which they are inſerted; therefore we judg it worth our labour, firſt to ſhew the bones, and the dearticulation of theſe of the Thigh; beginning with theſe bones which are knit with the upper part of the holy-bone.

Of how many bones the *Oſſa Ilium* conſiſt.

And they are two in number, on each ſide one, commonly called the *Oſſa Ilium*; each of theſe is compoſed of three bones, of which one is the upper, another the lower and anterior, and the third the middle, and after a manner the poſterior. The upper by a particular name is

What the *Os Ilium* ſtrictly taken is.

called the *Os Ilium*, the hanch-bone, and it is the largeſt and biggeſt, having a griſtly Appendix in the compaſſe thereof, even to the connexion it hath with the other neighbouring bones, whoſe upper part we term the right line thereof; but the *baſis*, which is adjoined to it by *Symphyſis*, we call the lip or brow thereof, becauſe it ſtands both ſomewhat

What the line, lip, brow and rib of the *Os Ilium* are.

out and in, after the manner of the brow. But that which lies between the *baſis* and ſtreight line we name the Rib; this ſame upper bone hath two hollow ſuperficies, the one internall, the other externall. The connexion thereof by *Symphyſis*, is twofold, the one with the upper part of the holy-bone; the other with that bone we called the middle, and after ſome

The *Os Iſchium*, or huckle-bone

ſort the poſterior; which taking its beginning from the narrower part of the *Os Ilium*, makes that cavity in which the head of the thigh is received; this cavity the Greeks call *Cotyle*, the Latins *Acetabulum*, and it is ended by the ſide of the hole common to it, and the ſhare-bone; this middle, and in ſome ſort poſterior bone is called properly and particularly the *Os Iſchii*, or huckle-bone, and contains nothing elſe but the forementioned cavity, but that on the hind and lower part thereof, it brings forth a proceſſe, which adjoins it ſelf to the ſhare-bone at the lower part of the common hole, in which place it appears very rough and unequall, and it is called the tuberoſitie of the huckle-bone, at whoſe extremity alſo it brings forth a little head ſomewhat reſembling the proceſſe of the lower jaw called *Corone*. The third bone named *Os pubis* or the ſhare-bone, ſtretches it ſelf even to

The *Os pubis*, or ſhare-bone.

the higheſt part of the *pecten*, where meeting with the like bone of the other ſide, it is united to it by *Symphyſis*, after which manner alſo, all theſe three bones are united; it is reported, that this bone opens in women in their travel, yet hitherto I can find no certainty thereof.

You may perceive a manifeſt ſeparation of theſe three bones in the *Sceleton* of a child; for in thoſe who are of more years, the griſtles which run between theſe connexions turn into bones.

The deſcription of the thigh-bone.

Now followes the thigh-bone, the biggeſt of al the bones of the body; it is round, and ſo bended that it is gibbous on the exterior and forepart thereof, that ſo it might be the ſafer

from

from externall injuries; but on the hind and inner part, it is hollow or sinous, like to the back of an Asse, whereby the muscles might have a more commodious originall and insertion.

The figure of the Thigh-bone.

A 1, 2. The head of the thigh going into the cup of the hip-bone.

B, 2. A sinus in the head of the thigh, into which is inserted a round ligament.

C 1, 2. The conjunction of the appendix of the thigh with the bone it self.

D 1, 2, 3. The neck of the thigh.

E F The two lower heads of the thigh.

G 1, 2. The conjunction of the lower appendix.

H 1, 12. A sinus betwixt the two heads of the thigh.

K 2. A part of the lower head of the thigh, from whence the first muscle of the foot doth proceed.

L 2. Another part from whence the second and first muscles arise.

M 2. Another part to which the Tendon of the fift muscle of the thigh is infixed.

N 1, 2 A sinus of the outward side of the head for the fourth muscle of the leg.

O 2. A sinus of the inside through which the tendons doe passe.

P 2. A protuberation at which the said tendons are reflected.

Q 2. The upper processe of the thigh, and betwixt *Q* and *D* is the sinus. *R* 1, 2. The union of the processe with the thigh. *S S* 2. A rough line from the impression of the externall processes. *T* 1. The anterior impression of the internall processes, *V* betwixt *T* and *V* another impression higher than the former. *V*, 1, 2. The fourth impression in the top of the processe. *X* 3. Four *X*, shew the four appendices of the thigh. *Y* 3. Three *Y*, shew the three heads of the thigh. *Z Z* 3. Two processes of the thigh. *a* 1. The interior processe of the thigh. *b* 1. The conjunction of the processe with the thigh, *c c* 2. A line descending obliquely from the inner processe. *d d* 2. A line running through the length of the thigh. *e* 2. The largeness of the thigh in this part. *f* 1. A roughness from which the eighth muscle issueth. *g, h* 5. A knub of the Whirle-bone going into the sinus marked with *I*, which is betwixt the heads of the thigh. *i* 5. A sinus fitted for the inner head of the thigh. *k* 5. A sinus agreeing with the externall head of the thigh. *l* 5. the lower asperity or roughnesse. *m* 4. The foreside of the pattell or whirle-bone rough and unequall.

That sinous part a little below the midst thereof, is divided into two lines, the one whereof goes to the internall tuberosity, the other to the externall of the lower appendix of the same thigh. These are chiefly to be observed, because the oblique fibers of the vast muscles thence take their originall.

Besides, this bone hath two appendices in the ends thereof, as easily appears in a childs thigh; the upper appendix makes the round head of the thigh it self, which (as every other appendix) seated upon a long neck, is received in the cavity of the hanch-bone by Enarthrosis; it is stayed and fastned there by two sorts of ligaments, of which the one is common, proceeding from the muscles, which descend from above, about the neck thereof, the other is proper, which is twofold, that is, one membranous and broad, proceeding from the

The two appendices of the thigh-bone.

the whole cavity of the orb, or cup, deſcending about all the head of the thigh, above the neck thereof; the other thick and round, deſcending from the ſecond cavity of the *Cotyle* it ſelf, which is extended, even to the common hole at the top of the head thereof.

The two proceſſes of the thigh-bone make the two *Trochanters*.

Beſides, under this head, that bone hath two proceſſes, the one great and thick, the other little and ſhort.

The greater ſeated in the hind part, is called the great *Trochanter*; the leſſer ſituate in the inner part, is named the little *Trochanter*.

But you muſt note, that the greater *Trochanter*, on the higher and hind part thereof, which looks towards the head of this bone, makes a certain ſmall *ſinus* or boſome, into which the twin muſcles and others, whereof we ſhal hereafter ſpeak, are implanted; we muſt alſo conſider the multitude of holes encompaſſing this neck, between the head and the two *Trochanters*, which yeeld a paſſage to the veſſels, that is, the veins, arteries, and nerves, into the marrow of the bone it ſelf, whence the marrow it ſelf becomes partaker of ſenſe, eſpecially on that part which is covered with a coat, and the bone lives and is nouriſhed.

Whence the marrow becomes partaker of ſenſe.

The other Appendix of the thigh, that is, the lower, is the greateſt and thickeſt, riſing as it were with two heads, which are divided by two cavities, the one ſuperficiary and on the foreſide, whereby it receives the whirl-bone of the knee; the other deep, and on the back part, by which it receives the griſtly and as it were bony ligaments, proceeding from the eminencie which is ſeen between the two cavities of the upper appendix of the bone of the leg, which *Hippocrates*, *lib. de fracturis*, calls in his tongue *Diaphyſis*.

CHAP. XXXV.

Of the Muſcles moving the thigh.

Their number.

THe muſcles of the thigh are juſt fourteen in number, that is, two bend it, whereupon they are called the *Flexores*, or benders; three extend it, whereupon they are called *Tenſores*, extenders; three move it inwards, driving the knee outwards, and drawing the heel inwards, as when we croſſe our legs; yet ſome make theſe three one, and call it the *Triceps*, or threeheaded muſcle. Six ſpread it abroad, and dilate it, as happens in the act of venery.

Four of theſe are called *Gemini* or Twins, by reaſon of the ſimilitude of their thickneſſe, originall inſertion and action; the two other are called *Obturatores*, becauſe they ſtop the hole which is common to the ſhare and back-bones.

The two *flexores*.

Now one of the two *Flexores*, being round, deſcends on the inſide with fibers of an unequall length from all the tranſverſe proceſſes of the loins, above the hind commiſſure of the haunch and ſhare-bones, and is inſerted into the little *Trochanter*; the other broader and larger from the origiuall paſſes forth of the whole lip, and inner brow of the haunch-bone, and filling the inner cavity thereof, is inſerted above the forepart of the head of the thigh, into the little *Trochanter* by a thick tendon, which it with the fellow muſcle lately deſcribed, produces even from the fleſhy part thereof; wherefore you need to take no great pains in drawing or plucking them away.

The three *tenſores*,

The three *Tenſores* or extenders, make the buttocks, of which the firſt being the thicker, larger, and externall, ariſing from the rump, the holy-bone, and more than half of the exteriour and hinder lip of the haunch-bone, is inſerted by oblique fibers, ſome four fingers bredth from the great *Trochanter* at the right line, which we ſaid, reſembled an Aſſes back.

The ſecond, which is the middle in bigneſſe and ſite, deſcends from the reſt of the lip, and from the fore and outward rib of the haunch-bone, and above the midſt of the bone, is inſerted into the upper part of the great *Trochanter*, by a triangular inſertion above the upper and exterior part thereof.

The third being leſſer, ſhorter, and thinner, lying hid under theſe former, proceeds from the middle of the externall ſurface of the haunch-bone; and then is inſerted into the greater part of the right line of the great *Trochanter*.

Theſe three muſcles have a great and large originall, but a narrow inſertion, as it were by oblique fibers.

Three *Intromoventes*.

Then follow thoſe three muſcles which move the thighs inwards, ſtraiten and croſſe them, ſo that the knee ſtands forwards or outwards, but the heel is drawn inwards, as you may underſtand by their inſertion, although ſome think otherwiſe. But theſe three muſcles by their originall, partly fleſhy, and partly membranous, ariſe from the upper and forepart of the circumference of the ſhare-bone, and thence are inſerted into the hind line of the huckle-bone, ſome higher than otherſome; for the leſſer and ſhorter ſtayes at the roots of the little *Trochanter*, the middle deſcends a little deeper, the third with the longeſt of his fibers, deſcends even to the midſt of the line.

This if it be ſo, that is, theſe muſcles proceeding from the fore and upper part, to be inſerted into the hinder line of the huckle-bone, whilſt they alone perform their action, and draw the thighs together, they will turn them outwards, juſt ſo as when we put them

acroſſe,

acroſſe, but they will not draw one heel to another, and put the heel outwards, for ſuch like motion is performed by the inner vaſt muſcle of the thigh, moving the leg. Now follow the ſix which move the buttocks.

The movers of the buttocks.

The firſt, and higher of the *Quadragemini*, or the four twin muſcles, paſſes forth of the commiſſure of the holy-bone, with the bone of the rump, or rather from the loweſt extream of the holy-bone, and thence it is inſerted into the cavity of the great *Trochanter* by a tendon of a ſufficient largeneſſe.

The ſecond proceeding from the hollow part or fiſſure, which is between the extremity of the huckle-bone, and the tuberoſity or ſwelling out of the ſame, is inſerted in like manner into the cavity of the great *Trochanter*.

The third aſcends from the inner part of the ſwelling out of the huckle-bone; a little above, between the two *Trochanters*, into the cavity of the greater of them.

The fourth and laſt, the loweſt and broadeſt of them all, proceeds from all the exteriour protuberancie of the huckle-bone, and thence is inſerted into the great *Trochanter*, and theſe four muſcles lie hid under the thick and more eminent part of the buttocks; wherefore that you may the better ſhew them, they muſt be turned up towards their originall.

The two *Obturatores* remain to be ſpoken of, that is, the internall and externall, both which ariſe from the circuit and circumference of the hole which they ſtop, which as we ſaid is common to the ſhare and huckle bone, but the internall aſcends to the exterior root of the great *Trochanter* by the middle fiſſure between the upper part of the protuberancy of the huckle bone, and the ſpine which ſtands up in the hinder baſis of the haunch bone.

The two *Obturatores*.

But the externall proceeds from the exteriour cavity, and the middle ſpace between the tuberoſity of the huckle bone and cavity thereof, and is inſerted into the lower part into the cavity of the great *Trochanter*, together with the *Quadragemini*.

If you would plainly ſee the exteriour *Obturator*, you muſt either cut off the beginning of the three-headed muſcle, or handſomely pluck it away, and then extend it, and turn it up; the internall is eaſily diſcerned when the bladder is taken away.

CHAP. XXXVI.

Of the bones of the Leg, or Shank.

THoſe which would deſcribe the muſcles of the legge, ought firſt to deſcribe the bones thereof, beginning at the *Rotula*, or whirle bone of the knee.

What the *Rotella*, or whirle bone of the knee is.

This bone is griſtly on the outſide, and round in compaſſe, but on the inner and middle part after ſome ſort gibbous, but ſomewhat flatted at the ſides, that ſo it may be fitlier applied to the joint of the knee, and fitted within the anteriour cavity of the two appendices of the thigh, and the upper and foremoſt of the leg.

The uſe thereof is to ſtrengthen the joint of the knee, and to hold the leg at his due extent, ſo that it may not be bended ſo far forwards, as it is backwards.

The uſe thereof

The bones of the leg are two, the one thicker, called by the particular and proper name, the *Os Tibiæ* or leg bone; the other which is leſſer, is termed *Perone*, or *Fibula*, but commonly the leſſer *ſcile*, (and in Engliſh it may be termed the ſhin-bone.) The thicker being hollow and marrowie, is ſeated in the inner part of the leg, having two proceſſes, the one bigger, the other leſſe.

What, and how many bones the leg hath.

The leg-bones

The bigger ſeated on the upper part of the bone, and conjoined to it by *Symphyſis*, makes two ſuperficiall and ſide cavities disjoined by an indifferent riſing; wherefore this bone is connext to the bone of the thigh by *Ginglymos*. For in the cavities thereof it receives the lower and hinder protuberances of the Appendix of the thigh bone, but the middle eminencie thereof, is received by it between the two protuberances thereof.

This joint is ſtrengthned, not only by the force of the tendons, or muſcles ending there, but alſo of three ſtrong ligaments, of which one proceeds from all the externall, another from all the internal parts of thar connexion; the third which we, out of *Hippocrates*, called *Diaphyſis*, from the diſtance or ſpace between them. The other proceſſe of the leg bone, which we called the leſſe, ſeated in the lower part thereof, makes as it were a double cavity, whereby it receives the *Aſtragalus* or paſtern bone; but on the inſide it makes the ankle, as the *Perone* makes it without: between theſe ankles the *Aſtragalus* is received on the ſides, and turned as the nut in a Croſſe-bow, as often as there is need to bend or extend the Foot. Beſides, this ſame leg-bone, being triangular, hath three eminencies made in the ſhape of an Aſſes back; the ſharper deſcends alongſt the fore part, called by the Greeks *Antiozemion*; the ſecond reſides on the inner part, and the third on the outer; all theſe muſt be diligently obſerved, and chiefly, that on the forepart; becauſe it is as a guide and rule to a Chirurgeon in the well ſetting of a broken leg. The *Perone*, or ſhin bone, is ſeated, as it were, on the outſide, and as behind the leg-bone; it hath alſo two appendices hollow on the inſide, but gibbous on the out. This bone by the upper of theſe is faſtned and inſerted under the inner, and in ſome ſort the hinder appendix of the leg bone, ſo that it is in no ſort articulated with the thigh, but ſerves only in ſtead of a leaning ſtock. But by the lower, this ſame bone is not only received in the loweſt part of the leg, or ankle, or paſtern bone, but

What *Diaphyſis* is.

The *Perone* or *Fibula*, or ſhin-bone.

alſo receives part thereof, which is joined on the ſame ſide with the heel, eſpecially then when we bend our foot outwards.

This bone is faſtned to the forementioned bones by *Synarthroſis*, but bound by ſtrong ligaments proceeding from the ſame bones, and mutually ſent from one to another, or if you had rather, from the upper into the lower, as we ſaid in the arm. But this ſame *fibula* or ſhin bone is alſo triangular, having three lines, of which one ſtands outwards, another on the foreſide, and the third behind.

CHAP. XXXVII.

Of the Muſcles of the Legs.

Their number. ALL the motions of the leg, are performed by eleven muſcles, of which there be ſix on the foreſide, and five on the hind. But of theſe, ſome move the leg only, as thoſe which take their originall from the bone of the thigh; others truly move the leg, but with the thigh, as thoſe which ariſe above the thigh, that is, from the hanch, huckle, and ſhare bones.

The *Longus*. The firſt of theſe on the foreſide called the Long, but commonly the *Sutorius* (or Tailor muſcle, by reaſon of its action) it ariſes from the lower and fore extremity of the ſpine or appendix of the hanch bone, and deſcending obliquely above the other muſcles, is inſerted by a large and membranous tendon, in the fore and inner part of the leg under the knee; the action thereof is to croſſe the legs, but being firſt bended by the muſcles preſently to be treated of, it helps alſo the three headed muſcle in the performance of the formentioned action.

The *Membranoſus*. The ſecond of theſe four muſcles is termed the *membranoſus*, or membranous, becauſe it is wholly ſuch, unleſſe at the originall where it deſcends fleſhy from the root and baſis of the above mentioned ſpine of the hanch bone, and that obliquely with its membranous and broad tendon (mixed with the common coat of the muſcles) into the outward part of the leg, which it moves outwards, as alſo the thigh with the four twin muſcles; for as we have in another place obſerved, of two oblique motions concurring in one, is made a right motion; and beſides, almoſt all the motions of the body, are thus performed; the muſcles which perform ſuch motions are placed and oppoſed in an oblique ſite, as may be perceived by the motions and ſite of the muſcles of the hand taken in generall.

The *Rectus*. The third, called the *Rectus*, or right (becauſe it deſcends above the *Crureus*, alongſt the right fore line of the thigh, between the two vaſt muſcles) comes forth between the extremity of the appendix of the hanch bone and cavity thereof, with a very ſtrong ligament, and then is inſerted into the forepart of the leg, paſſing over the midſt of the whirlebone of the knee; it extends the leg, with the three following, but by accident it may help the bending of the thigh.

The two *Vaſti*. The fourth and fifth are called *Vaſti*, vaſt or huge muſcles, by reaſon of their largeneſſe, the one of theſe is internall, the other externall: they both ariſe with right fibers, from their originall, but with oblique at their inſertion, by reaſon whereof they both ſeem to have a compound action from a right and oblique motion; the right helping for the extenſion of the leg, but the oblique to draw one knee to another, or to disjoin both the knees; the internall comes by its right fibers from the root of the little *Trochanter*, but by its oblique from the inner deſcendent line of the thigh. The externall paſſes forth by its right fibers from the root of the great *Trochanter*, but by the oblique from the externall deſcendent line of the ſame bone. But all theſe fibers are in certain places ſo mixed with the *Crureus* that they cannot be ſeparated unleſſe you violate the one of them; they go into the leg (each on his ſide) above the whirlbone of the knee alongſt the ſides of the right muſcle, with which it makes an unſeparable tendon, as you ſhall preſently hear. The ſixt

The *Crureus*. and laſt of theſe fore muſcles called the *Crureus*, or thigh muſcle (by reaſon of the ſtrait and firm adheſion, which it hath with the thigh bone, which is by ſome called *Crus*) from the ſpace between the two *Trochanters* deſcends under the right muſcle and two vaſt muſcles into the forepart of the thigh, even to the whirlbone of the knee. But we muſt note that theſe four laſt muſcles make a common thick and broad tendon, with which they cover the *Patella*, or whirl bone, and all the fore dearticulation of the knee, that they cannot be ſeparated without tearing; wherefore we muſt think that this tendon ſerves the knee for a ligament; now all theſe muſcles performing their action together, extend the leg. The five hind muſcles follow to be ſpoken of; of which three ariſe from the tuberoſitie of the huckle bone, going into the inner part; the fourth from the middle of the *Pubis*, called *Biceps*, that is, the two-headed muſcle into the outſide of the leg.

The three Internall. Of the internall, one paſſing from the forementioned tuberoſity, deſcends ligamentous even into the midſt of the thigh, and then becoming fleſhy, is inſerted by its tendon, after the manner we formerly mentioned.

The other being ſlender, paſſing forth alſo from the ſame place, with its tendon, is inſerted with the tendon of the long muſcle, and ends in the inner part of the leg, which with its companion, it draws inwardly, and brings to the other, which ſame thing it performs in the thigh, by the help of the three-headed muſcle.

The

The third being the inner, or hinder, descends from the middle part of the share-bone, with a broad and slender ligament, and is inserted with a round tendon, into the inner part of the leg after the manner of the forementioned.

The fourth called *Biceps* takes one of the two heads, of which it consists, from the last mentioned tuberositie, the other from the outer line of the thigh, but is inserted into the externall part of the leg, as we formerly said. The *Biceps*, or two-headed muscle.

The fifth and last called the *Popliteus* descends obliquely fleshy from the externall condyle or knot of the thigh, into the inner and hinder part of the leg, at the joining thereof to the shin-bone; the action thereof is, to draw the leg, after a manner inwards. The *Popliteus* or ham muscle.

CHAP. XXXVIII.

Of the Bones of the Foot.

THe Order of Anatomy requires, that we now prosecute the muscles moving the foot, but because we should in vain deliver their insertion, the disposition and condition of the bones of the foot, not being first known, wherefore it first behoves us, to set forth their description. Therefore the bones of the foot are six and twenty in number, distinguished into three ranks; that is, the bones of the *Tarsus* or Instep, are seven; those of the *Pedium*, the after wrist, or Back of the foot, five; and those of the toes, fourteen. Of the seven bones of the instep, there are 4 named, and 3 unnamed. The first of the named immediately following the bones of the leg, is called *Astragalus*, the pastern or ankle-bone. This hath three connexions, one, as we said before, in the upper and broader part, with the bones of the leg, of which it is received; the other in the lower and hind part, by which it receives the upper and inner processe of the bone of the heel; the third on the foreside by which it is received in the cavity of the *Os Naviculare* or *Scaphoides*, that is, the boat-like bone. By the first connexion the foot is extended and bended; by the second it is moved with the heel to the sides: the two first connexions are by *Diarthrosis*, the last by *Synarthrosis*. But it is strengthned by strong and broad ligaments, descending and ascending from one bone into another; also they are strengthned by membranes, muscles and tendons, descending to the foot above and under these joints. But this bone hath three processes, as three feet fastened to the bone of the heel; of which the first and least is under the outer ankle; the bigger (which *Galen* saith, makes a round head, fastned on a long neck) looks towards the forepart of the foot, over against the great toe, and the next toe to it; the middlemost is at the heel, behind the leg-bone. Their number. The bones of the Instep. The *Astragalus* its three connexions and their use. Its three processes.

I passe over in silence many other things, as the smoothness and asperity or roughness of the bone, which I had rather you should learn by oculate inspection than by book. The second bone lying under this is called the *Calcaneum*, or heel-bone, being the biggest of all the bones of the foot, upon which all the body relies when we go. It hath two upper processes, the one great, the other little. The great is received in the hind and outer processe of the *Astragalus*; the lesser is received on the inside in the third processe of the same bone, which we said had a round head fastned to a long neck. Besides, it is round on the hind part, and much disjoined from the leg-bone, but on the fore part longer, where it is knit by *Synarthrosis* to the Die-bone, whose lower and inner part, it seems to receive; the superficies thereof is wholly unequall, and rising up with many swellings. On the inner side it makes as it were a channell, to give way, as well to the vessels as tendons going to the sole of the foot and toes. Lastly, we must consider the holes by which the vessels passe into that bone to give it nourishment, by reason of which vessels the fracture of this heel-bone is very dangerous, because of the pressing and contusion of the vessels, as *Hippocrates* shews. For the ligaments of this heel, or heel-bone, they are such, as these of the *Astragalus*, to wit, tendons, membranes and ligaments properly so called, coming from one bone to another. The third bone of the foot is named *Scaphoides*, or boat-like, from the resemblance it hath to a boat, for on that part which looks towards the pastern bone, it is hollow; but on that part which is next the three *Innominata*, or nameless bones (which it sustains, and of which it is received, as it in the cavity thereof receives the head of the *Astragalus*) it is gibbous like the bottom of a boat. The connexions thereof are by *Synarthrosis*, and they are strengthned by the forementioned ligaments; this same bone is arched on the upper part, but somewhat hollowed or flatted below, the inner part ends in a poine, like the prow of a ship, but the outer obtuse like the stern of a ship. The fourth bone of these which have names, is called the *Cuboides*, from the resemblance of a Die, although that similitude be very obscure. On the forepart it sustains the toes, which by a certain proportion to the fingers of the hand, may be called the ring and little toes, but it is fastened on the hind part, with the back part of the heel; on the inner side it is joined with the boat-like bone, and that nameless bone which sustains the middle toe, on the outside, it produces a rising like the back of an Asse, which on the lower part is extended transversely all the length thereof; at the two sides of this eminency or rising there are two final cavities, in form of a channel, Why a fracture of the heel is so dangerous. *Hippocrates, Sect. 3. lib. de fracturis.* The *Os Scapboides*, or boat-like-bone. The *Os Cubo-ides* or Die-bone. The description of the *Calcaneum* or *Calx*.

X Y Z 2. the place of the heel. Y Z 2, Y 8, Z 9. a proceſſe of the heel made for the production of muſcles. *a b* 7, 8, 9. from *a* to *b* the diſtance of the upper part of the heel. *c* 8, 9. the hinder part of the heel. *d* 2, 8. the inner ſide of the heel. *e* 8. the place where the tendons that run to the bottom of the foot are reflected. *f* 7, 8. the outer ſide of the heel. *g* 1, 7, 9. here the tendons of the 7 and 8 muſcles of the foot are ſtretched out. *h* 7. the forepart of the heel which is joined to the paſtern bone. *i* 7. that part of the heel which is joined to the Cube bone. *k* 11. the *ſinus* of the boat bone receiving the head of the *Talus*. *l m n* 10, three ſurfaces of the boat bone lightly prominent, which are articulated to the bones of the wriſt. *o* 7, 11. the upper part of the boat bone regarding the top of the foot. *q r* 10. and *q* 11. his lower part. *q* 10, 11. A *ſinus* through which the foot muſcle of the foot is led. *t u* 13. the plain ſurfaces of the three inner bones of the wriſt whereby they are articulated to the boat bone. *x* 13. a ſhallow *ſinus* of the Cube bone whereby it is articula ted to the heel. *αβ* 12. the place of the Cube bone to which that bone of the After-wriſt is joined which ſupporteth the laſt toe ſave one. *γ* 12, 13. the place of the Cube bone where the third bone of the wriſt is articulated. *δ* 12, 13. that part of the Cube bone which reſpecteth the outſide of the foot. *ε* 12, 13. the ſurface of the Cube bone in the upper part of the foot. *ζ* 2, 13. that part of the Cube bone which regardeth the earth. *η* 2, a *ſinus* of the

Cube

Cubebone at which the tendon of the ſeventh muſcle of the foot is reflected. B 13. a proceſſe of the third bone of the wriſt whereinto the fift muſcle of the foot is inſerted. ι 12. the place of the inner bone of the wriſt to which that bone of the Afterwriſt which ſuſtaineth the great toe is coupled. ϰ 12. the place of the ſecond bone of the wriſt whereto the bone of the Afterwriſt that ſupporteth the fore Toe is articulated. λ 12. the place of the third bone of the wriſt whereto that bone of the Afterwriſt which ſupporteth the middle Toe is articulated. μ 1, 2. a ſmall bone whereby that bone of the Afterwriſt which ſuſtaineth the little toe is joined unto the Cubebone. ν 1, 2 the diſtances betwixt the bones of the Afterwriſt. ξξ, 1, 2. the heads of the bones of the Afterwriſt, which enter into the boſomes of the toes. ο 2, a proceſſe of the bone of the afterwriſt wherein the tendon of the ſeventh muſcle of the foot is implanted. π 2, a proceſſe of the bone of the Afterwriſt, which ſuſtaineth the little toe, which proceſſe receiveth the tendon of the eight muſcle of the foot. ρ, σ, τ, 1, 2. the three bones of the foretoe. υ, φ, 2, two ſeed bones placed under that bone of the afterwriſt which ſuſtaineth the great toe. * 2 under *X*. a ſeed bone ſet to the ſecond joint of the great Toe. Γ, 1, 2. the *Talus* or paſtern. Δ, 1, 2. the Heel. Θ, 1, 2, the Boat-bone. Λ, Ξ, 1, 2. the bones of the toes. Φ, Χ, 1, 2. two bones of the great toe, I, II, III, IV, V, 1. the five bones of the afterwriſt.

The firſt and the greater of the *Oſſa innominata*, or nameleſs bones, ſuſtains the great toe; the leſſer and ſecond, the next toe thereto; the third and middle in bigneſſe, the middle toe. Theſe three bones are arched on their upper part, but ſomewhat hollowed below. They are knit to the three forementioned bones by *Synarthroſis*, of which they are received, but on the hind part with the boat-like bone which they receive. Now we muſt come to the bones of the ſecond rank, that is, of the *Pedium*, or back of the foot; theſe are five in number, bearing up the five bones of the toes. They are ſomewhat gibbous on the upper part, but hollow below, each of them hath two proceſſes at the end thereof, by the lower and firſt of which they receive the three nameleſs and Die-bone, but by the upper made into a round head, they are received of the firſt bones of the toes. Their connexions, whether with the toes, or bones of the inſtep, are by *Synarthroſis*. The ligaments as well proper as common are ſuch, as we ſaid of the former. The bones of the third order now remain to be ſpoken of which we ſaid, make the toes, and they are fourteen, two of the great toe, but three of each of the other toes. The firſt is ſomewhat longiſh, but the reſt are very ſhort, except that of the great toe, all of them on the upper ſide are round and convex, but on the lower ſomewhat hollow, and plain long-wiſe, that the tendons which bend them, may paſſe more ſtraitly and ſafely without inclining to either ſide, even to their furtheſt joints; although ſuch paſſages are much helped by the membranous & common ligament, which riſing from the ſides of theſe bones, involves theſe tendons, as we mentioned in the fingers. To conclude, each of theſe bones, the laſt excepted, have a double connexion by *Diarthroſis*, they are all unequall in their bigneſſe, that is, thick at their beginning (where they receive the heads of the precedent bones, upon which they move as a dore upon the hinges) and ſo they grow ſmaller towards the ends, but by their ends, they are received of the following bones: at their ends they riſe into two eminencies on their ſides, diſtinguiſhed by a cavity between them, through which occaſion they are far thicker at their ends, than in their middle. The Ligaments by which their connexions are faſtned, are ſuch as the former. The *Oſſa ſeſamoidea* or ſeed bones of the feet are like in number and ſize to theſe of the hands. But this is to be noted, that thoſe ſeed-bones which are in the firſt articulation are ſomewhat bigger than the reſt, and they are round and longiſh on the outſide, but ſmooth and hollow on the inſide, ſeated between two cavities, encompaſſed by three riſings, of which two are on the ſides, and the third in the midſt of the extremity of the firſt bone of the *Pedium*, which chiefly bears up the great toe. To conclude, before we come to ſpeak of the muſcles, we muſt obſerve that the foot was made for two commodities. The firſt is to ſtay and bear the whole body, when we ſtand, for which cauſe nature ſet not the great toe contrary to the other, as it placed the thumb on the hand. The other is for apprehenſion, or taking hold of, wherefore nature framed and made the foot, and theſe moveable and jointed in the toes, as in the fingers of the hand. Beſides alſo for that we muſt goe upon our feet, Nature hath made them in ſome places hollow on the lower ſide, and in other ſom plain in a triangular figure, that ſo our foot may carry us over every ſoil, plain, mountainous, equal and unequal, through all parts of the world.

The Oſſa innominata or nameleſs bones.

The bones of the foot or Pedium.

The bones of the toes.

The ſeed bones of the foot.

The twofold uſe of the foot.

CHAP. XXXIX.

Of the Muſcles moving the foot.

THe muſcles of the Leg moving the foot are abſolutely nine, three in the forepart and ſix in the hind. Two of the three fore muſcles bend the foot, when they jointly perform their action, but when ſeverally, each draws it to his ſide; the third chiefly extends the Toes, for other whiles it ſeems by its ſlenderer and longer tendon (which exceeds not that bone of the *Pedium* which ſuſtains the little toe) to help alſo to bend the foot.

Their number.

Muſculus Peroneus. The firſt is called *Peroneus*, becauſe it deſcends alongſt the bone *Perone*; the other the *Tibiæus anticus*, for that it deſcends along the *Os Tibiæ*, or bone of the leg. The third from its action is called the *Digitumtenſor*, or Toe-ſtretcher. For their originall the *Peroneus* which ſeems to have two heads, deſcends from the upper appendix of the *Perone* or ſhin-bone by its firſt head, but by the other from the middle of the ſame bone from the fore ſide into the hind, as the ſuperficies ſhews which paſſes between the fore and outward line of the ſaid bone; but after it arrives at the lower and hinder appendix of the ſame bone, behind the outer ankle it produces two tendons, which by the guidance of the Ligaments as well proper, as common, goe, the thicker under the ſole of the foot, ending in the Die-bone and that bone of the *Pedium* which ſuſtains the great toe; the leſſer goes on the outſide to the Die-bone, and the laſt and leaſt bone of the *Pedium* which bears up the little toe, ſometimes a ſlender portion thereof is produced even to the ſide of the little Toe, extending it and drawing it from the reſt. The *Tibiæus anticus* or fore leg muſcle proceeding from the upper and outer appendix of the Leg-bone deſcends above the ſurface of the ſame bone, which is between the fore and outer line to which it adheres, as alſo to that ſurface even to the midſt, from which place it produces one tendon, which deſcending on the fore and loweſt part, ends on the outſide into two of the nameleſs bones, that is, into the firſt which is the thicker, and into the middlemoſt, but beſides by a ſlender portion thereof it is extended into the firſt and greater bone of the *Pedium*, ſo to extend the great toe, drawing it inwards to the other foot. And this muſcle with the precedent bends the foot, if they both perform their parts at once; but if ſeverally, each draws the foot towards his ſide. The third which is the *Digitumtenſor*, or Toe-ſtretcher, is twofold; the one takes its originall from the top of the leg, and running alongſt the ſhin-bone, and paſſing under the ring, carries it ſelf into the foot, in which it ends by five tendons going to all the joints of the Toes, and by a ſixth at that bone of the *Pedium* which ſuſtains the little toe, whereby (as we formerly ſaid) it helps the bending of the foot. The other deſcends into the midſt of the ſhin-bone, and ſomewhat faſtned thereto, by one tendon paſſing under the ring it goes to the great Toe. But you muſt note that all theſe Tendons have nervous, ligamentous and fleſhy fibers ſo ſeparated from each other, that they can equally alone perform their function, as if they were more diſtinct muſcles. And we muſt think the ſame of the reſt which have diſtinct tendons preſently from their fleſhy part.

Tibiæus anticus.

The Toe-ſtretcher is twofold.

The 6 hind muſcles. The ſix hind muſcles follow, of which the two firſt are called the *Gemelli* or twins by reaſon of the ſimilitude of their thickneſſe, originall, inſertion and action. The third is called the *Plantaris*, becauſe it is ſpent upon the ſole of the foot, as the *Palmaris* upon the palm of the hand. The fourth is termed the *Soleus* or ſole muſcle by reaſon of the reſemblance it hath to the fiſh of that name. The fift the *Tibiæus poſticus* or hind leg muſcle which deſcends alongſt the back part of the leg-bone. The ſixth and laſt the *Digitumflexor* or Toe-bender, equivalent to the deep muſcle of the hand; ſome make but one muſcle of this and the *Tibiæus poſticus*, which produces three tendons; others had rather make three, as thus, that one ſhould be the *Tibiæus*, the other the bender of four Toes, the third the bender of the great Toe.

The two *Gemelli* or twin muſcles. Now for the two *Gemelli* or twins, the one is internall, the other externall; the internall paſſes forth from the root of the inner Condyle of the thigh; but the externall from the externa l Condyle; and from this their original preſently becoming fleſhy, eſpecially on the outſide, they meet together a little after in their fleſhy parts, and with the *ſoleus* they make the thick and great tendon at the midſt of the leg, which from thence is inſerted into the back part of the heel; in this very tendon breed painfull kibes. The action thereof is, to help our going by putting forth the foot, whilſt it draws the heel towards its originall.

In what place the kibes breed

The *Plantaris*. The *Plantaris* the leaſt and ſlendereſt of them all, paſſes forth fleſhy from the outward head of the leg-bone, and from thence the ſpace of ſome four fingers bredth it ends in a ſtrong and ſlender tendon, which it ſends between the twin and ſole muſcles to the ſole of the foot, there to produce a membrane which covers the ſole of the foot, and a muſcle equivalent to the upper bender of the Hand.

The *Soleus*. The *Soleus*, or ſole muſcle, the thickeſt of them all, and ſeated under the twin muſcles, deſcends from the commiſſure of the leg and ſhin-bones, and about the midſt of the leg, after it hath mixed his tendon with that of the twin muſcles, it runs into the foreſaid place that it may extend the foot for the foreſaid uſe.

The *Tibiæus poſticus*. The *Tibiæus poſticus* deſcends from the hinder appendix of the leg and ſhin-bones, and adhering to them almoſt as far as they goe, by a ſtrong tendon, being as it were bony at the end thereof, it is inſerted into the Boat-like bone, and the two firſt nameleſs bones, ſo to help the oblique extenſion of the foot.

The *Digitumflexor* twofold. The laſt being the *Digitumflexor* or Toe-bender is twofold, for one ariſes from the leg-bone, in that place where the *Popliteus* ends, and inſerted into that ſame bone it goes even to the backſide of the inner ankle & from thence into the joints of four of the toes. The other draws his original from almoſt the middle of the ſhin-bone, and ſomewhat inſerted into it, it goes by the heel and paſtern bone to the great toe, mixed with the precedent; their action is to bend the firſt joint of the Toes, rather by the force of the common ligament, than by the ſmall portion of the tendon which ends there. But it is their action to bend the laſt dear ticulation of the Toes by their proper inſertion.

CHAP.

CHAP. XL.

Of the muſcles moving the Toes of the feet.

NOw follow the muſcles moving the Toes; theſe are eight in number, one on the upper, and ſeven on the lower ſide. The firſt proceeds from the Paſtern, heel and Die bones below the external ankle, or the ligament of theſe bones with the leg-bone, and obliquely ſtretched to the top of the foot is parted into five ſmall tendons to the ſides of the five toes, ſo to draw them outwards towards its originall, whereupon it is called the *Abductor* of the Toes, and alſo *Pedioſus*, becauſe it is ſtretched over the *Pedium* or back of the foot. Their number. The *Abductor* of the toes, or *Pedioſus*.

The firſt of the ſeven of the lower ſide called the *flexor ſuperior* or upper bender, ariſes from the heel and ſtretched alongſt the foot under the ſtrong membrane, (which from the heel is ſtraitly faſtned to the extremity of the bones of the *Pedium* to ſtrengthen the parts contained under it) is inſerted by four tendons, at the ſecond joints of the four toes which it bends. Here you muſt note, that neer the inſertion thereof, this muſcle divides it ſelf, like that muſcle of the hand which is called *ſublimis*, that ſo it may give way to the deep, which (as we ſaid) deſcends alongſt the fingers, to which a certain common membranous ligament adjoins it ſelfe, which involves and faſtens it to the bone all alongſt the lower part of the fingers, even to the laſt dearticulation. The *Flexor ſuperior*.

The ſecond equivalent to that muſcle of the hand which is called *Thenar*, ſeated on the inner ſide of the foot, ariſes from the inner and hollow part of the heel and paſtern bones, and ends in the ſide, and inner part of the great toe, which it draws from the reſt, inwards. This may be divided into two or three muſcles, as the *Thenar* of the hand, to draw the great toe to the reſt, as much as need requires, juſt as we ſaid of the Hand. The third anſwerable to that of the hand which is named the *Hypothenar*, paſſes from the outer part of the heel, and aſcending by the ſides of the foot it is in like manner inſerted into the ſide of the little Toe, ſo to draw it from the reſt; to which ſame action a certain fleſh contained under the ſole of the feet may ſerve, which is ſtretched even to theſe Toes, that alſo it may ſerve to hollow the foot. The four *Lumbrici* or wormy muſcles follow next, which from the membrane of the deep Toe-bender are inſerted into the inner and ſide part of the four toes, ſo to draw them inwards, by a motion contrary to that which is performed by the *Pedioſus*. The *Interoſſes* or bone-bound muſcles of the *Pedium* or back of the foot, remain to be ſpoken of: Theſe are eight in number, four above, and as many below, different in their originall, inſertion and action; for the upper, becauſe they draw the foot outwards with the *pedioſus*, ariſe from the fore and inner part of that bone of the *Pedium*, which bears up the little Toe (and ſo alſo the reſt each in its order) and are inſerted into the outward and fore part of the following bone. The lower on the contrary paſſe from the fore and outer part of that bone of the *Pedium*, which bears up the Great Toe (and ſo each of the reſt in its order,) but are inſerted into the inner and upper part of the following bone, ſo with the wormy muſcles to draw it inwards, or to hollow the foot as the outwards, or to flat the foot, as we ſaid of the *Interoſſes* of the hand. The muſcle equivalent to the *Thenar*. The 4 *Lumbrici*. The deſcription of the upper and lower *Interoſſes*.

CHAP. XLI.

An Epitome or brief recitall of the bones in a mans body.

THe whole head which hath the leaſt conſiſts of 60 bones; but that which hath moſt of 63. that is, 14 of the *Cranium* or ſkull, 14 or 17 of the face, and 32 teeth; Of the bones of the ſcul there be 8 containing, and 6 contained; the containing are, the *Os frontis*, or Forehead bone, the Nowle-bone, the two bones of the *Sinciput*, the two ſtony bones, the Wedgbone, and the Sive-like or ſpongy bone. But the contained are ſix ſhut up in the cavity of the Ears, the Anvil, Hammer and Sitrrop. The bones of the ſcull 14.

For the bones of the face, there are ſix within or about the orb of the Eye, that is, on each ſide three; two bones of the Noſe, two leſſer Jaw bones, and two bigger, which are alwaies in beaſts ſeen diſtinguiſhed by a manifeſt difference, but it is ſo rare in men, that I have not found it as yet; therefore theſe only are diſtinguiſhed by manifeſt difference, two which contain all the upper teeth, the two inner of the palate, the two of the lower Jaw in children; And laſt of all the *Os Criſtæ*, whence the middle griſtle or partition of the Noſe ariſe. The bones of the face 14.

The two and thirty teeth are equally diſtributed in the upper and lower Jaws; and of theſe there be eight ſhearers, four fangs, or Dog teeth, and twenty Grinders. The teeth 32.

And

The bone *Hyoides*,

And there is another bone at the root of the tongue called *Os Hyoides*, alwaies compoſed of three bones, ſometimes of four.

The bones of the ſpine 34. 2 Collar-bones. The ribs 24. The bones of the *Sternon* 3. The bones of the whole arm 62.

Now follow the bones of the Spine, or Back-bone, which are juſt four and thirty, that is, ſeven of the neck, twelve of the cheſt, five of the loins, ſix of the holy-bone, and four of the rump. Beſides there are two bones of the throat, or Collar bones.

The ribs are twenty four, that is, fourteen true and ten baſtard ribs. The bones of the *Sternon* or Breaſt-bone moſt frequently three, otherwhiles ſeven, as ſometimes in young bodies.

Hence coming to the Arms there are reckoned 62, beginning with the ſhoulder-blade; as there are two ſhoulder-blades, two Arm bones; four bones of the cubit; that is, two Ell bones and two Wands; ſixteen of the Wriſt, eight of the Afterwriſt, and thirty of the fingers; into this number alſo come the *Seſamoidea* or ſeed bones, of which ſome are internall, and theſe alwaies twelve at the leaſt, although ſometimes there may be more found, a great part of which rather merit the name of griſtles, than bones; there are others externall if we beleeve *Sylvius*.

The firſt ſheweth the forepart of the Sceleton of a man, &c.

The Declaration of theſe three figures put into one.

A 3. The Coronall Suture called in Greek στεφανιαία.

B 2 3. The ſuture like the letter λ, called λαμβδοειδὴς.

C 2. The ſagittall ſuture called ἰθυαιζία.

D 2 3. The ſcale-like *Conjunction* called λεπιδοειδὴς.

a 2 3. *Os verticis*, or *Sincipitis*, the bone of the *Sinciput*, called *Os* βρεγματικὸν.

1 3. The forehead bone, that is, μετωπιαῖον.

γ 2 3. The bone of the nowl or ἰνιὰ.

δ 2 3. The bones of the temples or κροτάφοι.

ε 3. An appendix in the temple bone like a Bodkin, βελονοειδὴς.

ζ 1 2 3. A proceſſe in the temple bone like the teat of a dug, called therefore *Mamillaris* and μαστοειδὴς.

E 2 3. The wedge bone, σφηνοειδὴς.

θ 3. The ſtony part of the ſcul.

ι 3. A proceſſe of the wedg bone much like the wing of a Bat, and therefore called ὀρφνοειδὴς.

The bones of the whole leg 66.

Now remain the bones of the leg, which (if we reckon the *Oſſa Ilium* on each ſide three, as in young bodies, it is fit they ſhould) they are ſixty ſix, beſides the ſeed-bones, that is to ſay, two Haunch bones, two ſhare bones, two Huckle bones, two thigh bones, two Whirlbones of the knees, four of the leg, that is, two leg bones, and two ſhin bones. Fourteen of the Inſtep, as two heel, two paſtern, two boat-like, two Die, and ſix nameleſſe bones. Ten of the *Pedium* or back of the foot, that is, five in each foot; and twenty eight of the Toes: and as many ſeed bones in the feet, as the hands enjoy. But I have thought good to add theſe figures for the better underſtanding of what hath been ſpoken hereof.

The

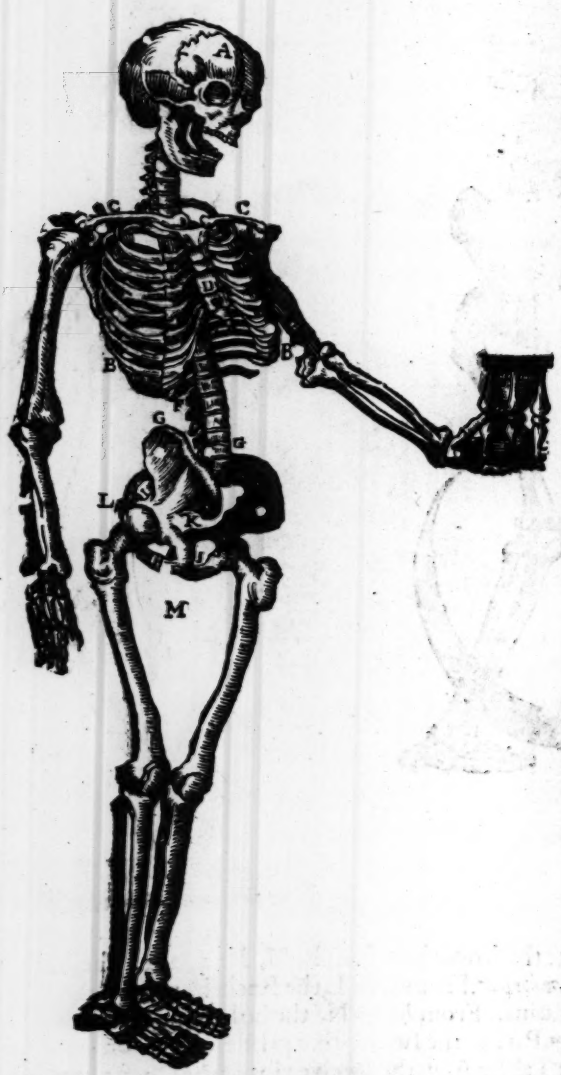
The 2 and 3 Figure ſheweth the back ſide of the Sceleton, and the lateral all part of the Sceleton.

F 1, 2, 3. the yoak bone ζυγωμα. G 1, 3. the lower jaw. I, K, L, M, N. 1, 2, 3. the back or the ſpine, ραχις. From I to K, the neck, τραχηλος. From K to L, the Rack bones of the Cheſt. From L to M, the rack bones of the Loins. From M to N, the holy bone ιερον. N, the rump bone, αιδοιον. O, 1, 3. the breſt bone στερνον. P 1, 3. the ſword-like griſtle of the breſt, ξιφοειδες. Char. 1, 3. as far as to 12. in all three Tables, ſhew the twelve ribs of the Cheſt, πλευραι. Q 1. the clavicles or collar bones, κλειδες. R, 1, 2, 3. the ſhoulder-blade, ωμοπλατη. S 1, 2, 3. The upper proceſſe of the ſhoulder blade, or the top of the ſhoulder, called ακρωμιον. T, 1, 3. the lower proceſſe of the ſhoulder blade, called αγκωνη. S 1, 2. the bone of the arm, called *Humerus* and βραχιων. T V 1, 2, 3. the cubit πηχυς. X 1, 2, 3. the wand or the upper bone of the Cubit, called ραβδος. Y 1, 2, 3. the ell or lower bone of the Cubit, called πηχυς. Z. the proceſſe of the cubit, ωλενοκρανον. & 13. the proceſſe like a bodkin or probe, called στυλος, ακις. ZZ. 1, 2, 3. the wriſt καρπος. Γ 1, 3. the Afterwriſt μετακαρπιον. ΔΔ. 1. the fingers δακτυλοι. Θ 1, 2, 3. the bones joined to the ſides of the holy bone, on each ſide diſtinguiſhed as it were into three parts. Λ 1, 2, 3. the firſt part called the Hanch bone *Os Ilium*, λαγονων. Ξ 1, 2, 3. the ſecond part, the bone of the *Coxendix* ισχιον, 1, 2, 3. the third part the ſhare bone, *Os pubis*, ηβικον. 1, 2, 3. a griſtle going between the conjunction of the ſhare bones. Π 1, 2, 3. the thigh, μηρος, 1, 2, 3. the greater outward proceſſe of the thigh called *Rotator*, τροχαντηρ. Ρ 1, 2, 3. his leſſer and inner proceſſe. Σ 1, 2, 3. the whirlbone of the knee, *Patella Rotula*, επιμηλις. Τ Σ 1, 2, 3. the leg κνημη. Φ 1, 2, 3. the inner and greater bone of the leg, κνημιον. Υ, 1, 2, 3. the outer and ſmaller bone of the leg, called the Brace bone, *Fibula*, περονη. Ψ 1, 2, 3. the proceſſe of the leg or the inner ankle called *Malleolus internus*. X, 1, 2. the proceſſe of the brace of the outward ankle, both of them are called in Greek σφυρον. Ω 1, 2, 3. the bone called the cockall,

Talus,

Talus, ha liſta, Os ἀστράγαλος. *a*, 2, the Heel *Calx*, πτέρνα. *b* 1, 3. the bone called *Os Naviculare*, σκαφοειδὲς. *cc*, 1, 2, 3. the wriſt of the foot called *Tarſus*, conſiſting of four bones, ταρσὸς. *d*, *e*, *f*. 1, 2, 3. three inner bones of the wriſt of the foot, called by ſome κυνοειδῆ. *g* 1, 2, 3. the utter bone of the wriſt of the foot like a Die, κυβοειδὲς. *hh* 1, 2, 3. the Afterwriſt of the foot called *Pedium*, by ſome μετατάρσιον. *ii*, 1, 2, 3. the toes of the foot. *k* 1, 2, 3. the ſeed bones of the foot, called *oſſicula ſeſamina* σησαμοειδῆ.

This figure ſheweth the Sceleton of the bones and griſtles of a woman, that it may appear all her bones are in proportion leſſer than the bones of a man. But in this figure only thoſe parts are marked with letters wherein a woman differeth from a man in her bones and griſtles.



A, The ſagittall ſuture deſcending into the noſe, and dividing the fore-head bone, which is ſometimes found in women, very rarely in men, but alwaies in infants.

BB, The Cheſt ſomewhat depreſſed before, becauſe of the Paps.

CC, the collar bones not ſo much crooked as in men, nor intorted ſo much upward.

D, the breſt bone perforated ſometimes with a hole much like the form of a heart, through which veins do run outward, from the mammary veins unto the paps.

E, the griſtles of the ribs, which in women are ſomewhat bony, becauſe of the weight of the Dugs.

F, a part of the back reflected, or bent backward above the loins.

GG, the compaſs of the hanch bones running more outward, for the womb to reſt upon, when a woman is with child.

HH, the lower proceſſes of the ſhare bones, bearing outward, that the cavity marked with K, might be the larger.

I, the anterior commiſſure or conjunction of the ſhare-bones filled up with a thick griſtle, that in the birth they might better yeeld ſomewhat for natures neceſſity.

K, a great and large cavity circumſcribed by the bones of the coxendix and the Holy-bone.

L, The rump or coccyx, curved backward to give way in the time of the birth.

M, the thigh bones by reaſon of the largeneſſe of the foreſaid cavity, have a greater diſtance betwixt them above, whence alſo is is that womens thighs are thicker than mens.

CHAP. XLII.

An Epitome of the names and kinds of compoſure of the bones.

BEcauſe it is as neceſſary for a Chirurgeon to know the manner of ſetting and repairing broken bones, as to put them in their places when they are diſlocated, or out of joynt; but ſeeing neither of them can be underſtood when the naturall connexion of the bones is not knowne, I have thought it a worke worth my labour, briefly to ſet down, by what and how many means the bones are mutually knit and faſtned together. The univerſall compoſure and ſtructure of all the bones in a mans body is called by the Greeks *Sceletos*. But all theſe bones are compoſed after two ſorts, that is, by *Arthron*, an Articulation or joint, and by *Symphyſis* a naturall uniting or joining together.

What the *Sceletos* is.

The

There are many other kinds both of these sorts. For there are two kinds of Articulation, that is, *Diarthrosis*, or Dearticulation, and *Synarthrosis*, or Coarticulation; which differ as thus, Dearticulation is a composition of the bones with a manifest and visible motion; Coarticulation hath a motion of the bones, yet not so manifest, but more obscure. But these two do again admit a subdivision into other kinds. For *Diarthrosis* contains under it *Enarthrosis*, *Arthrodia*, and *Ginglymos*. Now *Enarthrosis* or Inarticulation is a kind of Dearticulation, in which a deep Cavity receives a thick and long head, such a composition hath the Thigh-bone with the Huckle-bone.

2 Sorts of Articulation.
What *Diarthrosis* and *Synarthrosis* are.
3 Sorts of *Diarthrosis*.
What *Enarthrosis* is.

Arthrodia is when a lightly engraven cavity admits a small and short head; such a connexion is that of the arm-bone with the shoulder-blade; of the first *vertebra* with the second. The Greeks have distinguished by proper names these two kinds of Cavities and heads; For they call the thick and long head *Cephale*, that is, a Head absolutely; but the lesser they term *Corone*, or *Coronus* which the Latines call *Capitulum*, a Little-head. But they call a deep Cavity *Cotyle*, and a superficiary one *Glene*. The third sort called *Ginglymos*, is when the bones mutually receive and are received one of another; as when there is a cavity in one bone, which receives the head of the opposite bone, and also the same bone hath a head which may be received in the Cavity of the opposite bone; such a compofure is in the Cubit knee, that is in the connexion of the Thigh-bone.

What *Arthrodia*.
What *Cephale* is.
What *Corone* is.
What *Cotyle* is.
What *Glene* is.
What *Ginglymos*.

And thus much of Dearticulation and the three kinds thereof. *Synarthrosis* or Coarticulation, another kind of juncture, hath also three kinds thereof (*Gal. lib. de Offibus*) to wit, *Sutura*, *Gomphosis* and *Harmonia*.

3 kinds of *Synarthrosis*.

Suture is a composition of the bones after the manner of sowing things together, example whereof appears in the bones of the Skull. *Gomphosis* is when one bone is fastened in another as a pin is fastened in a hole, after which manner the teeth are fastened in their sockets in both the Jaws. *Harmony* is when the bones are composed by the interposition of a simple line, after which manner many bones of the nose and face are joined together.

What a Suture is.
What *Gomphosis* is.
What *Harmonia* is.

Hitherto we have spoken of the first construction of the bones by articulation and the kinds thereof; now it follows we treat of *Symphysis*.

Symphysis, or growing together, as we formerly said, is nothing else, than naturall union of the bones; such union is made two manner of wayes, that is, either by interposition of no other thing, after which sort in success of time the bones of the lower Jaw grow together, which formerly in children were manifestly distinguished; or by the mediation of some *Medium*; but that happens three manner of wayes, by interposition of three severall *Media*, as first of a Gristle, which kind of union the Greeks cal *Synchondrosis*, after which manner the Share-bones grow together and also some *Appendices* in young bodies; secondly, of a Ligament, and it is named by the Grecians *Syneurosis*, the Name of a Nerve being taken in the largest sense, for sometimes it is used for a tendon, otherwhiles for a Ligament, otherwhiles for a Nerve properly so called and which is the author of sense and motion. But this *Symphysis* or union hath place by *Syneurosis*, or interposition of a Nerve, in certain bones of the *Sternon* and Haunch.

What *Symphysis* is.
Synchondrosis.
Syneurosis.
The things signified by the word Nerve.

Thirdly, the bones grow into one by interposition of flesh, called in Greek *Synsarcosis*; thus the flesh of the Gums fasten the teeth and makes them immoveable. But if some be less pleased with this division, by reason of the obscurities, in which it seems to be involved, this following expression comes into my mind, which I was first admonished of by *German Cortin* Doctor of Physick, which if you well observe it, is both blameless and more easie for your understanding.

Synsarcosis.

An Epitome or brief recitall of all the Muscles of mans body.

As I have formerly reckoned up the bones, so here, I have decreed to recite the muscles of mans body. Wherefore in the face we first meet with the broad or skin muscle arising from the fleshy pannicle, and covering the whole neck and almost all the face. Then follow 4, pertaining to the upper eye-lids. In the Orbs of the eyes lye 14, that is 7, in each Orb, of which 4 are called right, two oblique, and one pyramidall. Then succeed 4 of the nose, two externall on each side one, and two internall, these draw it together and the other open it. After these come the ten muscles of the lower Jaw, of which two are called the *Crotaphitæ* or Temporall; two *Masseteres* or Grinders; two round (which seem to mee rather to pertain to the lips, than to this Jaw;) two little ones hid in the mouth, arising from the winged process of the wedg-bone; two openers of the mouth being nervous or tendinous in their midst. Then follow the 8 muscles of the lips, that is, 4 of the upper, and as many of the lower, shutting and opening the mouth. The tongue with his ten muscles is hid as it were in the den of the mouth. Wherefore the muscles of the whole face are 51. In the fore part of neck are found the muscles of the bone *Hyoides* and throttle; now 8 muscles hold the bone *Hyoides* as equally ballanced; of which there are 2 upper arising from the Chin; 2 on the sides from the processe *Styloides*, perforated in their midst, through which the 2 openers of the mouth in that part nervous do pass; 2 arise from the *Sternon*, and lastly 2 from the upper rib of the shoulder-blade to the *Coracoides*, which also in their midst are nervous, in which place the two *Mastoidei* lye upon them.

The

United mutually by *Symphyſis* or union; by which they are ſo conjoined that there is no diſſimilar, nor heterogenous body, at leaſt which may be diſcerned, interpoſed between them. Such union appears in the two bones of the lower Jaw at the Chin, in the bones of the *Sternon*, the Hanch with the Huckle-bones, and the Share-bones between themſelves; of this union there are no more kinds, for by this it cometh to paſs, that the bones which were more and diſtinct meet together by interpoſition of one *Medium*, to wit, a Griſtle, which now indeed is no Griſtle, but is turned into a Bone.

The bones, which as pillars ſuſtain the fabrick of the whole body, are either

or Conjoined by that which they call *Arthrodia*, or Articulation, as when they ſo concur & are bound together, that ſome Heterogeneous ſubſtance may be noted betwixt them, but the bones thus compoſed are knit two manner of wayes, that is,

either more looſly as by *Diarthroſis*, that is a kind of Articulation not very ſtrait, as by which it might have opportunity to perform diverſe motions: of this compoſure or Articulation of bones there are three kinds, as

Enarthroſis, when the head of a bone is wholly received in the cavity of another, and hid therein, as the Thigh-bone is joyned with the Huckle-bone.

Arthrodia, when in a lightly engraven and not much depreſſed cavity the head of another bone is not wholly hid, but only received in part thereof; ſo that unleſs nature had otherwiſe provided a ſufficient receptacle for the head of this bone (as by the ligaments of the neighbouring Muſcles) it would otherwiſe have been in perpetuall danger of diſlocation. Thus the Arm-bone is faſtened to the ſhoulder-blade.

Ginglymos, when the bones mutually receive each other, ſuch like compoſition hath the Cubit and Arm-bone.

or more ſtraitly, as by *ſynarthroſis*, when the bones are more ſtraitly knit ſo that they can perform no motions in the body. Of this Articulation there are alſo 3 kinds, that is,

Gomphyſis, as when one bone ſo receives another as a Pin is faſtened in the hole made by a piercer, thus the teeth are faſtened in the Jaws.

Sutura, like a Saw, or teeth of a combe; as the bones of the skull are mutually knit together, or as ſcales, or tiles are laid, after which manner the ſtony bones are faſtened to theſe of the *Synciput*.

Harmonia, which is by interpoſition of a ſimple line, which parts bones abutting one upon another, as the bones of the Noſe.

The 18. of the *Larinx*.

The Throttle compoſed of three griſtles hath eighteen or twenty muſcles, of which ſix or eight are common, and twelve proper; Of the common there are two above, two below, and two at the ſides of the firſt griſtle, to which we may add theſe two which ſerve for the opening of the *Epiglottis*, which are alwayes found in great four-footed beaſts for to preſs down the *Epiglottis*.

The proper are twelv, ewhich almoſt all of them come from the ſecond griſtle, ſo to be inſerted into the firſt and third, of which ſome are before, others behind the *Thyroides*. Beſides theſe there are the *Maſtoidei* which bend the head.

The head is moved by 14 Muſcles.

But in the back part of the Neck there are twelve muſcles alſo appointed for to move the head, ſo that in all there are fourteen muſcles ſerving for the motion of the head, the two fore *Maſtoidei*, and the twelve hind muſcles, that is to ſay, the two *Splenii*, two *Complexi*, four Right, and ſo many oblique, which are very ſhort, ſo that they paſs not beyond the firſt and ſecond *vertebra*.

The 8. muſcles of the neck.

The Neck hath eight Muſcles, of which two are called the long, lying before upon the bodies of the *Vertebræ*; the two *Scaleni*, which are at the ſides; the two *Spinati*, which run alongſt the Spine; the two tranſverſe, which go to the tranſverſe proceſs of the Cheſt.

The Muſcles of the cheſt 81

The Cheſt hath 81 Muſcles, of which ſome are on the fore part, ſome on the hind, others on the ſides; they are all combined and coupled together except the Midriffe. Now of theſe there are the two *Subclavii*; the two great Saw-muſcles which proceed from the baſis of the ſhoulder-blade; the four little *Rhomboides* or ſquare muſcles, that is, two above, and two below; the two *Sacrolumbi*, the two binders of the Griſtles within the Cheſt.

Beſides there are twenty and two externall and as many internall Intercoſtall muſcles, twenty four *Intercartilaginei*, that is, twelve externall and as many internall; ſo that the Intercoſtall, and *Intercartilaginei* are 68, which with the twelve before mentioned make the number of 80 Muſcles. Add to theſe the Midriffe being without an aſſociate, and you ſhall have the number formerly mentioned, to wit, 81. But alſo if you will add to theſe the Muſcles of the lower belly, I will not much gainſay it, becauſe by accident they help inſpiration and exſpiration.

The 8. muſcles of the lower belly.

Wherefore of the eight muſcles of the *Epigaſtrium*, there are four oblique, of which two are deſcendent and ſo many aſcendent; two right, to which you may add the two Aſſiſting

ex

or Pyramidall muſcles which come from the ſhare-boue, if it pleaſe you to ſeparate them from the head of the right muſcles.

There are ſix or eight muſcles of the Loins, of which two bend the loins, which are the triangular; the two *Semiſpinati*; two *Sacri*; two are in the midſt of the back, which for that cauſe we may call the *Rachitæ* or chin-muſcles. Now, that hereafter we may ſeverally and diſtinctly ſet down the muſcles of the extreme parts, we will come to the privities. The 6. or 8. of the loins.

Where for the uſe of the teſticles there are two muſcles called the *Cremaſteres*, or Hanging muſcles. At the root of the yard, or *Perinæum*, there are four others, partly for the commodious paſſing of the urin and ſeed, and partly for erecting the yard. The *Sphincter* muſcle is ſeated at the neck of the Bladder. The two Cremaſters of the Teſticles.

At the end of the right gut are three muſcles, two *Levatores Ani*, or lifters up of the fundament, and one *Sphincter* or ſhutting muſcle. Now let us proſecute the muſcles of the extremities, or limbs. But it will be ſufficient to mention only the muſcles of one ſide, becauſe ſeeing theſe parts of the body are double, thoſe things which are ſaid of the one may be applyed to the other. The three of the fundament.

Wherefore the muſcles of the Arm, beginning with theſe of the ſhoulder-blade, at the leaſt, are 42. for there are four of the ſhoulder-blade: of the Arm properly or particularly ſo called, ſeven or eight; and there are three, four or five proper muſcles of the Cubit; that is, appointed for the performance of the motions thereof; in the inner part of the Cubit are ſeven, and as many in the outer; but thoſe of the hand are reckoned thirteen at the leaſt. The muſcles of the Arm in generall 32.

The fourth of the ſhoulder-blade are the *Trapezius* reſembling a Monks Cowl, which moves it upwards and downwards, and draws it backwards; the ſecond is the *Levator*, or lifter-up; the third the great *Rhomboides* lying under the *Trapezius*. The fourth, the leſſer ſaw muſcle which is inſerted into the *Coracoides*. The arm is moved forwards, backwards, upwards, downwards and circularly.

The Pectorall muſcle ariſing from the Clavicle, Breſt-bone and neighbouring ribs, draws it forwards; the *Humilis* or low muſcle coming from the lower rib of the ſhoulder-blade draws it backwards; the *Deltoides* upwards; and the *Latiſſimus* downwards, and ſomewhat backwards. But the three ſeated about the ſhoulder-blade move it about, or circularly.

The *Epomis* or *Scapularis* upwards; the *Superſcapularis*, which may ſeem two, backwards and downwards; the *Subſcapularis* which is in the Cavitie of the ſhoulderblade, forwards, ſo that by a certain viciſſitude and ſucceſſion of action they move it circularly. Two muſcles bend the Cubit, the one named *Biceps* or twoheaded, and the other *Brachiæus* or the Arm muſcle; but one, two or three muſcles extend it; for if you have reſpect to the original, this muſcle hath two or three heads, but one only inſertion.

In the inſide of the cubit are ſeven muſcles, one *Palmaris*, two wriſt benders; two *pronatores*, one ſquare, another in ſome ſort round; two finger benders, and one *Abductor* or Drawer aſide. Theſe fourteeen internall and externall muſcles of the Cubit, do not indeed move the Cubit, but only ſeated there move the wand and with it the hand. Theſe are the thirteen muſcles of the hand; the *Thenar* which may not only be divided into two, but into ſix, not only by the diverſe actions it performs, but alſo by the branches divided by a manifeſt ſpace between them; the ſecond is called the *Hypothenar*, which lies under the little finger, as the *Thenar* doth under the thumb; the third is the *Abductor* of the thumb; then follow the four *Lumbrici* and ſix *Interoſſes*, although eight may be obſerved.

The whole leg hath at the leaſt 50 muſcles, for we reckon there are fourteen muſcles in the thigh; there are eleven made for the uſe of the Leg; there are nine ſeated in the Leg, three before, and ſix behind, which ſerve for the uſe of the foot and toes; in the foot are ſeated ſixteen. Therefore of the fourteen muſcles ſerving the thigh two bend it, one called the *Lumbaris*, the other ariſing from the cavity of the Hanch bone, but the three which make the Buttocks and the *Triceps* or Three-headed muſcle, (which if you pleaſe, you may divide into three) extend it. Beſides theſe the four twin muſcles, and two *Obturatores*, of which the one is internal, and the other external turn the thigh about. The leg hath eleven; that is, the Long, the membranous, the four *Poſtici* or hind muſcles (three of which come from the Huckleboue, but the other from the commiſſure of the Share bone) the right, the two vaſt, the *Crureus* or Leg muſcle, and the *Popliteus*, or ham muſcle. Theſe ſeated in the leg for the uſe of the foot and toes are three fore, and ſix hind muſcles: two of the fore bend the foot, one of which is called the *Tibiæus anticus*, the other *Peroneus*, which you may divide into two. The third the bender of the toes, although it alſo partly bend the foot, to which alſo the bender of the thumb may be revoked. One of the hind is the Toe-bender, others extend the foot; and are in this order; two Twins, one *Plantaris*, one *Soleus*, one *Tibiæus poſticus* and the great bender of the toes, to which may be revoked the bender of the thumb. Of the ſixteen ſeated in the foot, one is above, ſeated on the back of the foot, which wee call the *Abductor* of the Toes; another in the ſole of the foot; to wit, the little bender of the Toes, which goes to the ſecond joint of the Toes alongſt the inſide of the foot; the other lends his help to the great Toe, which you may call the *Abductor* of the thumb; ano- The muſcles of the leg in generall 50.

ther is ſeated on the outſide for the uſe of the little toe. To theſe are added the four *Lumbrici*, beſides the eight *Interoſſes*; or if you had rather, ten. And thus much may ſuffice for the enumeration of the muſcles.

The Figure of the muſcles when the skin with its veins, the fat, and all the fleſhy membranes are taken away, that part of the fleſhy membrane excepted, which takes upon it the nature of a muſcle, as being conjoined with the muſcles.

a, the muſcle of the forehead.
b, the temporall muſcle.
c, the muſcle ſhutting the eyelid.
d, the muſcle opening the wings of the noſe.
e, the fore part of the yoak-bone.
f, the muſcle of the upper lip tending to the noſe.
g, the beginning of the maſſeter or grinding muſcle.
h, the broad muſcle conſiſting of a fleſhy membrane.
i, *k*, the beginning therof which riſes immediatly from the coller-bone and the top of the ſhoulder.
l, that part thereof which bends forwards to *l*.
m, the muſcle which lifts up the arm.
n, the pectorall muſcle.
o, the membranous part of this muſcle which is joined to the nervous part of the firſt muſcle of the *Abdomen*, or belly.
q, *q*, the fleſhy portion thereof, from the 6 and 7 ribe, and the inſertion thereof. *r* the muſcle drawing down the arm. *ſ*, the oblique deſcending muſcle of the lower belly. *t*, *t*, *t*, the inſertion of the greater ſaw muſcle. u u. the *lineæ albæ* or white line, at which the two oblique deſcendent muſcles meet, covering the whole belly. *x*, the yard, the skin being taken away. *y*, the veſſels of ſeed. *z* the teſticles wrapped in the fleſhy membrane. *a*, the fore muſcle bending the cubit. *γ*, *γ*, the hind muſcle bending the cubit. *δ*, the muſcle extending the cubit. *ε*, the two-headed muſcle extending the wriſt. *ζ*, the muſcle producing the broad tendon on the back of the hand. *ζ*, his tendon. *η*, the muſcle turning up the Wand. *θ*, the upper muſcle flatting the Wand. *ι*, the ſecond of the arm-benders, whoſe beginning is *κ*, and tendon *λ*. *μ*, a portion of the muſcle, whereof one part yeelds tendons to the wriſt, the other to the thumb. *ν*, the fleſhleſſe articulation of the thumb. *ξ*, a muſcle inſerted into the wriſt, lying neer to the following muſcle. *ο*, a muſcle divided into two tendons, the one whereof is inſerted into the firſt joint of the thumb, the other into the following. *π*, the firſt muſcle of the thigh, whoſe head is at *ρ*, and tendon at *σ*, and inſertion at *χ*. *τ*, the end of the ſecond muſcle of the thigh. *υ*, the end of the third muſcle of the thigh. 1, the fixt muſcle of the leg; his beginning at 2. almoſt wholly membranous at 3. 4, the ninth muſcle of the leg. 5, the eight of the leg. 6, a portion of the ſixth and ſeventh of the thigh. 7, the Glandules of the groins. 8, the eight of the thigh. 9, the ſecond of the leg. 11, the innermoſt of the ankle. 12, the ſixth muſcle of the foot, his originall 13. and 14. 15, the ſeventh of the foot. 16, the tendon of the muſcle lifting up the great toe. 17, the muſcles extending the four other toes. 18, the abductor of the great toe. 19, a tranſverſe ligament. 20, a tendon of the ninth muſcle of the foot. 21, the firſt muſcle. 22, the fourth muſcle of the foot. 23, the tendon of the third muſcle. 24, a muſcle bending the third bone of the four leſſer toes.

The

THE SEVENTH BOOK Of Tumors against Nature in generall.

CHAP. I.

What a Tumour against Nature, vulgarly called an Impostume, is, and what be the differences thereof.

AN Impostume, commonly so called, is an affect against nature, composed and made of three kinds of diseases, Distemperature, ill Conformation, and Solution of Continuity, concurring to the hindering or hurting of the Action. An humor, or any other matter, answering in proportion to a humor, abolishing, weakning, or depraving of the office or function of that part or body in which it resides, causeth it.

What an Impostume vulgarly so called is.

The materiall causes of Impostumes, or unnatural tumors.

The differences of Impostumes are drawn principally from five things, that is,

- From their quantity, by reason whereof *Impostumes* are called
  - Great, which are comprehended under the generall name of Phlegmons, which happen in the fleshy parts, by *Galen, Lib. de tumor. contra naturam, & lib. 2. ad Glauconem.*
  - Indifferent, or of the middle sort, as Fellons.
  - Small, as those which *Avicen* calls *Bothores*, i. Pushes and Pustules, all kind of Scabs and Leprosies; and lastly, all small breakings out.
- From their accidents, as
  - Colour, from whence Impostumes are named white, red, pale, yellow, blew or black, and so of any other colour.
  - Pain, hardness, softness, and such like, from whence they are said to be painfull, not painfull, hard, soft, and so of the rest.
- From the matter, of which they are caused and made, which is either
  - Natural
    - Hot, and that either
      - Sanguin, from whence a true *Phlegmon.*
      - Cholerick, frō whence a true *Erysipelas.*
    - Cold, & that either,
      - Phlegmatick, frō whence a true *Oedema.*
      - Melancholick, frō whence a perfect *Scirrhus.*
  - or
  - Not naturall, which hath exceeded the limits of its naturall goodnesse, from whence illegitimate tumors, therefore
    - of a sanguine humour, — Carbuncles, Gangrenes, eating ulcers, Sphacels are caused.
    - of a cholerick humour, — Of the grosser, the eating *Herper*, of the subtiler the *Herpes miliaris* is made.
    - of a phlegmatick humor, — Watery and flatulent Impostumes, the Kings evil, knots and all phlegmatick swellings and excrescences.
    - of a melancholick humor. — The exquisit or perfect *Scirrhus*, hardnesses and all sorts of cancerous Tumors.
- From the condition and nature of the parts which they possess, from whence the *Ophthalmia*, is a Phlegmon of the eyes. *Paratis* a tumor neer the ears; *Paronychia* or a whitlow at the roots of the nails; and so of the rest.
- From the efficient causes, or rather the manner of doing. For some Impostumes are said to be made by defluxions, others by congestion, those are commonly hot, and the other commonly cold, as it shal more manifestly appear by the following chapter.

CHAP. II.

Of the generall cauſes of Tumors.

After what manner tumours againſt nature are chiefly made.

THere are two generall cauſes of Impoſtumes, Fluxion, and Congeſtion. Defluxions are occaſioned, either by the part ſending, or receiving; the part ſending diſcharges it ſelf of the humors, becauſe the expulſive faculty reſident in that part is provoked to expell them, moved thereto, either by the troubleſomneſs of their quantity or quality. The part receiving draws, and receives occaſion of heat, pain, weakneſſe (whether naturall, or accidentall) openneſſe of the paſſages, and lower ſituation.

Three cauſes of heat.

The cauſes of heat, in what part ſoever it be, are commonly three, as all immoderate motion (under which frictions are alſo contained,) externall heat, either from fire or ſun, and the uſe of acrid meats and medicines.

Four cauſes of pain.

The cauſes of pain are four, the firſt is a ſodain and violent invaſion of ſome untemperate thing, by means of the four firſt qualities; the ſecond is ſolution of continuity, by a wound, luxation, fracture, contuſion, or diſtention; the third, is the exquiſit ſenſe of the part, for you feel no pain in cutting a bone, or expoſing it to cold or heat; the fourth is, the attention, as it were, of the animall faculty; for the mind diverted from the actuall cauſe of pain, is leſſe troubled, or ſenſible of it.

Two cauſes of weakneſſe.

A part is weak, either by its nature, or by ſome accident; by its nature, as the Glandules and the Emunctories of the principall parts; by accident, as if ſome diſtemper, bitter pain, or great defluxion have ſeized upon it, and wearied it, for ſo the ſtrength is weakned, and the paſſages dilated. And the lowneſſe of ſite yeelds opportunity for the falling down of humors.

Two cauſes of congeſtion.

The cauſes of congeſtion are two principally, as the weakneſſe of the concoctive faculcie, which reſides in the part, (by which the aſſimilation into the ſubſtance of the part of the nouriſhment flowing to it is fruſtrated) and the weakneſſe of the expulſive faculty; for whilſt the part cannot expell ſuperfluities, their quantity continually encreaſes.

And thus oftentimes cold Impoſtumes, have their originall from a groſſe and tough humor, and ſo are more difficult to cure.

Laſtly, all the cauſes of Impoſtumes may be reduced to three; that is, the primitive, or externall; the antecedent, or internall; and the conjunct, or containing, as we will hereafter treat more at large.

CHAP. III.

The ſignes of Impoſtumes or Tumors in generall.

The principall ſigns of tumors are drawn from the eſſence of the part.

BEfore we undertake the cure of Tumors, it is expedient to know their kinds and differences, which knowledg muſt be drawn from their proper ſigns, the ſame way, as in other diſeaſes. But becauſe the proper and principall ſigns of tumors are drawn from the eſſence of the part they poſſeſſe, we muſt firſt know the parts, and then conſider what their eſſence and compoſition are.

We are taught both by skill in Anatomy, and the obſervation of the deprived function, eſpecially when the affected part is one of thoſe which lie hid in the body; for we know whether or no, the externall parts are affected with a tumor againſt nature, by comparing that with his naturall which is contrary. For comparing the ſound part with the diſeaſed, we ſhall eaſily judge whether it be ſwollen, or no.

But becauſe it is not ſufficient for a Chirurgeon only to know theſe generall ſigns (which are known even to the vulgar) he muſt attentively obſerve ſuch as are more proper and neer. And theſe are drawn from the difference of the matter and humors, of which the tumors conſiſt.

Lib. 2. ad Glauc. & 13. method. The proper ſigns of a ſanguin tumor, of a phlegmatick, of a melancholick, of a cholerick.

For this *Galen* teaches, that all differences of tumors ariſe from the nature and condition of the matter which flows down and generates the tumor; alſo they are known by ſuch accidents as happen to them, as colour, heat, hardneſs, ſoftneſs, pain, tenſion, reſiſtance.

Wherefore pain, heat, redneſſe, and tenſion indicate a ſanguine humour; coldneſs, ſoftneſſe, and no great pain, phlegm; tenſion, hardneſs, the livid colour of the part, and a pricking pain by fits, melancholy; and yellowiſh and pale colour, biting pain without hardneſs of the part, choler.

The knowledg of tumors by their motion and exacerbation. *Lib. 2. Epidem.*

And beſides, Impoſtumes have their periods and exacerbations following the nature and motion of the humors of which they are generated. Wherefore by the motion and fits it will be no difficult matter to know the kind of the humor; for as in the ſpring, ſo in the morning the blood is in motion; as in the ſummer, ſo in the midſt of the day, choler; as in Autumn, ſo in the evening, melancholy; as in Winter, ſo in the night the exacerbation of phlegm are moſt predominant. For *Hippocrates* and *Galen* teach, that the year hath circuits of diſeaſes, ſo that the ſame proportion of the exceſs and motion of humors, which is in the four ſeaſons of the year, is alſo in the four quarters of each day. Im-

Impostumes which are curable have four times, their beginning, encrease, state, and declination, and we must alter our medicines according to the variety of these times. We know the beginning by the first swelling of the part; The encrease, when the swelling, pain, and other accidents do manifestly encrease, and enlarge themselves; the state, when the foresaid symptomes increase no more, but each of them, because at their height, remain in their state immoveable, unlesse the very matter of the tumor degenerate; and change it self into another kind of humor; The declination, when the swelling, pain, feaver, restlessnesse are lessened. And from hence the Chirurgeon may presage what the end of the tumor may be; for tumors are commonly terminated four manner of wayes, if so be that the motion of the humors causing them be not intercepted, or they without some manifest cause, do flow back into the body.

The beginning of an impostume. The encrease. The state.

Therefore first they are terminated by insensible transpiration, or resolution; secondly, by suppuration when the matter is digested and ripened; thirdly, by induration, when it degenerates into a Scirrhus, the thinner part of the humor being dissolved; the fourth, which is the worst of all, by a corruption and Gangrene of the part, which is, when over come with violence, or the abundance or quality of the humor, or both, it comes to the distemper, that it loses its proper action.

It is best to terminate a tumor by resolution, and the worst by corruption, suppuration and induration are between both, although that is far better than this. The signs by which the Chirurgeons may presage that an Impostume may be terminated by resolving, are the remission or slacking of the swelling, pain, pulsation, tension, heat, and all other accidents, and the unaccustomed liveliness and itching of the part; and hot Impostumes are commonly thus terminated, because the hot humor is easily resolved, by reason of its subtilty.

The signs of a tumor to be terminated by resolution.

Signs of suppuration are the intension or encrease of pain, heat, swelling, pulsation, and the feaver; for according to *Hippocrates*, pain and the feaver are greater when the matter is suppurating, than when it is suppurated.

The signs of suppuration.

The Chirurgeon must be very attentive to know and observe when suppuration is made, for the purulent matter oft-times lies hid (as *Hippocrates* saith) by reason of the thickness of the part lying above, or over it.

The signs and causes of a tumor terminated in a *Scirrhus*.

The signs of an Impostume degenerating into a Scirrhous hardness, are the diminution of the tumor, and hardness remaining in the part. The causes of the hardness not going away with the swelling, are the weakness of nature, the grosness and toughness of the humor, and unskilfulness of the Chirurgeon, who by too long using resolving things hath occasioned, that the more subtil part of the humor being dissolved, the rest of the grosser nature like earthy dregs remains concrete in the part. For so Potters vessels dried in the Sun grow hard. But the unskilfull Chirurgeon may occasion a Scirrhous hardness by another means, as by condensating the skin, and incrassating the humors, by too much use of repercussives. But you may perceive an Impostume to degenerate into a Gangrene thus, if the accidents of heat, redness, pulsation and tension shall be more intense, than they are wont to be in suppuration, if the pain presently cease without any manifest cause, if the part wax livid or black, and lastly, if it stink.

The signs of a Gangrene to hand.

But we shall treat of this more at large when we come to treat of the Gangrene and *Sphacelus*.

Of disappearance of a tumor, and the signs thereof.

A sudden diminution of the tumor, and that without manifest cause, is a sign of the matter fallen back, and turned into the body again, which may be occasioned by the immoderate use of refrigerating things. And sometimes much flatulencie mixed with the matter, although there be no fault in those things which were applied.

Feavers and many other malign Symptomes, as swoundings and convulsion, by translation of the matter to the noble parts, follow this flowing back of the humor into the body.

CHAP. IV.

Of the Prognostiques in Impostumes.

Cold tumors require a longer cure.

Tumors arising from a melancholy, phlegmatick, grosse, tough, or vicious humor, aske a longer time for their cure, than those which are of blood or choler. And they are more difficultly cured which are of humors not naturall, than those which are of humors yet contained in the bounds of nature.

Tumors made of matter not naturall, are more difficultly cured.

For those humors which are rebellious, offend rather in quality, than in quantity, and undergoe the divers forms of things dissenting from nature, which are joined by no similitude or affinity with things naturall, as suet, poultis, hony, the dregs of oil, and wine; yea, and of solid bodies, as stone, sand, coal, straws; and sometimes of living things, as Wormes, Serpents, and the like monsters.

The tumors which possesse the inner parts, and noble entrails, are more dangerous and deadly, as also those which are in the joints, or neer to them. And these tumors which seise upon great vessels, as veins, arteries, and nerves, for fear of great effusion of blood, wasting

wasting of the ſpirits and convulſion. So Impoſtumes of a monſtrous higneſs are often deadly by reaſon of the great reſolution of the ſpirits cauſed by their opening. Thoſe which degenerate into a *Scirrhus* are of long continuance and hard to cure, as alſo thoſe which are in hydropick, leprous, ſcabby and corrupt bodies, for they often turn into malign and ill conditioned ulcers.

Hippo. Aph. 8. ſect. 6.

CHAP. V.

Of the generall cure of Tumors againſt Nature.

What muſt be conſidered in undertaking the cure of tumors.

THere be three things to be obſerved in cure of Impoſtumes. The firſt is the eſſence thereof; the ſecond, the quality of the humor cauſing the Impoſtume; the third, the temper of the part affected. The firſt indication drawn from the eſſence, that is, from the greatneſſe or ſmalneſſe of the tumor, varies the manner of curing, for the medicines muſt be increaſed or diminiſhed according to the greatneſs of the tumor. The ſecond, taken from the nature of the humor alſo changes our counſell, for a *Phlegmon* muſt be otherwiſe cured than an *Eryſipelas*, and an *Oidema* than a *Scirrhus*, and a ſimple tumor, otherwiſe than a compound. And alſo you muſt cure after another manner a tumor coming of an humor not natural, than that which is of a natural humor, and otherwiſe that which is made by congeſtion, than that which is made by defluxion. The third Indication is taken from the part in which the tumor reſides; by the nature of the part we underſtand its temperature, conformation, ſite, faculty, and function.

What we muſt underſtand by the nature of the part.

The temperature indicates that ſome medicines are convenient for the fleſhy parts, as thoſe which are more moiſt; others for the nervous, as more drie; for you muſt apply ſome things to the eye, and others to the throat; one ſort of things to theſe parts which by reaſon of their rarity are eaſily ſubject to defluxion, another to thoſe parts which by their denſity are not obnoxious to it.

But we muſt have good regard to the ſite of the part, as if it have any connexion with the great veſſels, and if it be fit to powre forth the matter and humor when it is ſuppurated.

What we muſt underſtand by the faculty of the part.

Galen by the name of Faculty underſtands the uſe and ſenſe of the part. This hath a manifold indication in curing, for ſome parts are principall, as the Brain, Heart, and Liver; for their vertue is communicated to the whole body, by the nerves, arteries, and veins.

What we muſt conſider in performing the cure.

Others truly are not principall, but yet ſo neceſſary that none can live without them, as the ſtomach. Some are endued with a moſt quick ſenſe, as the eye, the membranes, nerves, and tendons; wherefore they cannot indure acrid and biting medicines. Having called to mind theſe indications, the indication will be perfected by theſe three following intentions, as if we conſider the humor flowing down, or which is ready to flow; the conjunct matter, that is, the humor impact in the part; the correction of accidents; yet ſo that we alwaies have care of that which is moſt urgent and of the cauſe. Therefore firſt repercuſſives muſt be applied for the antecedent matter, ſtrong or weak, having regard to the tumor as it is then, only excepting ſix conditions of tumors; the firſt is, if the matter of the tumor be venenate: the ſecond, if it be a criticall abſceſs: the third, if the defluxion be neer the noble parts: the fourth, if the matter be groſſe, tough, and viſcid: the fifth, when the matter lies far in, that is, flows by the veins which lies more deep: the ſixth, when it lies in the Glandules. But if the whole body be plethorick, a convenent diet, purging and Phlebotomie muſt be appointed, frictions and bathes muſt be uſed. Ill humors are amended by diet and purging. If the weakneſs of the part receiving draw on a defluxion, it muſt be ſtrengthned.

What things diſſwade us from uſing repercuſſives.

If the part be inferior in its ſite, let the patient be ſo ſeated, or layed, that the part receiving, as much as may be, may be the higher. If pain be the cauſe of defluxion, we muſt aſſwage it by things mitigating it. If the thinneſs, or lightneſs of the humor cauſe defluxion, it muſt be inſpiſſate by meats and medicines. But for the matter contained in the part, becauſe it is againſt nature, it requires to be evacuate by reſolving things, as cataplaſmes, ointments, fomentations, cupping-glaſſes; or by evacuation, as by ſcarifying, or by ſuppurating things, as by ripening and opening the Impoſtume. Laſtly, for the conjunct accidents, as the Feaver, pain and ſuch like, they muſt be mitigated by aſſwaging, mollifying and malaxing medicines, as I ſhall ſhew more at large hereafter.

CHAP. XXXV.

Of the four principall and generall Tumors, and of other Impostumes which may be reduced to them.

THe principall and chief Tumors which the abundance of humors generate, are four, a *Phlegmon*, *Erysipelas*, *Oedema* and *Scirrhus*: innumerable others may be reduced to these, distinguished by divers names according to the various condition of the efficient cause and parts receiving. Wherefore a *Phygethlum*, *Phyma*, Fellon, Carbuncle, inflammation of the eyes, Squincy, *Bubo*, and lastly, all sorts of hot and moist tumors may be reduced to a Phlegmon. The *Herpes miliaris*, the eating *Herpes*, Ringwormes and Tetters and all impostumes brought forth by choler, are contained under an *Erysipelas*. *Atheromata*, *Steatomata*, *Melicerides*, the *Testudo*, or *Talpa*, *Ganglion*, Knots, Kings-Evill, Wens, watery Ruptures, the *Ascites* and *Leucophlegmatia* may be reduced to an *Oedema*, as also all flatulent tumors, which the abundance of corrupt Plegm produces.

What tumors may be reduced to a Phlegmon.
Which to an *Erisipelas*.
Which to an *Oedema*.

In the kindred of the *Scirrhus* are reckoned a Cancer, Leprosie, Warts, Corns, a *Thymus*, a *Varix*, *Morphew*, black and white, and other Impostumes arising from a Melancholy humor.

Which to a *Scirrhus*.

Now we will treat of these Tumors in particular, beginning with a Phlegmon.

CHAP. VII.

Of a Phlegmon.

A Phlegmon is a generall name for all Impostumes, which the abundance of inflamed bloud produces. That is called a true Phlegmon, which is made of laudable bloud, offending only in quantity. But a bastard Phlegmon, or a Phlegmonous Impostume hath some other, and proper name; as a Carbuncle, Fellon, Gangrene, Sphacel, and the like malign Pustules. So when there is a conflux of divers humors into one tumor, divers kinds of Phlegmonous Impostumes called by divers names, according to the more abundant humor, arise; as if a small portion of Phlegm shall be mixed with a greater quantity of bloud, it shall be called an *Oedematous Phlegmon*; but if on the contrary, the quantity of phlegm be the greater, it shall be named a phlegmonous *Oedema*, and so of the rest; alwayes naming the tumor, from that which is predominant in it.

What a true Phlegmon is. A Phlegmon one thing, and a Phlegmonous tumor another.

Therefore we must observe that all differences of such tumors arise from that, either because the bloud causing it offends only in quantity; which if it do, it causes that tumor which is properly called a Phlegmon; if in quality, it makes a phlegmonous tumor, because the matter thereof is much departed from the goodness of bloud.

But bloud is said to offend in quantity, either by admixture of some other matter, as Phlegm, Choler, or Melancholy, from whence proceeds *Oedematous*, *Erysipelous* and *Scirrhous* Phlegmons; or by corruption of its proper substance, from whence Carbuncles, and all kinds of Gangrens; or by concretion, and when nature is disappointed of its attempted and hoped for suppuration, either by default of the air, or patient, or by the error of the Physitian; and hence oft times happen *Atheroma's*, *Steatoma's*, and *Melicerides*. Although these things be set down by the Ancients, of the simple and similar matter of the true Phlegmon; yet you must know, that in truth there is no impostume, whose matter exquisitely shews the nature of one, and that simple humor without all admixture of any other matter; for all humors are mixed together with the bloud, yet from the plenty of bloud predominating, they are called Sanguine, as if they were of bloud alone.

Wherefore if any tumors resemble the nature of one simple humor, truly they are not of any naturall humor, but from some humor which is corrupt, vitiated and offending in quality; for so bloud by adustion degenerates into choler and melancholy.

Therefore a true Phlegmon is defined by *Galen*; a tumor against nature, of laudable blood, flowing into any part in too great a quantity.

Gal. lib. de morib. cap. ad Glauc. Hippoc. lib. de vuln. cap. Gal. lib. de tumor. praet. natur.

This tumor though most commonly it be in the flesh, yet sometimes it happens in the bones, as *Hippocrates* and *Galen* witness.

A Phlegmon is made and generated thus: when bloud flows into any part, in too great a quantity; first the greater veins and arteries of the affected part are filled, then the middle, and lastly, the smallest and capillary; so from those thus distended, the blood sweats out of the pores and small passages like dew; and with this the void spaces which are between the similar parts are first filled, & then with the same bloud all the adjacent parts are filled, but especially the flesh, as that which is most fit to receive defluxions, by reason of the spongious rarity of its substance; but then the nerves, tendons, membranes, and ligaments, are likewise stuffed full; whereupon a Tumor must necessarily follow, by reason of the repletion which exceeds the bounds of nature; and from hence also are tension and resistance; and

pain

pain alſo happens at the ſame time, both by reaſon of the tenſion and preternaturall heat.

The cauſe of a beating pain in a Phlegmon.

And there is a manifeſt pulſation in the part, ſpecially whilſt it ſuppurates, becauſe the veins, arteries, and nerves, are much, being they are not only heated within by the influx of the fervid humor, but preſſed without by the adjacent parts. Therefore ſeeing the pain comes to all the foreſaid parts becauſe they are two immoderately heated and preſſed, the arteries, which are in the perpetuall motion of their *ſyſtole & diaſtole*, whilſt they are dilated, ſtrike upon the other inflamed parts, whereupon proceeds that beating pain.

Hereunto add, the Arteries then filled with more copious and hot bloud, have greater need to ſeek refrigeration by drawing in the encompaſſing Air; wherefore they muſt as of neceſſity, have a conflict with the neighbouring parts which are ſwollen and pained. Therefore from hence is that pulſation in a Phlegmon which is defined by *Galen*, an agitation of the arteries, painfull and ſenſible to the Patient himſelf; for otherwiſe as long as we are in health, we do not perceive the pulſation of the arteries.

Comm. ad Aph. 21. ſect. 7.

Wherefore theſe two cauſes of pulſation, or a pulſick pain in a phlegmon, are worthy to be obſerved, that is, the heat and abundance of bloud, contained in the veſſels and arteries (which more frequently than their wont incite the arteries to motion, that is, to their *ſyſtole* and *diaſtole*) and the compreſſion and ſtraitning of the ſaid arteries, by reaſon of the repletion and diſtention of the adjacent parts, by whoſe occaſion the parts afflicted and beaten by the trembling and frequent pulſation of arteries are in pain.

Another kind of Pulſation in a Phlegmon.

Hence they commonly ſay, that in the part affected with a Phlegmon, they feel as it were the ſenſe or ſtroke of a Mallet or Hammer ſmiting upon it. But alſo beſides this pulſation of the arteries, there is, as it were, another pulſation with itching from the humors whilſt they putrefie, and ſuppurate, by the permixtion, motion, and agitation of vapours, thereupon ariſing.

The cauſe of heat in a Phlegmon is bloud, which whilſt it flows more plentifully into the part, is as it were troden or thruſt down, and cauſes obſtruction, from whence neceſſarily follows a prohibition of tranſpiration, and a putrefaction of the bloud, by reaſon of the preternaturall heat. But the Phlegmon looks red by reaſon of the bloud contained in it, becauſe the humor predominant in the part ſhines through the skin.

CHAP. XXIII.

Of the cauſes and ſignes of a Phlegmon.

The primitive cauſes of a Phlegmon. The Antecedent and conjunct.

THe cauſes of a Phlegmon are of three kinds; for ſome are primitive, ſome antecedent, and ſome conjunct. Primitive are falls, contuſions, ſtrains, immoderate labour, frictions, application of acrid ointments, burnings, long ſtaying or labouring in the hot Sun, a diet unconſiderate, and which breeds much bloud. The antecedent cauſes are, the great abundance of bloud, too plentifully flowing in the veins. The conjunct, the collection or gathering together of bloud impact in any part.

The ſigns of a Phlegmon.

The ſigns of a Phlegmon are ſwelling, tenſion, reſiſtance, feaverish heat, pain, pulſation, (eſpecially while it ſuppurates) redneſs, and others, by which the abundance of bloud is ſignified.

And a little Phlegmon is often terminated by reſolution; but a great one by ſuppuration; and ſometimes it ends in a Scirrhus, or a Tumor like a Scirrhus, but otherwhiles in a Gangren, that is, when the faculty, and native ſtrength of the part affected, is overwhelmed by the greatneſs of the defluxion, as it is reported by *Galen*. The Chirurgeon ought to conſider all theſe things, that he may apply and vary ſuch medicines as are convenient for the nature of the Patient, and for the time and condition of the part affected.

Gal. lde Tum.

CHAP. IX.

Of the cure of a true Phlegmon.

What kind of diet muſt be preſcribed in a Phlegmon.

THe Chirurgeon in the cure of a true Phlegmon muſt propoſe to himſelf four intentions. The firſt of Diet; This, becauſe the Phlegmon is a hot affect and cauſes a feaver, muſt be ordained of refrigerative and humecting things, with the convenient uſe of the ſix things not naturall, that is, air, meat and drink, motion and reſt, ſleep and waking, repletion and inanition; and laſtly, the paſſions of the mind. Therefore let him make choiſe of that air which is pure and cleer, not too moiſt, for fear of defluxion, but ſomewhat cool; let him command meats which are moderately cool and moiſt, ſhunning ſuch as generate bloud too plentifully, ſuch will be broths not too fat, ſeaſoned with a little Borage, Lettuce, Sorrell, and Succory: let him be forbidden the uſes of all ſpices, and alſo of Garlick, and Onions, and all things which heat the bloud, as are all fatty and ſweet things, as thoſe which eaſily take fire. Let the Patient drink ſmall wine, and much allaied with water: or if the feaver be vehement, the water of the decoction of Licoris, Barly, ſweet Almonds, or water and Sugar; alwayes having regard to the ſtrength, age, and cuſtome of the Patient.

For

For if he be of that age, or have ſo led his life, that he cannot want the uſe of wine, let him uſe it, but altogether moderately. Reſt muſt be commanded; for all bodies wax hot by motion, but let him chiefly have a care that he do not exerciſe the part poſſeſſed by the phlegmon for fear of a new defluxion. Let his ſleep be moderate, neither, if he have a full body, let him ſleep by day, ſpecially preſently after meat. Let him have his belly ſoluble, if not by nature, then by art, as by the frequent uſe of glyſters and ſuppoſitories. Let him avoid all vehement perturbations of mind, as hate, anger, brawling; let him wholly abſtain from venery.

How to divert the defluxion of humors.

This manner of diet thus preſcribed, we muſt come to the ſecond ſcope, that is, the diverſion of the defluxion, which is performed by taking away its cauſe, that is, the fulneſs and ilneſs of the humors. Both which we may amend by purging and bloud-letting, if the ſtrength and age of the patient permit.

The pain muſt be aſſwaged.

But if the part receiving be weak, it muſt be ſtrengthned with thoſe things which by their aſtriction amend the openneſs of the paſſages, the violence of the humor being drawn away by cupping-glaſſes, frictions, ligatures. But if pain trouble the part, which often ten the occaſion of defluxion, it muſt be mitigated by medicines aſſwaging pain.

When we muſt uſe repercuſſives.

The third ſcope is to overcome the conjunct cauſe. That we may attain to this, we muſt enter into the conſideration of the tumor, according to its times, that is, the beginning, increaſe, ſtate, and declination. For from hence the indications of variety of medicines muſt be drawn. For in the beginning we uſe repercuſſives to drive away the matter of the Phlegmon flowing down, as the white of an Egge, Oxycrate, the juices or waters of Houſleek, Plantain, Roſes; Cataplaſms of Henbane, Pomgranate, Pils, Balauſties, Bole armenick, *Terra ſigillata*, oil of Roſes, Quinces, Mirtils, Poppies.

Of theſe ſimples variety of compound medicines ariſes. This may be the form of a Cataplaſm. ℞, *ſar. hordei* ℥ ij. *ſucci ſemper vivi, plantag. an.* ℥ iij. *pul. malicorii, balauſtiorum & roſar. an.* ℥ ij. *ol. mirtill. & roſar. an.* ℥ i. *fiat Cataplaſma.* Another, ℞, *Plantag. ſolani, hyoſcyam. an. m.* ij. *caudæ equin. tapſi barb. centinodiæ. an. m. i. coquantur perfectè in oxycrato, piſtentur, trajiciantur, addendo pulveris mirtill. nuc. cupreſſi. & roſ. rub. an.* ℥ iij. *farin. fab.* ℥ ij. *olei roſar. & cydon. an.* ℥ i ß, mixe them and make a cataplaſm to the form of a liquid pultis. And you may uſe this liniment, by dipping linnen clothes in it, and applying to the part; ℞, *ol. nymph. & roſar. an.* ℥ iij. *aq. roſ. ſolani & plantag. an.* ℥ ij, *aceti* ℥ iij, *albumin. ovorum n.* iij. *fiat linimentum.* Alſo *ung. roſatum & ung. Album, camphor. Raſis* are good to apply to it, as in like manner, *Emp. Diacalcitheos* diſſolved in vinegar, and oil of Roſes, and alſo *Populeon* may be uſed. In the increaſe you muſt have care of the humor flowing down, and of that which already impacted in the part did formerly fall down. Therefore repercuſſives muſt be tempered and mixed with diſcuſſing medicines, but ſo that they may carry the chief ſway, as ℞, *fol. malvæ, abſinth. plantag. an. m.* iij. *coquantur in oxycrato, contundantur, trajectis* add *farinæ fabarum & hordei an.* ℥ i. *pul. roſar. rub. & Abſinth. an.* ℥ i, *ol. roſar. & chamæm. an.* ℥ i, *fiat cataplaſma ad formam pultis ſatis liquidæ.* Another, ℞, *farinæ hord.* ℥ iij, *farinæ ſem. lini & fenugræci, an.* ℥ i, *coquantur in aqua communi, addendo ſub finem pul. mirtillorum, roſarum & chamæmeli an.* ℥ ß, *axungiæ anſeris & olei roſarum an.* ℥ i, *miſce, fiat cataplaſma.*

What locall medicines we muſt uſe in the encreaſe.

But in the ſtate the repercuſſives, and diſcuſſives ought to be alike with ſome anodyne, or mitigating medicines, if it be painful, as ℞, *rad. Althææ* ℥ iiij, *malvæ, parietar. ana m.* ij, *coquantur ſub cineribus, addendo farin. fabarum & lentium an.* ℥ ij, *pulveris chamæm. & meliloti an.* ℥ ß, *olei chamæm. & roſar. an.* ℥ i. *axungiæ gal.* ℥ ij. *fiat cataplaſma.* Another, ℞, *micæ panis triticei aqua calida macerati* ℔ ß, *pulveris roſar. rub. & abſinth. ana* ℥ vi, *olei aneth. & mellis com. an.* ℥ ij, *miſce omnia ſimul & fiat cataplaſma ad formam pultis ſatis liquidæ*; which is of chief uſe when there is pain.

What in the ſtate.

What in the declination.

But when the violence of pain and other ſymptomes are aſſwaged, it is likely that the plegmon is come to determination. Wherefore then we muſt uſe more powerfull and ſtrong diſcuſſives, and only then beginning with the more gentle, leſt the ſubtiler part of the humor being diſſolved, the groſſer, remaining in the part, ſhould grow hard, as ℞, *mal. biſmal. an. m.* iij. *coquantur, addendo farinæ hordei* ℥ ij, *mellis com.* ℥ i, *ol. chamæ. & melilot. an.* ℥ ß, *fiat cataplaſma.* Or ℞, *radi cum Brion. & Cucumer. agreſt. an.* ℥ ij, *florum chamæm. & melilot. ana m.* iij, *coquantur in hydromelite addendo farinæ, ſem. lini & fenugræc. an.* ℥ i). *ol. aneth. axungiæ anſer. & anat. an.* ℥ i. *fiat Cataplaſma.* And this plaiſter following may here find place.

℞, *Diachyl. mag.* ℥ ij, *Empl. de melilot.* ℥ i, *olei aneth. & chamæmel. an.* ℥ ß, diſſolve them all together and make a medicine for your uſe. Or ℞, *Empl. de mucag. & oxycr. an.* ℥ ij. *Empl. Diachyl. Ireat.* ℥ i, *olei liliorum & chamæmel. quantum ſatis eſt*, and make thereof a ſoft emplaiſter.

The correction of the accidents.

The fourth ſcope of curing a Phlegmon conſiſts in correction of the accidents which accompany it; of which pain is the principall.

The diſcommodities of pain.

Wherefore the Chirurgeon muſt be diligent to aſſwage it; for beſides, that it weakens the ſtrength, and debilitates and depraves the function, it alſo cauſes defluxions by drawing the bloud and ſpirits to the part affected.

Medicines aſſwaging pain.

According to the variety of pain there muſt be variety of medicines, as ℞, *micæ panis albi in lacte tepido macerati* ℔ ß, *vitell. ovorum* iij, *ol. roſar.* ℥ ij, *croci* ℈ ß, *fiat cataplaſma.* Or ℞, *florum chamæm. & melil. an. p.* iij, *farinæ ſem. lini. & fenugræc. an.* ℥ i, *fiat cataplaſma pultis ſatis liquidæ.* Or ℞, *mucagin. rad. Althææ & fenugræci an.* ℥ iij, *ol. roſar. & aneth. an.* ℥ i, *farin. ſem. lini. quantum ſatis, ut inde formetur cataplaſma ſatis molle.*

But

Narcotick medicines.

But if the pain remain, and yeeld not to theſe remedies, we muſt flie to ſtronger, making of narcoticks, or ſtupefactives, but with care leſt we benum, or dead the part; as ℞, *fol. hyoſcyani & papaver. ſub. cineribus coctorum an.* ℥ iij, *adipis ſuillæ & ol. roſ. an.* ℥ i, *croci* ℈ ij, *fiat cataplaſma:* or ℞, *fol. cicutæ & ſolani furioſi. an.* ℥ iiij, *coquantur ſub cineribus, piſtentur, & trajiciantur addendo unguent. popul. & ol. roſar. an.* ℥ i, *farin. fænugræc. quantum ſatis erit ut inde formetur cataplaſma ad formam pultis liquidæ.*

CHAP. X.

The cure of an ulcerated Phlegmon.

The ſigns of a Phlegmon turning to an Abſceſs.

BUt it often happens that the humor is ſo impact in the part, that it cannot be repreſſed, and ſo groſs, that it cannot be diſcuſſed; which we may know by the greatneſs of the heat and ſwelling, by the bitterneſs of the pricking pain, the feaver, and pulſation, and heavineſs.

Lib. 2 ad Glan. Cap. 7.

Wherefore laying aſide all hope of diſcuſſing, we muſt come to the ſuppuratives. For which purpoſe *Galen* foments the ſwollen part with water, or oil being warm, or with both of them; and then applies this following cataplaſm.

Suppurative medicines.

℞, *farinæ tric. vel micæ panis* ℥ iiij, *ol. com.* ℥ ij. *aquæ com. quantum ſufficit, fiat cataplaſma;* Or ℞, *rad. lilior. alb. & altheæ, an.* ℥ iij, *fol. malvæ, parietar. & ſenecionis ana m.* i. *coquantur in hydromelite, piſſentur trajectis adde farin. ſem. lini* ℥ ij, *axungiæ ſuillæ, ol. liliorum an.* ℥ ß, *fiat cataplaſma:* Or ℞, *malvæ, biſmalv. violar. an. m.* i. *caricarum ping. n.* x. *paſſul.* ℥ ij, *coquantur in aq. com. tuſis, & trajectis, adde mellis com.* ℥ ij, *ung. baſilicon. & butyri recent. ana* ℥ i, *fiat cataplaſma.* You may profitably uſe for the ſame purpoſe *Empl. Diachylon magnum*, or *Baſilicon.* Or ℞, *Empl. Diachyl. Mag.* ℥ iij, *ung. baſilicon.* ℥ i. *ol. liliorum* ℥ ß. Of theſe mixed together make a medicine for the foreſaid uſe.

The ſigns of *pus* or matter.

When the heat, pain, feaver, and other accidents ſhall remit, when the tumor hath a ſharpe head, when by the preſſing of your finger you find the humor to flow as it were to and fro, then you may know that it is ripe.

Wherefore without any further delay the tumor muſt be opened, leſt the matter too long ſhut up, corrode the adjacent parts, and the ulcer become ſinuous and fiſtulous.

For this uſually happens, eſpecially then, when the matter is venenate or malign, or when the ſwelling is near a joint, or at the fundamennt, or ſuch like hot and moiſt places.

Hip. lib. de Fiſtula.

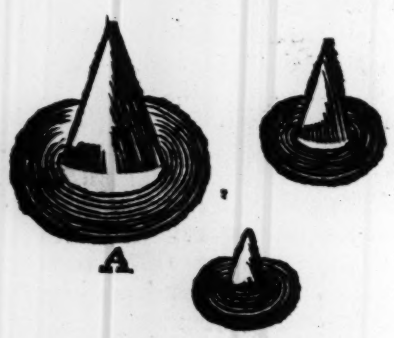
For by the decree of *Hippocrates* we ſhould anticipate the maturation of ſuch tumors by opening.

They may be opened with an inciſion knife or cauſtick, and that either actuall or potentiall. For if the Patient ſhall be heartleſs and leſs confident, ſo that he either cannot, or will not indure any inſtrument, you muſt make way for the matter by a potentiall cautery. You may alſo do the buſineſs by another ſlight, as thus.

Thruſt the point of a ſharpe knife or lancet, through a braſs counter that it may ſtand faſt in the midſt thereof; then cover it diligently with ſome Emplaiſter or Cataplaſm, that neither the Patient nor ſtanders by perceive the deceit: then laying on the plaiſter as that you would make a paſſage for the matter by that means, but when you have fitted the point to the part, where it is fit to open the tumor, ſo guide the Counter with your fingers, that you may preſently make an impreſſion into the Tumor, ſufficient for excluding the matter. I have here expreſſed three delineations of ſuch Inſtruments that you may uſe theſe, either bigger, leſſer or indifferent, as occaſion ſhall ſerve.

Counters with the points of Knives or Launces put through them.

B



A

A. ſhews the Counter or peece of Silver.
B. ſhews the point of the Laneet.

But there are ſeven things which muſt be diligently conſidered in opening all ſorts of Impoſtumes. The firſt is, that you put your knife to that part of the Abſceſs which is the ſofter, and yeelds to the impreſſion of your fingers, and where it riſes into a head, or point.

point. The ſecond is, that you make choiſe of that place for diſſection which is the loweſt, that ſo the contained impuritie may the more readily flow out, and not ſtay in the paſſage. The third is, that it be made according to the wrincles of the skin, and the right fibers of the Muſcles lying next under the skin. The fourth is, that you turn your knife from the larger veſſels and Nerves worth ſpeaking of. The fifth is, that the matter contained in them be not evacuated too abundantly at once in great Abſceſſes, leſt thereby the ſtrength be dejected, the ſpirits being much waſted together with the unprofitable humor. The ſixth is, that the affected part be handled as gently as you can. The ſeventh is, that after the opening when the matter is evacuated, the Abſceſs be cleanſed, filled with fleſh, and laſtly, conſolidated and cicatrized. But ſeeing that commonly after ſuch ſections ſome part of the Tumor remains, all the contained humor being not wholly ſuppurated, the Chirurgeon may perceive that this is an implicite affect, that is, a Tumor and Ulcer. But the Cure thereof muſt be ſo, that you take away the Tumor before the Ulcer; for the Ulcer cannot be healed before the part be reſtored to its nature. Therefore the ſuppuratives formerly preſcribed muſt be uſed, and the Ulcer muſt be dreſſed for two or three dayes with this following Medicine.

What the cure muſt be after the opening of the abſceſs.

℞ *Vitellum unius ovi, terebinth. Venet. & ol. Roſar. an.* ℥ ß, *fiat medicamentum.* Then you muſt ſeek to cleanſe it by this following Medicine.

Deterſive Medicines.

℞ *Mellis roſar.* ℥ ß, *Syrupi roſar. & tereb. Venet. an.* ℥ i ß, *far. hordei* ℥ ij, *fiat medicamentum ad uſum.* For this very purpoſe there is a ſingular Deterſive made of *Appium* or Smallage of which this is the deſcription.

Vnguentum de Appio.

℞ *Succi appii, plantag. beton. an.* ℥ i, *Mellis communis* ℥ v, *terebint. Venet.* ℥ iiij, *farin. Hordei & Orobi, an.* ℥ ij, *pulveris Aloes, rad. Ireos florent. myrrhæ, an.* ℥ i, *coquatur mel cum ſuccis quibus conſumptis addantur farina & pulveres, & miſceantur omnia ad formam unguenti.* But if you would cleanſe it more powerfully, you may uſe *Vnguentum Apoſtolorum*, or *Vnguentum Aureum* and *Egyptiacum* mixed according to the ſcope you conceive in your minds; when the Ulcer ſhall ſeem ſufficiently cleanſed, it ſhall be filled with fleſh and cicatrized after the manner we ſhall declare in the proper treatiſe of the cure of Ulcers.

Other Inſtruments for opening Abſceſſes.

Rings in which little knives lye hid, fit for to open Abſceſſes.

The Delineation of a Trunke or hollow Inſtrument going with a ſpring.

A. Shews the thicker pipe.
B. Shews another which enters and is faſtened in the other by a ſcrue.
C. The point of the Inſtrument looking out.
D. The ſpring which forces the Inſtrument.

CHAP.

CHAP. XI.

Of feavers, and the cures of theſe feavers which accompany Phlegmons.

The Feaver of a Phlegmon. What a Feaver is.

AMongſt the *Symptoms* which moſt uſually accompany Phlegmons, and afflict all the body of the patient, Feavers are the chief; that is, hot, and dry diſtempers kindled in the heart, and thence by the Artery is ſent over all the body; yet theſe which uſually follow this kind of Tumors are *Ephemeræ*, that is, Diary, unputrid *Synochi*; Of whoſe nature and order of cure I will here briefly relate what I have learnt from my Maſters, that is, Doctors of Phyſick, as I have been converſant with them in the practiſe of my Art.

What an *Ephemera*, or Diary is.

The *Ephemera*, or Diary [that is, of one day] is a hot and dry diſtemperature kindled in the vitall ſpirits. It hath that name, becauſe by its own nature it tarries not above the ſpace of one day or twenty four houres, by reaſon it is kindled in a ſubtile eaſily diſſipable matter.

The cauſes thereof.

The efficient cauſes of this Feaver are wearines, hunger, and drunkenneſs, anger, fury, ſorrow, watching, great & piercing cold, Aduſtion, Bathes, and manner of living inclining more to heat then ordinary, applying, uſing or drinking of acrid medicines, as Poyſons, or of hot meats, or drinks; to conclude, all the efficient cauſes common to all Feavers, putrefaction only excepted whch properly appertains to putrid feavers.

Aphoriſm. 55. *lib.* 4.

For a *Bubo* alſo, which is a *Phlegmon* of the Glandules, cauſes a Diary, as *Hippocrates* ſhews. All feavers proceeding from the Tumors of the Glandules are evill, the Diary excepted. Which *Aphoriſm* muſt be underſtood warily and with that diſtinction which *Galen* gives in his commentary, where he ſaith; It is only to be underſtood of Tumors riſing in the Glandules without occaſion, that is, without any evident and manifeſt cauſe; for otherwiſe Feavers that thence take their originall, though not Diary, yet are not all evill, as we learn by Buboes in Children, and the venereous Buboes, which happen without inflammation, or corruption of the liver; for ſuch commonly have no malign Feaver accompanying them, which thing is worthy a Chirurgeons obſervation.

The ſigns of a Diary.

The common ſigns of a Diary are, a moderate and vaporous heat feeling gentle to the hand, a pulſe ſwift and frequent, ſometimes great and ſtrong, as when the Diary is cauſed by anger; ſometimes little, if the Feaver proceed from ſorrow, hunger, cold, crudity; for other reſpects equall and ordinary.

The moſt certain ſigns are, if the Feaver come upon one not by little and little but ſodainly and that from ſome externall and evident cauſe, no loathing of meat, no cauſleſs wearineſs, no deep ſleep, yawning, great pain, reſtleſneſs, ſhaking nor cold going before, and laſtly, no other troubleſome ſymptome preceding. We here make no mention of the urine, becauſe moſt frequently they reſemble the urines of ſound bodies; for in ſo ſhort a time as Diaries endure, there cannot ſo great a perturbation be raiſed in the bloud that there may be ſignes thereof found in the urine.

Why in a Diary the urines like to theſe in health.

A Diary is ended in one fit, which by the proper nature of this Feaver laſts but one day, although ſometimes, otherwiſe it is extended to three, or four dayes ſpace; and then it eaſily degenerates into a Putrid, eſpecially any error of the Patient, Phyſitian, or thoſe which attend him concurring therewith, or if the externall things be not rightly fitted.

The unputrid *Synochus*.

This Feaver is terminated either by inſenſible tranſpiration, or by the moiſture of the skin, or by a ſweat naturall, gentle, and not ill ſmelling; to this Diary we may refer the unputrid *Synochus* generated of bloud not putrid, but only heated beyond meaſure. For uſually there ariſes a great heat over all the body, by means of the bloud immoderately heated; whence the veins become more tumid, the face appears fiery, the Eyes red and burning, the breath hot, and to conclude, the whole habit of the body more full, by reaſon of that ebullition of the bloud, and the diffuſion of the vapours thence ariſing over all the body: Whence it is, that this kind of *Synochus* may be called, a vaporous Feaver. To this Children are incident as alſo all ſanguine bodies, which have no ill humors. The cure of this and the *Ephemera* or Diary is the ſame; becauſe it may ſcarſe ſeem different from the *Ephemera* in any other thing, than that it may be prolonged for three or four dayes. Wherefore whatſoever we ſhall ſay for the cure of the *Ephemera*, may be applyed to the *Synochus*, bloud-letting excepted, which in an unputrid *Synochus* is very neceſſary.

The cure of a Diary Feaver.

Now the cure of a Diary Feaver conſiſts in the decent uſe of things not natural, contrary to the cauſe of the diſeaſe; wherefore bathes of warm and naturall water are very profitable; ſo that the Patient be not Plethorick, nor ſtuft with excrements, nor obnoxious to catarrhes and defluxions, becauſe a catarrh is eaſily cauſed and augmented by the humors diffuſed and diſſolved by the heat of a bath; therefore in this caſe we muſt eſchew frictions, and anointing with warm oil, which things notwithſtanding are thought very uſefull in theſe kinds of Feavers, eſpecially when they have their originall from extreme labour, by aſtriction of the skin or a *Bubo*. Let this be a generall rule, that to every cauſe, whence this Feaver proceeded, you oppoſe the contrary for a remedy; as to labour, reſt; to watching, ſleep; to anger and ſorrow, gratefull ſociety of friends, and all things repleniſhed

plenished with pleasant good will; and to a *Bubo*, the proper cure thereof.

Wine moderately tempered with water according to the custome of the sick patient, is good and profitable in all causes of this Feaver, except he be pained in his head, or that the Feaver drew its originall from anger, or a *Bubo*; for in this last case especially, the patient must abstain wholly from wine, untill the inflammation come to the state, and begins to decline. This kind of Feaver often troubles infants; and then you must prescribe such medicines to their Nurses, as if they were sick, that so by this means their milk may become medicinable. Also it will be good to put the infant himself into a bath of naturall and warm water, and presently after the bath to anoint the ridge of the back and brest with oyl of Violets. But if a *Phlegmon* possess any inward part, or otherwise by its nature be great, or seated near any principall Bowel, so that it may continually send from it either a putrid matter or exhalation to the heart, and not only affect it by a quality or preternaturall heat by the continuity of the parts, thence wil arise the putrid *Synochus*, if the blood by contagion putrefying in the greater vessels, consists of one equall mixture of the four humors. This Feaver is thus chiefly known, it hath no exacerbations, or remissions, but much less intermissions; it is extended beyond the space of twenty four houres, neither doth it then end in vomit, sweat, moisture, or by little and little by insensible transpiration; after the manner of intermitting Feavers, or Agues; but remains constant, untill it leaves the patient for altogether; it commonly happens not unless to these of a good temper and complexion, which abound with much bloud, and that tempered by an equall mixture of the four humors. It commonly indures not long, because the blood by some peculiar putrefaction degenerating into choler or Melancholy, will presently bring forth another kind of Feaver, to wit, a Tertian or continued Quartain.

The use of wine in a Diary.

How a putrid *Synochus* is caused.

The cure of this Feaver (as I have heard of most learned Physitians) chiefly consists in bloodletting. For by letting of blood the fulness is diminished, and therefore the obstruction is taken away, and lastly, the putrefaction. And seeing that in this kind of Feaver there is not only a fault of the matter, by the putrefaction of the blood, but also of the Temper by excess of heat; certainly Phlebotomy helps not only, as we said, the putrefaction, but also the hot distemper. For the blood in which all the heat of the creature is contained, whilst it is taken away, the acrid and fuliginous excrements exhale and vanish away with it, which kept in, encreased the Feaverish heat. Moreover, the veins, to shun emptiness, which nature abhors, are filled with much cold air in stead of the hot blood which was drawn away, which follows a cooling of the habit of the whole body; yea and many by means of Phlebotomy have their bellies loosed, and sweat, both which are much to be desired in this kind of Feaver.

Phlebotomy necessary in a putrid *Synochus*.

This moved the ancient Physitians, to write, that we must draw blood in this disease, even to the fainting of the Patient.

What benefit we may reap by drawing blood even to fainting.

Yet because thus, not a few have poured out their lives together with their blood, it will be better and safer to divide the evacuations, and draw so much blood at severall times, as the greatness of the disease shall require, and the strength of the Patient may bear.

When you have drawn blood, forthwith inject an emollient and refrigerative clyster; lest that the veins emptied by Phlebotomy may draw into them the impurity of the Guts; but these clysters which cool too much, rather bind the belly, than loose it. The following day the Morbifick matter must be partly evacuated by a gentle purge, as a bole of *Cassia*, or *Catholicon*; then must you appoint Syrups which have not only a refrigerative quality, but also to resist putrefaction, such as the Syrup of Lemmons, Berberries, of the Juice of Citrons, of Pomgranats, Sorrell and Vineger; let his diet be absolutely coolling and humecting, and also slender; for the native heat much debilitated by drawing of a great quantity of blood cannot equall a full diet. Therefore it shall suffice to feed the Patient with chicken and veal broths made with cooling herbs, as Sorrell, Lettuce, and Purslain. Let his drink be Barly water, Syrup of Violets mixed with some pretty quantity of boiled water, *Julepum Alexandrinum*, especially if he be troubled with scouring, or laske. But the Physitian must chiefly have regard to the fourth day, for if then there appear any signs of concoction in the excrements, the *Crisis* must be expected on the eveth day, and that either by a loosness of the belly, or an aboundance of urine, by vomits, sweats, or bleeding. Therefore we must then do nothing but commit the whole business to nature.

Why we must give a clyster presently after blood letting.

What Syrups profitable in this case.

Why a slender Diet must be used after letting much blood.

But for drinking cold water, which is so much commended by *Galen* in this kind of Feaver, it is not to be suffered before there appear signs of concoction; moreover in the declining of the disease the use of wine will not be unprofitable to help forwards sweats.

When drinking of water is to be permitted in a putrid *Synochus*.

CHAP. XII.

Of an Eryſipelas, *or Inflammation.*

HAving declared the cure of a Phlegmon, cauſed by laudable blood, we muſt now treat of theſe tumors which acknowledg choler the materiall cauſe of their generation, by reaſon of that affinity which intercedes between Choler and Blood. Therefore the tumors cauſed by naturall Choler, are called *Eryſipelata*, or Inflammations; theſe contain a great heat in them, which chiefly poſſeſſes the skin, as alſo oftentimes ſome portion of the fleſh lying under it. For they are made by moſt thin and ſubtle blood (which upon any occaſion of inflammation eaſily becomes cholerick) or by blood and choler, hotter than is requiſit, and ſometimes of choler mixed with an acrid ſerous humor.

The definition of an *Eryſipelas.*

Gal. Cap. 2. lib. 14. Meth. med. & 2. ad Glau.

That which is made by ſincere and pure choler, is called by *Galen*, a true and perfect *Eryſipelas*. But there ariſe three differences of *Eryſipelaes* by the admixture of choler with the three other kinds of humors. For if it being predominant be mixed with blood, it ſhall be termed *Eryſipelas Phlegmonodes*; if with Phlegm, *Eryſipelas œdematodes*; if with Melancholy, *Eryſipelas Scirrhodes*. So that the former and ſubſtantive word ſhews the humor bearing dominion, but the latter or adjective that which is inferior in mixture. But if they concur in equall quantity, there will be thereupon made *Eryſipelas Phlegmone*; *Eryſipelas œdema*, *Eryſipelas ſcirrhus*.

Two kinds of *Eryſipelas.*

Galen acknowledges two kinds of *Eryſipelaes*, one ſimple and without an ulcer, the other ulcerated. For choler drawn & ſevered from the warmnes of the blood, running by its ſubtlety and acrimony unto the skin, ulcerates it; but reſtrained by the gentle heat of the blood, as a bridle, it is hindered from piercing to the top of the skin, and makes a tumor without an ulcer. But of unnaturall choler are cauſed many other kinds of cholerick tumors, as the *Herpes exedens*, and *Miliaris*, and laſtly, all ſorts of tumors which come between the *Herpes* and *Cancer*. You may know *Eryſipelaes* chiefly by three ſigns, as by their colour, which is a yellowiſh red; by their quick ſliding back into the body at the leaſt compreſſion of the skin (the cauſe of which is the ſubtlety of the humor and the outward ſite of it under the skin, whereupon by ſome an *Eryſipelas* is called a Diſeaſe of the skin;) Laſtly, by the number of the Symptoms, as heat, pulſation, pain. The heat of an *Eryſipelas* is far greater than that of a Phlegmon, but the pulſation is much les; for as the heat of the blood is not ſo great, as that of choler, ſo it far exceeds choler in quantity and thickneſs, which may cauſe compreſſion and obſtruction of the adjacent muſcle.

Gal. lib. 2. ad Glauc.

For Choler eaſily diſſipable by reaſon of its ſubtlety quickly vaniſhes, neither doth it ſuffer it ſelf to be long contained in the empty ſpaces between the muſcles; neither doth an *Eryſipelas* agree with a Phlegmon in the propriety of the pain. For that of an *Eryſipelas* is pricking and biting without tenſion, or heavineſs, yet the primitive, antecedent and conjunct cauſes are alike of both the tumors. Although an *Eryſipelas* may be incident to all parts, yet principally it aſſails the face, by reaſon of the rarity of the skin of that place, and the lightneſs of the cholerick humor flying upwards. It is ill when an *Eryſipelas* comes upon a wound, or ulcer, and although it may come to ſuppuration, yet it is not good; for it ſhews that there is obſtruction by the admixture of a groſs humor, whence there is ſome danger of eroſion in the parts next under the skin.

Hip. Apho. 79. Sect. 7. Aph. 25. Sect. 16. Aph. 43. Sect. 3.

It is good when an *Eryſipelas* comes from within outwards; but ill when from without it retires inward. But if an *Eryſipelas* poſſeſs the womb it is deadly, and in like manner if it ſpread too far over the face, by reaſon of the ſympathy of the membranes of the brain.

CHAP. XIII.

Of the cure of an Eryſipelas.

FOr the cure of an *Eryſipelas* we muſt procure two things, to wit, evacuation and refrigeration. But becauſe there is more need of cooling, than in a Phlegmon, the chief ſcope muſt be for refrigeration. Which being done, the contained matter muſt be taken away and evacuated with moderately reſolving medicines. We muſt do four things to attain unto theſe forementioned ends. Firſt of all we muſt appoint a convenient manner of Diet, in the uſe of the ſix things not naturall; that is, we muſt incraſſate, refrigerate and moiſten as much as the nature of the diſeaſe and patient will ſuffer, much more than in a Phlegmon; then we will evacuate the Antecedent matter, by opening a vein, and by medicines purging choler. And that by cutting the Cephalick vein, if there be a portion of the blood mixed with Choler, if the *Eryſipelas* poſſeſs the face, and if it be ſpread much over it.

Gal. 14. Method.

4 Things to be performed in curing an *Eryſipelas.*

In what *Eryſipelas* it is convenient to let blood, in what not.

But if it ſhall invade another part, although it ſhall proceed of pure choler, Phlebotomy will

will not be ſo neceſſary, becauſe the bloud which is as a bridle to the choler being taken away, there may be danger, leſt it become more fierce; yet if the body be plethorick, it will be expedient to let bloud, becauſe this, as *Galen* teacheth, is oft times the cauſe of an *Eryſipelas*. It will be expedient to give a clyſter of refrigerating and humecting things before you open a vein; but it belongs to a learned and prudent Phyſitian to preſcribe medicines, purging choler.

What topick medicines are fit to be uſed in the beginning of an *Eryſipelas*.

The third care muſt be taken for Topick, or locall medicines, which in the beginning and encreaſe muſt be cold and moiſt, without any either dryneſs or aſtriction, becauſe the more acrid matter by uſe of aſtringent things being driven in, would ulcerate and fret the adjacent particle.

Galen and *Avicen* much commend this kind of remedy; Take fair water ℥vi, of the ſharpeſt Vinegar ℥ i, make an Oxycrate, in which you may wet linnen clothes and apply to the affected part and the circumjacent places, and renew them often. Or ℞, *Succi ſolani, plantag. & ſempervivi, an.* ℥ ij, *aceti* ℥ ß, *Mucaginis ſem. Pſylii* ℥ ij, *ſuccihyoſcyami* ℥ i, *Miſce.* But if the *Eryſipelas* be upon the face, you muſt uſe the medicine following.

℞, *Unguent. Roſ.* ℥ iiij, *ſucci plantagin. & ſempervivi, an.* ℥ i, *trochiſc. de Camphora* ℥ ß, *aceti parum*; let them be mixed together and make a liniment. But if the heat and pain be intolerable, we muſt come to narcotick medicines. As ℞, *ſucci hyoſcyami, ſolani, cicutæ, an.* ℥ i, *album. ovorum n.* ii, *aceti* ℥ ß, *opii & Camphor. an. grā.* 4, *croci* ℈ ß, *Mucaginis ſem. pſyll. & ſemin. extractæ in aq. roſ. & plantag. an.* ℥ i, *ol. de papav.* ℥ ij. *fiat linimentum, addendo unq. refrigerantis Gal. camphor. q. ſatis ſit.* Yet we muſt not uſe ſuch like medicines too long, leſt they cauſe an extinction of the native heat and mortification of the part.

What caution muſt be had in the uſe of narcotick medicines.

Wherefore ſuch Narcotick medicines muſt be uſed with regard of place, time and ſuch other circumſtances. Therefore we may three manner of wayes underſtand when to deſiſt from uſing Narcotick or ſtupefactive medicines. The firſt is when the Patient in the affected part feels not ſo much heat, pricking and pain, as before; The ſecond is when the part feels more gentle to the touch than before; The third when the fiery and pallid colour begins by little and little to waxe livid and black; for then muſt we abſtain from Narcotick, and uſe reſolving and ſtrengthening things, whereby the part may be revived and ſtrengthened by recalling the Native heat; As ℞, *Farinæ hordei & Orobi, an.* ℥ ij, *ſarinæ ſem. lini* ℥ i ß, *coquantur in Hydromelite vel oxycrato, addendo pulv. roſarum & chamæmel. an* ℥ ß, *ol. anethi & chamæm. an.* ℥ i, *fiat cataplaſma.* Or you may uſe this following fomentation, ℞, *Rad. Althææ* ℥ ij, *fol. malvæ, biſmal. pariet. abſinthii, ſalviæ, an. m. I, flor. chamæm. melilоti, roſar. rub. an. m.* ij, *coquantur in æquis partibus vini & aquæ, & fiat fotus cum ſpongia.* After the fomentation you may apply an Emplaiſter of *Diachylon Ireatum*, or *Diapalma* diſſolved in oil of chamomile and Melilote, and ſuch other like. The fourth Intention which is of the correction of accidents, we will perform by theſe means which we mentioned in curing a Phlegmon, by varying the medicaments, according to the judgment of him which undertakes the cure.

Reſolving and ſtrengthening medicines.

CHAP. XIIII.

Of the Herpes; *that is, Tetters, or Kingwormes, or ſuch like.*

What a *Herpes* is, what be the kinds thereof. *Gal. 2. ad Glauconem.*

Herpes is a tumor cauſed by pure choler ſeparated from the reſt of the humors, that is carryed by its naturall lightneſs and tenuity even to the outer or ſcurfe skin, and is diffuſed over the ſurface hereof. *Galen* makes three ſorts of this tumor. For if perfect choler of an indifferent ſubſtance, that is, not very thick, cauſe this tumor, then the ſimple *Herpes* is generated, obtaining the name of the *Genus*; but if the humor be not ſo thin, but compounded with ſome ſmall mixture of Phlegm, it will raiſe little bliſters over the skin like to the ſeeds of Millet, whence it was that the Ancients called this Tumor the *Herpes Miliaris*. But if it have any admixture of Melancholy, it will be an *Herpes exedens*, terrible by reaſon of the roſion or eating into the skin and muſcles lying under it.

What the *Herpes miliaris* is.

What the *exedens*.

Theſe are abſolutely three intentions of curing; The firſt is to appoint a Diet juſt like that we mentioned in the cure of an *Eryſipelas*; The ſecond is to evacuate the antecedent cauſe, by medicines purging the peccant humor, for which purpoſe oft-times clyſters will ſuffice, eſpecially if the patient be ſomewhat eaſie by nature, and if the urine flow according to your deſire; for by this a great part of the humor may be carryed into the bladder; The third ſhall be to take away the conjunct cauſe by locall medicines ordained for the ſwelling and ulcer: Therefore the Chirurgeon ſhall have regard to two things, that is, the reſolving of the tumor, and the drying up of the ulcer; for every ulcer requires drying, which can never be attained unto, unleſs the ſwelling be taken away. Therefore becauſe the chiefeſt care muſt be to take away the Tumor, which unleſs it be performed there can be no hope to heal the ulcer, he ſhall lay this kind of medicine to diſſolve and dry, as ℞ *Ceruſæ & tuthiæ præpar. an.* ℥ i, *ol. roſ. & adipis caprin. an.* ℥ ij, *corticis pini ſicc. & loti,* ℥ ß, *ceræ quantum ſatis, fiat unguentum.* Or ℞, *Farin. hordei & lent. an.* ℥ ij, *coquantur in decoct. corticis*

Three intentions in curing *Herpes*.

A rule for healing ulcers conjoyned with tumors.

mali granati, balauſt. plantag. addendo pulveris roſar. rub. abſinth. an. ℥ ß, *olei Myrtillor. & mellis com. an.* ℥ vi, *fiat unguentum, ut artis eſt.* But for an *Herpes Miliaris* theſe muſt chiefly be uſed, ℞. *pulv. gallarum, malicurii, balauſt. boli armeni an.* ℥ i, *aquæ roſ.* ℥ iij, *aceti acerrimi* ℥ i, *axungiæ anſer. & olei Myrtillor. an.* ℥ i ß, *terebinth.* ℥ i, *fiat unguentum ad uſum.* I have often found moſt certain help in *unguentum enulatum cum Mercurio*, for it kills the puſtules, and partly waſts the humor contained in them. Yet if the ulcer, not yet neither yeelds, but every day diffuſes it ſelf further and further, you ſhall touch the edges and lips thereof with ſome acrid medicine, as *Aqua fortis*, oyl of Vitriole, or ſuch like, for by this kind of remedy, I have oft times healed fretting ulcers, which ſeemed altogether incurable.

The force of *Unguentum enulatum cum Mercurio.*

Medicines fit for reſtraining eating and ſpreading ulcers.

CHAP. XV.

Of Feavers, which happen upon Eryſipelous Tumors.

AS Feavers ſometimes happen upon Inflammations, and Eryſipelaes, which favour of the humor whereof they proceed, that is, Choler. Therefore ſeeing it is peculiar to Choler, to move every third day, it is no marvail if great Inflammations bring with them Tertian Feavers, or Agues, which have their fit every third day; for it is called an Intermitting Tertian which comes every other day.

A vulgar deſcription of an intermitting Tertian feaver.

The Primitive cauſes in generall are ſtrong exereiſes, eſpecially in the hot Sun, the uſe of heating, and drying either meats or medicines, great abſtinence joyned with great labour, care, ſorrow; the antecedent cauſes are the plenty of choler in the body, an hot and dry diſtemperature either of the whole body, or of the liver only: the conjunct cauſe is the putrefaction of the cholerick humor lying in ſome plenty without the greater veſſels, in the habit of the body.

The cauſes of Tertian feavers.

The ſigns, a ſhaking or ſhivering like as when we have made water in a cold winter morning, a great pricking, ſtretching, or ſtiffneſs, as if there were pins thruſt into us over all our bodies, by reaſon of the acrimony of the cholerick humor driven uncertainly and violently over all the body, and the ſenſible membranous and nervous particles at the beginning of the fit; then preſently the heat becomes acrid, the Feaver kindled, like a fire in dry ſtraw; the pulſe is great, quick and equal; the tongue dry; the urine yellowiſh, red and thin. The Symptomes are watchings, thirſt, talking idlely, anger, diſquietneſs and toſſing the body at the leaſt noiſe or whiſpering. Theſe Feavers are terminated by great ſweats. They are incident to cholerick young men, ſuch as are lean, and in Summer; after the fit oft times follow cholerick vomiting and yellowiſh ſtools. After the fit there follows an abſolute intermiſſion retaining no reliques of the Feaver, untill the approach of the following fit, becauſe all the cholerick matter by the force of that fit and nature is eaſily caſt out of the body, by reaſon of its naturall levity and facility; whereas in Quotidians there is no ſuch thing, as which after the fit alwayes leave in the body a ſenſe and feeling of a certain inequality by reaſon of the ſtubborneſs of the Phlegmatick humor, and dulnes to motion. The fit commonly uſes to endure 4, 5, or 6 houres, although at ſome time it may be extended to 8 or 10. This Feaver is ended at 7 fits, and uſually is not dangerous, unleſs there be ſome error committed by the Phyſitian, Patient, or ſuch as attend him. Tertians in ſummer are ſhorter, in winter longer.

The ſigns of an intermitting Tertian.

The Symptomes

Why Tertians have an abſolute ceſſation of the feaver at the end of each fit.

Wherefore the beginning of the fit is accompanied with ſtifneſs, or ſtretching, the ſame with ſweat, whereupon if the noſe, lips or mouth break forth into pimples or ſcabs, it is a ſign of the end of the Feaver, and of the power of nature which is able to drive the conjunct cauſe of the diſeaſe from the center to the habit of the body; yet theſe pimples appear not in the declining of all Tertians, but only then, when the cholerick humor cauſing the Feaver ſhall reſide in the ſtomach, or is driven thither from ſome other part of the firſt region of the Liver. For hence the ſubtler portion thereof carryed by the continuation of the inner coat to the mouth and noſe, by its acrimony eaſily cauſes pimples in theſe places. The cure is performed by Diet, and Pharmacy.

The diet of ſuch as have a Tertian.

Therefore let the Diet be ſo ordered for the ſix things not naturall, that it may incline to refrigeration and humection, as much as the digeſtive faculty will permit, as Lettuce, Sorrel, Gourds, Cowcumbers, Mallows, Barly Creams, Wine much allaid with water, thin, ſmall, and that ſparingly and not before ſigns of concoction ſhall appear in the urine; for at the beginning he may not uſe wine, nor in the declining, but with theſe conditions, which we have preſcribed.

When ſuch as have a tertian may uſe wine.

The time of feeding the patient.

But for the time of feeding the patient, on that day the fit is expected, he muſt eat nothing for three houres before the fit, leſt the aguiſh heat lighting on ſuch meats as yet crude, may corrupt and putrefie them; whence the matter of the Feaver may be increaſed, (becauſe it is as proper to that heat to corrupt all things, as to the native to preſerve and vindicate from putrefaction) the fit lengthened, and nature called away from the concoction and ſecretion of the Morbifick humor; yet we may temper the ſeverity of this law by having regard to the ſtrength of the patient; for it will be convenient to feed a weak patient not only before the fit, but alſo in the fit it ſelf, but that only ſparingly, leſt the ſtrength ſhould be too much impaired.

Now

Now for Pharmacy; It must be considered, whether the strength of the Patient be sufficient, if the humors abound; for then you may prescribe *Diaprunum simplex*, *Cassia* newly extracted, the decoction of Violets, of Citrin Myrobalanes; Syrups of Violets, Roses, of Pomegranats and Vineger. But if the powers of the Patient languish, he must not only not be purged, but also must not draw blood too plenteously, because Cholerick men soon faint, by reason of the facile and easie dissipation of the subtle humors and spirits; besides such as are subject to tertian Feavers do not commonly abound with blood, unless it be with Cholerick bloud, which must rather be renued, or amended by cooling and humecting things, than evacuated. Yea verily, when it is both commodious and necessary to evacuate the body, it may bee attempted with far more safety by such things as work by insensible transpiration, which provoke sweats, vomit or urine by reason of the subtlety of the Cholerick humor, than by any other. Also the frequent use of emollient glysters made with a decoction of Prunes, Jujubes, Violets, Bran and Barley, will profit much. If the Patient fall into a *Delirium* or talk idlely by reason of the heat and dryness of the head, with a particular excess of the cholerick humor, the Head must be cooled by applying to the Temples and Forehead and putting into the Nose oyl of Violets, Roses, or womans milk. Let the feet and legs be bathed in fair and warm water, and the soles of the feet be anointed with oyl of Violets and such like. When to purge the patient.

In the declining, a Bath made of the branches of Vines, the leaves of Willowes, Lettuce and other refrigerating things boiled in fair water, may be profitably used three houres after meat eaten sparingly.

But I would have you so to understand the Declination or declining not of one particular fit, but of the disease in generall, that the humors already concocted, allured to the skin by the warmness of the bath, may more easily and readily breath forth: he which otherwise ordains a bath at the beginning of the disease, will cause a constipation in the skin and habit of the body, by drawing thither the humors peradventure tough and gross, no evacuation going before. When the time is fit to use a Bath.

Also it will be good after generall purgations to cause sweat by drinking White wine thin and well tempered with water; but urine by a decoction of Smallage and Dill; Certainly sweat is very laudable in every putrid Feaver, because it evacuates the conjunct matter of the disease, but chiefly in a Tertian, by reason that choler by its inbred levity easily takes that way, and by its subtilty is easily resolved into sweat. But that the sweat may be laudable it is fit it be upon a criticall day, and be foreshewed by signs of concoction agreeable to the time and manner of the disease. Sweats when as they flow more slowly are forwarded by things taken inwardly and applied outwardly; by things taken inwardly, as with white wine, with a decoction of Figs, Raisins stoned, grasse roots and the like opening things; but by things outwardly applied, and spunges dipped in a decoction of hot herbs (as Rosmary, Time, Lavander, Marjerom and the like) applied to the Groins, Armholes, and ridge of the back. What kinds of evacuations are most fit in a Tertian. Sudorificks.

You may for the same purpose, fill two Swines bladders with the same decoction, or else stone bottles, and put them to the feet, sides, and between the thighes. Then let this be the bound of sweating, when the Patient begins to waxe cold, that is, when the sweat feels no more hot, but cold.

But by the consent of all, bloud must not be letten after the third fit, but presently at the beginning of the Feaver, according to the opinion and prescription of *Galen*; for seeing this Feaver for the most part is terminated at seven fits, if you stay untill the third fit bee past, the Feaver will now be come to its state; but *Hippocrates* forbids us to move any thing in the state, lest nature then busied in concocting the disease, be called from its begun enterprise. When blood must be let. *Aphor. 29. Sect. 2.*

CHAP. XVI.

Of an Oedema *or cold Phlegmatick Tumor.*

Hitherto we have treated of hot Tumors, now we must speak of cold; Cold Tumors are only two, an *Oedema* and a *Scirrhus*; And for all that *Hippocrates* and the Ancients used the word *Oedema* for all sorts of Tumor, in generall; yet by *Galen* and these Physitians, which succeeded him, it hath been drawn from that large and general signification, to a more strait and speciall, only to design a certain *species*, or kind of Tumor. *Gal. lib. de tumor. præter natur.*

Wherefore an *Oedema* is a soft, laxe and painlesse Tumor, caused by collection of a Phlegmatick humor. What an *Oedema* is.

The Ancients made eight differences of Tumors proceeding of Phlegm: The first they termed a true and lawfull *Oedema* proceeding from naturall Phlegm; from unnaturall phlegm by admixtion of another humor they would have three sorts of Tumors to arise, as The differences of *Oedema*.

that by mixture of blood, ſhould be made an *Oedema Phlegmonode s*, and ſo of the reſt.

Beſides, when they perceived unnaturall Phlegm either puffed up by flatulency, or to flow with a wateriſh moiſture, they called ſome *Oedemaes* flatulent, others wateriſh; but alſo when they ſaw this ſame Phlegm often to turn into a certain Plaiſter-like ſubſtance, they thought that hence proceeded another kind of *Oedema*, which they expreſſed one while by the name of *Atheroma*, anotherwhile by *Steatoma*, and ſometimes by *Melicerides*, as laſtly, they called that kind of *Oedema* which is cauſed by putrid and corrupt flegm, *Scrophule*. For we muſt obſerve that Phlegm ſometimes is naturall, and offends only in quantity, whence the true *Oedema* proceeds; otherwhiles it is not naturall; and it becomes not naturall, either by admixtion of a ſtrange ſubſtance, as bloud, Choler or Melancholy, whence ariſe the three kinds of *Oedema's* noted formerly by the way; or by the putridneſs and corruptions of its proper ſubſtance, whence the *Struma* and *Scrophule* proceed; or by concretion, whence kernels and all kinds of Wens, *Ganglia* and knots; or by reſolution, whence all flatulent and wateriſh Tumors, as the *Hydrocele*, *Pneumatocele* and all kinds of Dropſies.

By how many waies Phlegm becomes not naturall.

The Cauſes.

The cauſes of all *Oedema's* are the defluxion of a Phlegmatick or flatulent humor into any part, or the congeſtion of the ſame made by little and little in any part, by reaſon of the imbecillity thereof in concocting the nouriſhment, and expelling the excrement.

The ſigns.

The ſigns are a colour whitiſh and like unto the skin, a ſoft Tumor, rare and laxe by reaſon of the plentifull moiſture with which it abounds, and without pain, by reaſon this humor infers no ſenſe of heat nor manifeſt cold; when you preſs it with your finger the print thereof remains, becauſe of the groſneſs of the humor and ſlowneſs to motion.

The prognoſticks.

Oedema's breed rather in winter than in ſummer, becauſe winter is fitter to heap up Phlegm; they chiefly poſſeſs the Nervous and Glandulous parts, becauſe they are bloudleſs, and ſo cold and more fit by reaſon of their looſneſs to receive a defluxion; for the ſame cauſe bodies full of ill humors, ancient, and not exerciſed, are chiefly troubled with this kind of Tumor.

How *Oedema's* are terminated.

An *Oedema* is terminated ſometimes by reſolution, but oftner by concretion, ſeldomer by ſuppuration, by reaſon of the ſmall quantity of heat in that humor.

A Symptomaticall *Oedema*, as that which follows upon a Dropſie or Conſumption, admits no cure unleſs the diſeaſe be firſt taken away.

The intentions of curing *Oedemata's*.

The generall cure is placed in two things, that is, in evacuation of the conjunct matter prohibiting the generation of the antecedent. We attaine to both chiefly by four meane.

The diet.

The firſt truly by ordaining a fit manner of living and preſcribing moderation in the uſe of the ſix things not naturall. Wherefore we muſt make choiſe of ſuch air as is hot, dry and ſubtile; we muſt preſcribe wine of a middle nature for his drink; let the bread be well baked; let meats be appointed which may generate good bloud, and theſe rather roſted than boyled. Let all fruits be forbidden, as alſo broths and milk-meats; let him eat ſuch fiſh as are taken in ſtony rivers; the Patient ſhall obſerve mediocrity in feeding, but principally ſobriety in drinking, for fear of crudities; after meat let him uſe digeſtive powders, or common drige powder; if his belly be not naturally looſe, let it be made ſo by art.

Exerciſe.

Let the Patient uſe exerciſe before meat, ſo by little and little to ſpend this humor, and reſtore the native heat. Let him ſleep little, becauſe much ſleep breedeth cold humors; let him avoid grief and ſadneſs. And if he be of a weak body, let him abſtain from venery, leſt by another weakning by the uſe of venery added to his preſent infirmity, he fall into an uncurable coldneſs, from whence a greater meaſure of crudity will ariſe. Otherwiſe, if the body be ſtrong and luſty, by ſuch exerciſes and the moderate uſe of venery it will be the more dryed and heated.

What to be obſerved in the uſe of venery. *6. Epid. ſect. 5. ſen. 23.*

For ſo that ſentence of *Hippocrates* is to be underſtood; That venery is a cure for Phlegmatick diſeaſes, as *Galen* in his commentaries tels us. The Phyſitian may perform the ſecond intention by turning his counſell to that part, from whence the ſpring of this Phlegmatick humor flows. For if the infirmity ariſe from the ſtomach, or from any other part, the part from whence it comes muſt be ſtrengthened; if from the whole habit of the body, let attenuating, penetrating and opening medicines be preſcribed. We perform the third intention by evacuating the humor impact in the part with locall medicines varied according to the four times of the Tumor.

Lib. 2 ad Glauc. cap. 3. A rowler.

For *Galen* in the beginning and encreaſe preſcribeth a fomentation of *Oxycratum* uſed with a ſponge. But if ſo be that the *Oedema* be upon the Arm or Leg, a repelling rowler is very good, that is, ſuch an one as is brought from below upwards. So theſe medicines following are very fit for the ſame purpoſe, ℞, *Lixivii ex cineribus ſarmentorum, & tartari an.* ℥ iiij, *Tartari & Aluminis an.* ℥ ß, *aceti* ℥ ij, mixe all together and make a decoction, wherein wet ſponges and foment the place. Alſo you may uſe the following Cataplaſm, ℞, *farinæ hordei* ℥ iiij, *coquantur in Lixivio communi, addendo pulveris nucis expreſſi, corticum exterminatorum, balauſti. an.* ℥ i, *Myrrhæ, Aloes, alum. an.* ℥ ß, *olei Myrtill.* ℥ ij, *fiat Cataplaſma.* In the ſtate and declination you muſt uſe drying and reſolving medicines, as ℞, *Nucum expreſſi, granat. ſumach. balauſti, an.* ℥ i, *Salviæ, origan. calament. Hyſſopi, meliſſæ an. m. i, abſinthii, plantag. caud. equi. expſi. barb. centinod. an. m. ſſ. alum. tartar. & ſalis com. an.* ℥ i, *coquantur cum lixivio*; foment it with a ſponge, then preſently apply this following Cataplaſm. ℞, *Rad.*

Briomiæ

Brionie ℥ ij, *abſinth. plantag. centin. chamem. melilot, peleg. an. m. ſſ. coquantur in hydromelite, paſſentur, trajiciantur, addendo pulveris roſ. rub. chamem. melil. an* ℥ i, *fiat Cataplaſma.*

Laſtly, you may here with good ſucceſs uſe reſolving emplaiſters and ointments, firſt, heating or chafing the part by friction or fomentations, as well moiſt as dry; otherwiſe emplaiſters will ſcarſly do their duty, by reaſon of the great coldneſs of the part, being not ſufficient of it ſelf to aſſimilate the nouriſhment, or to expell the ſuperfluous and unprofitable humor. Let a fomentation be made with white Wine, in which Sage, Roſemary, Time, Lavander, Chamomile and Melilote flowers, red Roſes, Orris roots, *Stechas* and ſuch like have been boyled, with a little Vinegar added thereunto. Quench hot bricks in the ſame decoction, and apply them wrapped in linnen clothes to the affected part, for ſo a vapour will breath forth which hath an attenuating, piercing, reſolving and ſtrengthening faculty. But you may in ſtead of the bricks fitly apply Hogs or Oxe bladders, filled half full with the foreſaid decoction, and that hot. The frictions muſt be made of hot linnen clothes, for ſo the native heat together with the bloud and ſpirits is recalled to the part, and fuliginous humors contained under the skin are reſolved, whereby the ſtrength of the part is in ſome part recovered.

What caution to be had in application of Emplaiſters.

CHAP. XVII.

Of the cure of flatulent and wateriſh Tumors.

FOrmerly declared that not only flatulent and wateriſh Tumors were comprehended under this word *Oedema*, but alſo ſuch as are bred of congealed Phlegm, as *Atheromata*, *Steatomata* and *Melicerides*. Flatulent or windy Tumors are cauſed by vapour and wind kept in or contained ſometimes under the skin, ſomewhiles under the membranes, as the *Periоſteum* and *Peritranium*, whereupon inſues cruell torment by reaſon of the diſtention of theſe parts which are endued with moſt exquiſite ſenſe. Sometimes the Entrails, as the ſtomach and Guts are ſwollen and ſtreched out with wind, as in a Tympany.

In what places flatulencies may be gathered.

They in this differ from a true and ligitimate *Oedema*, that when you lay your finger upon them and take it off again, there remains no ſign of the preſſure thereof, becauſe they are diſtent by vapour and not by humor, for the vapour being preſſed returns ſpeedily again, as you may perceive by balls or bladders filled with wind.

In what flatulent tumors differ from a true *Oedema*.

The cauſe of ſuch Tumors is the weakneſs of the native heat, not being able eaſily to reſolve and waſte the Phlegm by which the windy Tumors are raiſed, for ſo the morning Sun (which in ſome ſort reſembles our native heat) cannot reſolve the miſts diſperſed in the air, which at noon it eaſily reſolves into pure air. Alſo after the ſame manner our weaker heat ſtirs up vapours from that Phlegm it could not diſſolve, which vapours are the matter of inflamations, or ſwellings. But oft times although the native heat be ſufficiently powerfull, yet becauſe the humor lyeth deep, or is kept by the thickneſs of ſome membrane, tendon or Ligament, the ſtirred up vapour cannot exhale, whereby it comes to paſs, that encreaſed by little and little it cauſes a Tumor.

The cauſes of flatulent Tumors.

The ſigns of ſuch a Tumor are a certain renitency or reſiſtance perceived by preſſing it with your finger, and ſometimes a noiſe as if you ſmite upon a drum, eſpecially if much wind be contained therein, ſuch as are often gathered together in the hollowneſs of the belly, and in the ſpaces between the larger muſcles. The Tumor is neither red nor hot, but rather cold and white as in an *Oedema*. It often poſſeſſeth the joints, and eſpecially the knees, and it is very difficult to be reſolved. If ſuch flatulency be gathered together in the Guts, it cauſeth the wind Colick, in which ſometimes the diſtention is ſo great that death enſues by reaſon of the renting or tearing the coats of the Guts.

The ſigns of ſuch Tumors.

CHAP. XVIII.

Of the cure of a flatulent and wateriſh Tumor.

WE ſhall chiefly and principally cure flatulent and wateriſh tumors by three means. Firſt, by the ſame diet which we preſcribed in an *Oedema*; then by ſtrengthening the part appointed for concoction, as the ſtomach and Liver, chiefly by the temperate uſe of Aromatick things, as *Diacuminum*, *Diacalamentha*, *Aromaticum*, *Caryophillatum*, *Aromaticum Roſatum*, and the like, to be preſcribed according to good liking of the Phyſitian which overſees the cure; laſtly, by taking away of the conjunct matter by hot, drying and attenuating medicines which they call Carminative, that ſo the part being rarified the humor and flatulency therein contained may be diſcuſſed and diſſipated. But remedies of this nature muſt be varied according to the variety of the parts, for ſome things are fit to be applyed to the ſtomach, others to the Guts, others to the joints, and others to the fleſhy parts; for the Colick you muſt inject carminative glyſters, let reſolving *Soculi* or Bags be applied, and cupping-glaſſes faſtened to the Navel; if an outward part be affected

Diet.

Things ſtrengthning the parts.

Medicines evacuating the conjunct matter.

affected,we uſe fomentations,liniments,chiefly if pain torment; as alſo Cataplaſmes and Emplaiſters,as ℞ *Florum chamæm.melil. roriſmarini, roſar. rub. an. p.j.abſinthii ji. hyſſopi,an.m.* let them be boiled in Lye,adding a little vineger for a fomentation to be uſed with ſpunges.

Galens fomentation.

Galen foments the part with Roſe-vinegar and a little ſalt put thereto, and would have a ſpunge dipped therein to lye ſomewhat long upon the part. ℞ *Olei chamæm. aneth. rut. & liliorum, an.* ℥ß, *ceræ albæ* ℥ vj. *aq. vitæ* ℥j, let them all be mixed together and make a liniment,with which anoint the part after the fomentation. ℞ *Farinæ ſabar. orobi, an.* ℥iij, *coquantur in decocto pulegii, origani, calamenth. ſalviæ, addita pulverum chamæm. & melilot.an. m.ß, furfur. farinæ fab. & orobi, an.* ℥ij, *coquantur cum lixivio communi, addendo terebinth.* ℥iij, *oleor. aneth. & rut. an.* ℥ij.make an emplaiſter for the foreſaid uſe.

The emplaiſter of *Vigo* with Mercury,and without,is very good for the ſame purpoſe. But you muſt note, that ſuch medicines muſt be applied to the part actually hot, and the ſame heat muſt be contained and renewed by putting about it linnen clothes, bricks, bottles and ſuch like hot things.

Corroborating medicines.

The Humor and flatulency which were kept ſhut up in the part being reſolved, the part muſt be ſtrengthned,leſt now and then it receive or generate the like matter. That may be done by the following fomentation and cataplaſme.℞ *Nucum cupreſſi, corticum granat. ſumach. berberis, balauſt. an.* ℥j.*caudæ equin.arnogloſs.tupſi barb. abſinth.ſalviæ, roriſm.lavendul. an. m.ſſ. flor. chamæm. melil.roſar. anthos, an.p.* j. *alum. ſalis com. an.* ℥j, *bulliant omnia in æquis partibus aquæ fabrorum & vini auſteri,*make bags for a fomentation, or uſe the decoction for the ſame purpoſe with a ſpunge.℞ *Farinæ fab. hordei & lupin. an.*℥ij.*terebinth. com.* ℥iiij. *pulver.radicis ireos, maſtic. an.* ℥ß, *mellis com.* ℥ijß, of the foreſaid decoction as much as ſhall ſuffice,ſo to make a cataplaſme to the form of a poultis liquid enough, let it be applied hot to the affected part having uſed the fomentation before.

The ſigns of a wateriſh tumor.

The ſigns of a wateriſh tumor are the ſame as of a flatulent;but over and beſides it ſhines, and at the preſſing with your fingers, there is heard a noiſe or murmur as of a bladder half filled with water.

Why a wateriſh tumor muſt be opened with an inſtrument.

Therfore the wateriſh tumor if it ſhal not yeeld to the forementioned reſolving medicines, the way muſt be opened with an inciſion knife, after the ſame manner, as we mentioned in a Phlegmon. For oftentimes this kind of remedy muſt be neceſſarily uſed,not only by reaſon of the contumacie of the humor which gives no place to the reſolving medicines, but alſo becauſe it is ſhut up in its proper ciſt or bag, the thickneſſe of which fruſtrates the force of the reſolving medicines, neither ſuffers it to penetrate into the humor. As I ſome years agoe found by experience in a maid of 7 years old;which troubled with a *Hydrocele* or wateriſh rupture,to whom when I had raſhly applyed to diſſolve it reſolving medicines of all ſorts,at length I was forc't to open it with my knife;not only to evacuate the contained matter,but alſo that I might pluck out the bag, which unleſſe it were cut up by the root, would be a mean to cauſe a relapſe. *John Altine* Doctor of Phyſick called me to this buſineſſe. *James Guilemeau* the Kings Chirurgeon overſaw the cure.

A Hiſtory.

CHAP. XIX.

Of an Atheroma, Steatoma, and Meliceris.

In what an *Atheroma, Steatoma,* and *Meliceris* differ.

ALthough theſe tumors may be thought comprehended under one *genus* with other *Oedematous* tumors, yet they differ as thus;that is, their matter is ſhut up in its bladder or bag, as it were in a peculiar cell. But their difference amongſt themſelves is thus; the matter of the *Steatoma*,as the name ſignifieth, is like unto Tallow [for στέαρ in Greek ſignifieth Tallow,or ſeam] yet it oft-times is found ſtuffed with other divers hard bodies,ſtony, bony or callous like unto the claws of an hen.For *Philoxenus* reports that he ſometimes ſaw flyes in a *Steatoma* at the opening thereof,and ſuch other like things wholly diſſenting from the common matter of Tumors. The matter contained in an *Atheroma* is like to pap,with which they feed little Children.A *Meliceris* contains matter reſembling honey in colour and conſiſtence; theſe tumors appear and riſe without any inflamation going before them.Thus you ſhal know theſe tumors;a *Steatoma* is harder than the other two, neither yeelds it to the preſſure of your finger,but when it once yeelds, it doth not ſpeedily and eaſily return to its former figure,becauſe the matter is more groſs; it is of the ſame colour as the skin, without pain,and of a longiſh figure.The *Meliceris* yeelds to the touch, as being a looſe and ſoft body, and as it is eaſily diſpoſed and diffuſed,ſo it quickly returns to its former place and tumor. It differs from the *Atheroma* in figure and ſubſtance. For it is more globous and of a ſubtiler and more ſhining matter, beſides alſo it takes up a large ſpace, and is more obſequious to the touch, and for the reſt, without pain. As for the manuall operation of the Chirurgeon in their cure, it ſeems to be of no great conſequence of what ſort the matter is,whether reſembling tallow, honey, or pap, for there is one ſimple manner of operation, which is, that you pluck away the contained humor, as alſo the receptacle in which it is contained. Yet you muſt note ſuch tumors, ſometimes as it were hanging in the ſurface of the skin, are eaſily to be moved this way,

Of Chirurgery to be uſed to theſe tumors.

and

and that way; but otherſome again deeper faſtned firmly cohere with the adjacent bodies, and theſe require an exquiſit hand and alſo induſtry for fear of a great flux of blood and convulſion by cutting a vein. There are many other kinds of tumors, as the *Teſtudo* or Mole, the *Nata*, the *Glandula*, *Nodus*, *Bothon*, *Lupia*, which as in matter (for they are all of a thick, clammy and viſcous Phlegmatick humor) ſo alſo in kind they agree with an *Atheroma*, *Steatoma*, and *Meliceris*. But alſo in theſe for the moſt part, when they are opened, you may ſee bodies of all ſorts far different from the common matter of tumors, as ſtones, chalk, ſand, coals, ſnails, ſtraws, or awnes of corn, hey, horn, hairs, fleſh both hard and ſpongeous, griſtles, bones, whole creatures as well living as dead.

What the cauſe may be, that we ſometimes find *infecta* in theſe Tumors.

The generation of which things (by the corruption and alteration of humors) ſhall not make us much to admire it, if we conſider, that as nature of all the ſeeds and elements of the whole great world, hath made man the Microcoſme or little world, that he might be, as it were, the lively Image of that greater world; ſo in him, it being never idle in us, would have all the kinds of all motions and actions to ſhew themſelves, as long as matter for generation is not wanting. But becauſe there is little, or rather no mention of theſe tumors amongſt the ancients, we will briefly ſhew the opinions of the later writers concerning them.

What the *Teſtudo*, or *Talpa* is.

Now they ſay, the *Teſtudo* is a tumor contrary to nature, ſoft, diffuſed, or vaulted, or arched like a Tortois, ſometimes it ariſes in the head in form of a Mole, and then it is called a Mole.

What the *Nata* is.

The *Nata* is a great and fleſhy tumor, not in ſhape unlike a Melon, or rather the fleſh of a mans buttocks, whence it may ſeem to have had the name, unleſs we had rather ſay it had it, becauſe it more uſually breeds upon the buttocks, than upon any other part of the body.

What a *Glandula*.

The *Glandula* takes its denomination from an Acorn, called *Glans* in Latine, the which it ſomewhat reſembles in the compaſſe and form of the tumor; or elſe becauſe it moſt commonly breeds in the Glandules, or Emunctories of mans body.

What *Nodus*.

The *Nodus* or knot, is a round tumor, hard and immoveable, named from a rope tied on a knot.

Guido Cauliacenſis affirms knots commonly to grow in nervous bodies; but at this time they more uſually ariſe on the bones of ſuch as have the French diſeaſe.

CHAP. XX.

Of the cure of Lupiæ, *that is*, Wens, *or* Ganglions.

What a Ganglion is.

A Wen or *Ganglion* is a tumor ſometimes hard, ſometimes ſoft, yet alwaies round, uſing to breed in dry, hard, and nervous parts. And ſeeing that ſome of the tumors mentioned before in the former Chapter, ſtick immoveable to the part to which they grow, becauſe they are contained in no cift, or bag; otherſome are moved up and down by the touch of your fingers, becauſe they are contained in a bag or bladder, it commonly comes to paſſe that Wens have their bladder wherein to contain them, and therefore we think fit, the rather more freely, and particularly to treat of their cure, becauſe they are more difficultly cured, eſpecially where they are inveterate and of long ſtanding.

The cauſes.

The primitive cauſes of theſe are dull blows, fallings from high places, ſtrains, and other ſuch like occaſions. But the antecedent and conjunct cauſes are the ſame with thoſe of an *Atheroma*, *Meliceris* and *Steatoma*.

Signes.

The deſcription formerly ſet down, will furniſh you with the ſigns by which you may know when they are preſent; certainly from very ſmall beginnings they grow by little and little to a great bigneſs, in the ſpace of ſix or ſeven yeers, ſome of them yeeld much to the touch, and almoſt all of them are without pain.

Their cure at the beginning.

You may hinder ſuch as are beginning and firſt growing, from encreaſe by ſomewhat a ſtrong and frequent rubbing with your fingers. For ſo their bag or bladder, together with the skin wax thin, and the contained humor grows hot, is attenuated and reſolved. But if ſo you nothing prevail, you muſt lie upon them with your whole hand, or a flatted piece of wood as heavy as you can, untill ſuch time as the cift or bag be broken by your impreſſion. Then apply and ſtrongly bind unto it a plate of lead, rubbed over with Quick-ſilver, for I have many times found by experience, that it hath a wonderfull force to reſolve and waſt the ſubject humor. But if the Wen be in ſuch a place in which you can make no ſtrong impreſſion, as in the face, cheſt, belly, or throat, let there be applied an emplaiſter which hath a reſolving force, ſuch as this following hath; *℞ gummi ammon. bdelii, galban. an. ʒiij. liquefiant in aceto, & trajiciantur per ſtetaceum, addendo olei liliacini & lauri, an. ʒij. aqu. vitæ fortis, puluer. ireos, ſalis ammon. ſulphur. vivi, vitrioli romani, an. ʒß.* let them be all incorporated together, and make an Emplaiſter according to Art. But if the tumor cannot be thus reſolved, it muſt be operated with a knife or cautery. And after the Eſchar is removed, and the bag waſted by Ægyptiacum, Mercury, and the like, the ulcer muſt be cleanſed, replenifhed with fleſh, and cicatrized.

Plates of lead rubbed with Quick ſilver.

A reſolving plaiſter.

Things to waſt or conſume the bag.

Some-

Sometimes Wens grow to ſo great a maſſe, that they cannot be cured by the deſcribed remedies, wherefore they muſt be taken away by the root, by your hand and inſtrument, if ſo be that there be no danger by reaſon of their greatneſs, and ſo that they adhere not too cloſely to the adjacent parts, and if they be not too nigh to the greater veins and arteries; for it will be better in ſuch a cauſe to let them alone. This ſhall be your way to cut them off, or take them away. A ſmall inciſion muſt be made, even to the bladder, or bag, by which thruſt in a probe of a fingers thickneſs, hollowed in the midſt, round at the end, and as long as need ſhal require; then draw it many times about between the skin & the bag, even to the root of the Wen, that ſo the skin may be divided long waies, then it will be requiſite to make another inciſion overthwart, ſo that they may interſect each other like a croſs; then preſently draw the skin from the bladder, from the corners of the Wen, towards the root, and that with your finger covered with a fine linnen cloth, or elſe with a Razor if need require.

The manner to take away Wens.

But you muſt obſerve that in a Wen there are alwaies certain veſſels, which are ſmall in the beginning, but much encreaſed in proceſſe of time, according to the encreaſe of the Wen, whereof they are as it were the roots; wherefore if any *Hæmorrhagie* or flux of bloud happen, let it be ſtopped by binding the veſſels at their heads and roots, or make a ſtrait ligature at the roots of the Wen, with a peece of whipcord, or with a many times doubled thred, and let the ends hang forth until it fall away of its own accord. Neither will it bee ſufficient to have cut away all this tumor, but alſo it will be fit to cut away a portion of the skin, wherewith the tumor was covered, and only to leave ſo much as ſhall ſuffice to cover the part, then with a needle and thred draw together the lips of the inciſion, but in the interim let tents be put into the bottome of the ulcer untill it be perfectly cleanſed, and the reſt of the cure be workmanlike performed, even to the cicatrizing thereof.

A Hiſtory.

The Chirurgeon *Collo* and I uſing this method, in the preſence of Maſter Dr. *Violanius* the Kings Phyſitian, took away a Wen from Martiall *Colard*, the Major of *Burbon*; it hanged at his neck, as big as a mans head, and it weighed eight pounds; which made it ſo troubleſome and burdenſome to him, that he was forced to carry it bound up in a towell, as in a ſcrip.

What Wens to be cured by ligature.

Which dangerous to cure.

Verily if theſe kind of tumors have a ſlender root and broad top, they muſt be ſtraitly tied and ſo cut off. But it is very difficult and full of dangerous chance to take away ſuch Wens as are ſeated in the neck, neer unto the Jugular veins, theſe under the Arm-holes, in the groins, and ſuch as are under the ham; by reaſon of the deadly force of ſuch ſymptomes, as may thence ariſe. We can only conjecture, not certainly ſay, what kind of matter may be contained in them. We can only know of what ſort it is, when by inciſion it is preſented to our ſight. Yet in ſuch as are very hard and do much reſiſt the touch, there are often found matters, which in conſiſtence may be reſembled to little ſtones or pibles.

A Hiſtory.

I being on a time called to open the body of a great Lady, found in one of her breſts a body which might equal the bigneſs of an Hens egg, hard, and compact like a rough pible; it was held, whilſt ſhe lived, both by the Phyſitians and Chirurgeons, to be a *Cancer*, becauſe this hardneſs was very painfull to her, when it was but gently preſſed down.

The matter of a Wen is ſometimes taken for a Cancer.

Another Hiſtory.

But alſo ſome few yeers agon, I being called to the cure of a very honeſt woman, which was troubled with the ſame diſeaſe, ſtrongly withſtood the Phyſitians and Chirurgeons affirming it to be a *Cancer*, for the tumor had taken no deep root, the habit of the part was not changed from the native colour, the veins about it were not ſwollen, neither was there any other convincing ſign of a *Cancer*. For this ſame woman had her courſes at their due and uſuall time, and was well liking, and had a good colour in her face and body, was free from all ſort of pain, unleſſe when you preſſed down the part affected. Beſides thence forward the tumor grew not at all; no other evill accident befel her, yea verily ſhe lives merrily, and well both in body and mind.

How you may know a Wen from a Cancer.

CHAP. XXI.

Of a Ganglion *more particularly ſo called.*

What a Ganglion properly ſo called is.

The cauſes.

THere are alſo certain ſmall tumors of the kind of *Lupiæ* or Wens, which grow on divers parts of the body, but chiefly on the wriſts of the hands, and ankles of the feet, being called by a more particular name *Ganglia*; they appear on the top of the skin, neither do they ever lie deep. The cauſe of them is either the imbecillity of a nerve or tendon got by wreſting, extenſion, a blow, labour, or other ſuch like cauſe. Through which occaſion the alimentary juice which flowed to theſe parts, ſeeing it can neither be concocted, nor aſſimilated into the proper ſubſtance, is converted into an humor of the like nature cold, and groſs, which in continuance of time heaping it ſelf up by little and little about the fibers, and the very ſubſtance of the tendon, concretes into a tumor.

What Ganglia may not be cured with iron Inſtruments.

It is not fit to uſe any iron inſtrument to theſe *Ganglia* which poſſeſs the tendons and joints, but only apply *Ammoniacum* and *Galbanum* diſſolved in Vinegar and *Aqua vitæ*: as R

gum

gummi ammon. & sagapeni in aqua vitæ dissolutorum, an. ℥j. *coquantur super cineres validos ad formam emplastri, sub finem adde sulphuris vivi subtiliter pulverisati* ℥ß, *fiat empl. ad usum.* Also the Emplaister of *Vigo* with double *Mercury* would be good for the same purpose.

The tumor softned by these remedies, must be wrought, rubbed, or pressed, so long, untill the bladder or bag be broken under your fingers, which I have divers times done; then it will be expedient presently to apply and bind hard thereunto a plate of lead rubbed with Quick-silver, which may wast and consume the remainder of the tumor.

Sometimes there are *Ganglia* seen hanging by a small root, as it were a string; wherefore they must be tied with a string at the root, and every day twitched harder and harder, till such time as they fall off. The rest of the cure may be easily performed by the common rules of Art.

CHAP. XXII.

Of the Strumæ *or* Scrophulæ, *that is, the Kings-evil.*

What the *Scrophulæ* or Kings-evil is.

THe *Scrophulæ* are œdematous tumors arising in the glandulous parts, as the breast, armholes, groins, but chiefly in the glandules of the neck. They appear either one or many, according to the quantity of that matter from whence they proceed, commonly contained in their proper cist, or bag, as *Atheromaes*, *Steatomaes*, and *Melicerides* are.

Their materiall cause. How they differ from other glandulous tumors.

They are made of a grosse, cold, viscid, and phlegmatick matter with some admixture of melancholy. They differ from other glandulous tumors; first in number, for most usually there appear many of them united together, springing from somewhat a deeper root than glandulous tumors doe; some of them are moveable, othersome woven with the neighbouring nerves, remaining unremovable.

Ganglia appear fewer in number, and are without pain; but *Scrophulæ* oftenti mes are painfull, especially when they wax hot by putrefaction; so that sometimes they degenerate into cancerous ulcers, not to be touched by instruments nor acrid medicines.

Their cure by diet.

Phlegmatick, melancholick, and gluttonous persons, and such as are accustomed to feed on cold and moist nourishments, as fish and cold water, and lead a sedentarie and idle life, are subject to the *Scrophulæ*. They are cured by a most slender diet, for so the native heat by want of nourishment turned upon the material cause of such like tumors, wasts it.

Emollient and resolving medicines.

And they are cured by purging of the superfluous humors, and also by application of emollient resolving, and suppurating topick medicines, after this following manner. ℞ *Mucaginis alth. fenugr. & ficuum ping. an.* ℥ij, *olei liliorum, & chamem. an.* ℥j, *pinguedinis anseris & axungiæ porci* ℥ß, *Terebinth. Ven.* ℥ß, *ammoniaci, & galbani in aceto dissolutorum an.* ℥j. *ceræ novæ quantum satis, fiat cerotum secundum artem ad modum diachyli magni.*

The ointment for the French disease, and the Emplaister of *Vigo* with *Mercury*, are excellent for this purpose, especially if we continue so long untill the Patient come to Salivation, for so nature will disburden it self of the humor, generating the *Scrophulæ*, which I have sometimes tried with happy successe. ℞ *Emplastri diachyl. alb. & magn. cerati ascapi descriptionis Philagrii, an.* ℥ij. *Terebinth. claræ* ℥j. *olei liliorum parum, fiat emplastrum satis molle.* But if the *Scrophulæ* cannot by this means be resolved, but as it oft-times happens, tend to suppuration, you must use suppuratives, as ℞ *rad. alth. & liliorum, an.* ℥iij. *coquantur in aqua communi, pistentur, trajectis adde capitum allii ovum sub cineribus coctorum* ℥iij, *olei liliorum, & ping. anseris & anat. an.* ℥ß, *farinæ seminis lini quantum satis, formetur cataplasma.*

Suppuratives.

A note to be observed in opening *Scrophulous* tumors.

Here we must admonish the Chirurgeon, that he open not the *Scrophulæ* before that all the contained humor be fully and perfectly turned into *pus* or matter, otherwise the residue of the humor will remain crude, and will scarse in a long time be brought to maturation; which precept must be principally observed in the *Scrophulæ*, and also sometimes in other abscesses, which come to suppuration. For we must not as soon as any portion of the contained humors appears converted into *pus*, procure and hasten the apertion. For that portion of the suppurated humor, causes the rest sooner to turn into *pus*, which you may observe in inanimate bodies. For fruits which begin to perish and rot, unless we presently cut away the putrefying part, the residue quickly becomes rotten; there is also another reason; The native heat is the efficient cause of suppuration; it therefore (the sore being opened) diminished and weakned by reason of the dissipation of the spirits, evacuated together with the humor, will cause the remaining portion of the humor not to suppurate, or that very hardly, and with much difficulty. Yet if the tumified part be subject, by its own nature, to corruption and putrefaction, as the fundament; if the contained matter be malign, or criticall, it will be far better to hasten the apertion.

Naturall heat the cause of suppuration.

The Chirurgicall manner of curing *Scrophulæ*.

There is also another way of curing the *Scrophulæ*, which is performed by the hand. For such as are in the neck; and have no deep roots, by making incision through the skin, are pulled and cut away from these parts with which they were intangled. But in the performance of this work, we take speciall care, that we doe not violate or hurt with our instrument, the jugular veins, the sleepy arteries, or recurrent nerves. If at any time there be danger

ger of any great efflux of bloud, after they are plucked from the skin, they muſt be tied at their roots, by thruſting through a needle and thred, and then binding the thred ſtrait on both ſides, that ſo bound they fall off by themſelves by little and little without any danger. The remainder of the cure may be performed according to the common rules of Art.

CHAP. XXIII.

Of the Feaver which happens upon an œdematous Tumor.

How an intermitting Quotidian happens upon œdematous tumors.

HAving ſhewed all the differences of œdematous tumors, it remains that we briefly treat of the Symptomatical feaver, which is ſometimes ſeen to happen upon them. This therefore retaining the motion of the humor by which it is made, is commonly of their kind, which they name Intermitting Quotidians. Now the fit of a Quotidian comes every day, and in that repetition continues the ſpace of eighteen hours; the reſidue of the day it hath manifeſt intermiſſion.

The cauſe of a Quotidian feaver.

The primitive cauſes of this feaver are, the coldneſſe and humidity of the air encompaſſing us, the long uſe of cold meats and drinks, and of all ſuch things as are eaſily corrupted, as Summer fruits, crude fiſhes, and laſtly, the omiſſion of our accuſtomed exerciſe.

The antecedent cauſes are a great repletion of tumors, and theſe eſpecially phlegmatick. The conjunct cauſe, is phlegm putrefying in the habit of the body, and firſt region thereof without the greater veins.

The Signs.

The ſigns of this feaver are drawn from three things; as firſt naturall; for this Feaver or Ague chiefly ſeizes upon theſe which are of a cold and moiſt temper, as Old-men, Women, Children, Eunuches, becauſe they have abundance of phlegm; and it invades Old-men by its own nature, becauſe their native heat being weak, they cannot convert their meats, then taken in a ſmall quantity, into laudable blood, and the ſubſtance of the parts. But it takes children by accident, not of its ſelf, and the own nature, for children are hot and moiſt; but by reaſon of their voracity, or greedineſs, and their violent, inordinate, and continuall motion after their plentifull feeding, they heap up a great quantity of crude humors fit matter for this feaver; whereby it comes to paſſe, that fat children are chiefly troubled with this kind of feaver, becauſe they have the paſſages of their bodies ſtrait and ſtopped, or becauſe they are ſubject to Worms, they are troubled with pain, by corruption of their meat; whence ariſeth a hot diſtemper by putrefaction, and the elevation of putrid vapors, by which the heart being moleſted, is eaſily taken by this kind of feaver.

How children come to be ſubject to Quotidian feavers.

From things not naturall, the ſigns of this feaver are thus drawn. It chiefly takes one in Winter, and the Spring, in a cold and moiſt Region, in a ſedentary and idle life, by the uſe of meats, not only cold and moiſt, but alſo hot and dry, if they be devoured in ſuch plenty, that they overwhelm the native heat.

How phlegmatick humors happen to be generated by hot and dry meats.

For thus wine, although it be by faculty and nature, hot, and dry, yet taken too immoderately, it accumulates phlegmatick humors, and cauſes cold diſeaſes. Therefore drunkenneſs, gluttony, crudity, bathes and exerciſes preſently after meat, being they draw the meats as yet crude into the body and veins; and to conclude, all things cauſing much phlegm in us, may beget a Quotidian feaver. But by things contrary to nature, becauſe this feaver uſually follows cold diſeaſes, the Center, Circumference, and Habit of the body being refrigerated.

The ſymptoms of Quotidians.

The ſymptoms of this feaver are, the pain of the mouth of the ſtomack, becauſe that phlegm is commonly heaped up in this place, whence follows a vomiting, or caſting up of phlegm; the face looks pale, and the mouth is moiſt, without any thirſt, oftentimes in the fit it ſelf; becauſe the ſtomack flowing with phlegm, the watery and thinner portion thereof continually flows up into the mouth and tongue, by the continuity of the inner coat of the ventricle common to the gullet and mouth.

The manner of the pulſe and heat in a Quotidian.

It takes one with coldneſs of the extreme parts, a ſmall and deep pulſe, which notwithſtanding in the vigour of the fit, becomes more ſtrong, great, full, and quick. Juſt after the ſame manner, as the heat of this feaver at the firſt touch appears mild, gentle, moiſt and vaporous; but at the length it is felt more acrid, no otherwiſe than fire kindled in green wood, which is ſmall, weak, and ſmoakie at the firſt; but at the length when the moiſture being overcome, doth no more hinder its action, it burns and flames freely.

Critical ſweats. The urin.

The Patients are freed from their fits with ſmall ſweats, which at the firſt fits break forth very ſparingly, but more plentifully when the *Criſis* is at hand; the urin at the firſt is pale and thick, and ſometimes thin, that is, when there is obſtruction. But when the matter is concoct, as in the ſtate, it is red: if at the begiuning of the fit they caſt up any quantity of phlegm by vomit, and that fit be terminated in a plentifull ſweat, it ſhews the feaver will not long laſt: for it argues the ſtrength of nature, the yeelding and tenuitie of the matter flying up, and the excretion of the conjunct cauſe of the feaver.

Why Quotidians are oftimes long. Into what diſeaſes a Quartain uſually changes.

A Quotidian feaver is commonly long, becauſe the phlegmatick humor being cold, and moiſt by nature, is heavy and unapt for motion; neither is it without fear of a greater diſeaſe, becauſe oft-times it changes into a burning, or quartain feaver, eſpecially if it be bred

of

of salt Phlegme, for saltnes hath affinity with bitternes, wherefore by adustion it easily degenerates into it, so that it need not seem very strange, if salt phlegm by adustion turn into choler, or melancholy. Those who recover of a Quotidian feaver, have their digestive faculty very weak; wherefore they must not be nourished with store of meats, nor with such as are hard to digest. In a Quotidian the whole body is filled with crude humors, whereby it comes to passe that this Feaver oft-times lasts sixty daies. But have a care, you be not deceived, and take a double tertian for a Quotidian, because it takes the Patient every day as a Quotidian doth. Verily it will be very easie to distinguish these Feavers by the kind of the humor, and the propriety of the symptomes and accidents; beside, Quotidians commonly take one in the evening, or the midst of the night, as then when our bodies are refrigerated by the coldnes of the air caused by the absence of the Sun. Wherefore then the cold humors are moved in us, which were bridled a little before by the presence and heat of the Sun. But on the contrary, double tertians take one about noon. The shortnes and gentleness of the fit, the plentifull sweat breaking forth, the matter being concocted, causes us to think the Quotidian short and salutary.

How to distinguish a quotidian from a double tertian.

The cure is performed by two means; to wit, Diet, and Pharmacy. Let the Diet be slender and attenuating, let the patient breath in a cleer air moderately hot and dry; let his meats be bread well baked, cock or chicken broths in which have been boiled the roots of Parsly, Sorrell and the like.

Diet.

Neither at sometimes will the use of hot meats, as those which are spiced and salted, be unprofitable, especially to such as have their stomach and liver much cooled. Let him eat Chickens, Mutton, Partridge and small birds, river fishes and such as live in stony waters fryed or boiled, rear egs and such like. These fruits are also good for him, Raisons, stewed Prunes, Almonds and Dates. Let his drink be small white wine mixed with boiled water. Moderate exercises will be good, as also frictions of the whole body: sleep taken at a fitting time, and proportioned to waking, so that the time of sleep fall not upon the time of the fit; for then it hurts very much; for calling the heat to the inner parts, it doubles the raging of the feaverish heat inwardly in the bowels.

When the use of spiced and salted meats are fit.

When sleep is hurtfull.

For the passions of the mind, the patient must be merry, and comforted with a hope shortly to recover his health. It seems not amisse to some, at the coming of the fit to put the feet and legs into hot water, in which Chamomill, Dill, Melilot, Marjerom, Sage, and Rosemary have been boiled.

The medicines shall be such syrups as are called digestive and aperitive, as syrup of Wormwood, Mints, of the five opening roots, *Oxymel* with a decoction of Chamomill, Calamint, Melilot, Dill, and the like, or with common decoctions. The Purgatives shall be *Diaphœnicon*, *Electuarium Diacarthami*, *Hiera picra*, Agarick, Turbith, of which you shall make potions with the water of Mints, Balm, Hyssop, Sage, Fennell, Endive or the like; *Pilulæ aureæ* are also good. These purgatives shall sometimes be given in form of a bole with sugar, as the Physitian being present shall think most fit and agreeable to the nature of the Patient.

Medicines.

About the state of the disease, you must have a care of the stomach and principally of the mouth thereof, as being the chief seat of phlegm; wherefore it will be good to anoint it every other day with oil of Chamomill mixed with a little white wine, as also to unlade it by taking a vomit of the juice of Radish, and much *Oxymel*, or with the decoction of the seeds and roots of *Asarum* and Chamomill; and syrup of vinegar will be very good, especially at the beginning of the fit, when nature and the humors begin to move; for an inveterate Quotidian, though you can cure it by no other remedy, nothing is thought to conduce so much as one dram of old Treacle taken with sugar in form of a bole; or to drink it dissolved in *Aqua vitæ*.

Care must be had of the stomach. Vomits.

The use of Treacle in an inveterate quotidian.

CHAP. XXIV.

Of a Scirrhus, *or an hard tumor proceeding of Melancholy.*

HAving shewed the nature of tumors caused by blood, choler and phlegm, it remains we speak of these, which are bred of a melancholick humor; of these there are said to be four differences. The first is of a true and legitimate *Scirrhus*, that is, of an hard tumor endued with little sense, and so commonly without pain, generated of a naturall melancholick humor. The second is, of an illegitimate *Scirrhus*, that is of an hard tumor insensible, and without pain, of a a Melancholick humor concrete by too much resolving and refrigerating. The third is of a cancrous *Scirrhus* bred by the corruption and adustion of the Melancholick humor. The fourth of a phlegmonous, *Erysipelous* or *Oedematous Scirrhus*, caused by Melancholy mixed with some other humor. The cause of all these kinds of Tumors is a grosse, tough and tenacious humor concrete in any part. But the generation of such an humor in the body happens either of an ill and irregular diet, or of the unnaturall affects

What a true and legitimate Scirrhus is. What an illegitimate Scirrhus is.

of the liver or ſpleen, as obſtruction; or by ſuppreſſion of the *Hæmorrhoids* or Courſes.

The Signs. The ſigns are hardneſs, renitency, a blackiſh colour, and a dilation of the veins of the affected part with blackiſhneſs, by reaſon of the abundance of the groſs humor. The illegitimate or baſtard *Scirrhus* which is wholly without pain and ſenſe, and alſo the cancerous

Prognoſtick. admit no cure, and the true legitimate ſcarce yeeld to any. Thoſe which are brought to ſuppuration, eaſily turn into Cancers and fiſtulaes; theſe tumors though in the beginning they appear little, yet in proceſs of time they grow to a great bigneſs.

CHAP. XXV.

Of the cure of a Scirrhus.

Diet. THe Cure of a *Scirrhus* chiefly conſiſts of three heads. Firſt, The Phyſitian ſhall preſcribe a convenient diet, that is ſober and moderate in feeding, tending to humidity, and indifferent heat; for his manner of life, let it be quiet and free from all perturbation of anger, grief and ſadneſs, as alſo abhorring the uſe of venery. The ſecond is placed in the evacuation of the antecedent matter, as by Phlebotomy, if need require, and by purging, by procuring the *Hæmorrhoids* in men, and the courſes in women; let purgations be preſcribed of *Diacatholicon*, *Hiera*, *diaſenna*, polypody, *Epythymum* according to the mind of the learned Phyſitian. The third conſiſts in the convenient uſe of Topick medicines, that is, emollient at the beginning, and then preſently reſolving, or rather ſuch as are mixed both of reſolving and emollient faculties,

Lib. 2 ad Glauconem. as *Galen* teaches; for by the uſe of only emollient things there is danger of putrefaction and a *Cancer*, and only of reſolving there is fear of concretion, the ſubtiler part being reſolved, and the groſſer ſubſiding.

Emollients. The emollient ſhall be thus: ℞ *Rad. althæ. lib. ſ. rad. liliorum* ℥iij. *coquantur in aqua com. piſtentur, trajiciantur per ſetaceum, addendo olei chamæm. & lilior. an.* ℥ij. *æſypi humide* ℥ß. *emplaſtri diachyl. alb. cum oleo liliorum diſſoluti* ℥iij, *ceræ albæ quantum ſit ſatis, fiat cerotum.* Or ℞ *gummi ammoniaci, galb. bdellii, ſtyracis liquidæ in aceto diſſolutorum, an.* ℥j, *diachyl. magn.* ℥ß. *olei liliorum, & axungiæ anſeris, an.* ℥j. *ceroti æſyp. deſcriptione Philagr.* ℥ij. *liqueſcant omnia ſimul, ceræ quantum ſit ſatis, ut inde fiat cerotum ſatis molle.* When you have ſufficiently uſed emollient things, fume the tumor with ſtrong Vinegar and *Aqua vitæ* poured upon a piece of a Millſtone, flint or brick heated very hot; for the ſo mollified humor will be rarified, attenuated and reſolved; then ſome while after renew your emollients, and then again apply your reſolvers to waſt that which remains, which could not be performed together and at once; for

Lib. 2 ad Glau. thus *Galen* healed a ſcirrhus in *Cercilius* his ſon. Goats dung is very good to diſcuſs

The efficacy of the Empl. of Vigo with Mercury. Scirrhous tumors; but the Emplaiſter of *Vigo* with a double quantity of Mercury is effectuall above the reſt, as that which mollifies, reſolves and waſts all tumors of this kind.

CHAP. XXVI.

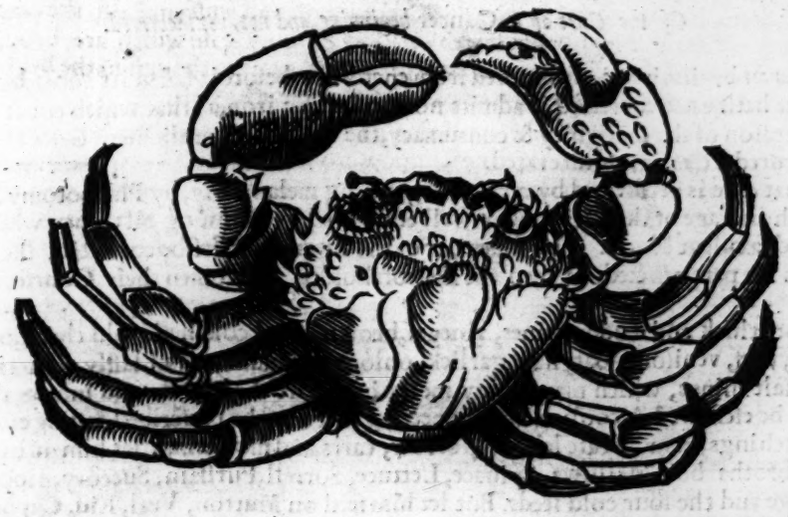
Of a Cancer *already generated.*

What a *Cancer* is. A *Cancer* is an hard tumor rough and unequal, round, immoveable, of an aſh or livid colour, horrid by reaſon of the veins on every ſide, ſwollen with black blood, and ſpred abroad to the reſemblitude of the ſtretched out legs and claws of a Crab. It is a tumor hard to be known at the firſt, as that which ſcarce equalls the bigneſs of a Chick, or *Cicer*, after a little time it will come to the greatneſſe of a Haſell nut, unleſs peradventure provoked by ſomewhat too acrid medicins it ſodainly encreaſe being grown bigger, according to the meaſure of the encreaſe it torments the patient with pricking pain, with acrid heat, the groſſe blood reſiding in the veins growing hot, and inferring a ſenſe like the pricking of needles, from which

The nature of the pain. notwithſtanding the Patient hath oft-times ſome reſt. But becauſe this kind of tumor by the veins extended and ſpred about it like claws and feet, being of a livid and aſh colour, aſſociated with a roughneſs of the skin and tenacity of the humor, repreſents, as it were,

The reaſon of the name. the toothed claws of the Crab, therefore I thought it not amiſſe here to inſert the Figure of the Crab, that ſo the reaſon both of the name and thing might be more perſpicuous.

The figure of the Crab, called Cancer *in Latin.*



CHAP. XXVII.

Of the cauſes, kinds, and prognoſticks of a Cancer.

HEre we acknowledge two cauſes of a *Cancer*, the antecedent, and conjunct. The antecedent cauſe depends upon the default of irregular diet, generating and heaping up groſſe and feculent blood; by the morbifick affection of the Liver diſpoſed to the generation of that blood; by the infirmity or weakneſs of the ſpleen in attracting and purging the blood; by the ſuppreſſion of the Courſes or Hæmorrhoids, or any ſuch accuſtomed evacuation. The conjunct cauſe is that groſs and melancholick humor ſticking and ſhut in the affected part as in a ſtrait. That melancholick blood which is more mild, and leſs malign, only increaſed by a degree of more fervid heat, breeds a not ulcerated *Cancer*, but the more malign and acrid cauſes, an ulcerated. For ſo the humor which generated Carbuncles, when it hath acquired great heat, acrimony, and malignity, corrodes, and ulcerates the part upon which it alights. A *Cancer* is made more fierce and raging by meats inflaming the blood, by perturbations of the mind, anger, heat, and medicines too acrid, oily, and emplaſtick, unfitly applied, both for time and place.

The cauſes of a Cancer.

The cauſes of a not ulcerated Cancer.

Amongſt the ſorts or kinds of *Cancers*, there be two chiefly eminent, that is, the ulcerated or manifeſt *Cancer*, and the not ulcerated or occult. But of *Cancers* ſome poſſeſs the internall parts, as the Guts, Womb, Fundament; others the externall, as the Breſts; alſo there is a recent, or late bred *Cancer*, and alſo an inveterate one. There is one ſmall, another great, one raging and malign, another more mild. Every *Cancer* is held almoſt incurable, or very difficult to be cured, for it is a diſeaſe altogether malign, to wit, a particular Leproſie. Therefore ſaith *Aetius*, a *Cancer* is not eaſily ſtaied untill it hath eaten even to the innermoſt of the part which it poſſeſſes. It invades women more frequently than men, and thoſe parts which are lax, rare, fungous, and glandulous, and therefore opportune to receive a defluxion of a groſs humor, ſuch are the breſts and all the emunctories of the noble parts. When it poſſeſſes the breſts, it often cauſes inflammation to the armholes, and ſends the ſwelling ever to the glandules thereof; whereupon the Patients do complain that a pricking pain, even pierces to their hearts. But this ſame pain alſo runs to the clavicles, and even to the inner ſide of the ſhoulder-blades and ſhoulders. When it is increaſed, and covers the noble parts, it admits no cure but by the hand; but in decayed bodies, whoſe ſtrength fail, eſpecially if the *Cancers* be inveterate, we muſt not attempt the cure, neither with inſtrument, nor with fire, neither by too acrid medicines, as potentiall cauteries: but we muſt only ſeek to keep them from growing more violent, and from ſpreading further, by gentle medicines, and a palliative cure. For thus many troubled with a *Cancer*, have attained even to old age. Therefore *Hippocrates* admoniſhes us, that it is better not to cure occult, or hidden *Cancers*; for the Patients cured (ſaith he) do quickly die, but ſuch as are not cured live longer.

The ſorts and differences of Cancers.

Aetius lib. 6. The parts moſt ſubject to *Cancers.*

What *Cancers* one muſt not undertake truely to cure.

CHAP. XXVIII.

Of the Cure of a Cancer *beginning, and not yet ulcerated.*

A *Cancer* beginning is oft hindred from encreaſing, before it faſten its roots, but when it hath once encreaſed, it admits no cure but by iron, as that which contemns, by reaſon of the malignity & contumacy, the force of all medicines. *Galen* affirms, he cured a *Cancer* not ulcerated.

Lib. 2. ad Glau.

Now that cure is performed by medicines, purging melancholy, by Phlebotomy, when the ſtrength and age of the Patient may well endure it, by ſhunning all things which may breed il and feculent blood. The diſtemper of the Liver muſt firſt be corrected, the Spleen ned, as alſo the part affected; in men the Hæmorrhoides, in women their Courſes muſt be procured.

Diet.

Therefore thick and muddy wines, vinegar, brown bread, cold herbs, old cheeſe, old and ſalted fleſh, beef, veniſon, goat, hare, garlick, onions and muſtard; and laſtly all acrid, acid and other ſalt things, which may by any means incraſſate the blood, and inflame the humors, muſt be eſchewed. A cooling and humecting diet muſt be preſcribed; faſting eſchewed, as alſo watchings, immoderate labours, ſorrow, cares, and mournings; let him uſe ptiſans, and in his broths boil Mallows, Spinace, Lettuce, Sorrell, Purſlain, Succory, Hops, Violets, Borrage and the four cold ſeeds. But let him feed on Mutton, Veal, Kid, Capon, Pullet, young Hares, Partridges, Fiſhes of ſtony rivers, rear Egs; and uſe white wine but moderately for his drink.

How to handle the cancerous part.

Antidotes.

Aſſes milk.

The part affected with the *Cancer* muſt be gently handled, and not overburdened by over hard or heavy things, or by too ſolid or fat Emplaiſters; on the contrary gentle and mitigating medicines muſt be uſed; applying alſo at certain times ſuch things as reſiſt venome or poyſon, as Treacle and Mithridate. Aſſes milk is exceeding fit to aſſwage the acrimony of the cancerons humor. Therefore it muſt not only be taken inwardly, but alſo applyed outwardly to the cancerous ulcer, making thereof a fomentation.

CHAP. XXIX.

Of the cure of an ulcerated Cancer.

The Signs.

AN Ulcerated *Cancer* hath many ſigns common with that which is not ulcerated, as the roundneſſe of the tumor, the inequality, roughneſs, and pain; to the judgment of the eye, the tumor ſeems ſoft, but it is hard to the touch; the Ulcer is filthy, with lips, thick, ſwoln, hard, knotty, turned out, and ſtanding up, having a horrid aſpect, and caſting forth ichorous, filthy, and carion-like filth, ſometimes black, ſometimes mixed with rotten filth, and otherwhiles with much bloud. This kind of ulcer is malign, rebellious, and untractable, as that which contemns mild remedies, and becomes more fierce, by acrid and ſtrong; the pain, feaver, and all the ſymptoms being increaſed, from whence the powers are dejected, the waſting and conſumption of the body follows and laſtly death. Yet if it be ſmall, and in a part which may ſuffer amputation, the body being firſt purged, and blood drawn, the ſtrength of the Patient not diſſwading, it will be convenient to uſe the hand, and to take hold of, and cut away whatſoever is corrupt, even to the quick, that no fear of contagion may remain, or be left behind. The amputation finiſhed, the bloud muſt not be preſently ſtopped, but permitted to flow out in ſome meaſure, yea verily preſſed forth all about it, that ſo the veins ſwoln with black and melancholy bloud may be disburdened. When you have taken a ſufficient quantity of blood, the place muſt be ſeared with an actuall cautery. For that will ſtrengthen the part affected, draw forth the venenate quality, and alſo ſtay the defluxion. Then muſt you apply mitigating medicines, and procure the falling away of the Eſchar. To conclude, that which remains, muſt be performed according to the cure of other ulcers. Now we know and underſtand that all the *Cancer* is cut away, and all the malignity thereof extinct, when the ulcer caſts forth laudable matter, when that good fleſh begins to grow by little and little, like to the grains of a Pomegranat, the pricking pain, and all the ſymptoms being aſſwaged. Yet the cure of an ulcerated *Cancer* which ſhall poſſeſs the lips may be more happily and mildly performed, no cauſtick medicine being applyed after ſection, ſo alſo that ſcarce any deformity will be left, when it is cicatrized. Which new and never formerly tried, or written of way, as far as I know, I found and performed in a man of fifty years old. Doctor *John Altine*, a moſt learned Phyſitian being called to Counſell, *James Guillemeau*, and Maſter *Euſtachius* the Kings Chirurgeons, and *John Le Ieune* the Duke of *Guiſe* his moſt worthy Chirurgeon being preſent.

How & where a *Cancer* may be cut away.

What to be obſerved in cutting away a *Cancer*.

The benefit of applying a cautery after amputation of the *Cancer*.

Signs that a *Cancer* is well taken away.

The way is this; The *Cancer* muſt be thruſt through the lips on both ſides, above and below

below with a needle and thred, that ſo you may rule and govern the *Cancer* with your left hand, by the benefit of the thred (leſt any portion thereof ſhould ſcape the inſtrument in cutting) and then with your Sizers in the right hand, you may cut it off all at once; yet it muſt be ſo done, that ſome ſubſtance of the inner part of the lip, which is next to the teeth may remain, (if ſo be that the *Cancer* be not grown quite through) which may ſerve as it were for a foundation to generate fleſh to fill up the hollowneſs again. Then when it hath bled ſufficiently, the ſides and brinks of the wound muſt be ſcarified on the right and left ſides, within, and without, with ſomewhat a deep ſcarification, that ſo (when we would draw together the ſides and lips of the wound, by that manner of ſtitching, which is uſed in an hare lip) we may have the fleſh more pliant and tractable to the needle and thred. The reſidue of the cure muſt be performed juſt after the ſame manner as we uſe in hare lips; of which we ſhall treat hereafter.

A new and obſervable way of taking away a *Cancer* from the lip.

CHAP. XXX.

Of the Topicke medicines to be applied to an ulcerated, and not ulcerated Cancer.

WE at the beginning uſe repercuſſive medicines, ſuch as are the juices of Nightſhade, Plantain, Henbane, Lettuce, Sorrell, Houſeleek, Water Lentill or Ducks meat, Knotgraſſe, Pomegranates, and the like. Alſo *oleum roſarum, omphacinum*, the powders of Sumach, Berberies, Litharge, Ceruſe, Burnt-lead, *Tutia*, Quickſilver, and the like. Of which you may compoſe Fomentations, Liniments, Ointments, Cataplaſmes, Emplaiſters. *Emplaſtrum Diacalcitheos* diſſolved with juice of Nightſhade, and oil of Roſes is very fit for not ulcerated *Cancers*. *Pompholix*, or *Tutia*, waſhed in juice of Nightſhade, or Plantain, is very good for ulcerated *Cancers*. Beſides this following medicine is very commendable.

Repelling medicines.

℞ *Litharg. & ceruſ. an.* ℥j, *terantur in mortario plumb. cum olei roſar. donec reducantur ad conſiſtentiam linimenti vel unguenti*; and there may be uſe of a reſolving and repercuſſive ointment, as ℞ *plumbi uſti loti, pomphol. thuris, an.* ʒijſs, *abſinth. pontic.* ʒſs, *olei roſarum* ʒiij, *ceræ* ʒ vj, *ſucci ſolani, quantum ſufficit ad unguenti craſſitudinem*. They very much commend *Theodorickes* Emplaiſter to aſſwage the pain of ulcerated *Cancers*.

℞ *olei roſ. ceræ alb. an.* ʒiſs, *ſucci granat. & ſolani, an.* ʒij, *ceruſæ lotæ* ʒj, *plumbi uſti, loti, & tuthiæ præpar. an.* ʒſs, *thuris, maſtich. an.* ʒij, *fiat empl. molle*. This following ointment I have often uſed with good ſucceſſe.

Theodorick's Emplaiſter.

℞ *Theriac. veter.* ʒj, *ſucci cancrorum* ʒſs, *ſucci lactucæ & olei roſar. an.* ʒiſs, *vitel. ovorum ſub cinerib. cocti.* ij, *camphor.* ʒſs. *piſtentur omnia in mortario plumb. & fiat unguentum.*

℞ *Spum. argent. unguis porci recentis, ceræ alb. an.* ℔ſs, *olei boni* ʒviij, *vitel. ovorum aſſat.* iiij, *fiat unguent. ſervetur uſui*. And when you will uſe it, mix it with a little ointment of Roſes.

Leaches.

I have alſo mitigated great pain by applying Leaches to an unulcerated *Cancer*, in that part where the torment was moſt vehement, by diſburdening the part of ſome portion of the malign humor; which ſame thing I have done by application of yong Whelps, or Kitlings, or Pidgeons, or Chickens cut long waies, and preſently applied to the ulcer, and now and then changed as ſoon as their heat ſeems diſſolved; and others applied for the naturall heat in an anodyne or mitigating medicine.

The application of Whelps, Chickens, &c.

John Baptiſta Theodoſius in his Epiſtles, writes, that a cataplaſme of the herb *Eryſimum* or Cadlock, being beaten, is very good to be applied to a *Cancer* not ulcerated; but if the *Cancer* be ulcerated, he boils this ſame herb in *Hydromel*, and ſo by injections and lotions cleanſes the ulcer, and mitigates the pain.

Epiſt. 21.

The eſtate of *Eryſimum*.

If the *Cancer* affect the womb, the patient feels the pricking of the pain in the groins above the *pecten*, and in the Kidneyes, and is often troubled with a difficulty of making water; but when it is ulcerated it poures forth filth or matter exceeding ſtinking and carion-like, and that in great plenty; the filthy vapour of which carryed up to the heart and brain cauſes often ſwounding.

The ſigns of the *Cancer* in the womb.

Now to mitigate the pains of ſuch like places, the following medicines are of good uſe.

℞ *Mucag. ſemin. lini, fænugr. extract. in aqua roſat. & plantaginis quod ſatis eſt*; Of this being warm make a fomentation.

℞ *Rad. Althææ* ℔ſs. *coquatur in hydromelite, piſtetur & trajiciatur, addendo olei roſar. parum, fiat Cataplaſma*. Alſo you ſhall make divers peſſaries according to the different kinds of pain; alſo make injections of the juice of Plantain, Knotgraſſe, Lettuce, Purſlain mixed together, and agitated or laboured in a leaden mortar with a little oil of Roſes; for this kind of medicine is commended by *Galen* in every kind of ulcerated *Cancers*. Alſo this following water is very profitable, and often approved by me. ℞ *Stercoris bubuli* ℔iij. *herbæ Roberti, plantag. ſempervivi, byſcyami, portulac. lactuc. endiv. an. m. j. cancros fluviatiles, num.* xij. let them be all beaten together and diſtilled in a leaden Alembick, keep the liquor for uſe and with it make often injection into the part; or if the ſite of the part will permit, let the cancerous ulcers be waſhed therewith, and pledgets of lint ſteeped therein, be applyed and renewed

Lib. 9. Simpl.

ever and anon; for ſo the acrimony and force of the inflammation is retunded, and the pain aſſwaged. *Galen* beats into powder river Crabs burnt; the powder mixed with ointment of Roſes is moſt profitably applied upon lint to cancerous ulcers.

Lib. 4. de comp. med. ſecundum gen.

It will be very convenient to put into the neck of the womb the following inſtrument made of Gold or Silver, whereby the cancerous filth may have free and ſafe paſſage forth, and the filthy and putredinous vapors may more eaſily breath forth. Therefore let it be hollow quite through, ſome five or ſix fingers long, and about the bigneſs of ones thumb, at the upper end, perforated with many holes whereby the filth may have paſſage forth. Let the outer or lower end be ſome two fingers thick in the circumference, make it with a neat ſpring, that may hold that end open more, or leſs, according to the Phyſitians mind; let there be two ſtrings or laces put unto it, by which being tyed before and behind to the rowler, with which the woman ſhall girt her loins, the Device may be kept from falling, as you may ſee in the following figure.

A Vent made like a Peſſary for the womb affected with a cancerous ulcer.

A. *Shews the upper end perforated with five or ſix holes.*
B. *The lower end.*
C. *That part of the end which is opened by the ſpring, which is marked with the Letter* D.
EE. *The ſtrings or laces.*

Lib. 6. ſimp. Plates of Lead.

Neither is that remedy for not ulcerated *Canters* to be contemned, which conſiſts of a plate of lead beſmeared with Quick-ſilver; for *Galen* himſelf teſtifies that lead is a good medicine for malign and inveterate ulcers. But *Guido Guliacenſis* is a witneſs of ancient credit and learning, that ſuch plates of lead rubbed over with Quick-ſilver, to ſuch malign ulcers as contemn the force of other medicines, are as it were Antidotes, to waſt and overcome their malignity and evill nature. This kind of remedy, when it was preſcribed by that moſt excellent Phyſitian *Holleriut*, who commanded me to apply it to the Lady of *Montigni* Maid of Honour to the Queen mother, troubled with a *Cancer* in her left breſt, which equalled the bigneſs of a Wallnut, did not truely throughly heal it, yet notwithſtanding kept it from further growth. Wherefore at the length growing weary of it, when ſhe had committed herſelf to a certain Phyſitian boldly promiſing her quick help, ſhe tryed with loſſe of her life, how dangerous, and diſadvantagious the cure of a *Cancer* was, which is undertaken according to the manner of healing other ulcers; for this Phyſitian, when he had caſt away this our medicine, and had begun the cure with mollifying, heating and attractive things, the pain, inflammation and al the other ſymptomes encreaſing the tumor grew to that bigneſſe, that being the humor drawn thither could not be contained in the part it ſelf, it ſtretched the breſt forth ſo much, that it broke it in the middle, juſt as a Pomgranat cleaves when it comes to its full maturity; whereupon an immoderate flux of blood following, for ſtaying whereof he was forc't to ſtrew cauſtick powders thereon; but by this means the inflammation and pain becoming more raging, and ſwoundings coming upon her, ſhe poor Soul in ſtead of her promiſed health, yeelded up her ghoſt in the Phyſitians boſome.

A Hiſtory.

CHAP.

CHAP. XXXI.

Of the Feaver which happeneth in Scirrhous Tumors.

Such a Feaver is a Quartain, or certainly coming near unto the nature of a Quartain, by reason of the nature of the Melancholick humor of which it is bred. For this shut up in a certain seat in which it makes the tumor, by communication of putrid vapours heats the heart above measure, & enflames the humors contained therein, whence arises a Feaver. Now therefore a quartain is a Feaver coming every fourth day, and having two dayes intermission. Why a quartain happens upon scirrhous tumors.

The primitive causes thereof are these things which encrease Melancholick humors in the body, such as the long eating of pulse, of course and burnt bread, of salt flesh and fish, of gross meats, as Beef, Goat, Venison, old Hares, old Cheese, Cabbage, thick and muddy wines and other such things of the same kind.

The antecedent causes are a heaped up plenty of Melancholick humors abounding over all the body. But the conjunct causes are Melancholick humors putrefying without the greater vessels, in the small veins and habit of the body.

We may gather the signs of a Quartain feaver from things which they call naturall, not naturall, and against nature; from things naturall, for a cold and dry temper, old age, cold and fat men, having their veins small, and lying hid, their spleen swollen and weak, are usually troubled with quartain Feavers. The signs

Of things not naturall; this Feaver, or Ague is frequent in Autumne, not only because, for that it is cold and dry, it is fit to heap up Melancholick humors; but chiefly by reason that the humors by the heat of the preceding Summer are easily converted into adust Melancholy, whence far worser and more dangerous quartains arise, than of the simple Melancholick humor; to conclude, through any cold or dry season in a region cold and dry, men that have the like Temper easily fall into quartains; if to these a painfull kind of life full of danger and sorrow doth accrew. Why they are frequent in Autumne.

Of things contrary to nature, because the fits take one with painfull shaking, inferring as it were the sense of breaking or shaking the bones; further it taketh one every fourth day with an itching over the whole body, and oft-times with a thin skurfe and pustules, especially on the legs; the pulse at the beginning is little, slow, and deep, and the urine also is then white and wateriſh, inclining to somewhat a dark colour.

In the declination when the matter is concocted the urine becomes black, not occasioned by any malign Symptome or preternaturall excess of heat, (for so it should be deadly) but by excretion of the conjunct matter. The fit of the Quartain continues 24 houres, but the intermission is 48 houres. It often takes its originall from an obstruction, paln, and *Scirrhus* of the Spleen, and of the suppression of the courses and Hæmorrhoides.

Quartains taken in the Summer are for the most part short, but in the Autumn long, especially such as continue till Winter. Those which come by succession of any disease of the Liver, Spleen, or any other precedent disease are worse than such as are bred of themselves, and commonly end in a Dropsie. But those which happen without the fault of any bowels, and to such a patient, as will be governed by the Physitian in his Diet; infer no greater harm, but free him from more grievous and long diseases, as Melancholy, the Falling sickness, Convulsions, Madness, because the Melancholy humor, the author of such diseases is expelled every fourth day by the force of the fit of the Quartain. Prognostick. From what diseases a quartain frees one.

A Quartain Feaver, if there be no error committed, commonly exceeds not a year, for otherwise some Quartains have been found to last to the twelfth year according to the opinion of *Avicen:* the Quartain beginning in Autumn is oft-times ended in the following spring; the Quartain which is caused by adust blood, or choler, or salt flegm, is more easily and sooner cured, than that which proceeds from an adust Melancholy humor; because the Melancholy humor, terrestriall of its own nature and harder to be discussed than any other humor, is again made by adustion (the subtiller parts being dissolved and the grosser subsiding) more stubborn, gross, malign, and acrid. The cure is wholly absolved by two means, that is, by Diet and medicines. The diet ought to be prescribed contrary to the cause of the Feaver in the use of the six things not naturall, as much as lyes in our power. Wherefore the Patient shall eschew Swines flesh, flatulent, viscid and glutinous meats, fenny fowls, salt meats and Venison, and all things of hard digestion. The use of white wine indifferent hot and thin, is convenient to attenuate and incide the gross humor, and to move urine and sweat; yea verily at the beginning of the fit a draught of such wine will cause vomiting, which is a thing of so great moment, that by this one remedy many have been cured. Yet if we may take occasion and opportunity to provoke vomit there is no time thought fitter for that purpose then presently after meat; for then it is the sooner provoked, the fibers of the stomach being humected and relaxed, and the stomach is sooner turned to vomiting, whereupon follows a more plentiful, happy & safe evacuation of the Phlegmatique and Cholerick humor, and less troublesome to nature: and of all the traditles Diet. How much vomiting prevails to cure a quartain.

dities with which the mouth of the ventricle abounds in a Quartane, by reaſon of the more copious afflux of the Melancholick humor, which by his qualities cold and dry, diſturbes all the actions and naturall faculties. Moreover exerciſes and frictions are good before meat; ſuch paſſions of the mind as are contrary to the cauſe from which this Feaver takes his originall, are fit to be cheriſhed by the patient; as Laughter, Jeſting, Muſick, and all ſuch like things full of pleaſure and mirth. At the beginning the patient muſt be gently handled and dealt withall, and we muſt abſtain from all very ſtrong medicines untill ſuch time, as the diſeaſe hath been of ſome continuance. For this humor, contumacious at the beginning when as yet nature hath attempted nothing, is again made more ſtubborn, terreſtriall and dry, by the almoſt fiery heat of acrid medicines. If the body abound with blood, ſome part thereof muſt be taken away by opening the Median or Baſilik vein of the left arm, with this caution, that if it appear more groſs and black, we ſuffer it to flow more plentifully; if more thin, and tinctured with a laudable red colour that we preſently ſtay it. The matter of this feaver muſt be ripened, concocted and diminiſhed with the Syrups of *Epithymum*, of *Scolopendrium*, of Mayden hair, Agrimony, with the waters of Hops, Bugloſs, Borage and the like. I ſincerely proteſt, next unto God, I have cured very many quartains by giving a portion of a little Treakle diſſolved in about ſome two ounces of *Aqua vitæ*, alſo ſometimes by two or three grains of Musk diſſolved in Muskadine, given at the beginning of a particular fit towards the generall declination of the diſeaſe, after generall purgations the humor and body being prepared, and the powers ſtrong; And certainly an inveterate Quartain can ſcarce ever bee diſcuſſed unleſs the body be much heated with meats and medicines. Therefore it is not altogether to be diſproved which many ſay, that they have driven away a quartain by taking a draught of wine every day as ſoon as they came forth of their bed, in which ſome leaves of Sage had been infuſed all the night. Alſo it is good a little before the fit to anoint all the ſpine of the back with oyls heating all the nervous parts, ſuch as are the oyl of Rue, Walnuts, of the Peppers, mixing therewith a little *Aqua vitæ*, but for this purpoſe the oyl of *Caſtoreum* which hath been boyled in an apple of *Coloquintida*, the Kernels taken out, upon hot coles to the conſumption of the half part, mixing therewith ſome little quantity of the powders of Pepper, Pelitory of *Spain* and *Euphorbium*, is excellent. Certainly ſuch like Inunctions are good not only to mitigate the vehemency of the terrible ſhaking, but alſo to provoke ſweats; for becauſe by their humid heat they diſcuſs this humor being dull and rebellious to the expulſive faculty, for the Melancholy is as it were the droſs and mud of the blood. Therefore if on the contrary the Quartain Feaver ſhall be cauſed by aduſt choler wee muſt hope for and expect a cure by refrigerating and humective medicines, ſuch as Sorrell, Lettuce, Purſlane, broths of the decoction of Cowcumbers, Gourds, Mellons and Pompions. For in this caſe if any uſe hot medicines, he ſhall make this humor moſt obſtinate by the reſolving of the ſubtiler parts. Thus *Trallianus* boaſts that he hath cured theſe kinds of Quartane Feaver by the only uſe of refrigerating *Epithemaes* being often repeated a little before the beginning of the fit. And this is the ſum of the Cure of true and legitimate intermitting Feavers. That is, of thoſe which are cauſed by one ſimple humor, whereby the Cure of thoſe which they call baſtard intermitting Feavers, may be eaſily gathered and underſtood; as which are bred by a humor impure and not of one kind, but mixt or compoſed by admixture of ſome other matter; for example, according to the mixture of divers humors Phlegmatick and cholerick, the medicines muſt alſo be mixt, as if it were a confuſed kind of Feaver of a *Quotidian* and *Tertian*, it muſt be cured by a medicine compoſed of things evacuating flegm and choler.

Medicines.

What quartains muſt be cured with refrigerating things.

What baſtard Agues are, and how they muſt be cured.

CHAP. XXXII.

Of an Aneuriſma, *that is, the dilatation, or ſpringing of an Artery, Vein, or Sinew.*

What it is.

AN *Aneuriſma* is a ſoft tumor yeelding to the touch, made by the blood and ſpirit powred forth under the fleſh and Muſcles, by the dilatation or relaxation of an Artery. Yet the Author of the definitions ſeems to call any dilatation of any venous veſſell by the name of an *Aneuriſma*. *Galen* calls an *Aneuriſma* an opening made of the *Anaſtomaſis*, of an Artery. Alſo an *Aneuriſma* is made when an Artery that is wounded cloſeth too ſlowly, the ſubſtance which is above it being in the mean time agglutinated, filled with fleſh and cicatrized, which doth not ſeldome happen in opening of Arteries unskilfully performed and negligently cured; therefore *Aneuriſmaes* are abſolutely made by the *Anaſtomaſis*, ſpringing, breaking, *Eroſion*, and wounding of the Arteries. Theſe happen in all parts of the body, but more frequently in the throat, eſpecially in women after a painfull travail. For when as they more ſtrongly ſtrive to hold their breath, for the more powerfull expulſion of the birth, it happens that the Artery is dilated and broken, whence follows an effuſion of blood and ſpirits under the skin. The ſigns are, a ſwelling one while great, another ſmall, with a pulſation and a colour not varying from the native conſtitution of the skin. It is a ſoft tumor, and ſo yeelding to the impreſſion of

In what parts they chiefly happen.

of the fingers that if it peradventure be ſmall, it wholly vaniſheth, the Arterious blood and ſpirits flying back into the body of the Artery, but preſently aſſoon as you take your fingers away, they return again with like celerity. Some *Aneuriſmaes* do not only when they are preſſed, but alſo of themſelves make a ſenſible hiſſing, if you lay your ear near to them, by reaſon of the motion of the vitall ſpirit ruſhing with great violence through the ſtraitneſs of the paſſage.

Wherefore in *Aneuriſmaes* in which there is a great rupture of the Artery, ſuch a noiſe is not heard, becauſe the ſpirit is carryed through a larger paſſage. Great *Aneuriſmaes* under the Arm pits, in the Groins, and other parts wherein there are large veſſels, admit no cure, becauſe ſo great an eruption of blood and ſpirits often follows upon ſuch an inciſion, that death prevents both Art and Cure. Which I obſerved a few years ago in a certain Prieſt of Saint *Andrews* of the Arches, Mr. *John Maillet*, dwelling with a chief Preſident *Chriſtopher de Thou*. Who having an *Aneuriſma* at the ſetting on of the ſhoulder about the bigneſs of a Wall-nut, I charged him, he ſhould not let it be opened, for if he did it would bring him into manifeſt danger of his life, and that it would be more ſafe for him to break the violence thereof with double clothes ſteeped in the juyce of Night-ſhade & Houſleek, with new and wheyey cheeſe mixt therewith: Or with *Unguentum de Bolo* or *Emplaſtrum contra rupturam* and ſuch other refrigerating and aſtringent medicines, if he would lay upon it a thin plate of Lead, and would uſe ſhorter breeches that his doublet might ſerve to hold it too, to which he might faſten his breeches in ſtead of a ſwath, & in the mean time he ſhould eſchew all things which attenuate and inflame the blood, but eſpecially he ſhould keep himſelf from all great ſtraining of his voice. Although he had uſed his diet for a yeer, yet he could not ſo handle the matter but that the tumor increaſed, which he obſerving goes to a Barber, who ſuppoſing the tumor to be of the kind of vulgar impoſtumes, applies to it in the Evening a Cauſtick cauſing an Eſchar ſo to open it. In the Morning ſuch an abundance of blood flowed forth from the tumor being opened, that he therewith aſtoniſhed, implores all poſſible ayd, and bids that I ſhould be called to ſtay this his great bleeding, and he repented that he had not followed my directions. Wherefore I am called, but when I was ſcarce over the threſhold, he gave up his ghoſt with his blood. Wherefore I diligently admoniſh the young Chirurgeon that he do not raſhly open *Aneuriſmaes* unleſs they be ſmal in an ignoble part, and not indued with large veſſels, but rather let him perform the cure after this manner. Cut the skin which lyes over it untill the Artery appear, and then ſeparate it with your knife from the particles about it, then thruſt a blunt and crooked needle with a thred in it under it, bind it, then cut it off and ſo expect the falling off of the thred of it ſelf whiles nature covers the orifices of the cut Artery with new fleſh, then the reſidue of the cure may be performed after the manner of ſimple wounds. The *Aneuriſmaes* which happen in the internall parts are incurable. Such as frequently happen to thoſe who have often had the unction and ſweat for the cure of the French diſeaſe, becauſe the blood being ſo attenuated and heated therewith that it cannot be contained in the receptacles of the Artery, it diſtends it to that largneſs as to hold a mans Fiſt. Which I have obſerved in the dead body of a certain Taylor, who by an *Aneuriſma* of the Arterious vein ſuddenly whilſt he was playing at Tennis fell down dead, the veſſel being broken: his body being opened I found a great quantity of blood powred forth into the capacity of the Cheſt, but the body of the Artery was dilated to that largneſs I formerly mentioned, and the inner coat thereof was bony. For which cauſe within a while after I ſhewed it to the great admiration of the beholders in the Phyſitians School whilſt I publiquely diſſected a body there; the whilſt he lived ſaid he felt a beating and a great heat over all his body by the force of the pulſation of all the Arteries, by occaſion whereof he often ſwounded. Doctor *Sylvius* the Kings profeſſor of Phyſick at that time forbad him the uſe of Wine, and wiſhed him to uſe boyled water for his drink, and Curds and new Cheeſes for his meat, and to apply them in form of Cataplaſms upon the grieved and ſwoln part. At night he uſed a ptiſan of Barly meal and Poppy-ſeeds, and was purged now and then with a Clyſter of refrigerating and emolljent things, or with Caſſia alone, by which medicines he ſaid he found himſelf much better. The cauſe of ſuch a bony conſtitution of the Arteries by *Aneuriſmaes* is, for that the hot and fervid blood firſt dilates the Coats of an Artery, then breaks them; which when it happens, it then borrows from the neighbouring bodies a fit matter to reſtore the looſed continuity thereof.

This matter whilſt by little and little it is dryed and hardened, it degenerates into a griſtly or elſe a bony ſubſtance, juſt by the force of the ſame materiall and efficient cauſes, by which ſtones are generated in the reins and bladder. For the more terreſtriall portion of the blood is dryed and condenſed by the power of the unnaturall heat contained in the part affected with an *Aneuriſma*; whereby it comes to paſs that the ſubſtance added to the dilated and broken Artery is turned into a body of a bony conſiſtence. In which the ſingular providence of nature, the handmaid of God is ſeen, as that which, as it were by making and oppoſing a new wall or bank, would hinder and break the violence of the raging blood ſwelling with the abundance of the vitall ſpirits; unleſs any had rather to refer the cauſe of that hardneſs to the continuall application of refrigerating and aſtringent

medicines

Prognoſtick.

A Hiſtory.

Aneuriſmaes muſt not raſhly be opened.

How they muſt be cured.

Theſe of the inward parts incurable.

A Caution in the knowing of *Aneuriſmaes*.

medicines. Which have power to condenſate and harden, as may not obſcurely be gathered by the writings of *Galen*. But beware you be not deceived by the forementioned ſigns; for ſometimes in large *Aneuriſmaes* you can perceive no pulſation, neither can you force the blood into the Artery by the preſſure of your fingers, either becauſe the quantity of ſuch blood is greater than which can be contained in the ancient receptacles of the Artery, or becauſe it is condenſate and concrete into clods, whereupon wanting the benefit of ventilation from the heart, it preſently putrefies; Thence enſue great pain, a Gangren, and mortification of the part, and laſtly the death of the Creature.

The End of the Seventh Book.

OF PARTICULAR *TUMORS* AGAINST NATVRE.

THE EIGHT BOOK.

The Preface.

BEcauſe the Cure of diſeaſes muſt be varied according to the variety of the temper, not only of the body in generall, but alſo of each part thereof; the ſtrength, figure, form, ſite, and ſenſe thereof being taken into conſideration: I think it worth my pains, having already ſpoken of Tumors in generall, if I ſhall treat of them in particular which affect each part of the body, beginning with thoſe which aſſail the head. Therefore the Tumor either affects the whole head, or elſe only ſome particle thereof, as the Eyes, Ears, Noſe, Gums and the like. Let the *Hydrocephalos*, and *Phyſocephalos* be examples of thoſe tumors which poſſeſs the whole head.

CHAP. I.

Of an Hydrocephalos *or watry tumor which commonly affects the heads of Infants.*

What it is.

THe Greeks call this diſeaſe *Hydrocephalos*, as it were a Dropſie of the Head, by a wateriſh humor; being a diſeaſe almoſt peculiar to Infants newly born. It hath for an externall cauſe the violent compreſſion of the head by the hand of the Midwife or otherwiſe at the birth, or by a fall, contuſion and the like. For hence comes a breaking of a vein, or Artery, and an effuſion of the blood under the skin. Which by corruption becoming whayiſh, laſtly degenerateth into a certain wateriſh humor. It hath alſo an inward cauſe, which is the aboundance of ſerous and acrid blood, which by its tenuity and heat ſweats through the pores of the veſſels, ſometimes between the Muſculous skin of the head and the *Pericranium*, ſometimes between the *Pericranium* and the skull, and ſometimes between the skull and the membrane called *Dura mater*, and otherwhiles in the ventricles of the brain.

The cauſes.

Differences by reaſon of place.

The

The signs of it, contained in the space between the Musculous skin and the *Pericranium*, are a manifest tumor without pain, soft, and much yeelding to the pressure of the fingers. The Signs when it remaineth between the *Pericranium* and the skull, are for the most part like the forenamed, unless it be that the Tumor is a little harder, and not so yeelding to the finger, by reason of the pares between it and the finger: And also there is somewhat more sense of pain. But when it is in the space between the skull and *Dura mater*, or in the ventricles of the Brain or the whole substance thereof, there is a dulness of the senses as of the sight and hearing; the tumor doth not yeeld to the touch, unless you use strong impression, for then it sinketh somewhat down, especially in infants newly born, who have their skulls almost as soft as waxe, and the junctures of their Sutures lax, both by nature, and so by accident, by reason of the humor contained therein moistening and relaxing all the adjacent parts; the humor contained here lifts up the skull somewhat more high, especially at the meetings of the Sutures, which you may thus know, because the Tumor being pressed, the humor flies back into the secret passage of the Brain.

Signs.

To conclude, the pain is more vehement, the whole head more swollen, the forehead stands somewhat further out, the eye is fixt and immoveable, and also weeps by reason of the serous humor sweating out of the brain.

Vesalius writes that he saw a girl of two yeers old, whose head was thicker than mans head by this kind of Tumor, and the skull not bony, but membranous, as is usual to be in abortive births, and that there was nine pound of water ran out of it.

A History.

Abucasis tels that he saw a child whose head grew every day bigger by reason of the watery moisture contained therein, till at length the tumor became so great, that his neck could not bear it neither standing nor sitting, so that he died in a short time. I have observed and had in cure four children troubled with this disease, one of which being dissected after it died had a brain no bigger than a Tennis Ball. But of a Tumor and humor contained within under the *Cranium*, or Skull, I have seen none recover, but they are easily healed of an external Tumor.

Therefore whether the humor lye under the *Pericranium*, or under the musculous skin of the head, it must first be assayed with resolving medicines, but if it cannot be thus overcome, you must make an incision, taking heed of the Temporall Muscle and thence presse out all the humor, whether it resemble the washing of flesh newly killed, or blackish blood, or congealed or knotted blood, as when the tumor hath been caused by contusion; then the wound must be filled with dry lint, and covered with double bouliers, and lastly, bound with a facing ligature.

CHAP. II.

Of a Polypus being an ulcer of the Nose.

The reason of the name.

The Polypus is a Tumor of the Nose against nature, commonly arising from the *Os Ethmoides* or spongy bone. It is so called because it resembles the feet of a Sea Polypus in figure, and the flesh thereof in consistence. This Tumor stops the Nose, intercepting and hindering the liberty of speaking and blowing the Nose. Calfus saith, the Polypus is a caruncle or excrescence one while white, another while reddish, which adheres to the bone of the Nose, and sometimes fills the Nostrils, hanging towards the lips, sometimes it descends back through that hole, by which the spirit descends from the Nose to the throttle; it grows so that it may bee seen behind the *Uvula*, and often strangles a man by stopping his breath. There are five kinds thereof, the first is, a fleshy membrane, long and thin like the relaxed and depressed *Uvula*, hanging from the middle gristle of the nose being filled with a Phlegmatick and viscid humor. This in expiration hangs out of the nose, but is drawn in and hid by inspiration; it makes one snaffle in their speech and snort in their sleep. The second hath hard flesh, bred of Melancholy blood without adustion, which obstructing the nostrils intercepts the respiration made by that part. The third is flesh hanging from the Gristle round, and soft, being the off-spring of Phlegmatick blood. The fourth is an hard Tumor like flesh, which when it is touched yeelds a sound like a stone; it is generated of Melancholy blood dryed, being somewhat of the nature of a *Scirrhus* confirmed and without pain.

Lib. 6. Cap. 8.

The difference between.

The fifth is, as it were compacted of many cancrous ulcers spread over the transverse surface of the gristle.

Which of these admit no manuall operation.

Of all these sorts of Polypi some are not ulcerated, others ulcerated, which send forth a stinking and smoug smelling filth. Such of them as are painfull, hard, resisting, and which have a livid, or leaden color, must not be touched with the hand because they favour of the Nature of a *Cancer*, as into which they oft degenerate; yet by reason of the pain which oppresses more violently, you may use the Anodyne medicines formerly described in a *Cancer*, such as this following.

An Anodyne.

℞ *Oki de vitell. ovorum* ℥ ii, *Lythary. auri, & Tutiæ prep. an.* ℥ i, *succi plat. solani an.* ℥ i ß, *Lapid. hæmatit. & camphoræ, an.* ℥ ß. Let them be wrought a long time in a leaden mortar, and so make a medicine to be put into the nostrills. Those which are soft, loose and without

out pain, are ſometimes curable, being plucked away with an inſtrument made for that purpoſe, or elſe waſted by actuall cauteries put in through a pipe, ſo that they touch not the ſound part; or by potentiall cauteries, as *Egyptiacum* compoſed of equall parts of all the ſimples with vitrioll which hath a faculty to waſte ſuch like fleſh. *Aqua fortis* and oyl of vitrioll have the ſame faculty, for theſe take away a *Polypus* by the roots; for if any part thereof remain it will breed again. But Cauteries and acrid medicines muſt be put into the noſtrills with this Caution, that in the mean time cold repelling and aſtringent medicines be applyed to the noſe and parts about it to aſſwage the pain, and hinder the inflammation. Such as are *Vnguentum de bolo*, and *Vnguentum nutritum*, whites of Eggs beat with Roſe leaves, and many other things of the like nature.

Why it muſt be taken clear away.

CHAP. III.

Of the Parotides, *that is, Certain ſwellings about the Ears.*

What it is.

The *Parotis* is a Tumor againſt nature, affecting the Glandules and thoſe parts ſeated behind and about the Ears, which are called the Emunctories of the brain; for theſe becauſe they are looſe and ſpongy, are fit to receive the excrements thereof. Of theſe ſome are critically, the matter of the diſeaſe ſomewhat digeſted being ſent thither by the force of nature. Others Symptomatically, the excrements of the brain increaſed in quantity or quality ruſhing thither of their own accord. Such abſceſſes often have great inflammation joyned with them, becauſe the biting humor which flows thither is more vitiated in quality than in quantity. Beſides alſo they often cauſe great pain, by reaſon of the diſtention of the parts indued with moſt exquiſite ſenſe, as alſo by reaſon of a Nerve of the fifth Conjugation ſpred over theſe parts; as alſo of the neighbouring membranes of the brain, by which means the patient is troubled with the Head-ach and all his face becomes ſwoln. Yet many times this kind of Tumor uſeth to be raiſed by a tough, viſcous, and groſs humor.

The differences. Their ſigns and Symptomes.

Prognoſtick.

This diſeaſe doth more grievouſly afflict young men than old; it commonly brings a Feaver and watching. It is difficult to be cured, eſpecially when it is cauſed by a groſs, tough, and viſcid humor, ſent thither by the *Criſis*.

The cure. *Lib. 3. de comp. med ſec. Locos. Hip. aph. 31. lib. 1.*

The cure muſt be performed by diet, which muſt be contrary to the quality of the humor in the temper and conſiſtence of the meats. If the inflammation and redneſs be great, which indicate aboundance of blood, Phlebotomy will be profitable, yea very neceſſary. But here we muſt not uſe the like judgment in application of locall medicines as we do in other tumors, as *Galen* admoniſheth us; that is, we muſt not uſe repercuſſives at the beginning, eſpecially if the abſceſs be critically; for ſo we ſhould infringe or foreſlow the indeavors of nature forcibly freeing it ſelf from the morbifique matter. But we muſt much leſs repell or drive it back if the matter which hath flowed thither be venenate, for ſo the reflow thereof to the noble parts would prove mortall. Wherefore the Chirurgeon ſhall rather aſſiſt nature in attracting and drawing forth that humor. Yet if the defluxion ſhall be ſo violent, if the pain ſo fierce that thence there may be fear of watchings and a Feaver, which may deject the powers, *Galen* thinks it will be expedient with many reſolving medicines to mix ſome repelling. Wherefore at the beginning let ſuch a Cataplaſm be applyed.

Gentle reſolving medicines.

℞. *Far. bord. & ſem. lin. ana* ℥ ij, *coquantur cum mulſo aut decocto chem. addendo but. recen. & olei chem. ana* ℥ i, *fiat cataplaſma.* And the following oyntment will alſo be good.

℞. *But. recen.* ℥ ij, *olei chem. & lilior. an.* ℥ i, *unguen. de Altbea* ℥ ß, *cerę parum*: make an oyntment to be applyed with moiſt and greaſie wooll, to mitigate the pain: alſo ſomewhat more ſtrong diſcuſſing and reſolving medicines will be profitable, as:

Stronger reſolvets.

℞. *Rad. Altheę & bryon. an.* ℥ ij, *fol. rutę, puleg. orig. an. m. j, flo. chamem. melil. an. p. j, coquantur in hydromelite, piſtentur, trajiciantur, addendo farin. fenugrec. orobi. an.* ℥ i, *pul. Ireos, chem. melilot. an.* ℥ ij, *olei aneth. rutac. an.* ℥ i, *fiat cataplaſma.* But if you determine to reſolve it any more, you may uſe *Emplaſtrum Oxycroceum & Melilot-Plaiſter.* If the humor doth there concrete and grow hard, you muſt betake you to the medicines which were preſcribed in the Chapter of the *Scirrhus*; but if it tend to ſuppuration, you ſhall apply the following medicine.

A Ripening medicine.

℞. *Rad. liliorum & ceparum ſub cineribus coct. an.* ℥ iij, *Vitell. ovor. num. ij. axung. ſuillę & unguent. baſilicon, an.* ℥ i, *farr. ſem. lini* ℥ i ß, *fiat Cataplaſma.* But if the matter do ſo require, let the tumor be opened as we have formerly preſcribed.

CHAP. IIII.

Of the Epulis, *or overgrowing of the flesh of the Gums.*

THe *Epulis* is a fleshy excrescence of the Gums between the teeth, which is by little and little oft-times encreased to the bigness of an Egge, so that it both hinders the speech and eating; it casts forth salvious and stinking filth, and not seldome degenerates into a *Cancer*, which you may understand by the propriety of the colour, pain and other accidents; for then you must by no means touch it with your hand. But that which doth not torment the Patient with pain, may be pluckt away; and let this be the manner thereof. What it is. The Symptomes.

Let it be tyed with a double thred, which must be straiter twitched untill such time as it fall off; when it shall fall away, the place must be burnt with a cautery put through a trunk or pipe, or with *Aqua fortis*, or oyl of *Vitriol*, but with great care that the sound parts adjoyning thereto be not hurt, for if so be that it be not burnt, it usually returns. The Chirurgecall cure.

I have often by this means taken away such large tumors of this kind, that they hung out of the mouth in no small bigness, to the great disfiguring of the face, which when as no Chirurgeon durst touch, because the flesh looked livid, I ventured upon because they were free from pain; and by taking them away and cauterizing the place, I perfectly healed them; not truly sodainly, and at once; for although I burnt the place after dissection; yet nevertheless they sprung up again, because a certain portion of the bone and sockets in which the Teeth stand fastened, were become rotten. I have often observed such like flesh by continuance of time to have turned into a gristly and bony substance. Wherefore the cure must be begun as speedily as may be; for being but little, and having fastened no deep roots, it is more easily taken away, being then only filled with a viscid humor, which in succes of time is hardered, and makes the taking away thereof more difficult. Why the cure must not be deferred.

CHAP. V.

Of the Ranula.

THere is oft-times a tumor under the tongue, which takes away the liberty of pronuntiation or speech; wherefore the Greeks call it *Batrachium*, the Latins *Ranula*, because such as have this disease of the tongue, seem to express their minds by croaking rather than by speaking. The Reason why it is so called.

It is caused by the falling down of a cold, moist, gross, tough, viscid and phlegmatick matter, from the brain upon the tongue, which matter in colour and consistence resembles the white of an egge, yet sometimes it looks of a citrin or yellowish colour. The Cause.

That you may safely perform the cure, you must open the Tumor rather with a cautery of hot Iron, than with a Knife, for otherwise it will return again. The manner of opening of it must be thus. You shall get a bended hollow and perforated iron plate with a hole in the midst, and making the Patient to hold open his mouth, you shall so fit it, that the hole may be upon the part which must be opened. Then there you must open it with an hot Iron, for so you shall hurt no part of the mouth which is whole; but when you are ready to burn it, by thrusting your thumb under the Patients Chin, you may somewhat elevate the Tumor whereby you may open it with more certainty; when it is opened you must thrust out the matter contained therein, and then wash the Patients mouth with some barly water, hony, and Sugar of Roses; for so the ulcer will be safely and quickly healed. The Cure.

The delineation of the Iron plate and crooked actuall Cautery.

CHAP. VI.

Of the ſwelling of the Glandules, or Almonds of the throat.

Why the Glandules are called Almonds. Their uſe.

NAture at the jaws near the roots of the Tongue, hath placed two Glandules oppoſite to one another; in figure and magnitude like to Almonds, whence alſo they have their name; their office is to receive the ſpittle falling down from the brain, both leſt that the too violent falling down of the humor ſhould hinder the tongue in ſpeaking, as alſo that the tongue might alwayes have moiſture, as it were laid up in ſtore, leſt by continuall ſpeaking, it ſhould grow dry and fail. For thus this ſpittle being conſumed by feaveriſh heats, the Patients are ſcarſe able to ſpeak, unleſs they firſt moiſten their tongue by much waſhing of their mouth.

The Cauſe of their tumor.

Theſe Glandules becauſe they are ſeated in a hot and moiſt place, are very ſubject to inflammations; for there flows into theſe oft-times together with the blood, a great quantity of crude, phlegmatick and viſcous humors, whence ariſes a tumor; which is not ſeldome occaſioned by drinking much and that vaporous wine, by too much Gluttony, and ſtaying abroad in the open air.

Symptomes.

Swallowing is painfull and troubleſome to the Patient, and commonly he hath a Feaver. Oft-times the neighbouring Muſcles of the throttle and neck are ſo ſwoln together with theſe Glandules, (that as it uſually happens in the *Squinzy*) the paſſage of the breath and air is ſtopped, and the Patient ſtrangled.

Cure.

We reſiſt this imminent danger by purging and blood-letting, by applying Cupping-Glaſſes to the Neck and ſhoulders, by frictions and ligatures of the extreme parts, and by waſhing and gargling the mouth and throat with aſtringent Gargariſms. But if they come to ſuppuration, you muſt with your inciſion Knife make way for the evacuation of the *Pus*, or Matter; but if on the contrary, theſe things performed according to art, defluxion be

Extreme diſeaſes muſt have extreme remedies.

increaſed, and there is preſent danger of death by ſtopping and intercepting the breath, for the ſhunning ſo great and imminent danger, the top or upper part of the *Aſpera arteria*, or Weazon muſt be opened, in that place where it uſes to ſtand moſt out; and it may be done ſo much the ſafer, becauſe the jugular veins, and arteries are furtheſt diſtant from this place, and for that this place hath commonly little fleſh upon it. And that the inciſion may be the fitlier made, the Patient muſt be wiſhed to bend his head back, that ſo the Artery

How you muſt open the Weazon.

be the more eaſily come to by the inſtrument; then you ſhall make an inciſion overthwart way with a crooked knife between two rings (not hurting nor touching the griſtly ſubſtance) that is to ſay, the membrane which tyes together the griſtly rings being only cut; you ſhall then judg that you have made the inciſion large enough, when you ſhall perceive the breath to break out by the wound; the wound muſt be kept open ſo long, untill the danger of ſuffocation be paſt; and then it muſt be ſowed up not touching the griſtle: But if the lips of the wound ſhall be hard and callous, they muſt be lightly ſcarified, that ſo they may become bloody for their eaſier agglutination and union, as we ſhall ſhew more at large in the cure of Hare lips. I have had many in cure, who have recovered, that have had their Weazon together with the griſtly rings thereof cut with a great wound, as we ſhall note when we ſhall come to treat of the cure of the wounds of that part.

CHAP. VII.

Of the inflammation and relaxation in the Vvula *or* Columella.

What the *Vvula* is, and what the uſe thereof.

THe *Vvula* is a little body, ſpongy and ſomewhat ſharpened to the form of a Pine apple, hanging even down from the upper and inner part of the palat, ſo to break the force of the Air drawn in, in breathing, and carryed to the Lungs, and to be as a quill to form and tune the voyce. It often grows above meaſure by receiving

The Cauſe of the ſwelling thereof.

moiſture falling down from the brain, becoming ſharpe by little and little from a broader and more ſwoln *Baſis*. Which thing cauſes many Symptomes; for by the continuall irritation of the diſtilling humor the Cough is cauſed, which alſo hinders the ſleep and intercepts the liberty of ſpeech; but alſo by hindering reſpiration the Patients cannot ſleep unleſs with open mouth: they are exerciſed with a vain indeavouring to ſwallow (having as it were a morſell ſticking in their jaws) and are in danger of being ſtrangled.

Symptomes.

The Cure.

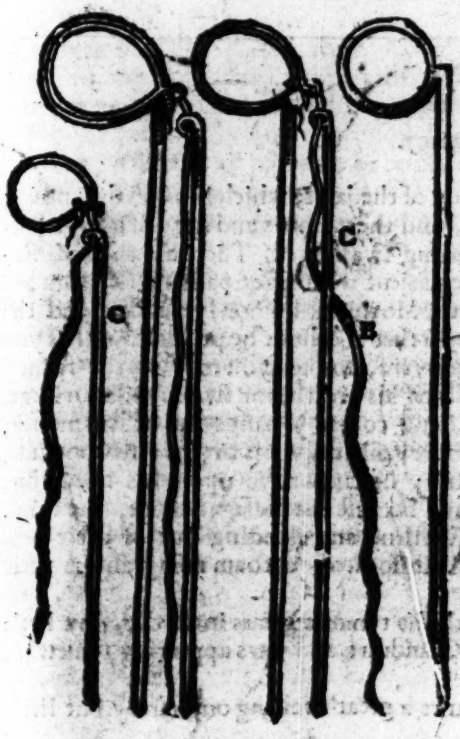
This diſeaſe muſt be reſiſted and aſſailed by purging, bleeding, Cupping, taking of clyſters, uſing aſtringent Gargles, and a convenient diet; but if it cannot thus be overcome, the cure muſt be tryed by a cauſtick of *Aqua fortis*, which I have divers times done with good ſucces. But if it cannot be ſo done, it wil be better to put to your hand, than through idlenes to ſuffer the patient to remain in imminent and deadly danger of ſtrangling; yet in this there muſt very great caution be uſed; for the Chirurgeon ſhall not judg the *Vvula* fit to be touched with an inſtrument or cauſtick, which is ſwoln with much inflamed, or black blood after the manner of a *Cancer*; but he ſhall boldly put to his hand if it be longiſh, grow

The cure by Chirurgery.

ſmall

ſmall by little and little into a ſharpe, loose and tort point; if it be neither exceeding red, neither ſwolne with too much blood, but whitiſh and without pain. Therefore that you may more eaſily and ſafely cut away, that which redounds and is ſuperfluous, deſire the Patient to ſit in a light place, and hold his mouth open; then take hold of the top of the *Vvula* with your fizers, & cut away as much thereof as ſhal be thought unprofitable. Otherwiſe you ſhall bind it with the inſtrument here-under deſcribed; the invention of this inſtrument is to be aſcribed to *Honoratus Taſtellanus* that diligent and learned man, the Kings Phyſitian ordinary, and the chief Phyſitan of the Queen mother; Which alſo may be uſe in binding of *Polypi* and warts in the neck of the womb.

The Delineation of conſtrictory rings fit to twitch, or bind the Columella, *with a twiſted thred.*

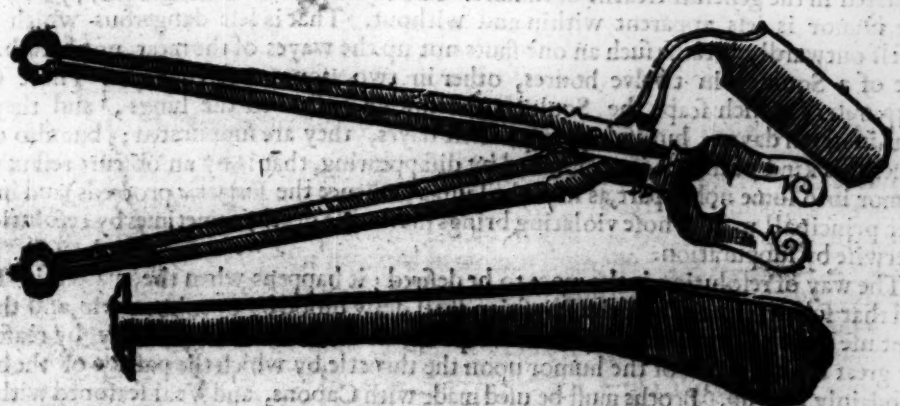


A. Shews the ring whoſe upper part is ſomewhat hollow.

B. A double waxed thred, which is couched in the hollowneſs of the ring, and hath a running, or looſe koot upon it.

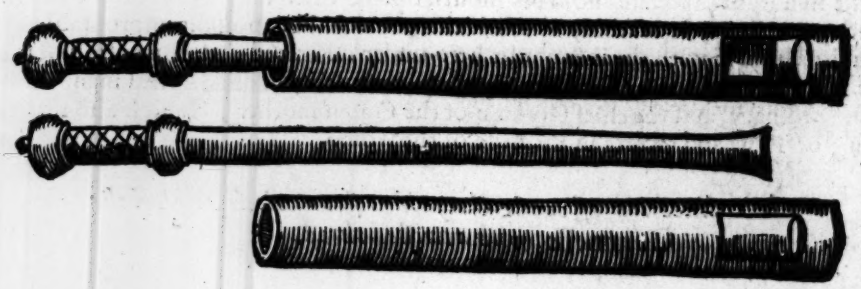
; An iron rod, into the eye whereof the forementioned double thred is put, and it is to twitch the *Columella* when as much thereof is taken hold of, as is unprofitable, and ſo to take it away without any flux of blood. When you would ſtraiten the thred, draw it again through this iron rod, and ſo ſtrain it as much as you ſhall think good, letting the end of the thred, hang out of the mouth. But every day it muſt be twitched harder than other, untill it fall away by means thereof, and ſo the part and patient be reſtored to health. I have delineated three of theſe inſtruments, that you may uſe which you will, as occaſion ſhall be offered.

A Figure of the Speculum oris, *by which the mouth is held and kept open whilſt the Chirurgeon is buſied in the cutting away or binding the* Vvula.



But if an eating ulcer ſhall aſſociate this relaxation of the *Vvula*, together with a flux of blood, then it muſt be burnt and ſeared with an hot iron, ſo thruſt into a Trunk, or Pipe, with an hole in it, that ſo no ſound part of the mouth may be offended therewith.

A hollow Trunk with a hole in the ſide, with the hot iron inſerted, or put therein.



CHAP. VIII.

Of the Angina, *or Squinzy.*

What it is.

THe Squinancy, or Squincy, is a ſwelling of the jaws, which hinders the entring of the ambient air into the weazon, and the vapours and the ſpirit from paſſage forth, and the meat alſo from being ſwallowed. There are three differences thereof. The firſt torments the patient with great pain, no ſwelling being outwardly apparent, by reaſon the Morbifick humor lyes hid behind the almonds or Glandules at the *Vertebræ* of the neck, ſo that it cannot be perceived, unleſs you hold down the tongue with a ſpatula or the *Speculum oris*, for ſo you may ſee the redneſs and tumor there lying hid. The Patient cannot draw his breath, nor ſwallow down meat, nor drink; his tongue, (like a Gray-hounds after a courſe) hangs out of his mouth, and he holds his mouth open that ſo he may the more eaſily draw his breath; to conclude, his voyce is as it were drownd in his jaws and noſe; he cannot lye upon his back, but lying is forced to ſit, ſo to breath more freely: and becauſe the paſſage is ſtopt, the drink flies out at his noſe; the eyes are fiery and ſwollen, and ſtanding out of their orb. Thoſe which are thus affected are often ſodainly ſuffocated, a foam riſing about their mouths.

The differences.

The firſt kind.

The Symptoms.

The ſecond kind.

The ſecond difference is ſaid to be that, in which the tumor appears inwardly, but little or ſcarſe any thing at all outwardly, the tongue, Glandules, and jaws appearing ſomewhat ſwollen.

The third.

The third being leaſt dangerous of them all, cauſes a great ſwelling outwardly, but little inwardly.

The Cauſes.

The Cauſes are either internall, or externall. The externall are a ſtroak, ſplinter or the like thing ſticking in the Throat, or the exceſs of extreme cold, or heat. The internall cauſes are a more plentifull defluxion of the humors either from the whole body of the brain, which participate of the nature either of blood, choler or flegm, but ſeldome of Melancholy. The ſigns by which the kind and commixture may be known, have been declared in the generall treatiſe of tumors. The Squincy it more dangerous, by how much the humor is leſs apparent within and without. That is leſs dangerous which ſhews it ſelf outwardly, becauſe ſuch an one ſhuts not up the wayes of the meat, nor breath. Some dye of a Squincy in twelve houres, other in two, four or ſeven dayes. Thoſe (ſaith *Hippocrates*) which ſcape the Squincy, the diſeaſe paſſes to the lungs, and they dye within ſeven dayes; but if they ſcape theſe dayes, they are ſuppurated; but alſo oftentimes this kind of diſeaſe is terminated by diſappearing, that is, by an obſcure reflux of the humor into ſome noble part, as into the Lungs (whence the *Empyema* proceeds) aud into other principall parts, whoſe violating brings inevitable death; ſometimes by reſolution, otherwiſe by ſuppuration.

Hip. ſect. 3. prog. 2. Aphor. 10 ſect. 5

The way of reſolution is the more to be deſired; it happens when the matter is ſmall, and that ſubtle, eſpecially if the Phyſitian ſhall draw blood by opening a vein, and the Patient uſe fitting Gargariſms. A Criticall Squincy divers times proves deadly by reaſon of the great falling down of the humor upon the throttle, by which the paſſage of the breath is ſodainly ſtut up. Broths muſt be uſed made with Capons, and Veal ſeaſoned with Lettuce, Purſlain, Sorrell, and the cold ſeeds.

Diet.

If the Patient ſhall be ſomewhat weak, let him have poached Eggs, and Barly Creams, the Barly being ſomewhat boyled with Raiſons in water and Sugar, and other meats of this kind. Let him be forbidden wine, inſtead whereof he may uſe *Hydromela*, and *Hydroſaccha* that is, drinks made of water and Hony, or water and Sugar as alſo the Syrups of dryed Roſes, of Violets, Sorrell and *Lemmons*, and others of this kind. Let him avoid too much ſleep. But in the mean time the Phyſitian muſt be carefull of all, becauſe this diſeaſe

disease is of their kind, which brook no delayes. Wherefore let the *Basilica* be presently opened, on that side the tumor is the greater; then within a short time after the same day, for evacuation of the conjunct matter, let the vein under the tongue be opened; let cupping-Glasses be applyed, sometimes with scarification, sometimes without, to the neck and shoulders, and let frictions and painfull ligatures be used to the extreme parts. But let the humor impact in the part be drawn away by clysters and sharp suppositories. Whilst the matter is in defluxion, let the mouth without delay be washed with astringent gargarismes to hinder the defluxion of the humor, lest by its sodain falling down it kill the Patient, as it often happens, all the Physitians care and diligence notwithstanding. Therefore let the mouth be frequently washed with Oxycrate, or such a gargarism: R. *Pomorum silvest. nu.* iiij, *sumach, Rosar. rub. an. m. ss. berber.* ʒ ij, let them be all boyled with sufficient quantity of water to the consumption of the half, adding thereunto of the wine of soure Pomgranats, ʒ iiij, of *Diamoron* ʒ ij, let it be a little more boyled and make a gargle according to Art. And there may be other Gargarisms made of the waters of Plantain, Night-shade, Verjuice, Julep of Roses and the like. But if the matter of the defluxion shall be Phlegmatick, Alum, Pomgranat pill, Cypress nuts, and a little Vineger may be safely added. But on the contrary, repercussives must not be outwardly applyed, but rather Lenities, whereby the externall parts may be relaxed and rarified, and so the way be open either for the diffusing or resolving the portion of the humor. You shall know the humor to begin to be resolved, if the Feaver leave the Patient, if he swallow, speak and breath more freely, if he sleep quietly, and the pain begin to be much asswaged. Therefore then natures endeavour must be helped by applying resolved medicines, or else by using suppuratives inwardly and outwardly, if the matter seem to turn into *Pus*. Therefore let gargarisms be made of the roots of March-Mallows, Figs, Jujubes, damask Prunes, Dates, perfectly boyled in water. The like benefit may be had by Gargarisms of Cows milk with Sugar, by oyl of sweet Almonds, or Violets warm, for such things help forward suppuration and asswage pain; let suppurating cataplasms be applyed outwardly to the neck and throat, and the parts be wrapped with woolI moistened with oyl of Lillies. When the Physitian shall perceive that the humor is perfectly turned into *pus*, let the patients mouth be opened with the *Speculum oris*, and the abscess opened with a crooked and long incision knife; then let the mouth be now and then washed with cleansing gargles; as R. *Aquae hordei lib. ss. mellis ros. & syr. rosar. sic. an.* ʒ i, *fiat gargarisma.* Also the use of *oenomel*, that is, wine and Hony, will be fit for this purpose. The ulcer being clensed by these means, let it be cicatrized with a little roch-Alum added to the former gargarisms.

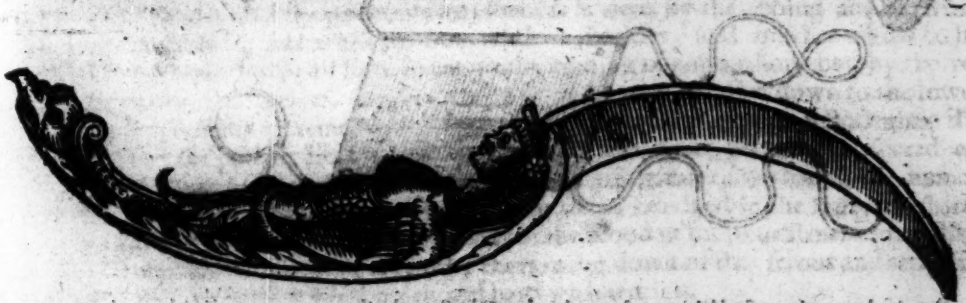
The Figure of an incision knife opened out of the haft, which serves for a sheath thereto.



CHAP. IX.

Of the Bronchocele, or Rupture of the throat.

That which the French call *Goetre*, that the Greeks call *Bronchocele*, the Latins *Cuturis Hernia*, that is, the Rupture of the throat. For it is a round tumor of the throat, the matter whereof coming from within outwards, is contained between the skin and weazon; it proceeds in women from the same cause as an *Aneurisma*.

The reason of the name.

But this generall name of *Bronchocele* undergoes many differences; for sometimes it retains the nature of *Melicerides*, other whiles of *Steatoma's*, *Atheroma's* or *Aneurisma's*, in some there is found a fleshy substance having some small pain; some of these are small, others so great, that they seem almost to cover all the throat; some have a Cist, or bag, others have no such thing; all how many so ever they be, and what end they shall have, may be known by their proper signs; these which shall be curable, may be opened with an actuall or potentiall cautery, or with an incision knife. Hence if it be possible, let the matter be presently evacuated, but if it cannot be done at once, let it be performed at divers times and discussed by fit remedies, and lastly, let the ulcer be consolidated and cicatrized.

The differences.

The Cure.

The difference.

CHAP. X.

Of the Pleuriſie.

What it is.

THe Pleuriſie is an inflammation of the membrane, inveſting the ribs, cauſed by ſubtile and cholerick blood, ſpringing upwards with great violence from the hollow vein into the *Azygos*, and thence into the intercoſtall veins, and is at length powred forth into the emptie ſpaces of the intercoſtall muſcles, and the mentioned membrane. Being contained there, if it tend to ſuppuration, it commonly infers a pricking pain, a Feaver and difficulty of breathing. This ſuppurated blood is purged and evacuated one while by the mouth; the Lungs ſucking it, and ſo caſting it into the Weazon, and ſo into the mouth, otherwhiles by urine, and ſometimes by ſtool.

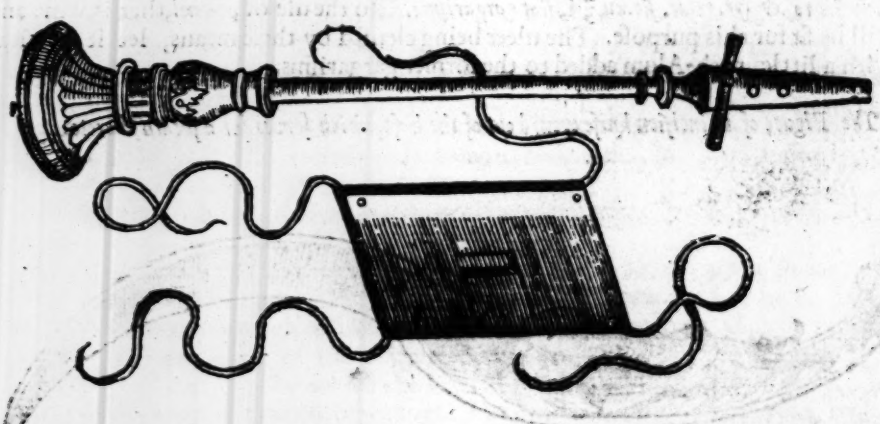
Of a Pleuriſie coming to ſuppuration.

Of the change thereof into an *Empyema*.

Of the aperition of the ſide in an *Empyema*.

But if nature being too weak, cannot expectorate the purulent blood poured forth into the capacity of the cheſt, the diſeaſe is turned into an *Empyema*, wherefore the Chirurgeon muſt then be called, who beginning to reckon from below upwards, may make a vent between the third and fourth true and legitimate ribs; and that muſt be done either with an actual or potentiall cautery, or with a ſharpe knife drawn upwards, towards the back, but not downwards, leſt the veſſels ſhould be violated which are diſſeminated under the rib. This apertion may be ſafely and eaſily performed by this actuall cautery; it is perforated with four holes, through one whereof there is a pin put higher or lower according to the depth and manner of your inciſion: then the point thereof is thruſt through a plate of Iron perforated alſo in the midſt, into the part deſigned by the Phyſitian, leſt the wavering hand might peradventure touch, and ſo hurt the other parts not to be medled withall. This ſame plate muſt be ſomewhat hollowed, that ſo it might be more eaſily fitted to the gibbous ſide, and bound by the corners on the contrary ſide with four ſtrings. Wherefore I have thought good here to expreſs the figures thereof.

The Figure of an actuall cautery with its plate fit to be uſed in a Pleuriſie.



But if the patient ſhall have a large body, Cheſt and ribs, you may divide and perforate the ribs themſelves with a Trepan; howſoever the apertion be made, the *pus* or matter muſt be evacuated by little and little at ſeverall times; and the capacity of the Cheſt cleanſed from the purulent matter by a detergent injection of vj ounces of Barley water, and ℥ ij. hony of Roſes, and other the like things mentioned at large in our cure of wounds.

CHAP. XI.

Of the Dropſie.

What the Dropſie is.

THe Dropſie is a Tumor againſt nature by the aboundance of waterish humor, of flatulencies, or Phlegm, gathered one while in all the habit of the body, otherwhiles in ſome part, and that eſpecially in the capacity of the belly between the *Peritonæum* and entrails. From this diſtinction of places and matters there ariſe divers kinds of Dropſies. Firſt, that Dropſie which fils that ſpace of the belly, is either moiſt or dry. The moiſt is called the *Aſcites*, by reaſon of the ſimilitude it hath with a leather bottle, or *Borachio*, becauſe the waterish humor is contained in that capacity, as if it were in ſuch a veſſell.

The differences thereof.

The dry is called the *Tympanites*, or Tympany, by reaſon the belly ſwollen with wind ſounds like a *Tympanum*, that is, a Drum. But when the whole habit of the body is diſtended with

with a phlegmatick humor, it is called *Anasarca* or *Leucophlegmatia*. In this last kind of Dropsie the lower parts first swell, as which by reason of their site are more subject to receive defluxions, and more remote from the fountain of the native heat; wherefore if you presse them down the print of your finger will remain sometime after; the patients face will become pale and puffed up, whereby it may be distinguished from the two other kinds of Dropsie. For in them first the belly, then by a certain consequence the thighs and feet do swell. There are besides also particular Dropsies, contained in the strait bounds of certain places, such are the *Hydrocephalos* in the head; the *Bronchocele* in the throat; the *Pleurocele* in the Chest; the *Hydrocele* in the *Scrotum*, or Cod; and so of the rest. Yet they all arise from the same causes; that is, the weakness or defect of the altering or concocting faculties, especially of the liver, which hath been caused by a *Scirrhus*, or any kind of great distemper, chiefly cold, whether it happen primarily, or secondarily by reason of some hot distemper dissipating the native and inbred heat, such a Dropsie is uncurable; or else it comes by consent of some other higher or lower part; for if in the Lungs, Midriff, or Reins there be any distemper, or disease bred, it is easily communicated to the gibbous part of the Liver, by the branches of the hollow vein, which run thither. But if the mischief proceed from the Spleen, Stomach, Mesentery Guts, especially the *jejunum* and *Ileum*, it creeps into the hollow side of the liver by the meseraick veins, and other branches of the *Vena porta* or Gate vein. For thus such as are troubled with the *Asthma*, Ptisick, Spleen, Jaundise, and also the Phrensie, fall into a Dropsie.

The Symptomes.

The Causes.

How divers diseases turn into Dropsies.

Lastly, all such as have the menstruall or haemorrhoidall blood suppressed or too immoderately flowing contrary to their custome, either overwhelms, diminisheth or extinguisheth the native heat; no otherwise than fire, which is suffocated by too great a quantity of wood; or dieth and is extinguished for want thereof. We must look for the same from the excrements of the belly or bladder, cast forth either too sparingly or too immoderately: Or by too large quantity of meats too cold and rashly devoured without any order; To conclude, by every default of externall causes, through which occasion, error may happen in diet or exercise.

The *Ascites* is distinguished from the two other kinds of Dropsies, both by the magnitude of the efficient cause, as also by the violence of the Symptoms, as the dejected appetite, thirst, and sweling of the *Abdomen*. And also when the body is moved or turned upon either side, you may hear a sound as of the jogging of water in a vessell half full. Lastly, the humor is diversly driven upwards or downwards, according to the turning of the body and compression of the *Abdomen*; It also causeth various Symptoms by pressure of the parts to which it floweth. For it causeth difficulty of breathing and the cough by pressing the Midriffe; by sweating through into the capacity of the Chest it causeth like Symptoms as the *Empyema*. Besides also the patients often seem, as it were, by the ebbing and flowing of the waterish humor, one while to be carried to the skies, and another whiles to be drowned in the water, which I have learnt not by reading of any author, but by the report of the patients themselves. But if these waterish humors be fallen down to the lower parts, they suppress the excrements of the guts and bladder by pressing and straitning the passages. When the patient lies on his back the tumor seems lesse, because it is spread on both sides; On the contrary when he stands or sits, it seems greater, for that all the humor is forced or driven into the lower belly, whence he feels a heavinesse in the *Pecten* or share. The upper parts of the body fall away by defect of the blood fit for nourishment in quality and consistence, but the lower parts swel by the flowing down of the ferous and waterish humor to them. The pulse is little, quick, and hard with tention.

The signs of an *Ascites*.

The Symptoms.

This disease is of the kind of Chronicall or long diseases; wherefore it is scarce, or never cured, especially in those who have it from their mothers womb, who have the Action of their stomach depraved, and those who are cachectick, old; and lastly, all such as have the naturall faculty languishing and faulty.

Prognosticks.

On the contrary, young and strong men, especially if they have no feaver, and finally all who can endure labour, and those exercises which are fit for curing this disease, easily recover, principally if they use a Physitian before the water which is gathered together do putrefie and infect the bowels by its contagion.

CHAP. XII.

Of the cure of the Dropsie.

The beginning of the cure must be with gentle and mild medicines; neither must we come to a *Paracentesis* unless we have formely used and tried these. Therefore it shal be the part of the Physitian to prescribe a drying diet, and such medicines as carry away water, both by stool and urine. *Hippocrates* ordains this powder for Hydropick persons. *Re Cantha. ablatis capitib. & alis 3ß. Comburantur in furno, & fiat pulvis*, of which administer two grains in white wine, for nature helped by this, and the like remedies hath not seldome been seen to have cured the Dropsie.

Hip. lib. 4. de aeur. & lib. de interiis.

But

But that we may haſten the cure, it will be available to ſtir up the native heat of the part by appplication of thoſe medicines which have a diſcuſſing force; as bags, baths, ointments, and Emplaiſters. Let bags be made of dry and harſh Bran, Oats, Salt, Sulphur, being made hot, or for want of them, of Sander, or Aſhes often heated.

Bags.

Bathes.

The more effectuall baths are ſalt, nitrous, and ſulphurous waters, whether by nature or art, that is, prepared by the diſſolution of ſalt, niter, and Sulphur; to which if Rue, Marjorom, the leaves of Fennell, and tops of Dill, of *Staechas*, and the like be added, the buſineſs will goe better forwards. Let the ointments be made of the oyl of Rue, Dill, Baies, and Squills, in which ſome *Euphorbium*, Pellitory of *Spain*, or Pepper have been boiled. Let plaiſters be made of Frankincenſe, Myrrh, Turpentine, *Coſtus*, Bayberries, Engliſh galengall, hony, the dung of Oxen, Pigeons, Goats, Horſes, and the like, which alſo may be applied by themſelves. If the diſeaſe continue, we muſt come to *Sinapiſmes* and *Phœnigmes*, that is, to rubrifying and veſicatory medicines. When the bliſters are raiſed, they muſt be anointed again, that ſo the water may by little and little flow ſo long untill all the humor be exhauſted, and the patient reſtored to health.

Liniments.

Emplaiſters.

Veſicatories.

Galen writes, the Husbandmen in *Aſia*, when they carried wheat out of the Country into the city in Cars, when they wil ſteal away and not be taken, hide ſome ſtone jugs fill'd with water in the midſt of the wheat; for that will draw the moiſture through the jugs into it ſelf, and encreaſe both the quantity and weight. When certain pragmaticall Phyſitians had read this, they thought that wheat had force to draw out the water, ſo that if any ſick of the Dropſie ſhould be buried in a heap of wheat, it would draw out all the water.

Gal. lib. de facul. natur. 1.

But if the Phyſitian ſhall profit nothing by theſe means, he muſt come to the exquiſitly chief remedy, that is, to *Paracenteſis*. Of which becauſe the opinions of the ancient Phyſitians have been divers, we will produce and explain them.

Divers opinions of *Paracenteſis*, or opening of the belly.

Thoſe therefore which diſallow *Paracenteſis*, conclude it dangerous for three reaſons. The firſt is becauſe by pouring out the contained water, together with it, you diſſipate and reſolve the ſpirits, and conſequently the naturall, vitall, an d animall faculties. Another opinion is, becauſe the Liver wanting the water by which formerly it was born up; thence forward hanging down by its weight, depreſſeth and draweth downwards the midriffe and the whole Cheſt, whence a dry cough, and a difficulty of breathing proceed. The third is, becauſe the ſubſtance of the *Peritonæum*, as that which is nervous, cannot be pricked or cut without danger, neither can that which is pricked or cut be eaſily agglutinated and united, by reaſon of the ſpermatick and bloudleſſe nature thereof. *Eraſiſtratus* moved by theſe reaſons condemned *Paracenteſis* as deadly: alſo he perſwaded that it was unprofitable for theſe following reaſons, *viz.* becauſe the water powred forth, doth not take away with it the cauſe of the Dropſie, and the diſtemper and hardneſs of the Liver, and of the other bowels, whereby it comes to paſs that by breeding new waters they may eaſily again fall into the Dropſie. And then the feaver, thirſt, the hot and drie diſtemper of the bowels, all which were mitigated by the touch of the included water, are aggravated by the abſence thereof, being powred forth: which thing ſeemeth to have moved *Avicen* and *Gordonius* that he ſaid none; the other ſaid very few lived after the *Paracenteſis*: but the refutation of all ſuch reaſons is very eaſie.

Reaſons'againſt it.

Eraſiſtratus his Reaſons againſt it.

Reaſons for it.

For, for the firſt *Galen* infers, that harmfull diſſipation of ſpirits, and reſolving the faculties happens, when the *Paracenteſis* is not diligently, and artificially performed. As in which the water is preſently powred forth; truly if that reaſon have any validity, Phlebomy muſt ſeem to be removed far from the number of wholſome remedies, as whereby the blood is poured forth, which hath far more pure and ſubtil ſpirits, than thoſe which are ſaid to be diffuſed and mixed with the Dropſie waters. But that danger which the ſecond reaſon threatens ſhall eaſily be avoided; the patient being deſired to lie upon his back in his bed, for ſo the Liver will not hang down. But for the third reaſon, the fear of pricking the *Peritonæum*, is childiſh: for thoſe evils which follow upon wounds of the nervous parts, happen by reaſon of the exquiſit ſenſe of the part, which in the *Peritonæum* ill affected & altered by the contained water, is either none or very ſmal. But reaſon and experience teach many nervous parts, alſo the very membranes themſelves being far removed from a fleſhy ſubſtance, being wounded admit cure; certainly much more the *Peritonæum*, as that which adheres ſo ſtraitly to the muſcles of the *Abdomen*, that the diſſector cannot ſeparate it from the fleſh, but with much labor. But the reaſon which ſeems to argue the unprofitableneſs of the *Paracenteſis* is refelled by the authority of *Celſus*. I, ſaith he, am not ignorant that *Eraſiſtratus* did not like *Paracenteſis*; for he thought the Dropſie to be a diſeaſe of the Liver, and ſo that it muſt be cured, and that the water was in vain let forth, which the Liver being vitiated, might grow again. But firſt this is not the fault of this bowel alone, and then although the water had his originall from the Liver, yet unleſs the water which ſtayeth there contrary to nature being evacuated, it hurteth both the Liver, and the reſt of the inner parts, whilſt it either encreaſeth their hardneſs, or at the leaſt keepeth it hard, and yet notwithſtanding it is fit the body be cured. And although the once letting forth of the humor profit nothing, yet it makes way for medicines, which while it was there contained, it hindered. But this ſerous, ſalt, and corrupt humor is ſo far from being able to

Lib. 3. cap. 21.

mitigate

mitigate a feaver and thirſt, that on the contrary it increaſeth them. And alſo it augmenteth the cold diſtemper, whilſt by its abundance it overwhelms and extinguiſheth the native heat. But the authority of *Celius Aurelianus* that moſt noble Phyſitian, though a Methodick, may ſatisfie *Avicen* and *Gordonius*. They, ſaith he, which dare avouch that all ſuch as have the water let out by opening their belly have died, do lie; for we have ſeen many recover by this kind of remedy: but if any died, it happened either by the default of the flow or negligent adminiſtration of the *Paracenteſis*. I will add this one thing which may take all error of controverſies: we unwiſely doubt of the remedy when the patient is brought to that neceſſity, that we can only help him by that means. Now muſt we ſhew how the belly ought to be opened. If the Dropſie happen by fault of the Liver, the ſection muſt be made on the left ſide; but if of the Spleen, in the right: for if the patient ſhould lie upon the ſide which is opened, the pain of the wound would continually trouble him, and the water running into that part where the ſection is, would continually drop, whence would follow a diſſolution of the faculties. The Section muſt be made three fingers bredth below the Navell, to wit, at the ſide of the right muſcle, but not upon that which they call the *Linea Alba*, neither upon the nervous parts of the reſt of the muſcles of the *Epigaſtrium*, that ſo we may prevent pain and difficulty of healing. Therefore we muſt have a care that the patient lie upon his right ſide, if the inciſion be made in the left, or on the left, if on the right. Then the Chirurgeon both with his own hand, as alſo with the hand of his ſervant aſſiſting him, muſt take up the skin of the belly, with the fleſhy pannicle lying under it, and ſeparate them from the reſt; then let him divide them ſo ſeparated with a Section even to the fleſh lying under them, which being done, let him force as much as hee can the divided skin upwards towards the ſtomach, that when the wound, which muſt preſently be made in the fleſh lying there-under, ſhall be conſolidated, the skin by its falling therein, may ſerve for that purpoſe: then therefore let him divide the muſculous fleſh and *Peritonæum* with a ſmall wound, not hurting the Call or Guts.

Lib. de morb. Ch. cap. de Hydrope.

The places of the apertion muſt be divers, according to the parts chiefly affected.

The manner of making aperti-on.

Then put into the wound a trunk, or golden, or ſilver crooked pipe, of the thickneſs of a Gooſes-quill, and of the length of ſome half a finger. Let that part of it which goes into the capacity of the belly have ſomething a broad head, and that perforated with two ſmall holes, by which a ſtring being faſtened, it may be bound ſo about the body, that it cannot be moved, unleſs at the Chirurgeons pleaſure. Let a ſponge be put into the pipe, which may receive the dropping humor: and let it be taken out when you would evacuate the water: but let it not be poured out all together, but by little and little for fear of diſſipation of the ſpirits, and reſolution of the faculties, which I once ſaw happen to one ſick of the Dropſie. He being impatient of the diſeaſe and cure thereof, thruſt a Bodkin into his belly, and did much rejoice at the pouring forth of the water, as if he had been freed from the humor and the diſeaſe, but died within a few houres, becauſe the force of the water running forth, could by no means be ſtaied, for the inciſion was not artificially made. But it will not be ſufficient to have made way for the humor by the means aforementioned, but alſo the external orifice of the pipe muſt be ſtopped & ſtrengthned by double cloaths, and a ſtrong ligature, leſt any of the water flow forth againſt our wils. But we muſt note that the pipe is not to be drawn out of the wound, before as much water ſhall be iſſued forth as we deſire, and the tumor requireth; for once drawn forth, it cannot eaſily be put in again, and without force and pain be fitted to the lips of the wound, becauſe the skin and fleſhy pannicle cover it by their falling into the wound of the fleſh or muſcle. But whilſt the water is in evacuation, we muſt have a diligent care of feeding the patient, as alſo of his ſtrength, for if that fail, and he ſeem to be debilitated, the effuſion of the water muſt be ſtaied for ſome daies, which at the length performed according to our deſire, the wound muſt be ſo conſolidated that the Chirurgeon beware it degenerate not into a Fiſtula.

A Hiſtory.

A caution for taking out the pipe.

The figure of a Pipe in form of a Quill, to evacuate the water in Dropſies.

Others performe this buſineſs after another manner; for making an inciſion, they thruſt through the lips of the wound with a needle and thred: but they take up much of the fleſhie ſubſtance with the needle, leſt that which is taken up ſhould be rent and torn by the forcible drawing of the lips together. Then the thred it ſelf is wrapped up and down over both ends of the needle, ſo thruſt through, as is uſually done in a hare-lip, that ſo the lips of the wound may ſo cloſely cohere, that not a drop of water may get out againſt the Chirurgeons wil. Sometimes ſuch as are cured and healed of the Dropſie, fall into the Jaundiſe, whom I uſually cure after this maner. ℞ *ſterc. exſer.* ℥ij, diſſolve it in ℥iij, *vini alb. colatur.* make a Potion, and let it be given two houres before meat.

Another manner of evacuating the water after the aperti-on.

A medicine for the Jaundiſe.

CHAP.

CHAP. XIII.

Of the tumor and relaxation of the Navell.

The divers cauſes thereof.

THe *Exomphalos* or ſwelling of the Navel, is cauſed by the *Peritoneum*, either relaxed or broken: for by this occaſion oft-times the guts, and oft-times the kal, fal into the ſeat of the Navell, and ſometimes ſuperfluous fleſh is there generated; otherwiſe this tumor is as an *Aneuriſma* by too great a quantity of bloud poured forth in that place: otherwiſe by a flatulent matter, and ſometimes by a wateriſh humor. If the humor be occaſioned by the kall, the part it ſelf will retain his proper colour, that is, the colour of the skin; the tumor will be ſoft and almoſt without pain, and which will reſide without noiſe, either by the preſſure of your fingirs, or of it ſelf when the Patient lieth on his back; but tumor cauſed by the guts, is more unequall, and when it is forced in by the preſſure of your fingers, there is ſuch a noiſe heard, as in the *Enterocele*; but if the tumor proceed of ſuperfluous fleſh it will be harder and more ſtubborn, not eaſily retiring into the body, although the patient lie upon his back, and you preſſe it with your fingers.

Signs hereof occaſioned by the kall.

By the guts.

By fleſh.

By wind.

By a wateriſh humor.

By bruiſed blood.

The tumor is ſofter which proceeds of wind, but which wil not retire into the body, & ſounds under your nail like a taber. If the ſwelling be cauſed by a wateriſh humor, it hath all things common with the flatuous tumor, except that it is not ſo viſible, and without noiſe. If it be from effuſion of blood, it is of a livid colour, but if the effuſed blood ſhall be arteriall, then there are the ſigns of an *Aneuriſma*. Wherefore when the tumor is cauſed by the guts, kall, wind or a wateriſh humor, it is cured by Chirurgery: but not if it proceed from a fleſhy excreſcence or ſuffuſion of blood. The tumor of the navell proceeding from the kall and guts, the Patient muſt lie upon his back to be cured, and then the kall, and guts, muſt with your fingers be forced into their due place: then the skin with which the tumor is circumſcribed muſt be taken up with your fingers, and thruſt through with a needle, drawing after it a double twined and ſtrong thred, then it muſt be ſcarified about the ſides, that ſo it may be the eaſier agglutinated. Then muſt it be thruſt through with a needle three or four times, according to the manner and condition of the diſtention and tumor. And ſo twitch it ſtrongly with a thred, that the skin which is ſo bound may at length fall off together with the ligatures. But alſo you may cut off the skin ſo diſtended even to the ligature, and then cicatrize it, as ſhall be fit. A flatulent tumor of the navell ſhall be cured with the ſame remedies, as we ſhall hereafter mention in the cure of a windy rupture, but the watery may be poured forth by making a ſmall inciſion. And the wound ſhall be kept open, ſo long, untill all the water be drained forth.

Which may be cured by Chirurgery, which not.

The cure by Chirurgery.

CHAP. XIIII.

Of the Tumors of the Groins and Cods called Herniæ, *that is, Ruptures.*

There are only 3. ſorts of Ruptures.

THe ancient Phyſicians have made many kinds of Ruptures, yet indeed there are only three to be called by that name, that is, the *Inteſtinalis*, or that of the guts, the *Zirbalis*, or that of the kall, and that which is mixed of them both. The other kinds of Ruptures have come into this order, rather by ſimilitude, than any truth of the thing: for in them the gut or kall doe not forſake their places.

Bubonocele. *Enterocele* and *Epiplocele.*

Hydrocele. *Phyſocele.*

Sarcocele. *Ciſſocele.*

The Cauſes.

The Greeks have given to all theſe ſeverall names, both from the ſeat of the tumor, as alſo from their matter. For thus they have called an unperfect rupture which deſcends not beyond the Groins, nor falls down into the cods, *Bubonocele*: but the compleat which penetrates into the cod, if it be by falling down of the gut, *Enterocele*: if from the kall, *Epiplocele*: if from them both together, they name it *Enterocepiplocele*: but if the tumor proceed from a wateriſh humor, they term it *Hydrocele*: if from wind, *Phyſocele*; if from both, *Hydrophydocele*; if a fleſhy excreſcence ſhall grow about the teſticle, or in the ſubſtance thereof, it is named *Sarcocele*. If the veins interwoven, and divarieated divers wayes ſhall be ſwoln in the cod and teſticles, the tumor obtains the name of a *Ciſſocele*. But if the humors ſhall be ſhut up or ſent thither, the name is impoſed upon the tumor, from the predominant humor, as we have noted in the beginning of our Tractate of Tumors. The cauſes are many, as all too violent motions, a ſtroak, a fall from a high place, vomiting, a cough, leaping, riding upon a trotting horſe, the ſounding of trumpets, or ſackbuts, the carrying, or lifting up of a heavy burden, racking, alſo the too immoderate uſe of viſcid and flatulent meats; for all ſuch things may either relax or break the *Peritoneum*, as that which is a thin and extended membrane. The ſigns of a *Bubonocele* are a round tumor in the groin, which preſſed, is eaſily forced in. The ſigns of an *Enterocele* are a hard tumor in the cod, which forced, returneth back and departeth with a certain murmur and pain; but the tumor proceeding of the kall, is lax and feels ſoft like wool, and which is more difficultly forced

The Signs.

in,

in, than that which proceeds from the guts, but yet without murmuring and pain: for the ſubſtance of the guts, ſeeing it is one, and continued to it ſelf, they doe not only mutually ſucceed each other, but by a certain conſequence doe, as in a dance draw each other, ſo to avoid diſtention, which in their membranous body cannot be without pain, by reaſon of their change of place from that which is naturall, into that againſt nature: none of all which can befall the kall, ſeeing it is a ſtupid body, and almoſt without ſenſe, heavy, dull, and immoveable. The ſigns that the *Peritoneum* is broken, are the ſudden increaſe of the tumor, and a ſharp and cutting pain; for when the *Peritoneum* is only relaxed, the tumor groweth by little and little, and ſo conſequently with ſmall pain; yet ſuch pain returns ſo often, as the tumor is renewed by the falling down of the gut, or kall, which happens not the *Peritoneum* being broken: for the way being once open, and paſſable to the falling body, the tumor it renewed without any diſtention, and ſo without any pain to ſpeak of. The reſt of the ſigns ſhall be handled in their places. Sometimes it happens that the guts, and kall, do firmly adhere to the proceſſe of the *Peritoneum*, that they cannot be driven back into their proper ſeat. This ſtubborn adheſion happens by the intervention of the viſcid matter, or by means of ſome excoriation cauſed by the rude hand of a Chirurgeon, in too violently forcing of the gut, or kall, into their place. But alſo, too long ſtay of the gut in the cod, and the neglect of wearing a Truſſe, may give occaſion to ſuch adheſion. A perfect and inveterate rupture by the breaking of the proceſs of the *Peritoneum* in men of full growth, never, or very ſeldome admits of cure. But you muſt note, that by great ruptures of the *Peritoneum*, the guts may fall into the cod, to the bigneſs of a mans head, without much pain and danger of life, becauſe the excrements, as they may eaſily enter, by reaſon of the largneſs of the place and rupture, ſo alſo they may eaſily return.

What rupture is uncurable.

CHAP. XV.

Of the cure of Ruptures.

BEcauſe children are very ſubject to Ruptures, but thoſe truly not fleſhy or varicous, but watry, windy, and eſpecially of the guts, by reaſon of continuall and painfull crying and coughing: Therefore in the firſt place we will treat of their cure. Wherefore the Chirurgeon, called to reſtore the gut which is faln down, ſhall place the child, either on a table, or in a bed, ſo that his head ſhall be low, but his buttocks and thighes higher, then ſhall he force with his hands by little and little, and gently, the gut into his proper place, and ſhall foment the groin with the aſtringent fomentation, deſcribed in the falling down of the womb. Then let him apply this remedy. R *Præſcripti, decoctionis quantum ſufficit, farinæ hordei & fabarum, an.* ℥j, *pulver. Aloes, Maſtiches, Myrtill. & Sarcocol. an.* ℥ß, *Boli Armeni* ℥ij. Let them be incorporated and made a cataplaſme according to Art. For the ſame purpoſe he may apply *Emplaſtrum contra Ruptu-ram*: but the chief of the cure conſiſts in folded clothes, and truſſes, and ligatures artificially made, that the reſtored gut may be contained in its place, for which purpoſe he ſhall keep the child ſeated in his cradle for 30 or 40 dayes, as we mentioned before; and keep him from crying, ſhouting, and coughing. *Aetius* bids ſteep paper 3 dayes in water, and apply it made into a ball to the groin, the gut being firſt put up, for that remedy by 3 days adheſion will keep it from falling down. But it will be, as I ſuppoſe, more effectuall, if the paper be ſteeped not in common, but in the aſtringent water, deſcribed in the falling down of the womb. Truly I have healed many by the help of ſuch remedies, and have delivered them from the hands of Gelders, which are greedy of childrens teſticles, by reaſon of the great gain they receive from thence. They by a crafty coverage, perſwade the Parents, that the falling down of the gut into the cod, is uncurable: which thing notwithſtanding experience convinceth to be falſe, if ſo be the cure be performed according to the forementioned manner, when the *Peritoneum* is only relaxed, and not broken: for the proceſs thereof by which the gut doth fall as in a ſteep way, in progreſs of time and age is ſtraitned and knit together, whilſt alſo in the mean time the guts grow thicker.

To what ruptures children are ſubject.

An aſtringent cataplaſme.

Ser. 1. cap. 24.

The craft and covetouſneſs of Gelders.

A certain Chirurgeon who deſerveth credit, hath told me that he hath cured many children as thus: He beats a loadſtone into fine powder, and gives it in pap, and then he anoints with hony the groin, by which the gut came out, and then ſtrewed it over with fine filings of iron. He adminiſtred this kind of remedy for ten or twelve dayes: The part, for other things being bound up with a ligature and truſſe as was fitting. The efficacy of this remedy ſeemeth to conſiſt in this; that the loadſtone by a natural deſire of drawing the iron which is ſtrewed upon the groin, joins to it the fleſhy and fatty particles interpoſed between them, by a certain violent impetuoſity, which on every ſide preſſing and bending the looſneſs of the *Peritoneum*, yea verily adjoining themſelves to it, in proceſs of time by a firm adheſion intercept the paſſage and falling down of the gut or kall; which may ſeem no more abhorring from reaſon, than that we behold the loadſtone it ſelf through the thickneſs of a table, to draw iron after it any way. The ſame Chirurgeon affirmed, that he frequently and happily uſed the following medicine. He burnt into aſhes in an oven red ſnails, ſhut up in an earthen pot, and gave the powder of them to little children in pap, but to thoſe which were bigger, in broth.

Another way to cure ruptures.

The reaſon of this cure.

Another medicine.

But

A notable Hiſtory.

But we muſt deſpair of nothing in this diſeaſe, for the cure may happily proceed in men of full growth, as of fortie year old, who have filled the three dimenſions of the body, as this following relation teſtifies.

There was a certain Prieſt in the Pariſh of *St. Andrews*, called *John Moret*, whoſe office it was to ſing an Epiſtle with a loud voice as often as the ſolemnity of the day, and the thing required. Wherefore ſeeing he was troubled with the *Enteroceie*, he came to me, requiring help, ſaying, he was troubled with a grievous pain, eſpecially then, when he ſtretched his voice in the Epiſtle.

When I had ſeen the bigneſs of the *Enterocele*, I perſwaded him to get another to ſerve in his place; ſo having gotten leave of *M. Curio* Clerk, and Deacon of Divinity, he committed himſelf unto me: I handled him according unto Art, and commanded him he ſhould never go without a Truſſe; and he followed my directions. When I met him ſome five or ſix years after, I asked him how he did, he anſwered very wel, for he was wholly freed from the diſeas with which he was formerly troubled; which I could not perſwade my ſelf of, before that I had found that he had told me the truth, by the diligent obſervation of his genitals. But ſome ſix moneths after, he dying of a Pleuriſie. I came to *Curio's* houſe where he died, and deſired leave to open his body, that I might obſerve whether nature had done any thing at all in the paſſage through which the gut fell down: I call God to witneſs, that I found a certain fatty ſubſtance about the proceſſe of the *Peritoneum* about the bigneſs of a little egg, and it did ſtick ſo hard to that place, that I could ſcaree pull it away without the rending of the neighbouring parts. And this was the ſpeedy cauſe of his cure. But it is moſt worthy of obſervation, and admiration, that Nature but a little helped by Art, healeth diſeaſes which are thought incurable. The chief of the cure conſiſts in this, that wee firmly ſtay the gut in its place, after the ſame manner as theſe two figures ſhew.

We muſt never deſpair in diſeaſes if ſo be nature be aſſociated by art.

The figure of a man broken on one ſide, wearing a Truſſe, whoſe bolſter muſt have three Tuberoſities, two on the upper, and one on the lower part; and there muſt be a hollowneſs between them in the midſt, that they may not too ſtraitly preſs the ſhavelone, and ſo cauſe pain. The manner of ſuch a Truſſe, I found out not long agoe, and it ſeemed better and ſafer than the reſt for to hinder the falling down of the gut and kall.

A. *Shews the ſhoulderband which is tied before and behind to the girdle of the Truſſe.*
B. *The Truſſe.*
C. *The Cavity left in the midſt of the Tuberoſities.*

In the mean time we muſt not omit diet. We muſt forbid the uſe of all things, which may either relax, dilate, or break the proceſs of the *Peritoneum*, of which I have already treated ſufficiently. Sometimes, but eſpecially in old men, the guts cannot be reſtored into their place, by reaſon of the quantity of the excrements hardned in them: In this caſe they muſt not be too violently forced, but the patient muſt be kept in his bed, and lying with his head low, and his knees higher up; let the following Cataplaſmes be applied.

Another

Another Figure of a man having a Rupture on both sides, shewing by what means, what kind of Trusse, and what shoulder-band he must be bound in each groin.

A. Sheweth the shoulder-band divided in the midst for the putting through of the head.

B. The Truss with two bolsters, between which is a hole for putting through the yard. The form of both bolsters ought to be the same with the former.

℞ *rad. alth. & lil. ana* ℥ij. *semin. lini & fenugr. ana* ℥ss. *fol. malvæ, violæ, pariet. an. m. p.* ℈ß. Let them be boiled in fair water, afterwards beaten, and drawn through a searse, adding thereto of new butter without salt, and oil of Lillies, as much as shall suffice. Make a cataplasme in the form of a liquid pultis. Let it be applied hot to the end and bottome of the belly; by the help of this remedy when it had been applied all night, the guts have not seldome been seen of themselves, without the hand of a Chirurgeon, to have returned into their proper place. The windinesse being resolved, which hindered the going back of the excrements into another gut, whereby they might be evacuated and expelled. But if the excrements will not goe back thus, the flatulencies, yet resisting and undiscussed, an emolliene and carminative clyster is to be admitted, with a little Chymicall oyl of Turpentine, Dill, Juniper or Fennill. Clysters of Muscaline, oyl of Walnuts, and *Aqua vitæ*, and a small quantity of any the aforesaid oyls, are good for the same purpose.

A Cataplasme to soften the excrements,

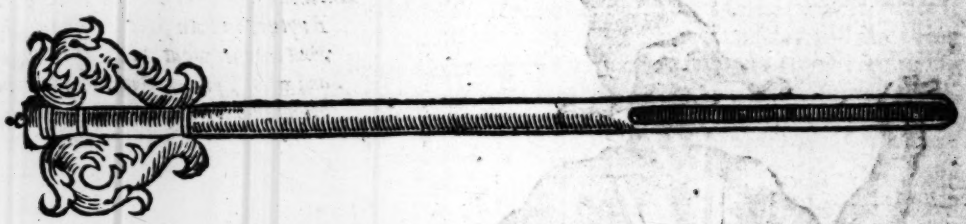
Chymicall oyl.

It often happens that the guts cannot yet be restored, because the protect of the Peritonæum is not wide enough. For when the excrements are fallen down with the gut into the cods, they grow hard by little and little, and encrease by the accesse of flatulencies caused by resolution, which cause such a tumor as cannot be put up through that hole, by which a little before it fell down; whereby it happens that by putrefaction of the matter there contained, come inflammations, and a new accesse of pain, and lastly, a vomiting and evacuation of the excrements by the mouth; being hindered from the other passage, as the fundament. They vulgarly call this affect *Miserere mei*. That you may help this symptome, you must rather allay extreme remedies, than suffer the patient to die by so filthy and loathsome a death. And we must cure it by Chirurgery after this manner following. We will bind the patient lying on his back upon a table or bench, then presently make an incision in the upper part of the cod, not touching the substance of the gut, then we must have a silver Cane or Pipe, of the thickness of a Goose quill, round, and all open in one part thereof, like some-what hollowed in the other, as is shewed by this following Figure.

Another sort

The

The Figure of the Pipe or Cane.



We muſt put it into the place of the inciſion, and put it under the production of the *Peritoneum* being cut together with the cod, all the length of the production, that ſo with a ſharp knife we may divide the proceſs of the *Peritoneum*, according to that cavity ſeparated from the guts there contained, by the benefit of the Cane in a right line not hurting the guts. When you have made an indifferent inciſion, the guts muſt gently be put up into the belly with your fingers, and then ſo much of the cut *Peritoneum* muſt be ſowed up, as ſhall ſeem ſufficient, that by that paſſage made more ſtrait, nothing may fall into the cod after it is cicatrized.

But if there be ſuch abundance of excrements hardned, either by the ſtay or heat of inflammation, that that inciſion is not ſufficient to force the excrements into their place, the inciſion muſt be made longer, your Cane being thruſt up towards the belly: ſo that it may be ſufficient for the free regreſs of the guts into the belly. Then ſow it up as is fit, and the way will be ſhut up againſt the falling down of the gut or kall; the proceſs of the *Peritoneum* being made more ſtrait, by reaſon of the future; for the reſt, the wound ſhall be cured according to Art. But before you undertake this work, conſider diligently whether the ſtrength of the Patient be ſufficient, neither attempt any thing before you have foretold, and declared the danger to the Patients friends.

CHAP. XVI.

Of the golden Ligature, or the Punctus Aureus, *as they call it.*

The Chirurgicall cure by the golden Tie.

IF the Rupture will not be cured by all theſe means, by reaſon of the great ſolution of the continuity of the relax'd or broken *Peritoneum*, and the patient by the conſent of his friends there preſent, is ready to undergoe the danger in hope of recovery; the cure ſhall be attempted by that which they call the *Punctus Aureus*, or Golden tie.

For which purpoſe a Chirurgeon which hath a skilful and ſure hand, is to be imployed. He ſhall make an inciſion about the ſhare bone, into which he ſhall thruſt a Probe like to the Cane, a little before deſcribed; and thruſt it long wayes under the proceſs of the *Peritoneum*, and by lifting it up, ſeparate it from the adjoining fibrous, and nervous bodies, to which it adheres; then preſently draw aſide the ſpermatick veſſels, with the *Cremaſter*, or hanging muſcle of the teſticle; which being done, he ſhall draw aſide the proceſs it ſelf, alone by it ſelf: And he ſhall take as much thereof, as is too lax, with ſmall and gentle mullets, perforated in the midſt, and ſhal with a needle, having five or ſix threds, thruſt it through as neer as he can to the ſpermatick veſſels, and Cremaſter muſcles. But the needle alſo muſt bee drawn again in to the midſt of the remnant of the proceſs, taking up with it the lips of the wound; then the thred muſt be tied on a ſtrait knot, and ſo much thereof muſt be left after the ſection, as may be ſufficient to hang out of the wound. This thred will of it ſelf be diſſolved by little and little by putrefaction: neither muſt it be drawn out before that nature ſhall regenerate and reſtore fleſh into the place of the ligature, otherwiſe all our labour ſhall be ſpent in vain.

And laſtly, let the wound be cleanſed, filled with fleſh, and cicatrized, whoſe callous hardneſs may withſtand the falling of the gut or kall.

Another manner thereof.

There are ſome Chirurgeons who would perform this golden ligature after another manner. They cut the skin above the ſhare bone where the falling down commonly is, even to the proceſs of the *Peritoneum*, and they wrap once or twice about it, being uncovered, a ſmall golden wire, and only ſtraiten the paſſage as much as may ſuffice to amend the looſneſs of this proceſs, leaving the ſpermatick veſſels at liberty; then they twiſt the ends of the wire twice or thrice with ſmall mullets, and cut off the remnant thereof; that which remains after the cutting, they turn in, leſt with the ſharpneſs it ſhould prick the fleſh growing upon it. Then leaving the golden wire there, they cure the wound like to other ſimple wounds, and they keep the patient ſome fifteen or twenty daies in his bed, with his knees ſomething higher, and his head ſomething lower.

Many are healed by this means; others have fallen again into the diſeaſe by reaſon of the ill twiſting of the wire.

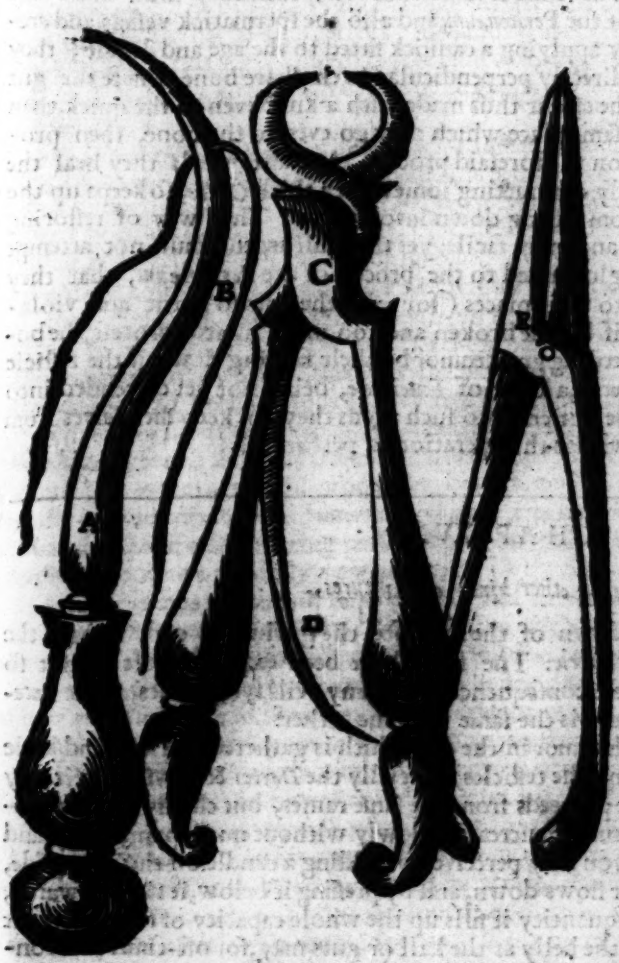
There

There is also another manner of this golden tie, which I judg more quick and safe, even for that there is no externall body left in that part after the cure. Wherefore they wrap a leaden wire in stead of the golden, which comes but once about the process of the *Peritonæum*, then they twine it as much as need requires; that is, not too loosly, lest it should leave way for the falling down of the body, neither too straitly, lest a Gangrene should come by hindring the passage of the spirits and nourishment. The ends thereof are suffered to hang out; when in process of time, this contraction of the *Peritonæum* seems callous, then the wire is untwisted and gently drawn out. And the rest of the cure performed according to Art. But let not the Chirurgeon thrust himself upon his work rashly, without the advice of the Physitian, for it diverse times comes to pass, that the testicles are not as yet fallen down into the cod by the too great sluggishness of nature, in some of a pretty growth, but remains long in the groins, causing a tumor with pain, which thing may make a good Chirurgeon beleeve that it is an *Enterocele*. Therefore whilst he labors by repelling medicines and trusses to force back this tumor, he encreaseth the paine, and hinders the falling down of the testicles into the cod. I observed this not long agoe in a Boy, which an unskilful Chirurgeon had long, and grievously troubled, as if he had had a rupture: for when I had observed that there was but one stone in the cod, and knew the boy was never gelt, I bid them cast away the plaisters and trusses, and wisht his parents that they should suffer him to run and leap, that so the idling stone might be drawn into the cod, which thing by little and little, and without pain, had the event, as I foretold.

the third manner thereof.

A thing to be noted.

A History.



A. *Shewes a crooked needle, having an eye not far from the point, through which you may put the golden wire.*

B. B. *The golden wire put through the eye of the needle.*

C. *The mullets or Pincers, to cut away the waste or superfluous ends of the wire.*

D. *The spring of the mullets.*

E. *The mullets to twist the ends of the wire together.*

That the reason of this affect may be understood, we must know a man differs from a woman, only in efficacy of heat; but it is the nature of strong heat to drive forth, as of cold to keep in. Hence it is that the stones in men hang forth in the cod, but in women they lie hid in the lower belly. Therefore it happens that in some males more cold by nature, the testicles are shut up some certain time, untill at length they are forc't down into the cod by youthfull heat. But that we may return to our former treatise of the cod, although that way of curing ruptures wants not pain and danger, yet it is safer than that which is performed by gelding, which by the cruelty thereof expoſes the patient to manifest danger of death. For the gelders whilst they fear lest when the cure is finished, the relaxation may remain, pull with violence the process of the *Peritonæum* from the parts to which it

adheres, and together with it a nerve of the ſixth conjugation which runs to the ſtones; they offer the ſame violence to the ſpermatick veſſels; by which things enſue great pain, convulſion, efflux of blood, inflammation, putrefaction, and laſtly, death, as I have obſerved in many whom I have diſſected, having died a few daies after their gelding. Although ſome eſcape theſe dangers, yet they are deprived of the faculty of generation for all their life after, for performance whereof, nature hath beſtowed the teſticles, as parts principally neceſſary for the conſervation of mankind. Through which occaſion *Galen* hath not feared to prefer them before the heart; becauſe the heart is the beginning of life, but the teſticles of a better life; for it is far more noble to live well, than ſimply and abſolutely to live; therefore Eunuches degenerate into a womaniſh nature, for they remain without beards, their voice is weak, their courage fails them, and they turn cowards; and ſeeing they are unfit for all humane actions, their life cannot but be miſerable. Wherefore I wil never ſubſcribe to the cutting out of the ſtones, unleſs a *Sarcocele* or Gangrene invade them. But that the way of performing the *Punctus aureus* may be better known, I have thought good here to ſet the inſtruments, by which this operation is performed, before your view.

Lib. de arte medica.

Lib. de ſem.

Another more eaſie and ſafe way to reſtore the gut and kall.

Lib. 3. cap. 33. THeodorick and *Guido* have invented another way of performing this operation. They put back into their places the gut and kall being fallen down, the patient being ſo placed, that his thighs are high and his head is ſomewhat low; then they draw aſide the lower portion of the production of the *Peritonæum*, and alſo the ſpermatick veſſels, and cremaſter muſcle to the *Iſchium*; then by applying a cauſtick fitted to the age and diſeaſe, they burn the other part of the proceſs, directly perpendicular to the ſhare bone, where the gut did fall down. Then they pull off the eſchar thus made with a knife even to the quick, then they apply another cauſtick in the ſame place, which may go even to the bone, then procure the falling of this eſchar made on the foreſaid proceſs. And afterwards they heal the ulcer which remains, which preſently contracting ſomewhat a thick *Callus*, ſo keeps up the guts and kall, that it binds them from falling down into the cod. This way of reſtoring the gut and kall, though it be ſafer and more facile; yet the Chirurgeon muſt not attempt it, if the guts or kall ſtick ſo faſt, agglutinated to the proceſs of the *Peritonæum*, that they cannot be ſevered, nor put back into their places (for from the guts ſo burnt and violated, greater miſchief would enſue) if by the broken and too much dilated proceſs, the bodies thereby reſtrained, make an exceeding great tumor by their falling down; if the teſticle yet lying in the groin as in a *Bubonocele*, a kind of *Enterocele*, being not yet deſcended into the *Scrotum* or cod; if the patients be not come to ſuch age as they can keep themſelves from ſtirring, or hold their excrements whiles the operation is performed.

CHAP. XVIII.

Of the cure of other kinds of Ruptures.

EPiplocele is the falling down of the kall into the groin, or cod, it hath the ſame cauſes as an *Enterocele*. The ſigns have been explained. It is not ſo dangerous, nor infers a conſequence of ſo many evill ſymptomes, as the *Enterocele* doth, yet the cure is the ſame with the other.

What a *Hydrocele* is.

Hydrocele is a wateriſh tumor in the cod, which is gathered by little and little between the membranes encompaſſing the teſticles, eſpecially the *Dartes* & *Erythroides*; it may be called a particular dropſie, for it proceeds from the ſame cauſes, but chiefly from the defect of native heat. The ſigns are a tumor encreaſing ſlowly without much pain, heavy, and almoſt of a glaſſie clearneſs, which you may perceive by holding a candle on the other ſide, by preſſing the cod above, the water flows down, and by preſſing it below, it riſes upwards, unleſs peradventure in too great a quantity it fills up the whole capacity of the cod, yet it can never be forced or put up into the belly as the kall or guts may, for oft-times it is contained in a ciſt or bag; it is diſtinguiſhed from a *Sarcocele*, by the ſmoothneſs and equality thereof. The cure muſt firſt be tried with reſolving, drying and diſcuſſing medicines, repeated often before, and in the Chapter of the dropſie, this which follows I have often tried and with good ſucceſs.

The ſigns.

The Cure.

A medicine to draw forth the contained matter.

℞ *Vng. comitiſſæ, & deſiccat. rub. an.* ℥ij. *malaxentur ſimul*, and make a medicine for your eaſe. The water by this kind of remedy is digeſted and reſolved, or rather dried up, eſpecially if it be not in too great quantity. But if the ſwelling, by reaſon of the great quantity of water, will not yeeld to thoſe remedies, there is need of Chirurgery; the cod and membranes wherein the water is contained, muſt be thruſt through with a Seton, that is, with a large three-ſquare pointed needle, thred with a ſkean of ſilk; you muſt thruſt your needle preſently through the holes of the mullets made for that purpoſe, not touching the ſubſtance of the Teſticles. The ſkean of thred muſt be left there, or removed twice

or

or thrice a day, that the humor may drop down, and be evacuated by little and little. But if the pain be more vehement by reason of the Seton, and inflammation come upon it, it must be taken away, and neglecting the proper cure of the disease, we must resist the symptoms.

Some Practitioners use not a Seton, but with a Razor, or incision knife, they open the lower part of the cod, making an incision some half fingers bredth long, penetrating even to the contained water; alwaies leaving untouched the substance of the testicles and vessels, and they keep the wound open, untill all the water seems evacuated; truly by this only way the cure of a watery rupture whose matter is contained in a cist, is safe, and to be expected; as we have said in our Treatise of Tumors in generall.

What a *Pneumatocele* is.

The *Pneumatocele*, is a flatulent tumor in the cod, generated by the imbecillity of heat residing in the part.

The Cure.

It is known by the roundness, lenity, renitency and shining. It is cured by prescribing a convenient diet, by the application of medicines which resolve and discusse flatulencies, as the seeds of Annis, Fennell, Fænugreek, *Agnus Castus*, Rue, *Origanum*, other things set down by *Avicen* in his Treatise of Ruptures. I have often used with good success for this purpose, *Emplastrum Vigonis cum Mercurio*; and *Emplastrum Diacalcitheos*, dissolved in some good wine, as Muscadine, with oyl of Bayes.

What a *Sarcocele* is.

A *Sarcocele* is a tumor against nature, which is generated about the stones by a scirrhous flesh. Grosse and viscid humors breed such kind of flesh, which the part could not overcome and assimilate to it self; whence this over-abundance of flesh proceeds like as Warts do. *Varices*, or swoln veins often associate this tumor; and it increases with pain. It is known by the hardness, asperity, inequality, and roughness.

The Signs. Prognosticks.

It cannot be cured but by amputation or cutting it away; but you must diligently observe, that the flesh be not grown too high, and have already seized upon the groin, for so nothing can be attempted without the danger of life.

The Cure.

But if any may think, that he in such a case may somewhat ease the patient by the cutting away of some portion of this same soft flesh, he is deceived. For a *Fungus* will grow, if the least portion thereof be but left, being an evill sore worse than the former; but if the tumor be either small or indifferent, the Chirurgeon taking the whole tumor, that is, the testicle tunified through the whole substance, with the process incompassing it, and adhering thereto on every side, and make an incision in the cod, even to the tumor; then separate all the tumid body, that is, the testicle from the cod; then let him thrust a needle with a strong thred in it, through the midst of the process, above the region of the swoln testicle; and then presently let him thrust it the second time through the same part of the process; then shall both the ends of the thred be tied on a knot, the other middle portion of the *Peritonæum* being comprehended in the same knot. This being done, he must cut away the whole process with the testicle comprehended therein. But the ends of the thred, with which the upper part of the process was bound, must be suffered to hang some length out of the wound, or incision of the cod. Then a repercussive medicine shall be applied to the wound, and the neighbouring parts with a convenient ligature. And the cure must be performed as we have formerly mentioned.

What a *Cirsocele* is.

The *Cirsocele* is a tumor of veins dilated, and woven with a various and mutuall implication about the testicle and cod, and swelling with a grosse and melancholy bloud. The causes are the same as those of the *Varices*. But the signs are manifest.

The Cure.

To heal this tumor, you must make an incision in the cod, the bredth of two fingers to the *Varix*. Then you must put under the varicous vein, a needle having a double thred in it, as high as you can, that you may bind the roots thereof: then let the needle be again put after the same manner about the lower part of the same vein, leaving the space of two fingers between the ligatures. But before you bind the thred of this lowest ligature, the *Varix* must be opened in the midst, almost after the same manner as you open a vein in the arm to let bloud: That so this grosse blood causing a tumor in the cod, may be evacuated as is usually done in the cure of the *varices*. The wound that remains shall be cured by the rules of Art after the manner of other wounds: Leaving the threds in it, which presently fall away of themselves. To conclude then, it being grown callous, especially in the upper part thereof, where the vein was bound, it must be cicatrized, for so afterwards the bloud cannot be strained or run that way.

Hernia Humoralis

Hernia Humoralis is a tumor generated by the confused mixture of many humors in the cod, or between the tunicles which involve the testicles, often also in the proper substance of the testicles. It hath like causes, signs and cure as other tumors. While the cure is in hand, rest, trusses, and fit rowlers to sustain and bear up the testicles, are to be used.

CHAP. XVIII.

Of the falling down of the Fundament.

The cauſes.

When the muſcle called the *Sphincter* which ingirts the Fundament is relaxed, then it comes to paſſe that it cannot ſuſtain the right gut. This diſeaſe is very frequent to Children by reaſon of the too much humidity of the belly; which falling down upon that muſcle mollifieth and relaxeth it or preſſeth it down by an unaccuſtomed weight, ſo that the muſcles called *Levatores Ani*, or the lifters up of the Fundament, are not ſufficient to bear up any longer. A great bloudy flux gives occaſion to this effect. A ſtrong endevour to expell hard excrements, the *Hæmorrhoids*, which ſuppreſſed do over-load the right gut, but flowing relax it: Cold, as in thoſe which go without breeches in winter, or ſit a long time upon a cold ſtone, a ſtroak or fal upon the holy-bone, a palſie of nerves which go from the Holy-bone to the muſcles the lifters up of the fundament: the weight of the ſtone being in the bladder.

The cure.

That this diſeaſe may be healed, we muſt forbid the Patient too much drinking, too often eating of broth, and from feeding on cold fruits. For locall medicines the part muſt be fomented with an aſtringent decoction made of the rinds of Pomegranats, galls, myrtles, knotgraſſe, ſhepherds purſe, cypreſs nuts, alum, and common ſalt boiled in ſmiths water or red wine. After the fomentation, let the gut be anointed with oyl of Roſes or myrtles, and then let it be gently put by little and little into its place, charging the child if he can underſtand your meaning, to hold his breath. When the gut ſhall be reſtored, the part muſt be diligently wiped leſt the gut fall down again by reaſon of the ſlipperineſs of the unction. Then let the powder preſcribed for the falling down of the womb be put into the fundament as far as you can: Then you muſt ſtraitly bind the loins with a ſwath, to the midſt whereof behind let another be faſtned which may be tied at the *Pubes* coming along the *Perineum*, ſo to hold up the fundament; the better to contain it in its place, a ſponge dipt in the aſtringent decoction. The patient if he be of ſufficient age to have care of himſelf, ſhall be wiſhed when he goes to ſtool that he ſit upon two pieces of wood being ſet ſome inch a ſunder, leſt by his ſtraining he thruſt forth the gut together with the excrement; but if he can do it ſtanding, he ſhall never by ſtrayning thruſt forth the gut.

Hippocrates his cure.

But if the gut cannot by the preſcribed means be reſtored to its place, *Hippocrates* bids that the Patient hanging by the heels be ſhaken, for ſo the gut by that ſhaking will return to his place: but the ſame *Hippocrates* wiſheth to anoint the fundament, becauſe that remedy having a drying faculty, hath alſo power to reſolve the flatulent humors without any acrimony, by reaſon of which the gut was the leſs able to be contained in his place.

CHAP. XIX.

Of the Paronychia.

What the *Paronychia* is.

The *Paronychia* or *Panaris* is a tumor in the ends of the fingers, with great inflammation, coming of a malign and venemous humor, which from the bones by the *Periosteum* is communicated to the tendons and nerves of that part which it affecteth, whereof cruell ſymptoms do follow, as pulſifique pain, a feaver, reſtleſneſs, ſo that the affected through impatiency of the pain are variouſly agitated like thoſe tormented with Carbuncles: for which cauſe *Guido* and *Johannes de Vigo* judge this diſeaſe to be mortall; wherefore you muſt provide a skilfull Phyſitian for the cure of this diſeaſe, which may appoint convenient diet, purging and blood-leting. In the mean time the Chirurgeon ſhal make way for the virulent and venenate matter, by making inciſion in the inner part of the finger, even to the bone alongſt the firſt joint thereof; for *Vigo* ſaith there is not a preſenter remedy, if ſo be that it be quickly done and before the maturation of the matter; for it vindicates the finger from the corruption of the bone and nerves, and aſſwages pain, which I have often and happily tried immediatly at the beginning, before the perfect impreſſion of the virulencie.

Lib. cap. 4. tract.

But the wound being made you muſt ſuffer it to bleed well, then preſently let him dip his finger in ſtrong and warm vinegar, in which ſome treakle being diſſolved may draw forth the virulencie. But to appeaſe the pain, the ſame remedies muſt be applyed to the affected part as are uſed in Carbuncles, as the leaves of Sorrell, Henbane, Hemlock, Mandrake roaſted under the Embers and beaten in a Morter with new *Vnguentum Populeon*, or oyl of Roſes or new butter without ſalt: for ſuch like medicines alſo helpe forward ſuppuration: whilſt by their coldneſs, they repreſs the extraneous heat affecting the part; and ſo ſtrengthen the native heat being the author of ſuppuration: which reaſon moved the ancient Phyſitians to uſe ſuch medicines in a Carbuncle: but if by reaſon of the fearfulneſs of the patient, or unskilfulneſſe of the Chirurgeon,

no incision being made, a Gangren and Sphacel shall posses the part, it remains that you cut off with your cutting mullets as much of the part as shall be corrupt, and perform the rest of the cure according to Art. Yet it doth not seldome happen that there may be no need to cut off such a finger, because it being corrupted together with the bone by little and little dissolve into a purulent or rather sanious or much stinking sich. But in this affect there is often caused an Eschar by the adustion of putredinous heat, and superfluous flesh indued with most exquisite sense groweth underneath it, which must in like manner be cut off with the Mullets that the part may receive comfort, the pain being asswaged by the copious effusion of blood.

CHAP. XX.

Of the swelling of the Knees.

AFter long and dangerous diseases there oftentimes arise Tumors in the knees, and also in Plethorick bodies and such as have evill juyce after labours and exercise. This kind of disease is frequent because the humor easily falls into the part which hath been heated by labour. But if such tumors follow long diseases, they are dangerous and difficult to cure, and therefore not to be neglected, for bitter pain accompanieth them, because the humor falling thither distends the Membranes, which being many involve the part; besides that this humor participateth of a certain virulent and malign quality whether it be cold or hot, when it hath setled into those parts, being such as we find in the pains of the joynts, and in the bitings of venemous creatures. *Gal. com ad sent. 1 ser. 4. lib. 6. Epid. Gal. Com. ad sent. 64. sect. 2. prog.*

For the cure if the tumor be caused by blood, let a slender and a refrigerating diet be appointed, and phlebotomy for the revulsion of the antecedent cause; divers locall medicines shall be used according to the variety of the four times. But for to asswage the pain, *Anodyne*, or mitigating medicines shall be appointed: of all which we have sufficiently treated in the Chapter of the cure of a Phlegmon. The Cure

And because these parts are of exact sense, if there be necessity to open the tumor, yet must we not do it rashly or unconsiderately, for fear of pain and evill accidents.

This kind of tumor is oft-times raised by wind contained there; in which case the Chirurgeon must be very provident, that he be not deceived with the shew of flowing of the humor, which he seems to perceive by the pressure of his fingers, as if there were matter and humor contained therein, and so be brought to open the tumor. For the wind breaking forth in stead of the humor, causeth evill symptomes by reason of the section rashly made in a part so sensible.

But if waterish humors shall tumefie the part, the body shall first be purged with medicines purging flegm: And then incising, attenuating, rarifying, dissolving and very drying local medicines shall be used.

Of which we have abundantly spoken in the Chapter of the *Oedema*. Yet this humor of divers times lyes deep between the whirl bone and the joint, which causeth it that it cannot be discussed and resolved by reason of the weakness of the part and defect of heat, so that the adventicious humor often moves and excludes the bones from their seat. As I have observed it to have happened to many.

In which cause Irrigations of red wine falling something high, whereby the force of the medicine may enter and more easily penetrate, are much commended.

CHAP. XXI.

Of the Dracunculus.

ICannot chuse, but explain in this place those things which may be spoken of this kind of tumor against nature, which by the antients is called *Dracunculus*. The matter & reason of these hath been variously handled by divers Authors, so that hitherto we have nothing written of them to which we may by right and with good reason adhere as a firm foundation of their essence. It is not as yet sufficiently known what *Dracunculi* are.

For first, for *Galens* opinion, *Lib. 6. de Loc. affect. cap. 3.* The generation, saith he, of those hairs which are evacuated by the urine is worthy no less admiration than the *Dracunculi*, which as they say, in a certain place of *Arabia* breed in the legs of men being of a nervous nature and like worms in colour and thickness.

Therefore seeing I have heard many who have said they have seen them, but I my self never saw them, I cannot conjecture any thing exactly neither of their originall nor essence.

Paulus Ægineta writes that the *Dracunculi* are bred in *India*; and the higher parts of *Egypt*, like worms in the musculous parts of mans body, chiefly in the arms, thighs, and legs; and also creep by the intercostall muscles in children with a manifest motion. *Lib 4. cap. 60.*

But whether they be creatures indeed, or only have the shape of creatures, they must be cured with a hot fomentation, by which the *Dracunculus* raised to a just tumor, may put forth it self, and be plucked away presently with the fingers, also suppurating Cataplasms The cure out of *Ægineta*.

may

may be applyed,compoſed of water, hony,wheat and barly meal.

Cap. 21. lib. 4. ſent. 3. tract. 3. *Avicen* being various,having no certainty whereon to reſt, inclineth one while to this, and another while to that opinion: for now he ſpeaketh of the *Dracunculi* as of creatures, then preſently of a matter and humor ſhut up in a certain place; for the reſt he rightly delivers the cure and eſſence of this diſeaſe,as we ſhall afterwards ſhew.

Lib. 14. cap. ult. *Aetius* ſaith, the *Dracunculi* are like worms, and that they are found ſometimes great, ſometimes ſmall,and that their generation is not unlike to that of flat worms, which are bred in the guts,for they move under the skin,without any trouble,but in proceſs of time, the place becomes ſuppurate about the end of the *Dracunculus*. The skin openeth, and the head thereof is thruſt forth.

But if the *Dracunculus* be pulled it cauſeth great grief; eſpecially if it be broken by too violent pulling. For that which is left cauſeth moſt vehement pain. Wherefore that the creature may not run back,the arm muſt be bound with a ſtrong thred, and this muſt be done every day, that the *Dracunculus* going forward by little and little,may be intercepted by this binding,but not broken off.

The Cure out of *Aetius*.

The place muſt be bathed with *Aqua Mulſa* and oyl in which wormwood or ſouthernwood hath been boyled,or ſome other of thoſe medicines which are preſcribed for the worms of the belly.

But if the *Dracunculus* going forward of its one accord, may be eaſily drawn forth, we muſt do nothing elſe: but if it be turned to ſuppuration we muſt not leave off the Cataplaſms, the *Aqua Mulſa* and anointing with oyl: It was uſuall with him after the taking away of the Cataplaſms,to apply *Emplaſtrum e Baccis Lauri*: but when it is come to ſuppuration the skin muſt be opened long wayes,and the *Dracunculus* ſo laid open muſt be taken away, but the skin muſt be filled with lint, and the reſt of the ſuppurative cure uſed, ſo that the creature being ſuppurated and drawn forth, the wound may be incarnated and cicatrized.

Tractat. 7. cap. 34. *Rhaſis* writeth,that when the part is lifted up into a bliſter,and the vein haſteneth its egreſs,it is good for the Patient to drink the firſt day half a dram of *Aloes*, the next day a whole dram,the third day two drams; and in like manner the place affected muſt be fomented with *Aloes*, for ſo that which lies hid will break forth: that which ſhall come forth muſt be rolled in a pipe of lead,which may equal the weight of a dram ſo that it may hang down,for the vein drawn by the weight will come more forth; and when that which ſhall come forth is grown much and long, it muſt be cut off, but not by the root, but ſo that a portion thereof may remain and hang forth,to which the leaden pipe may be faſtened,for otherwiſe it would withdraw it ſelf into it skin and its lurking hole, and ſo cauſe a putrid and malign ulcer.

The cure out of *Rhaſis*.

Therefore we muſt gently meet with this diſeaſe, and the vein muſt be drawn by little and little out of the body untill it be all come forth that no worſe thing happen: but if by chance it ſhall happen that as much of the vein as ſhall be come forth ſhall be cut off by the roots, then the Ulcer muſt be opened long wayes with an inciſion knife, and that ſo that whatſoever remains thereof may be wholly taken away. Then for ſome dayes the part muſt be anointed with butter untill whatſoever of ſuch a ſubſtance adheres,being conſumed with putrefaction ſhall flow away. Then the Ulcer muſt be cured with ſarcotick things.

His opinion of them.

Therefore *Rhaſis* thus in the ſame text expreſſeth the ſame thing by divers names, and armed with Iron and Lead,he comes to the cure thereof, as if he meant to encounter with ſome fierce beaſt.

Soranus his opinion.

Soranus the Phyſitian,who lived in the times of *Galen*,was of a quite contrary opinion,as *Paulus Ægineta* in the place being before cited,relates of him;as who denies the *Dracunculus* to be a living creature,but only a condenſation of a certain ſmall nerve,which ſeems both to the Phyſitians and Patients to have ſome motion under the skin.

Wherefore *Soranus* ſeems to have come neerer the truth than the reſt, but yet not ſo, as throughly to underſtand,and know the eſſence of this diſeaſe, as we ſhall demonſtrate hereafter.

Epiſt. 2. lib. 7. *Manardus* writes, that the *Dracunculi* are generated of evill and unlaudable blood, groſs, hot,and melancholick,or of aduſt phlegm very much dryed.

Gorræus a moſt learned Phyſitian of our time, *Lib. de Definitionib. medic.* denyes any of our Phyſitians to be able to ſay any thing of the *Dracunculi*,becauſe it is a diſeaſe ſo unfrequent in theſe our regions, that it is ſcarſe ever met withall in practice.

The Author of the Introduction,and Medicinall definitions,defines the *Dracunculus* to be a diſeaſe very like the *Varices*; then cauſing great pain,when increaſing by little,and little, it begins to be moved: Therefore to be cured after the ſame manner, and by the ſame method of Section and inciſion,as the *Varices* are. Which thing chiefly ſeems to have moved *Guido* to refer this kind of diſeaſe to the *Varices* in his Tractate of Impoſtumes, becauſe it hath the ſame cauſe,and is healed with the ſame remedy as the *Varices*.

But ſeeing that divers names have been impoſed upon this diſeaſe by ſeverall writers,yet they have all expreſſed it by the name of a vein, for it is called by *Avicen* and *Guido*, *Vena Meden*,becauſe it is a diſeaſe frequent in the City *Medina*: by *Albucraſis*,*vena civilis*. *Haliabas* hath

hath called it *vena famosa*; others have called it *Vena Cruris* or the leg vein. Truly the contrariety of so many opinions repugnant not only amongst themselves, but also with themselves, easily argueth how little certainty they had of the essence of this disease, who have written of it unto us: To which also this may be added, that none of the latter Physitians have written any things thereof. For although *Jacobus Dalechampius* a man most conversant in every part of Physick, hath written much of this matter in his book of the French Surgery which he set forth some years ago: Yet he hath left us no amplier testimony of his industry, than that he was very diligent in collecting the writings of the Ancients concerning this thing, interposing no judgment of his own, the better to assure us of a thing so controverted.

But my modesty cannot so contain me, but that I shall chuse rather to undergoe the censure of being thought too daring, than (as much as in me lyeth) to suffer this question of the *Dracunculi* to remain longer ambiguous and undecided. Therefore for the present, I will thus order it, that refuting the opinions of the Ancients I may strengthen by certain reasons, my opinion of the essence and cure of this disease.

For first, that *Dracunculi* are no living things, nor like unto worms, nor of like generation as the flat worms of the belly, which was the opinion of *Aetius*, is easie to disprove both by his writings, as also by reason it self. For he writes that the broad worm which he calls *Tenia*, is as it were a certain *Metamorphosis* or transmutation of the inner tunicle of the small guts into a quick living and movable body.

Aetius opinion confuted. *Tract. 9. serm. 1 cap. 40.*

But no man ever said, neither will he confess that the *Dracunculi* hath the material causes of their beginning from the Tunicle of the vein, in which they are closed, or from the fibers of a nervous body, to which often they are adjoined; but much less from the skin under which they lye, may they draw their materiall causes of their originall.

Moreover, neither can there be any generation of worms, nor of any other living creatures whatsoever, who have their originall from putrefaction, unless by the Corruption of some matter, of whose better and more benign part, nature by the force of the vitall heat, produceth some animate body, as *Aristotle* teacheth. Wherefore to produce this effect, it is fit the matter should have such a disposition to putrefaction as is required for the generation of such a creature as they would make the *Dracunculus* to be: It is fit the helping causes should coucur as assistants to the principals in the action. And it is meet the place should be opportune or fit.

4. Meteorolog.

But there may be many causes found which may give life to the *Dracunculi*, for by the common consent of all those who have written of them, their generation proceeds from an humor melancholick, terrestriall and grosse, which by its qualities both by the first coldness and dryness, as also by the second, that is Acidity, is not only thought most unfit of all others for putrefaction, but also is judged to resist putrefaction, as that which is caused by heat and superfluous heat humidity. Besides if the materiall cause of this disease should be from an humor putrefying and turning by putrefaction into some living creature, it was fit there should be stench also, as being an unseparable accident of putrefaction, for thus the excrements in the guts of which the worms are generated, do smell or stink.

Naturall Melancholik humors is most unapt to putrefie. Stink an unseparable companion to putrefaction.

Therefore that which exhales from their bodies which are troubled with the *Dracunculi*, should be stinking, as it happens to those sick of the *Phthisis* or *Lunge-evil*. But none of those who have delivered the accidents or symptomes of the *Dracunculi* are found to have made mention hereof. But for the efficient cause whereby so great heat may be raised in the places next under the skin, by the efficacy whereof such a creature may be formed of a matter melancholick and most unapt to putrefie, as they make the *Dracunculus* to be who faint our bodies to be fruitfull monsters; especially seeing the surface of the body is continually ventilated by the small Arteries spread under the skin, as also by the benefit of insensible transpiration, and breached with the coolness of the air incompassing us. But now the materiall and efficient causes being defective, or certainly very weak, for the generation of so laborious an effect; what coadjutory cause can yeeld assistance? Can the humidity of meats? for those bodies which are fed with warm and moist meats, as milk, Cheese, Summer fruits, usually breed worms, as we are taught by experience in children.

What things usually breed worms.

But on the contrary *Avicen* in the place before cited writeth, that meats of a hot and dry temper chiefly breed this kind of disease, and that it is not so frequent to moist bodies and such as are accustomed to the Bath, moist meats and wine moderately taken. But whether may the condition of the air of those regions in which it is as it were an Endemiall disease, conser any thing to the generation of such creatures? Certainly for this purpose a cloudy, warm and thick air, such as useth to be at the beginning of the Spring when all the places resound with frogs, toads and the like creatures breed of putrefaction.

But on the contrary *Jacobus Dalechampius* by the opinion of all the Physitians that have written of the *Dracunculi*, writes that this disease breeds in the dry and Sun burnt regions of *India* and *Arabia*; but if at the least that part of our body which is next under the skin should have any opportunity to ingender and nourish such creatures, they may be judged to have written that the *Dracunculus* is a living creature with some probability. But if there be no opportunity for generation in that place, nor capacity for the nourishment of such like

Cap. 23. Chir. Gallic.

creatu-

creatures as in the guts, if that region of the body be breathed upon with no warmneſs and ſmothering heat, if it be defiled with none of thoſe groſs excrements, as the guts uſually are, but only by the ſubtiller exhalation, which have an eaſie and inſenſible tranſpiration by the pores of the skin, which may ſeem to be a juſt cauſe of ſo monſtrous and prodigious an effect: but we ſhall little profit with theſe engines of reaſon unleſs we caſt down at once all the Bulwarkes, with which this old opinion of the *Dracunculi* may ſtand and be defended.

Why they are called *Dracunculi*.

For firſt they ſay, why have the ancients expreſſed this kind of diſeaſe by the name of a living thing, that is, of a *Dracunculus* or little Serpent? I anſwer, becauſe in Phyſick names are often impoſed upon diſeaſes rather by ſimilitude than from the truth of the thing; for the confirmation whereof, the examples of three diſeaſes may ſuffice, that of the *Cancer*, *Polypus*, and *Elephas*. For theſe have thoſe names not becauſe any Crab, Polypus, or living Elephant may breed in the Body by ſuch like diſeaſes, but becauſe this by its propagation into the adjacents parts repreſents the feet and claws of a Crab; the other repreſents the fleſh of the Sea-Polypus in its ſubſtance; and the third becauſe ſuch as have the Leproſie have their skin wrinckled, rough, and horrid with ſcales and knots, as the skin of a living Elephant. So truly this diſeaſe of which we now enquire ſeems by good right to have deſerved the name *Dracunculus*, becauſe in its whole conformation, colour, quality and production into length and thickneſs it expreſſeth the image of a Serpent. But whence, will they ſay, (if it be without life) is that manifeſt motion in the matter? We reply that the humor the cauſe of this diſeaſe is ſubtill and hot, and ſo runs with violence into the part whence it may ſeem to move. But when the *Dracunculi* are ſeparated, why do they put their heads as it were out of their holes? We anſwer, in this the Ancients have been very much deceived, becauſe after the ſuppuration the ulcer being opened, ſome nervous body being laid bare, thruſt forth and ſubjected it ſelf to the ſight, which by the convulſive and ſhaking motion might expreſſe the crooked creeping of a Serpent. But they will ſay, pain happens not unleſs to things indued with ſenſe & life, but this *Dracunculus* when he is drawn too violently, eſpecially if he be broken, thereby will cauſe extream pain: We do anſwer, that the concluſion doth not follow & is of no conſequence, for theſe pains happen not unleſſe when the unprovident Surgeon draws or puls in ſtead of the *Dracunculus* ſome nervous or membranous body ſwoln and repleat with an aduſt humor, whence there cannot but be great pain that part being puld which is the author of ſenſe. But it is childiſh to ſay that the *Dracunculus* feels, for that it cauſeth ſharp pains to the living body in which it is. Therefore that at laſt we may determin ſomething of the nature, eſſence and generation of theſe *Dracunculi*, I dare boldly affirm it is nothing elſe but a tumor and abſceſs bred from the heat of the blood in a venenate kind. Such blood driven by the expulſive faculty through the veins to the Externall parts, eſpecially the limits, that is, the Arms and Legs, cauſeth a tumor round and long often ſtretched from the joynt of the ſhoulder even to the wriſt, or from the groin even to one of the Ankles with tenſion, heat, renitency, pricking pain, and a feaver. But this tumor is ſome while ſtretched forth ſtreight, otherwhiles into oblique and crooked tumors, which hath been the cauſe that many taken with this kind of diſeaſe, and having their limbs ſo infolded as with the twinings of a Serpent, would ſay they had a Serpent. I have thus much to ſay of the *Dracunculi*, eſpecially of thoſe of our own country.

The Cure.

For the cure, it is not unlike to the cure of a Phlegmon ariſing from a defluxion, for here alſo in like manner the remedies muſt be varied according to the four times of the diſeaſe, and the ſame rule of diet, phlebotomy and purging muſt be obſerved, which is before preſcribed in the cure of a Phlegmon.

So the *Malum pilare* in *Ariſtotle cap.* 11. *lib.* 7. *hiſt. animal.*

The mention of the *Dracunculi* cals to my memory another kind of Abſceſſe, altogether as rare. This our *French* men name *Cridones*, I think *a Crinibus*. i. from hayrs: it chiefly troubles children and pricks their backs like thorns. They toſs up and down being not able to take any reſt. This diſeaſe ariſeth from ſmall hairs which are ſcarſe of a pins length, but thoſe thick & ſtrong. It is cured with a fomentation of water more than warm, after which you muſt preſently apply an oyntment made of hony and wheaten flower; for ſo theſe hairs lying under the skin are allured and drawn forth; and being thus drawn, they muſt be plucked out with ſmall mullets. I imagine this kind of diſeaſe was not known to the ancient Phyſitians.

The End of the Eighth Book.

OF VVOUNDS IN GENERALL.

The Ninth Book.

CHAP. I.

What a wound is, what the kinds and differences thereof are, and from whence they may be drawn, or derived.

A Wound is a solution of Continuity, caused by a stroak, fall, or bite, newly done, bloody and with putrefaction and filth. They also call it a new simple ulcer; for the solution of continuity happens to all parts of the body; but according to the diversity of parts, it hath divers names amongst the Greeks. For in the flesh it is called *Helcos*, in the bone *Catagma*, in the nerve *Spasma*, in the ligament *Thlasma*, in the vessels *Apospasma*, in the Muscles *Ragma*: and that solution of continuity, which happens in the vessels, their mouths being open, is termed *Anastomasis*, that which happens by erosion, *Aneurosis*; that which is generated by sweating out and transcolation, *Diapedesis*. That these may be the more easily understood, I have thought good to describe them in the following table.

What a Wound properly is.

Divers appellations of wounds according to the varieties of the parts.

A Table of the differences of Wounds.

The differences of wounds are drawn or taken

- From the nature of the parts in which they are made or happen. But these parts are
  - Either similar, and these,
    - Either soft, as the
      - Glandules,
      - Flesh,
      - Fat,
      - Marrow.
    - Or hard, as
      - A Bone,
      - A Gristle.
    - Or of a middle consistence, as the
      - Membranes,
      - Ligaments,
      - Fibers,
      - Vessels,
      - Nerves,
      - Veins,
      - Arteries.
  - Or Organicall, and these either
    - Principall, as the
      - Brain,
      - Heart,
      - Liver, to which same add the Womb and Testicles.
    - Or serving the principall, as
      - The Weasan,
      - Lungs,
      - Gullet,
      - Stomach,
      - Guts,
      - Bladder.
    - Or neither
      - The Ears,
      - Nose,
      - Feet,
      - hands, and
      - other of the same kind.

from

- From their proper essence, from whence they are called,
  - Simple wounds — When there is no complication of any other disease or symptome besides.
  - Or compound, — When there is a complication of some one or more diseases, which unlesse they be taken away, wee must not hope for to cure the wound.
- From their quantity according to which they are called,
  - Great, — Long, Broad, Deep.
  - Indifferent, — Short, Narrow, Superficiary.
  - Little,
- From their figure, according to which they are named,
  - Streight,
  - Oblique,
  - Cornered.

CHAP. II.

Of the causes of Wounds.

Divers denominations from their causes.

ALL things which may outwardly assail the body with force and violence, may be counted the causes of wounds; which are called green, and properly bloody. These things are either animate, or inanimate. The animate, as the bitings, and prickings of beasts. The Inanimate, as the stroak of an arrow, sword, club, gun, stone, a dagger, and all such like things.

From the variety of such like causes, they have divers names: for those which are made by sharp and pricking things are called punctures: those caused by cutting things, are called wounds or gashes: and those which are made by heavy and obtuse things are named Contusions, or wounds with contusions.

CHAP. III.

Of the signs of Wounds.

A caution for making reports of Wounds.

WOunds are first known by sight, and by the signs drawn from thence. The Chirurgeon ought first and chiefly, to consider, what wounds are curable, and what not; what wounds will scarse admit of cure, and what may be easily cured; for it is not the part of a prudent Chirurgeon, to promise cure in a deadly or dangerous and difficult wound; lest he may seem to have killed him, whom not the unsufficiency of the Art, but the greatnesse of the wound hath slain.

But when the wound is dangerous, but yet without despair of recovery, it belongs to him to admonish the Patients friends which are by, of the present danger, and doubtfull state of the wound, that if Art shall be overcome by the greatnesse thereof, he shall not be thought ignorant of the Art, neither to have deceived them.

A Jugling cheating Chirurgeon.

But as this is the part and duty of a good and prudent Chirurgeon, so it is the trick of a cheating and jugling knave, to enlarge small wounds, that so he may seem to have done a great cure, when it is nothing so.

But it is agreeable to reason, that the Chirurgeon professing the disease easie to be cured, will think himself in credit bound by such promises and his duty, and therefore seek all means for the quick recovery of the Patient; lest that which was of its own nature smal, may by his negligence become great. Therefore it is expedient, he should know what wounds are to be accounted great.

Lib. 4. Meth. cap. 6. 1.

This (as *Galen* saith) is three wayes to be known; The first is by the magnitude and principality of the part affected; for thus the wounds of the Brain, Heart, and of the greater vessels, though small of themselves, yet are thought great. Then from the greatnes of the solution of continuity; for which cause wounds may be judged great, in which much of the substance of the part is lost in every dimension, though the part be one of these which are accounted servile. Then from the malignity; through which occasion the wounds of the joints are accounted great, because for the most part, they are ill conditioned.

Wounds are called great out of three respects.

CHAP.

CHAP. IIII.

Of Prognosticks to be made in Wounds.

THose Wounds are thought dangerous, wherein any large nerve, vein, or Artery are hurt. From the first there is fear of convulsion, but from the other large effusion of the veinous, or arterious blood, whence the powers are debilitated; also these are judged evill, which art upon the arm pits, groins, lesks, joynts and between the fingers; and likewise those which hurt the head or tail of a Muscle. They are lest dangerous of all other which wound only the fleshy substance. But they are deadly which are inflicted upon the Bladder, Brain, Heart, Liver, Lungs, Stomach and small guts. But if any Bone, Gristle, Nerve or portion of the cheek or prepuce, shall be cut away, they cannot be restored. Contused wounds are more difficult to cure, than those which are only from a simple solution of continuity; for before you must think to heal them up, you must suppurate and clense them; which cannot be done in a short time. Wounds which are round and circular are so much the worse; for there can be no unity unlesse by an angle, that is, a meeting together of two lines, which can have no place in round wounds, because a circular figure consists of one oblique line. Besides, wounds are by so much thought the greater, by how much their extreams and lips are the further disjoyned, which happens to round Wounds. Contrary to these are cornered wounds or such as are made alongst the fibers, as such as may be easily healed.

What wounds are dangerous.

What least dangerous. What deadly; *Hip. apbor. 14. Lib. 6.*

Why round Wounds are difficult to heal.

Wounds may be more easily healed in young men, than in old, because in them nature is more vigorous, and there is a greater plenty of fruitfull, or good blood, by which the losse of the flesh may be the better and more readily restored, which is slowlier done in an old body, by reason their blood is smaller in quantity and more dry, and the strength of nature more languid.

Wounds received in the Spring, are not altogether so difficult to heal as those taken in Winter or Summer. For all excesse of heat and cold is hurtfull to them, it is ill for a convulsion to happen upon a Wound, for it is a sign that some Nervous body is hurt; the braine suffering together therewith, as that which is the originall of the Nerves. A Tumor comming upon great Wounds is good; for it shews the force of nature is able to expell that which is harmfull, and to ease the wounded part. The organicall parts wholly cut off cannot again be united: because a vitall part once severed and plucked from the trunk of the body cannot any more receive influence from the heart as from a root without which there can be no life. The loosed continuity of the Nerves, Veins, Arteries, and also the bones, is sometimes restored, not truly, and as they say, according to the first intention, but by the second, that is, by reposition of the like, but not of the same substance. The first intention takes place in the fleshy parts by converting the Alimentary bloud into the proper substance of the wounded part. But the second, in the spermatique parts in which the lost substance may be repaired by interposition of some heterogeneous body, which nature, diligent for its own preservation, substitutes in place of that which is lost: for thus the body, which restores and agglutinates, is no bone but a *Callus*, whose originall matter is from an humor somewhat grosser than that, from whence the bones have their originall and beginning.

Hip. lib. de ulcer. Hip. aph. 66. lib. 3.

What a *Callus* is and whence it proceeds.

This humor, when it shall come to the place of the fracture, agglutinateth the ends of the bones together, which otherwise could never be so knit by reason of their hardnes. The bones of children are more easily and speedily united by reason of the pliantnes of their soft and tender substance. Lastly we must here admonish the Chirurgeon, that small Wounds and such as no Artisan will judg deadly, do divers times kill by reason of a certain occult and ill disposition of the wounded, and incompassing bodies; for which cause we read it observed by *Hippocrates*, that it is not sufficient for the Physitian to performe his duty, but also externall things must be rightly prepared, and fitted.

Small and contemptible Wounds often prove mortall.

Aphor. 1. sect. 1.

CHAP. V.

Of the Cure of Wounds in generall.

THe Chirurgeon ought for the right cure of wounds to propose unto himself the common and generall indication: that is, the uniting of the divided parts, which indication in such a case is thought upon and known even by the vulgar: for that which is dis-joyned desires to be united, because union is contrary to division. But by what means such union may be procured, is only known to the skilfull Artisan. Therefore we attain unto this chief and principall Indication by the benefit of nature as it were the chief Agent, and the work of the Chirurgeon as the servant of nature. And, unless nature shall be strong, the Chirurgeon shall never attain to his conceived and wished for end: therefore that he may attain hereto, he must perform five things; the first is, that if there be any strange bodies, as peeces of Wood, Iron, Bones, bruised flesh, congealed blood, or the like, whether they have come from without, or from within the body, and shall be by accident fastened or stuck in the wound, he must take them away, for otherwise there is no union to be expected.

The generall Indication of Wounds.

Five things necessary for uniting wounds.

Another is, that he join together the lips of the Wound; for they cannot otherwiſe be agglutinated and united. The third is, that he keep cloſe together the joined lips. The fourth, that he preſerve the temper of the wounded part, for the diſtemper remaining, it is impoſſible to reſtore it to its unity. The fifth is, that he correct the accidents, if any ſhall happen, becauſe theſe urging, the Phyſitian is often forced to change the order of the cure.

All ſtrange and externall bodies muſt be taken away, as ſpeedily as is poſſible, becauſe they hinder the action of nature intending unity, eſpecially if they preſs or prick any Nervous body, or Tendon, whence pain or an Abſceſs may breed in any principall part, or other ſerving the principall.

Yet if by the quick and too haſty taking forth of ſuch like bodies there be fear of cruell pain or great effuſion of blood, it will be far better to commit the whole work to nature than to exaſperate the Wound by too violent haſtening.

For nature by little and little will exclude, as contrary to it, or elſe together with the *Pus*, what ſtrange body ſoever ſhall be contained in the wounded part. But if there ſhall be danger in delay, it will be fit the Chirurgeon fall to work quickly, ſafely, and as mildly as the thing will ſuffer: for effuſion of blood, ſwooning, convulſion and other horrid ſymptomes, follow upon the too rough and boyſtrous handling of Wounds, whereby the Patient ſhall be brought into greater danger than by the Wound it ſelf.

Therefore he may pull out the ſtrange bodies, either with his fingers, or with inſtruments, fit for that purpoſe: but they are ſometimes more eaſily and ſometimes more hardly pulled forth, according as the body infixed is either hard or eaſie to be found or pulled out. Which thing happens according to the variety of the figure of ſuch like bodies, according to the condition of the part it ſelf, ſoft, hard, or deep, in which theſe bodies are faſtened more ſtraitly or more looſly: and then for fear of inferring any worſe harm, as the breaking of ſome Veſſell: but how we may perform this firſt intention, and alſo the expreſſion of the inſtruments neceſſary for this purpoſe, ſhall be ſhown in the particular treaties of Wounds made by Gun-ſhot, Arrows and the like.

Ligatures and Sutures for to conjoyn and hold together the lips of wounds.

But the Surgeon ſhal attain to the ſecond and third ſcope of curing Wounds by two and the ſame means, that is, by ligatures & ſutures: which notwithſtanding before he uſe he muſt well obſerve whether there be any great flux of blood preſent, for he ſhall ſtop it if it be too violent; but provoke it, if too ſlow, (unleſs by chance it ſhall be powred out into any capacity or belly) that ſo the part freed from the ſuperfluous quantity of blood may be leſs ſubject to inflammation. Therefore the lips of the Wound ſhall be put together, and ſhall be kept ſo joined by ſuture and ligatures: Not truly of all, but only of thoſe which both by their nature, and magnitude, as alſo by the condition of the parts in which they are, are worthy and capable of both the remedies. For a ſimple and ſmall ſolution of continuity, ſtands only in need of the Ligature which we cal incarnative, eſpecially, if it be in the Arms or Legs, but that which divides the Muſcles tranverſly, ſtands in need of both Suture and Ligature; that ſo the lips which are ſomewhat far diſtant from each other, and as it were drawn towards their beginning, and ends may be conjoyned.

If any portion of a fleſhy ſubſtance by reaſon of ſome great cut ſhall hang down, it muſt neceſſarily be adjoyned and kept in the place by Suture. The more notable and large Wounds of all the parts, ſtand in need of Suture, which do not eaſily admit a Ligature, by reaſon of the figure and ſite of the part in which they are, as the Ears, Noſe, Hairy-ſcalp, Eye-lids, lips, Belly and Throat.

Three ſorts of Ligatures. Whatan incarnative Ligature is.

There are three ſorts of Ligatures, by the joint conſent of all the Ancients. They commonly call the firſt, a Glutinative, or Incarnative; the ſecond Expulſive, the third Retentive. The Glutinative or Incarnative is fit for ſimple, green and yet bloody Wounds. This conſiſts of two ends, and muſt ſo be drawn, that beginning on the contrary part of the Wound, we may ſo go upwards, partly croſſing it, and going downwards again, we may cloſely joyn together the lips of the Wound. But let the Ligature be neither too ſtrait, leſt it may cauſe inflammation or pain; nor too looſe, leſt it be of no uſe, and may not well contain it.

What an expulſive.

The Expulſive Ligature is fit for ſanious and fiſtulous Ulcers, to preſs out the filth contained in them. This is performed with one Rowler, having one ſimple head; the beginning of binding muſt be taken from the botome of the *Sinus*, or boſome thereof; and there it muſt be bound more ſtraitly, and ſo by little and little going higher, you muſt remit ſome-thing of that rigour, even to the mouth of the Ulcer, that ſo (as we have ſaid) the ſanious matter may be preſſed forth.

What the retentive.

The Retentive Ligature is fit for ſuch parts as cannot ſuffer ſtrait binding, ſuch are the Throat, Belly, as alſo all parts oppreſſed with pain; For the part vexed with pain, abhorreth binding. The uſe thereof, is to hold to locall Medicines. It is performed with a Rowler, which conſiſts ſomewhiles of one, ſome whiles of more heads. All theſe Rowlers ought to be of linnen, and ſuch as is neither too new, nor too old, neither too courſe, nor too fine. Their breadth muſt be proportionable to the parts to which they ſhal be applied; the indication of their largeneſs, being taken from their magnitude, figure and ſite. As we ſhall ſhew more at large in our Tractates of Fractures and Diſlocations.

What the rowlers muſt be made of.

The

The Chirurgeon ſhall perform the firſt ſcope of curing Wounds, which is of preſerving the temper of the Wounded part, by appointing a good order of diet by the Preſcript of a Phyſitian, by uſing univerſall and locall Medicines. A ſlender, cold and moiſt Diet muſt be obſerved, untill that time be paſſed, wherein the Patient may be ſafe and free from accidents which are uſually feared. Therefore let him be fed ſparingly, eſpecially if he be plethorick; he ſhall abſtain from ſalt and ſpiced fleſh, and alſo from Wine; If he ſhall be of a cholerick or ſanguine nature: In ſtead of Wine he ſhall uſe the decoction of Barly or Liquorice, or Water and Sugar. He ſhall keep himſelf quiet; for reſt is (in *Celſus* opinion) the very beſt Medicine. He ſhall avoid Venery, Contentions, Brawls, Anger, and other perturbations of the mind. When he ſhall ſeem to be paſt danger, it will be time to fall by little and little to his accuſtomed manner and diet of life. Univerſall remedies are Phlebotomies and purging, which have force to divert and hinder the defluxion, whereby the temper of the part might be in danger of change.

Why and how the temper of the wounded part muſt be preſerved.

For Phlebotomy it is not alwayes neceſſary, as in ſmall Wounds and bodies, which are neither troubled with ill humors, or Plethorick: But it is only required in great Wounds, where there is fear of defluxion, pain, *Delirium*, Raving and unquietneſs; and laſtly in a body that is Plethorick, and when the joynts, tendons, or nerves are wounded. Gentle purgations muſt be appointed, becauſe the humors are moved and inraged by ſtronger; whence there is danger of defluxion and inflammation: wherefore nothing is to be attempted in this caſe, without the advice of a Phyſitian.

In what wounds bloodletting is not neceſſary.

The Topick and particular Medicines are Agglutinative, which ought to be indued with a drying and aſtrictive qnality, whereby they may hold together the lips of the Wound, and drive away defluxion, having alwayes regard to the nature of the part and the greatneſs of the diſeaſe. The Simple Medicines are *Olibanum*, *Aloes*, *Sarcocolla*, *Bole-Armenick*, *Terra ſigillata*, *Sanguis Draconis*, Common and Venice, Turpentine, Gum, *Elemni*, Plantane, Horſe-tail, the greater Comfery, *Parina Volatilis* and many other things of this kind, which we ſhall ſpeak of hereafter in our Antidotary.

What medicines are to be judged agglutinative.

The fifth ſcope of healing Wounds, is the correction of thoſe Symptomes or Accidents which are accuſtomed to follow Wounds, which thing verily makes the Chirurgeon have much to do; For he is often forced to omit the proper cure of the diſeaſe, ſo to reſiſt the accidents and ſymptomes, as bleeding, pain, inflammation, a feaver, convulſion, palſie, talking idly, or diſtraction, and the like. Of which we ſhall treat briefly and particularly, after we have firſt ſpoken of Sutures as much as we ſhall think fitting for this place.

CHAP. VI.

Of Sutures.

What wounds ſtand in no need of a ſuture.

WHen Wounds are made alongſt the thighes, legs, and arms, they may eaſily want Sutures, becauſe the ſolution of continuity is eaſily reſtored by Ligatures, but when they are made overthwart, they require a Suture, becauſe the fleſh and all ſuch like parts, being cut are drawn towards the ſound parts; whereby it comes to paſs that they part the further each from other; wherefore that they may be joyned and ſo kept, they muſt be ſowed, and if the Wound be deep, you muſt take up much fleſh with your needle; for if you only take hold of the upper part, the Wound is only ſuperficially healed: but the matter ſhut up, and gathered together in the bottome of the Wound, will cauſe abſceſſes and hollow Ulcers: Wherefore now we muſt treat of making of Sutures.

The firſt manner of ſuture.

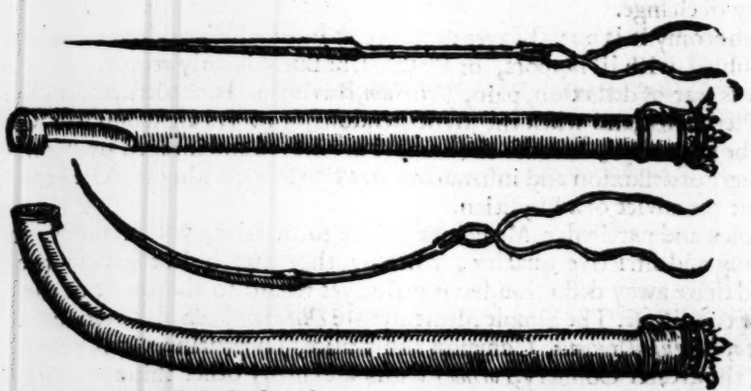
The firſt, called *Interpunctim*, leaves the diſtance of a fingers breadth, and therefore is fit for the green Wounds of the fleſhy parts, which cannot be cured with a Ligature, and in which no heterogeneous or ſtrange body remains; It is performed after this manner. You muſt have a ſmooth needle with a thred in it, having a three ſquare point, that ſo it may the better enter the skin, with the head of it ſomewhat hollowed, that the thred may lie therein; for ſo the needle will the better go through. You muſt alſo have a little pipe with a hole or window in the end, which you muſt hold and thruſt againſt the lip of the Wound, that it be not moved to the one ſide or other, whilſt you thruſt through the needle: And that we may ſee through that Window when the needle is thruſt through, and alſo draw it together with the thred, and withall hold the lip of the Wound in more firmly, that it follow not at the drawing forth of the needle and thred. Having thus pierced the lips of the Wound, tie a knot, neer to which cut off the thred; leſt that if any of it be left below the knot, it may ſo ſtick to the Emplaſters that it cannot be plucked and ſeparated from them without pain, when they are taken off. But you muſt note the firſt ſtitch muſt be thruſt through the midſt of the Wound, and then the ſecond muſt be in that ſpace which is between the midſt and one of the ends; but when you have made your ſtitches, the lips of the Wound muſt not bee too cloſely joined, but a little ſpace muſt be left open between them, that the matter may have free paſſage forth, and inflammation and pain may be avoided: otherwiſe if they ſhall be cloſely joined together without any diſtance between, a tumor after ariſing when the matter ſhall come to ſuppuration, the lips will

The form of your needle.

The form of the pipe with a window in it.

be ſo much diſtended that they may eaſily be broken by the ſtifneſs of the thred. But you muſt neither take hold of too much nor too little fleſh with your needle, for too little will not hold, and too much cauſeth pain and inflammation. And beſides leaves an ill favoured ſcar. Yet in deep wounds, ſuch as are thoſe which are made in the thicker muſcles, the needle muſt be thruſt home, that ſo it may comprehend more of the fleſhy ſubſtance; leſt the thred drawn away by the weight of the fleſh not taken hold of, may be broken. But oft-times wounds are ſeen made in ſuch places as it would be needfull, the Chirurgeon ſhould have a crooked needle and pipe, otherwiſe the Suture will not ſucceed according to his deſire. Wherefore I have thought good to ſet forth both their figures, that you may uſe either as occaſion ſhalll ſerve.

The Figure of Pipes with feneſtels in them, and Needles fit for Sutures.



The 2. means of Suture.

The ſecond Suture is made juſt after the ſame manner as the Skinner ſows their fels or furs. And the guts muſt be ſowed with this kind of Suture, (if they ſhall be at any time wounded) that the excrements come not forth by the wound.

The third manner of Suture.

The third Suture is made by one or more needles having thred in them, thruſt through the wound, the thred being wrapped to and again at the head and the point of the needle, as boyes uſe to faſten their needle, for fear of loſing it, in their caps, or clothes. This kind of Suture is fit in the curing and healing of Hare-lips, as we ſhall ſhew you hereafter expreſſed by a Figure.

The 4. kind of Suture termed *Gaſtroraphia*.

The fourth kind of Suture is termed *Gaſtroraphia*, invented for the reſtoring and uniting the great Muſcles of the *Epigaſtrium*, or lower belly, cut with a great wound together with the *Peritoneum* lying under them. The manner whereof we ſhall ſhew in due place.

The 5. kind called the Dry Suture.

The fifth kind is called the dry Suture, which we uſe only in the wounds of the face, which alſo we will deſcribe in its proper place.

CHAP. VII.

Of the flux of blood, which uſually happens in Wounds.

The ſigns of blood flowing from an artery.

OFt-times great bleeding follows upon wounds, by reaſon of ſome veſſel cut, broken, or torn, which there is need to heal and help diligently, becauſe the blood is the treaſure of nature, without which life cannot conſiſt. The blood which floweth from an Artery, is thus known. It is more ſubtile, it runs forth as it were leaping, by reaſon of the vitall ſpirit contained together with it in the Arteries. On the contrary that which floweth from a Vein is more groſs, black, and ſlow. Now there are many wayes of ſtanching blood.

The firſt way of ſtaying bleeding.

The firſt and moſt uſuall is that, by which the lips of the Wound are cloſed, and unleſs it be ſomewhat deep, are contained by Medicines which have an aſtringent, cooling, drying, and glutinous faculty; As *terræ ſigill. Bali Armeni, ana* ℥ ß, *Thuris, Maſtichis, Myrrhæ, Aloes, ana* ʒ ij, *Farinæ volat. molend.* ℥ j, *Fiat pulvis qui albumine ovi exſipiatur.* Or ℞. *Thuris & Aloes, ana partes æquales*. Let them be mixt with the white of an Egge, and the down of a hare, and let the pledgets be dipped in theſe Medicines, as well thoſe which are put unto the Wound as thoſe which are applyed about it. Then let the Wound be bound up with a double clop and fit Ligature, and the part be ſo ſeated as may ſeem the leaſt troubleſome and moſt free from pain.

The 2. manner of ſtanching it.

But if the blood cannot be ſtayed by this means, when you have taken off all that covereth it, you ſhall preſs the Wound and the orifice of the Veſſell with your thumb, ſo long untill the blood ſhall be concrete about it, into ſo thick a clot as may ſtop the paſſage.

The 3. way by binding of the veſſels.

But if it cannot be thus ſtayed, then the Suture (if any be) muſt be opened, and the mouth of the Veſſell towards the originall or root, muſt be taken hold of, and bound with your needle and thred, with as great a portion of the fleſh as the condition of the part will permit. For thus I have ſtaid great bleedings, even in the amputation of members, as I ſhall ſhew in fit place. To perform this work, we are often forced to divide the skin

which

which covereth the wounded veſſell. For if the Jugular vein, or Artery be cut, it will contract and with draw it ſelf upwards and downwards. Then the skin it ſelf muſt be laid open under which it lyeth, and thruſting a needle and thred under it, it muſt be bound as I have often done. But before you looſe the knot, it is fit the fleſh ſhould be grown up, that it may ſtopt the mouth of the veſſell, leſt it ſhould then bleed.

An admonition

But if the condition of the part ſhall be ſuch as may forbid this comprehenſion; and binding of the veſſell, we muſt come to *Eſcharoticks*, ſuch as are the powder of burnt *Vitriol*, the powder of Mercury, with a ſmall quantity of burnt Allum; and Cauſticks which cauſe an Eſcar. The falling away of which muſt be left to nature, and not procured by art, leſt it ſhould fall away before that the orifice of the veſſell ſhall be ſtopt with the fleſh, or clotted blood.

The 4. way by Eſcharoticks.

But ſometimes it happens that the Chirurgeon is forced wholly to cut off the veſſell it ſelf, that thus the ends of the cut veſſell withdrawing themſelves, and ſhrincking upwards and downwards, being hidden by the quantity of the adjacent and incompaſſing parts, the flux of the blood, which was before not to be ſtaid, may be ſtopped with leſſe labour. Yet this is an extream remedy and not to be uſed, unleſſe you have in vain attempted the former.

The 5. way by cutting off the veſſell.

CHAP. VIII.

Of the pain which happens upon wounds.

THe pains which follow upon wounds ought to be quickly aſſwaged, becauſe nothing ſo quickly dejects the powers, and it alwayes cauſes a defluxion, of how good ſoever a habit and temper the body be of; for Nature ready to yeeld aſſiſtance to the wounded part, alwayes ſends more humors to it, than are needfull for the nouriſhment thereof, whereby it comes to paſſe that the defluxion is eaſily increaſed, either by the quantity, or quality, or by both.

Pain weakens the body, and cauſes defluxions.

Therefore to take away this pain, the author of defluxion, let ſuch medicines be applyed to the part as have a repelling and mitigating faculty; as ℞. *Olei Myrtili, & Roſarum, ana* ℥ ij, *Ceræ alb.* ℥ i, *Farinæ hordei,* ℥ ſs, *Boli armeni, & terræ ſigillat. ana* ʒ vj, Melt the Wax in the oyls, then incorporate all the reſt, and according to Art, make a medicine to be applyed about the part: or ℞. *Emplaſt. Diacalcith.* ℥ iv, *Ole. Roſar. & aceti, ana* ℥ ß, *liquifiant ſimul*, and let a medicine be made for the fore mentioned uſe. Irrigations of oyl of Roſes and Myrtiles, with the white of an Egge, or a whole Egge added thereto, may ſerve for lenitives, if there be no great inflammation; Rowlers and double cloaths moyſtened in Oxycrate, will be alſo convenient for the ſame purpoſe. But the force of ſuch medicines muſt be often renewed, for when they are dryed, they augment the pain. But if the pain yeeld not to theſe, we muſt come to narcotick Medicines, ſuch as are the Oyl of Poppy, of Mandrake, a cataplaſm of Henbane and Sorrell, adding thereto Mallows and Marſh-mallows, of which we ſpoke formerly in treating of a Phlegmon.

Divers anodynes or medicins to aſſwage pain.

Laſtly, we muſt give heed to the cauſe of the pain, to the kind and nature of the humor that flows down, and to the way which nature affects: for according to the variety of theſe things, the Medicines muſt be varied, as if heat cauſe pain, it will be aſſwaged by application of cooling things; and the like reaſon obſerved in the contrary; if Nature intend ſuppuration, you muſt help forwards its indeavours with ſuppurating medicines.

CHAP. IX.

Of Convulſion by reaſon of a Wound.

A Convulſion is an unvoluntary contraction of the Muſcles (as of parts movable at our pleaſure) towards their originall, that is, the Brain and Spinall Marrow, for by this the convulſed member or the whole body (if the convulſion be univerſall) cannot be moved at our pleaſure. Yet motion is not loſt in a Convulſion as it is in a Palſie, but it is only depraved: and becauſe ſometimes the Convulſion poſſeſſeth the whole body, otherwhiles ſome part thereof, you muſt note that there are three kinds of Convulſions in generall.

What a Convulſion is.

The firſt is called by the Greeks *Tetanos*, when as the whole body grows ſtiffe like a ſtake that it cannot be moved any way.

Three kinds of an univerſall Convulſion.

The ſecond is called *Opiſthotonos*, which is when the whole body is drawn backwards.

The third is termed *Emproſthotonos* which is when the whole body is bended or crooked forwards. A particular Convulſion is, when as the Muſcle of the Eye, Tongue, and the like parts which is furniſhed with a Nerve, is taken with a Convulſion. Repletion or Inanition, Sympathy or conſent of pain cauſe a Convulſion. Abundance of humors cauſe Repletion, dulling the body by immoderate eating and drinking, and omiſſion of exerciſe, or any accuſtomed evacuation, as ſuppreſſion of the Hemorrhoides, and courſes: for hence are ſuch like excrementitious humors drawn into the Nerves, with which they being replete and filled, are dilated more than is fit, whence neceſſarily becoming

Three cauſes of a Convulſion. Cauſes of Repletion.

more ſhort, they ſuffer Convulſion. Examples whereof appear in Leather and Lute or Viol-ſtrings, which ſwoln with moiſture in a wet ſeaſon are broken by repletion.

Cauſes of Inanition.

Immoderate vomitings, fluxes, bleedings, cauſe Inanition or Emptineſs, wherefore a Convulſion cauſed by a wound, is deadly: as alſo by burning feavers. For by theſe and the like cauſes, the inbred & primogeneous humidity of the Nerves is waſted, ſo that they are contracted like leather which is ſhrunk up, by being held too neer the fire, or as fidle ſtrings which dryed with Summers heat, are broken with violence, ſuch a convulſion is incurable: For it is better a Feaver follow a Convulſion, than a Convulſion a Feaver; as we are taught by *Hippocrates*, ſo that ſuch a Feaver be proportionall to the ſtrength of the convulſitique cauſe, and the Convulſion proceed from Repletion; for the abundant and groſs humor cauſing the Convulſion is digeſted and waſted by the feaveriſh heat.

Aph. 26. ſec. 2.

Cauſes of convulſion by conſent of pain.

The cauſes of a convulſion by reaſon of pain, are either the puncture of a Nerve, whether it be by a thing animal, as by the biting of a venemous beaſt; or by a thing inanimate, as by the prick of a needle, thorn or pen-knife; or great & piercing cold, which is hurtfull to the wounds, principally of the nervous parts; whereby it comes to paſs, that by cauſing great and bitter pain in the nerves they are contracted towards their originall, that is, the Brain, as if they would crave ſuccour from their parents in their diſtreſſed eſtate. Beſides alſo, an ill vapour carried to the brain from ſome putrefaction ſo vellicateth it, that contracting it ſelf, it alſo contracteth together with it al the Nerves and Muſcles, as we ſee it happeneth in thoſe which have the falling ſickneſs. By which it appears that not only the brain it ſelf ſuffereth together with the Nerves, but alſo the Nerves with the Brain. The ſigns of a Convulſion are difficult, painfull and depraved motions, either of ſome part or of the whole body, turning aſide of the Eyes and whole Face, a contraction of the Lips, a drawing in of the Cheeks, as if one laughed, and an univerſall ſweat.

Signs of a convulſion.

CHAP. X.

The cure of a Convulſion.

The cauſe of a Convulſion by Repletion.

THe cure of a Convulſion, is to be varied according to the variety of the convulſive cauſe, for that which proceeds from Repletion muſt be otherwiſe cured, than that which is cauſed by an Inanition; and that which proceeds of pain, otherwiſe than either of them. For that which is cauſed by repletion is cured by diſcuſſing and evacuating medicines: as by diet conveniently appointed, by purging, bleeding, digeſtive locall Medicines, exerciſe, frictions, ſulphurious baths and other things appointed by the preſcription of ſome learned Phyſitian which ſhall overſee the cure, which may conſume the ſuperfluous and excrementitious humors that poſſeſs the ſubſtance of the Nerves, and habit of the body. The locall remedies are Oyls, Unguents and Liniments, with which the Neck, back-bone and all the contracted parts ſhall be anointed. The Oyls are, the oyl of Foxes, Bayes, Cammomill, Worms, Turpentine, of *Coſtus*, of *Caſtoreum:* The Oyntments are *Vnguentum Arragon, Agrippæ, de Althæa, Martiatum.* This may be the form of a Liniment; ℞. *Olei chamæm. & Laurin. ana* ℥ ij, *Olei Vulp.* ℥ i, *Vnguenti de Althæa & Marti. an.* ℥ ß, *Axungiæ vulpis,* ℥ i, *Aquæ vitæ,* ℥ i ß, *Ceræ quantum ſufficit.* Make a Liniment for your uſe, or ℞. *Olei Lumbric. de Spica & de Caſtoreo, an.* ℥ iij, *Axung. hum.* ℥ i, *Sulphuris vivi,* ℥. ß. *Ceræ quantum ſufficit.* Make a Liniment, or ℞. *Vnguenti Martiati, & Agrip. an.* ℥ iij. *Olei de Terebinth.* ℥ i ß, *Olei Salviæ,* ℥ ß, *Aquæ vitæ* ℥ i, *Ceræ* ℥ i ß, *fiat linimentum.* But this diſeaſe is cured by ſlender diet, and ſweating with the Decoctions of *Guiacum*, becauſe by theſe remedies the groſs, tough, and viſcid excrements, which are in fault, are digeſted.

The cure of a Convulſion cauſed by inanition.

A Convulſion proceeding of Inanition is to be cured by the uſe of thoſe things, which do wholeſomly and moderately nouriſh. And therefore you muſt preſcribe a diet conſiſting of meats full of a good nouriſhment, as broaths and cullices of Capons, Pigeons, Veal, & Mutton, boyling therein Violet and Mallow leaves. Conſerves muſt be ordained, which may ſtrengthen the debilitated powers, and humect the habit of the body, ſuch as are, the Conſerves of Bugloſs, Violets, Borage and water Lillies. The following broath will be profitable, ℞. *Lactucæ, Bugloſ. & portul. an* M i, *quatuor ſeminum frigid. major. an.* ℥ ß, *ſeminis Berberis* ℥ i. Let them all be boyled with a chicken, and let him take the broath every morning. If thirſt oppreſs him, the following Julep will be good. ℞. *Aquæ roſar.* ℥ iv, *Aquæ viol.* ℔ ß, *Saccari albiſſimi* ℥ vi. *fiat Iulep, utatur in ſiti.* If the Patient be bound in his body, emollient and humecting Clyſters ſhall be appointed, made of the decoction of a ſheeps head and feet, Mallows, Marſh Mallows, Pellitory of the wall, Violet leaves, and other things of the like faculty; or that the remedy may be more ready and quickly made: let the Clyſters be of Oyl and Milk. Topick remedies ſhall be Liniments and Baths. Let this be the example of a Liniment. ℞. *Olei Viol. & Amygdal. dulc. an.* ℥ ij, *Olei Lilior. & Lumbric. an.* ℥ i, *Axungiæ porci recentis,* ℥ iij, *Ceræ novæ quantum ſufficit, fiat Linimentum,* with which let the whole ſpine and part affected be anointed: This ſhall be the form of an emollient and humecting bath. ℞. *Fol. Malvæ, Bis Malvæ, Pariet. ana* M vi, *ſeminis Lini & fœnug. ana* ℔ ß, *Coquantur in aqua communi, addendo Olei Lilior.* ℔ viij. Make a Bath: into which let the Patient enter when it is warm. When he ſhall come forth of the Bath, let him be dried with

An Emollient Liniment for any Convulſion

An Emollient and humecting Bath.

with warm clothes, or reſt in his bed avoiding ſweat. But if the patient be able to undergo the charge, it will be good to ordain a bath of milk, or oyl alone, or of them equally mixt together.

CHAP. XI.

Of the cure of a Convulſion, by ſympathy and pain.

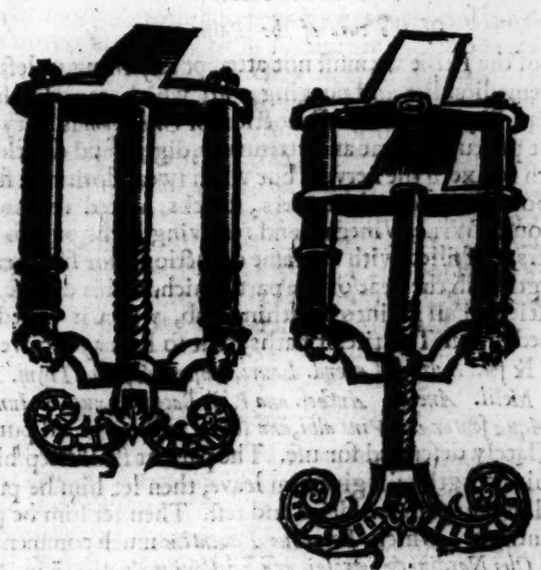
A Convulſion which is cauſed both by conſent of pain and Communication of the affect, is cured by remedies which are contrary to the dolorifick cauſe. For thus if it proceed from a puncture or venemous bite, the wound muſt be dilated and inlarged by cutting the skin, that ſo the venenate matter may flow forth more freely, for which purpoſe alſo medicines which are of a thin and liquid conſiſtence, but of a drying and digeſtive faculty ſhall be powred in, to call forth and diſſolve the virulency, as Treacle and Mithridate, diſſolved in *Aqua vitæ*, with a little of ſome mercuriall powder: for this is a noble antidote. Alſo cupping glaſſes and ſcarifications will be good. Laſtly, the condition of all dolorifick cauſes, ſhall be oppugned by the oppoſition of contrary remedies, as if pain by reaſon of a pricked nerve or tendon, ſhall cauſe a Convulſion, it muſt preſently be reſiſted by proper remedies, as oyl of Turpentine, of *Euphorbium*, mixt with *Aqua vitæ*, and alſo with other remedies appropriated to punctures of the nerves. If the pain proceed from exceſs of cold, becauſe cold is hurtfull to the brain, the ſpinall marrow, and nerves; the patient ſhall be placed in a hot air, ſuch as that of a hot-houſe, or ſtoave, all the ſpine of his back and convulſed parts, muſt be anointed with the hot liniments above mentioned: for that is much better, than ſuddenly to expoſe him from the conceived convulſifick cauſe to a moſt hot fire or warm Bath. In the mean time the Chirurgeon muſt take diligent heed, that as ſoon as the ſigns of the Convulſion to come, or already preſent, or at hand, do ſhew themſelves, that he put a ſtick between the patients teeth, leſt they be faſt locked by the pertinacious contraction of the Jaws: for many in ſuch a caſe have bit off their tongues, for which purpoſe he ſhall be provided of an inſtrument called *Speculum Oris*, which may be dilated and contracted according to your mind by the means of a ſcrew, as the figures underneath demonſtrate, the one preſenting it open and ſomewhat twined up, and the other as it is ſhut.

The Cure of a Convulſion by a puncture, or bite.

A worthy *Alexipharmacum* or Antidote.

You muſt hinder the locking of the teeth.

The Figure of a Speculum Oris, *to open the teeth when they are locked or held faſt together.*



CHAP. XII.

Of the Palſie.

THe Palſie is the reſolving or mollification of the nerves, with privation of ſenſe and motion, not truly of the whole body, but of the one part thereof, as of the right or left ſide. And ſuch is properly named the Palſie: for otherwiſe and leſs properly the reſolution of ſome one member is alſo called the Palſie: for when the whole body is reſolved, it is an Apoplexy. Therefore the Palſie ſometimes takes half the body, otherwhiles the upper parts which are between the navell and the head, otherwhiles

What a Palſie is.

The differences thereof.

therwhiles the lower which are from the navell to the feet; ſometimes the tongue, gullet, bladder, yard, eyes; and laſtly, any of the particles of the body.

How it differs from a Convulſion.

It differs from a Convulſion in its whole nature. For in a convulſion, there is a contention and contraction of the part, but in this a reſolving and relaxation thereof: beſides, it commonly happeneth that the ſenſe is either aboliſhed or very dull, which uſually remains perfect in a Convulſion. There are ſome which have a pricking, and as it were great pain in the part.

The cauſes.

The cauſes are internall or externall, the internall are humors obſtructing one of the ventricles of the brain, or one ſide of the ſpinall marrow, ſo that the animall faculty, the worker of ſenſe and motion, can not by the nerves come to the part to perform its action. The externall cauſes are a fall, blow, and the like injuries, by which oft-times the joints are diſlocated, the ſpinall marrow wreſted aſide, and conſtrictions and compreſſions of the *Vertebræ* ariſe, which are cauſes that the animall ſpirit cannot come to the Organs in its whole ſubſtance. But it is eaſy by skill in Anatomy perfectly to underſtand by the reſolved part the ſeat of the morbifick cauſe, for when there is a Palſie properly ſo called, that is, when the right or left ſide is wholly ſeized upon, then you may know that the obſtruction is in the brain, or ſpinall marrow; but if the parts of the head being untoucht, either of the ſides being wholly reſolved, the fault remains in the originall of the ſpinall marrow; if the armes be taken with this diſeaſe, we may certainly think that the matter of the diſeaſe lies hid in the fifth, ſixth, and ſeventh *Vertebræ* of the neck. But if the lower members languiſh, we muſt judge the Paralytick cauſe to be contained in the *Vertebræ* of the loins and holy bone. Which thing the Chirurgeon muſt diligently obſerve that he may alwaies have recourſe to the originall of the diſeaſe. The Palſie which proceeds from a nerve cut, or exceedingly bruiſed, is incurable, becauſe the way to the part by that means is ſhut againſt the animall ſpirit. Old men ſcarce or never recover of the Palſie, becauſe their native heat is languid, and they are oppreſſed with abundance of excrementitious humors; neither doth an inveterate Palſie which hath long poſſeſt the part, neither that which ſucceeds an Apoplexy, yeeld us any better hope of cure.

It is good for a feaver to happen upon a palſie.

It is good for a feaver to come upon a Palſie, for it makes the diſſipation of the reſolving and relaxing humor, to be hoped for. When the member affected with the palſie, is much waſted, and the oppoſite on the contrary, much encreaſed in quantity, heat and colour, it is ill: for this is a ſigne of the extream weakneſs of the afflicted part, which ſuffers it ſelf to be defrauded of its nouriſhment, all the proviſion flowing to the ſound or oppoſite ſide.

CHAP. XIII.

Of the cure of the Palſie.

IN the cure of the Palſie we muſt not attempt any thing, unleſs we have firſt uſed generall remedies, diet and purging; all which care lyeth upon the learned and prudent Phyſitian. The Decoction of *Guaiacum* is very fit for this purpoſe, for it procures ſweat and attenuates, digeſts and drieth up all the humidity which relaxeth the nerves: but when ſweat doth not flow it ſhall not be unprofitable to put about the reſolved members, bricks heated red hot in the fire and quenched in a decoction of Wine, Vineger, and reſolving herbs, or alſo ſtone bottles, or Ox and Swine bladders, half filled with the ſame decoction; for ſuch heat which is actuall reſuſcitateth and ſtrengthneth the heat of the part, which in this diſeaſe is commonly very languid: Then the patient ſhall go into a bathing-tub, which is vailed or covered over juſt as we have deſcribed in our Treatiſe of Baths, that ſo he may receive the vapour of the following decoction.

The decoction of *Guaiacum* is good for a palſie.

Things actually hot good for to be applied to paralytick members.

℞ *fol. Salviæ, Lavend. Lauri. major. Abſinth. Thym. Angelicæ, Rutæ, ana M.ß. Florum Chamæm. Melil. Anethi, Anthoſ. ana P ij. Baccar. Laur. & Juniper. Conquaſſatar. ana ℥ j. Caryophyl. ʒ ij. Aquæ fontanæ & Vini albi, ana lbiv.* Let them be all put in the veſſel mentioned in the Treatiſe lately deſcribed for uſe. The patient ſhall keep himſelfe in that Bathing-tub, as long as his ſtrength will give him leave, then let him be put into his bed wel covered, where he ſhall ſweat again, be dried and reſt. Then let him be preſently anointed with the following ointment, which *Leonellus Faventius* much commends,

Leon. Faventius. his ointment.

℞ *Olei Laurini & de Terebinth. ana ℥ iij. Olei Nardini & petrolei, ana ℥ j. Vini malvatici, ℥ iv. Aquæ vitæ ʒ ij. Pyrethri, Piperis, Sinap. Granor. Junip. Gummi hederæ, anacard. Ladani puri, an. ʒ j ß. Terantur & miſceantur omnia cum Oleis & Vino: bulliant in vaſe duplici uſque ad Vini conſumptionem, facta forti expreſſione, adde Galbani, Bdellii, Euphorbii, Myrrhæ, Caſtorei, adipis urſi, Anatis, Ciconiæ, an. ʒ ij.* Make an ointment in form of a liniment, adding a little wax if need ſhall require. Or you ſhall uſe the following remedy approved by many Phyſitians.

An approved ointment for the palſie.

℞ *Myrrhæ & Aloes, Spicæ nardi, Sanguinis draconis, thuris, opoponacis, Bdellii, Carpobalſami, amomi, ſarcocollæ, croci, maſtic. gummi arabici, ſtyrac. liquidæ, ladani, caſtorei, ana ʒ ij. Moſchi, ʒ j. Aqua vitæ, ℥ j. Terebinthinæ venetæ, ad pondus omnium, pulver abeuntur pulveriſanda & gummi eliquabuntur cum aqua vitæ & aceti tantillo.* And let them all be put in fit veſſels, that may be diſtilled in *Balneo Mariæ*, and let the ſpine of the back, and paralytick limbs be anointed with the liquor which comes from thence. I have often tried the force of this following Medicine. ℞ *rad. Angel. Ireos. floren. gentian. cyperi, ana ʒ j. Calami aromat. Cinnam.*

nam. Caryophil. nucis Moſch. macis, ana ʒij. *Salvia major. Iua arthritica, Lavend. roriſm. ſatureiæ, puleg. calament. ment aſtri, ana M* ß. *florum chamæm. melil. hyperic. anthos, ſtœchad. ana* P j. *Conciſa omnia contundantur. & in Aqua vit. & Vini malvat. an.* ℔ij. *infundantur.* And let them be diſtilled in *Balneo Mariæ*, like the former let the affected parts be moiſtned with the diſtilled liquor, of which alſo you may give the patient a ſpoon full to drink in the morning with ſome Sugar. For thus the ſtomach will be heated, and much phlegm contained therein as the fuel of this diſeaſe, will be conſumed.

A diſtilled water good to waſh them outwardly, & to drink inwardly.

You muſt alſo appoint exerciſes of the affected parts, and frequent and hard frictions, with hot linnen clothes, that the native heat may be recalled and the excrements contained in the parts digeſted: you may alſo uſe the Chymicall oyls of Roſemary, Tyme, Lavander, Cloves, Nutmegs, and laſtly, of all ſpices, the manner of extracting whereof we ſhall hereafter declare in a peculiar Treatiſe.

Exerciſes and frictions. Chymical oyls.

CHAP. XIV.

Of Sowning.

SOwning is a ſodain and pertinacious defect of all the powers, but eſpecially the vitall; in this the patients lie without motion and ſenſe, ſo that the Ancients thought that it differed from death only in continuance of time. The cauſe of ſowning, which happens to thoſe that are wounded is bleeding, which cauſeth a diſſipation of the ſpirits: or fear, which cauſeth a ſodain and joint retirement of the ſpirits to the heart. Whence follows an intermiſſion of the proper duty, as alſo of the reſt of the faculties, whilſt they being thus troubled, are at a ſtand. Alſo Sowning happens by a putrid and venenate vapour, carried to the heart by the arteries, and to the brain by the nerves; by which you may gather, that all ſowning happens by three cauſes. The firſt is, by diſſipation of the ſpirits and native heat, as in great bleeding. And then by the oppreſſion of theſe ſpirits by obſtruction, or compreſſion, as in fear, or tumult; for thus the ſpirits fly back haſtily from the ſurface and habit of the body, unto the heart and center. Laſtly, by corruption, as in bodies filled with humours, and in poyſonous wounds. The ſigns of ſowning are paleneſs, a dewy and ſodain ſweat ariſing, the failing of the pulſe, a ſodain falling of the body upon the ground without ſenſe and motion, a coldneſs poſſeſſing the whole body, ſo that the patient may ſeem rather dead, than alive. For many of theſe who fall into a ſown die unleſs they have preſent help.

What ſowning is. Three cauſes of ſowning.

Therefore you ſhall help them, if when they are ready to fall, you ſprinkle much cold water in their face, if that the ſowning happen by diſſipation of the ſpirits, or if they ſhal be ſet with their faces upwards, upon a bed or on the ground, as gently as may be; and if you give them bread dipt in wine to hold and chew in their mouths. But if it be cauſed by a putrid vapour and poyſonous air, you ſhall give them a little Mithridate or Treacle in *Aqua vitæ* with a ſpoon, as I uſually do to thoſe which have the plague, or any part affected with a Gangrene, or ſpacell. But if the patients cannot be raiſed out of their ſownes, by reaſon of the pertinacious oppreſſion and compreſſion of the ſpirits about the heart, you muſt give them all ſuch things as have power to diffuſe, cal forth and reſuſcitate the ſpirits, ſuch as are, ſtrong wines to drink, ſweet perfumes to ſmell; You muſt call them by their own name lowd in their eare, and you muſt pluck them ſomewhat hard by the hairs of the Temples, and neck. Alſo rub the temples, noſtrils, wriſts and palms of the hands with *Aqua vitæ*, wherein Cloves, Nutmegs, and Ginger have been ſteeped.

The cure of ſowning cauſed by diſſipation of ſpirits. The cure of ſowning cauſed by a venenate air. The cure of ſowning cauſed by oppreſſion & obſtruction.

CHAP. XV.

Of Delirium (i.) *Raving, Talking idly or Doting.*

DOting or talking idly, here is uſed for a ſymptome which commonly happeneth in feavers cauſed by a wound and inflammation; and it is a perturbation of the phantaſie, and function of the mind, not long induring. Wherefore ſuch a doting happens upon wounds, by reaſon of vehement pain, and a feaver, when as the nervous parts as the joints, ſtomach, and midriffe, ſhall be violated.

What a ſymptomaticall *Delirium* is. The cauſes thereof. Why the brain ſuffers with the midriffe.

For the Ancients did therefore call the Middriffe *Phrena*, becauſe when this is hurt, as if the mind it ſelf were hurt, a certain phrenſie enſues; that is, a perturbation of the animall faculty, which is imployed in ratiochmation; by reaſon of the community which the *Diaphragma* hath with the brain, by the nerves, ſent from the ſixth conjugation, which are carried to the ſtomach. Therefore doting happens by too much much bleeding, which cauſeth a diſſipation of the ſpirits, whereby it happens that the motions and thoughts of the mind erre, as we ſee it happens to thoſe who have bled much in the amputation of a member. And it happens by the puncture of a venemous beaſt, or from ſeed retained or corrupted in the womb, or from a Gangrene or Sphacel, from a venenate and putrid air carried up to the brain, or from a ſodain tumult & fear. Laſtly, what things ſoever with any diſtemper eſpecially hot, do hurt and debilitate the mind. Theſe may cauſe doting by the affluxion of

The Cure.

of humors, ſpecially cholerick, by diſſipation, oppreſſion or corruption of the ſpirits. Therefore if it ſhall proceed from the inflammation of the brain, and *Meninges* or membranes thereof; after purging and blood-letting by the preſcription of a Phyſitian, the hair being ſhaved or cut off, the head ſhall be fomented with roſe vinegar, and then an Emplaiſter of *Diacalcitheos* diſſolved in oyl and vinegar of Roſes, ſhall be laid thereupon. Sleep ſhall be procured with Barly creams, wherein the ſeeds of white Poppy have been boiled, with broths made of the decoction of the cold ſeeds of Lettuce, Purſlain, Sorrell, and ſuch like. Cold things ſhall be applyed to his noſtrills, as the ſeeds of Poppy gently beaten with Roſe water and a little vinegar. Let him have merry and pleaſant companions that may divert his mind from all cogitation of ſorrowful things, and may eaſe and free him of cares, and with their ſweet intreaties may bring him to himſelf again. But if it happen by default of the ſpirits, you muſt ſeek remedy from theſe things which have been ſet down in the Chapter of Sowning.

The End of the Ninth Book.

OF THE GREENE AND BLOODY VVOVNDS OF EACH PART.

The Tenth Book.

CHAP. I.

Of the kinds or differences of a broken skull.

NOw that we have briefly treated of wounds in generall, that is, of their differences, ſigns, cauſes, prognoſticks and cure, and alſo ſhewed the reaſon of the accidents and ſymptoms which uſually follow and accompany them, it remains that we treat of them as they are incident to each part, becauſe the cure of wounds muſt be diverſly performed according to the diverſity of the parts. Now we will begin with the wounds of the head. Therefore the head hath the hairy ſcalp lightly bruiſed without any wound, otherwhiles it is wounded without a Contuſion, and ſometimes it is both contuſed and wounded: but a fracture made in the ſkull, is ſometimes ſuperficiary, ſometimes it deſcends even to the *Diploe*, ſometimes it penetrates through the 2 Tables, and the Meninges into the very ſubſtance of the brain; beſides, the brain is oft-times moved and ſhaken with breaking of the internall veins, and divers ſymptoms happen when there appears no wound at all in the head: of all and every of which we will ſpeak in order, and add their cure, eſpecially according to the opinion of the divine *Hippocrates*. He in his Book of the wounds of the head, ſeems to have made 4 or 5 kinds of fractures of the ſkull. The firſt is called a fiſſure or fracture, the 2 a contuſion or colliſion, the 3 is termed *Effractura*, the 4 is named *Sedes*, or a ſeat; the 5 (if you pleaſe to add it) you may call a Counterfiſſure, or as the interpreter of *Paulus* cals it, a *Reſonitus*. As when the bone is cleft on the contrary ſide, to that which received the ſtroak. There are many differences of theſe 5 kinds of a broken ſkul. For ſome fractures are great, ſome ſmall, and others indifferent; ſome run out to a greater length or bredth; others are more contracted; ſome reſide only in the ſuperficies; others deſcend to the *Diploe*, or elſe pierce through both the Tables of the ſkull; ſome run in a right line, others in an oblique and circular; ſome are complicated amongſt themſelves, as a fiſſure is neceſſarily and alwaies accompanied with a Colliſion or Contuſion; and others are aſſociated with divers accidents, as pain, heat, ſwelling, bleeding and the like. Sometimes the ſkull is ſo broken, that the membrane lying under it, is preſſed with ſhivers of the bone, as with pricking needles. Somewhiles none of the bones falls off. All which differences are diligently to be obſerved, becauſe they force us to vary the cure, and therefore for the help of memory, I have thought good to deſcribe them in the following Table.

The differences of a broken head.

The kinds of a broken Skull out of *Hippocrates*.

Differences from their quantity.
Differences from their figure.
From their complication.

A Table of the fractures of the Skull.

- A fracture, or solution of continuity in the skull is caused either by
  - Contusion, that is, a collision of a thing bruising, hard, heavy and obtuse, which shall fall or bee smitten against the head, or against which the head shall be knocked, so that the broken bones are divided, or
    - Keep their naturall figure and site touching each other, whence proceeds that fracture of the skull which is called a fissure, which is
      - Either manifest, and apparent, that is
        - To your sight,
        - To your feeling,
        - Or instrument.
      - Or obscure and not manifest, when as not the part which received the blow is wounded, but the contrary thereto, and that happens either
        - In the same bone, and that two manner of wayes, as
          - On the side, as for example, when the right side of the bone of the forehead is strucken, the left is cleft.
          - Or from above to below, as when not the first Table which received the blow is cleft, but that which is under it.
        - In divers bones, to wit in such men as want sutures, or have them very close, or disposed otherwaies then is fit, and this opposition is either
          - From the right side to the left, and so on the contrary, as when the right Bregma is struck, and the left cleft.
          - From before to behind, and the contrary, as when the forehead is smitten, the nowle is cleft.
      - Or between both, that is, the obscure and manifest, as that which is termed a Capillary fissure, and is manifested by smearing it over with oyl and writing ink.
    - Or lose their site, and that either
      - Wholly, so that the particles of the broken bone removed from their seat, and falling down, press the membrane, whence proceeds that kind of effracture which retains a kind of attrition, when as the bone struck upon is broken as it were into many fragments, shivers and scales, either apparent, or hid in the sound bone, so that it is pressed down.
      - Or in some sort, as when the broken bone is in some part separated, but in others adheres to the whole bone, whence another kind of effracture arises, you may call it Arched, when as the bone so swells up that it leaves an empty space below.
  - Or by incision of a sharp, or cutting thing, but that incision is made, either by
    - Succision, when the bone is so cut, that in some part it yet adheres to the sound bone.
    - Recision, when the fragment falls down wholly broken off.
    - Or Seat, when the mark of the weapon remains imprinted in the wound that the wound is of no more length nor breath than the weapon fell upon.

Another

Another Table of the differences of a fractured Skull.

- *The differences of fractures common to these of all other parts are drawn, either from*
  - *Their nature, according to which fractures are cald,*
    - *Simple, as when they are found solitary and by themselves.*
    - *Compound and that either*
      - *Mutually with themselves, as a contusion, or collision with incision, a fissure with an effracture.*
      - *Or*
      - *with other symptomes, as swelling, pain, heat, bleeding, convulsion and the like.*
  - *Their Quantity, whence they are called, great, indifferent and small, according to the triple dimension of length, breadth and profunditie.*
  - *Their figure, from whence they are called*
    - *Right,*
    - *Oblique,*
    - *Transverse,*
    - *Round,*
    - *Triangular.*
  - *Their site, whence they are termed on the fore or back, or the right or left, or the upper or lower part, or superficiary and profound.*
  - *The part, whence it is called a Fracture of the Forehead, Nowl, Bregma, and Stony bones; and hence it is judged, what may be deadly or hopefull of recovery, easie or difficult to cure.*

CHAP. II.

Of the causes and signs of a broken Skull.

The externall causes.

THe causes of a broken Skull are externall, as a fall, a blow or stroak with any kind of weapon, sharp, obtuse, heavy, hard, the bitings of Beasts and many other things of the like kind. But the signs by which we come to know that the Skull is broken, are of two kinds; for some of them are found out by the reasoning and discourse of the mind, other by the sense, as those which lay open the wound to the ey & hand.

Rationall causes.

The Rationall signs shew by these things whith have happened upon the thing it self, whether it be, and of what sort it is. For you may know the skull is broken, if the Patient shall fall down with the stroak, or if he shal fal headlong from a high place upon some hard thing. If for some time after the stroak, he shall lie without speaking, sight and hearing, if he shall have felt and feel much pain, so that he is often forced to put his hand to the Wound. But also the weapon is to be considered, that is, whether if it be heavy, obtuse, pricking or sharp. Also we must consider with what and how great strength the stroak was given, and with how great anger and from what distance the weapon fell. Also he must consider whether the Patient received the blow, with his head unarmed and naked; whether he fell into a sown presently after the blow, whether when he came to him self, he was in his right senses; whether his eys were blinded, whether he were troubled with a giddines or dizines, and whether he bled at the nose, mouth, ears, or eyes, and lastly whether he vomited. For *Hippocrates* wriees, that those who have their brain cut, must necessarily have a feaver and vomiting of choler to ensue thereupon, which *Galen* confirming in his Commentary saith, that the same happens also when the Wound comes to the Membranes of the brain.

Aphor. 50. sec. 6.

Also a dull sound as from a broken vessell coming from the skull, (the hairy scalp and *Pericranium* being taken off), and it being lightly smitten upon with an Iron probe, is said to be a sign of a fracture thereof, as it is recorded by *Paulus Ægineta*. Truly all these signs make a great conjecture or rather assuredness that the skul is wounded, and the brain hurt, as which cannot happen unless the bone be broken, as *Celsus* hath written. Yet many have had their skulls broken, who had no such sign immediately after the blow, but this is very seldome. But I do not think fit amongst so many signs, here to omit that which is set down by *Guido*. If any (saith he) will know in what place the skull is broke, let the Patient hold fast between his fore teeth, one end of a lute string or thread, and the Chirurgeon hold the other in his hand; then let him lightly touch or play upon the string with his fingers; for in the very instant of the sound or stroke, the Patient will be certainly admonished, or perfectly perceive the part of the skull that is broken, and as one come and forc'd

Lib. 8. cap. 4.

by

but by [illegible] by the fall of the [illegible] on both sides of their jaws but so that you [illegible] whether they perceive any bone to crackle, or make a noise in their heads, for these which are broken seem to make a noise.

But passing over these things, now let us come to these signes, which may be obvious to our senses.

The matter to be handled in the following Chapter.

CHAP. III.

Of the signs of a broken skull, which are manifest to our sense.

Sensible signs of a broken skull before the dividing of the skin. *Lib. de vulner. cap.*

These signs are here said to be manifest to sense, which when the bone is bared, manifest the wound to our eyes, fingers and probe. But if the hairs stand upon one end in the wound, you may know the bone is broken, because the hair which yeelds to the violence of the blow, cannot be so cut, the bone which resists the stroak being not violated, as it is observed by *Hippocrates*, wherefore we may by this sight of this one thing, before any inspection of the wound it self, suspect by a probable conjecture, that the skull is broken, and perswade the beholders or standers by so much.

What a probe must be used in searching for a fracture.

Moreover we may, before we have cut the skin crosse, or laid bare the bone, give a guess by our feeling, whether the skull be broken, or no, if we by pressing down our fingers neer the wound shall perceive the bone either to stand up, or be prest down otherwise than it should naturally be.

The skin being cut crosswise and the bone laid bare, if the fracture be not obvious to the eye, you must try with your probe, which must neither be too thin nor too sharp, lest by falling into some naturall crannies, it may cause us to suspect without any cause that the bone is broken, neither let it be too thick, lest the little clifts may deceive you. If when your probe comes to the bone, it meets with nothing but that which is smooth and slippery, it is a sign that it is whole.

Lib. 3. Epid. in Aphorism. of Omitted Hippocrates cranies and deceived by their fissures.

But on the contrary if you find it any thing rough, specially where there is no fissure, it shews the bone is broken. But let the Chirurgeon consider, that the fractures are not seldom upon the sutures, and that the sutures have not always one and their naturall line, as also it often comes to pass that the broken clifts or cut bone can neither be perceived by your sight, nor hurt a probe: therefore if you think there is any such thing by the rationall signs above mentioned, anoint the place with writing Ink, and oyl, and so you shall find the crack or clift, by the blackness we shall shew you hereafter.

Upon what occasion the hairy scalp is cut.

When you are certain of the fracture, then you must diligently consider the greatness of the disease, and apply medicines speedily. Verily when a fracture chances to light upon any suture, the disease is but small to be known, and if the fracture be very great, because the sutures by their clifts and [illegible] receive the matter, wherefore *Hippocrates* saith that he was deceived by them. Now having briefly delivered the differences and signs of a broken skull, it is time to come to the cure of all kinds thereof, with a Preface.

Celsus.

CHAP. IIII.

Of a Fissure, being the first kind of a broken Skull.

Hippocrates.

If the Chirurgeon by the fore-mentioned signs shall know that the skull is broken [illegible] for a fissure, and if the wound made in the musculous skin shall not be [illegible] though the fissure be exceeding small, there must be shaven off the hair, and [illegible] cut with a razour, or incision knife, the musculous skin with the subjacent [illegible] lying under in a triangular or quadrangular figure to a proportionable bigness, always having regard in him how the fissures and complexions are, lest that any hurt to nature should ensue, for it is far better to have the bone lye naked, than to suffer the kind nature of the flesh to run into [illegible] by a too religious preservation of the skin, for the bone cured without any great ulcer, though it be not perfect, [illegible] Further it is more expedient (in *Hippocrates* opinion) to do it by degrees, safely and securely, though more speedily than to do it in a moment with fear of relapse and greater inconvenience. Let this dilation be made with a razour or sharp knife, and if there be any wound made in the skin by the wrapper, let one of your incisions be made agreeable thereto. *A Fissure, or Incision Fissure*

[illegible]

The manner how to pull the hairy scalp from the broken skull.

Now therefore the Musculous skin together with the *Pericranium* must be divided and cut with a sharpe rasour prested and guided with a strong and steady hand, in such sort to pluck it from the bone, or skull lying under it, that none thereof remain upon the bone, for if it should be rent or torn with the Trepan, it would cause vehement pain with inflammations. You must begin to pull it back at the corners of the lines croshing each other with right angles, with this Chissell whose figure you see here expressed.

A Chissell or Instrument to pull back or or separate the Pericranium *from the skull.*

Then you must fill all the wound with boulsters of fine soft lint, that so the lips may be kept further asunder. But you shall apply upon it medicines fit to stanch blood. But if it come so to pass that the blood flows forth so violently, that it can be stayed by no meane, the vessell it self must be bound, after this manner.

The manner to bind a vessell in case of too much blee ding.

First thrust through the musculous skin on the outside with a needle and thred, then thrust the needle back again; then tye the thred on a knot on the outside, but first put some lint rolled up to the bigness of a Goose quill between the thred and the hairy scalp on both sides thereof, least the strait twitching of of the thred which may serve to stay the bleeding, may cut and tear the skin, or cause pain: then must you raise his head somewhat higher.

A History.

I have lately tried, and performed this upon a certain Coach-man, who thrown from the Coach upon his head on a pavement of free stone, exceedingly brulsed the hind part of the *Bregma*, for which cause it was fit to open the musculous skin, with a cross incision, both that the congealed blood might be pressed out, as also that the fracture (if there were any) might be observed. But an Artery being cut in performance hereof, when as the Chirurgeon who was there present could not stay the blood leaping out with violence; and the Coachman already had lost so great a quantity thereof, that his strength was so much decayed, that he could not stir himself in his bed, or scarse speak: I being called, shewed them by experience, that whereas astringent medicines were used before to no purpose, it was better to stay the bleeding by binding the vessell, than to let the Patient dye for a childish fear of pricking him.

But that we may return to our former matter, the Chirurgeon shall the next day consider with what kind of fracture the bone is hurt; and if no signs of hurt appear to the eyes, nor be perceived with your fingers and probe, yet some of the rationall signs may cause one to have a conjecture that there is a fracture: Then you must anoint as we told you before, the bared bone with writing Ink, and a little oyl of Roses, that the cleft or crack may be dyed or coloured therewith, if that there be any there. Then the next dressing you must dry the bone with a linnen cloth, and scrape off the Ink, and oyl, with scraping Instruments made for the purpose, if any part thereof shall be sunk into the bone; for if there be any crack, it will be black; Wherefore you must continue scraping untill no sign of the fissure remain, or else untill you come even to the *Dura Mater*. But that he may be more certain whether the fissure pierce through both the Tables of the skull, he must bid the Patient, that stopping his nose and mouth, he strive to breath with a great indeavour. For then bloody matter or *sanies* will sweat through the fissure: For the breath driven forth of the cleft, and prohibited passage forth, swells and lifts up the substance of the brain, and the Membrane, whereupon that frothy humidity and *Sanies* sweats forth. Therefore then the bone must be cut even to the *Dura Mater*, with *Rudula* and other scraping Instruments fit for this purpose, yet so as you hurt not the membrane; but if the fissure shall be somewhat long, it will not be convenient to follow it all the extent thereof: for nature will repair and soulder the remnant of the fissure by generating a *Callus*; besides also the Chirurgeon according to *Celsus* opinion must take away as little of the bone as he can, because there is nothing so fit to cover the brain, as the skull. Therefore it shall suffice to make a passage, whereby the blood and *Sanies* may pass and be drawn forth, least that matter being suppressed may corrupt the bone, and cause an inflammation in the brain. But the broken bone must be taken forth within three dayes if it be possible, especially in Summer, for fear of inflammation. Yet I have often taken forth with a Trepan and with Sheeres the bones of the skull, after the seventeenth day, both in Winter and Summer; and that with happy success. Which I have the rather moved, least any should at any time, suffer the wounded to be left destitute of remedy: for is better to try a doubtfull remedy than none: [illegible] and told of the danger, for many more dye who have not the broken bones of the skull taken out, than those that have.

A way to find a fracture in the skull, when it presents not it self to the view at the first.

A sign that both the Tables are broken.

You may use the Trepan after the tenth day.

But the Inſtruments, with which the wounded or cleft bones may be cut out are called *Scalpri* or *Radulæ*, of which I have cauſed divers ſorts to be here decyphered, that every one might take his choice, according to his mind, and as ſhall be beſt for his purpoſe. But all of them may be ſcrued into one handle, the figure whereof I have exhibited.

Radulæ *or* Scalpri, (*i*) *Shavers or Scrapers.*

Radulæ *of another form, for the better cutting of the greater bones.*

To conclude, when the skull ſhall be wounded or broken with a ſimple fiſſure, the Chirurgeon muſt think he hath done ſufficient to the Patient, and in his Art, if he ſhall divide the bone and dilate the fiſſure or cleft with the deſcribed Inſtruments, though he have uſed no Trepan, although the fiſſure pierce through both the Tables. But if it doth not exceed the firſt Table, you muſt ſtay your ſcrapers as ſoon as you come to the ſecond, according to the opinion of *Paulus:* but if the bone ſhal be broken & ſhivered into many peeces, they ſhall be taken forth with fit Inſtruments, uſing alſo a Trepan if need ſhall require, after the ſame manner as we ſhall ſhew you hereafter.

It is ſufficient in a ſimple fiſſure to dilate it with your Scalpri only and not to Trepan it.

CHAP. V.

Of a Contuſion, which is the ſecond ſort of fracture.

What an Ecchymoſis is.

WHEN *Ecchymoſis*, that is, effuſion of blood, preſently concreting under the muſculous skin, without any wound, is oft cauſed by a violent contuſion. This Contuſion if it ſhall be great, ſo that the skin be divided from the skull, it is expedient, that you may make an inciſion, whereby the blood may be evacuated and emptied. For in this caſe you muſt wholly deſiſt from ſuppurative medicines (which otherwiſe would be of good uſe in a fleſhy part) by reaſon that all the moiſt things are hurtfull to the bones, as ſhall be ſhown hereafter.

How a contuſion of the skul muſt be cured.

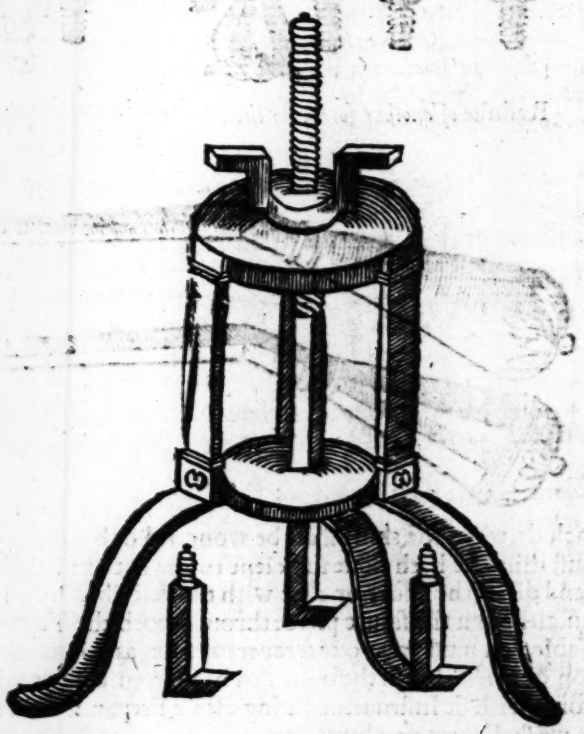
Such like Contuſions more frequently happen in children, being eaſily perceived by the ſoftneſs, and inundation of the contuſed part: forth of which oft-times when I have opened them with my inciſion knife, ſerous, clotted and blackiſh blood hath iſſued. The reſidue of the cure is perfected by moderate compreſſion of the part, and drying medicines. Moreover the skul of a child, may be preſſed down, by a great contuſion, even as we ſee it happens in thin veſſels of braſs, lead, or pewter, for oft-times by the preſſure of your finger, they are ſo dented in, that the print thereof remains; yet ſometimes they fly back of themſelves, and again acquire their former plainneſs and equability, which alſo happens in the bones of children, women and ſuch as are ſoft, humid, & phlegmatick. But if the bones do not ſpring back of themſelves, you muſt apply a cupping-glaſs with a great flame; withall command the Patient, to force his breath up as powerfully as he can, keeping his mouth and noſe cloſe

Different cures of a depreſſed skull.

cloſe ſhut; for thus there will be hope, to reſtore the depreſſed bone to its place, by the ſpirits forc'd upwards to the brain and skull, by the powerfull attraction of the cupping-glaſs. But if ſo be that the bone cannot by this means be reſtored, then you muſt make an inciſion in the skin, and faſten ſuch a Trepan, as you ſee here delineated, into the depreſt, or ſetled part of the bone, and ſo pull it directly upwards, juſt as we ſee Coopers raiſe the ſtaves of their cask, when they are ſunk too much in.

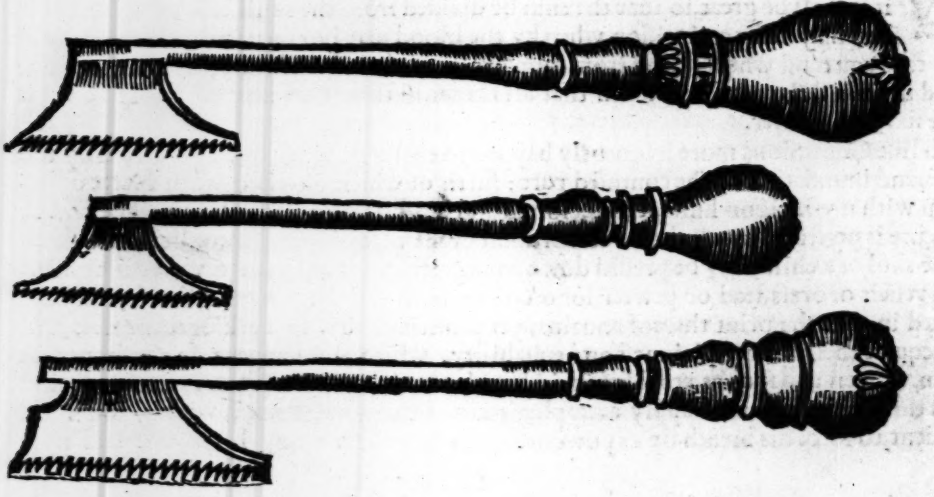
But if the bone ſhall be too ſtrong, thick, and denſe, ſo that this Inſtrument will not ſerve to pluck it forth, then you muſt perforate the skull, in the very center of the depreſſion, and with this threefold Inſtrument, or Levatory put into the hole, lift up and reſtore the bone to its naturall ſite; for this ſame Inſtrument is of ſtrength ſufficient for that purpoſe. It is made with three feet, that ſo it may be applyed to any part of the head which is round; but divers heads may be fitted to the end thereof according as the buſineſs ſhall require, as the figure here placed doth ſhew.

A three footed Levatory.



But if at any time it comes to paſs, that the bone is not totally broken or depreſt, but only on one ſide; it will be fit, ſo to lift it up, as alſo to make a vent for the iſſuing out of the filth, to divide the skul with little ſaws like theſe, which yee ſee here expreſſed; for thus ſo much of the bone, as ſhall be thought needfull, may be cut off without compreſſion, neither will there be any danger of hurting the brain or membrane with the broken bone.

The figures of Saws fit to divide the skull.

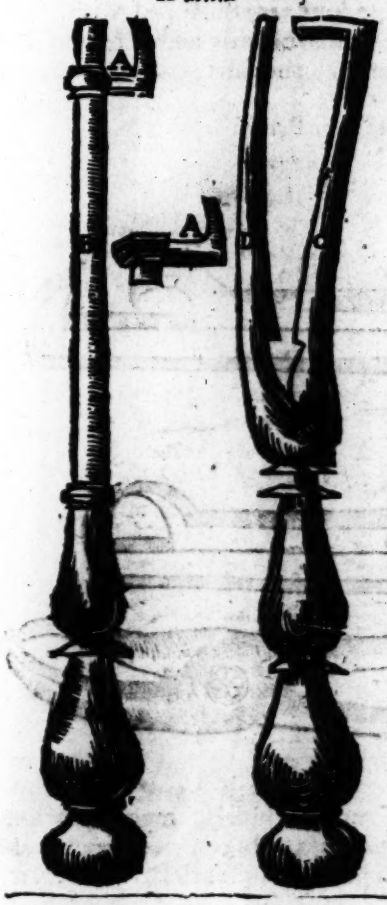


Bur

But if by ſuch ſigns as are preſent, and ſhall appear, we perceive or judg that the contuſion goes but to the ſecond Table, or ſcarſe ſo far; the baring or taking away of the bone, muſt go no further than the contuſion reaches; for that will be ſufficient to eſchew and divert inflammations and divers other ſymptomes. And this ſhall be done with a ſcaling or Deſquamatory Trepan, (as they term it) with which you may eaſily take up as much of the bone, as you ſhall think expedient: And I have here given you the figure thereof.

A Deſquamatory or Scaling Trepan.

A delineation of other Levatories.



A A. *Shews the point or tongue of the Levatory, which muſt be ſomewhat dull, that ſo it may be the more gently and eaſily put between the* Dura Mater *and the ſkull, and this part thereof may be lifted up ſo much by the head or handle taken in your hand, as the neceſſity of the preſent operation ſhall require.*

B. *Intimates the body of the Levatory, which muſt be four ſquare, leſt the point or tongue put thereon ſhould not ſtand faſt, but the end of this Body muſt reſt upon the ſound bone, as on a ſure foundation.*

The uſe thereof is, thus; put the point or tongue under the broken or depreſſed bone, then lift the handle up with your hand, that ſo the depreſſed bone may be elevated.

C. *Shews the firſt Arm of the other Levatory, whoſe crooked end muſt be gently put under the depreſſed bone.*

D. *Shews the other Arm, which muſt reſt on the ſound bone, that by the firm ſtanding thereof, it may lift up the depreſſed bone.*

CHAP. VI.

Of an Effracture, depreſſion of the bone, being the third kind of Fracture.

BEfore I come to ſpeak of an Effracture, I think it not amiſs to crave pardon of the curteous and underſtanding Reader, for this reaſon eſpecially, that as in the former Chapter, when I had determined and appointed to ſpeak of a Contuſion, I inſerted many things of a Depreſſion; ſo alſo in this chapter of an Effracture, I intend to intermixe ſomething of a Contuſion; we do not this through any ignorance of the thing it ſelf; for wee know that it is called a Contuſion, when the bone is depreſt and cruſht, but falls not down. But an Effracture is when the bone falls down and is broken by a moſt violent blow. But it can ſcarſe come to paſs, but that the things themſelves muſt be confounded and mixt, both as they are done; and alſo when they are ſpoken of: ſo that you ſhall ſcarſe ſee a Contuſion without an Effracture, or this without that. Therefore the bones are often broken off and driven down with great and forcible blows, with clubs whether round or ſquare, or by falling from a high place directly down, more or leſſe according to the force of the blow, kind of weapon, and condition of the part receiving the ſame: Wherefore you muſt be provided with diverſity of remedies and inſtruments to encounter therewith. Wherefore admit the bone is preſſed down, and ſhivered into many pieces, now for that theſe ſplinters need not be taken out with a Trepan, you may do the buſineſs with Levatories made and neatly faſhioned for that purpoſe; ſuch as theſe, which are here expreſt.

What a contuſion is.

What an Effracture is.

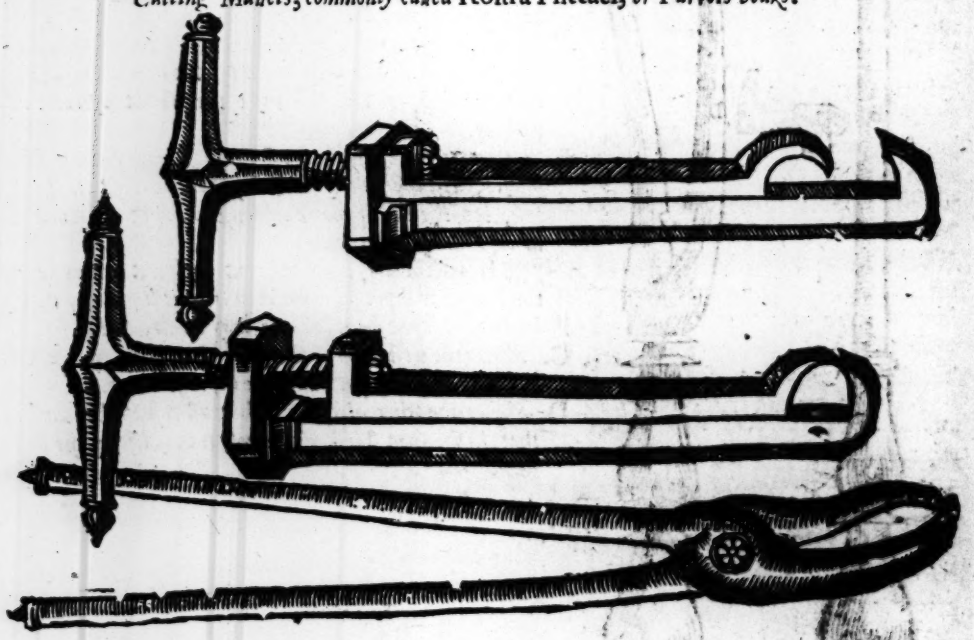
The cauſe of Effractures.

The cure.

A Levatorie.

But we muſt have ſpeciall care, leſt that in pulling and taking out of theſe ſcales and ſplinters, we hurt the membranes. Theſe ſcales are ſometimes very rough and prickly, ſo that they cannot touch the *Meninges* without offence; but ſomewhiles the buſineſs is ſo intricate, that they cannot be taken out unleſs by enlarging the fracture. Wherefore in this caſe, if there be a ſpace ſo large, as that the ends of theſe mullets may enter, you may eaſily ſhear off ſo much of the bone as ſhal be neceſſary and requiſite for the taking away of theſe ſcales, without any aſſiſtance of the Trepan, which I have done very often and with good ſucceſs; for the operation performed by theſe mullets is far more ſpeedy and ſafe, than that with the Trepan; and in the performance of every operation, the chief commendation is given to ſafeneſs and celerity.

Cutting Mullets, commonly called Roſtra Pſittaci, *or* Parrots beaks.



Moreover I have thought good here to give you the figures of chiſſels, ſcrapers, pincers, together with a leaden mallet, becauſe ſuch inſtruments are not only very neceſſary to take forth the ſcales of bones which are broken, but alſo to plain and ſmooth thoſe which remain whole.

The Figures of Scrapers, Pincers, a leaden mallet, &c.

But here you muſt note, that a Trepan, nor Levatorie, muſt never be applyed to a bone quite broken, leſt the membranes lying under it be hurt by the compreſſion thereof. Therefore you muſt apply them to a ſound bone, but as neer as you can to the fracture, ſo that you take away as little of the skull as is poſſible, leſt the brain deſpoiled of its bony cover, take ſome harm thereby. Neither effractures, nor yet fiſſures, if they be of ſome length, muſt be followed to their ends, but think your ſelf well, if you have made a paſſage for the iſſuing forth of the *Sanies* or filth, & have drawn forth that bone, which pricked the membranes. For nature is accuſtomed by generating a *Callus* to ſoulder, or unite the bones of the skul, as it alſo doth theſeof the other parts; as we have read it written by *Hippocrates* and *Galen*; for which purpoſe it hath by ſingular providence repleniſhed both the tables of the skull, with a certain alimentary and bloody matter, that with this as with marrow it might repair the loſs and defect of the bone.

Hip. lib. de vuln. cap. Gal. lib 6. meth. cap. ult.

The

The truth hereof was lately manifested in the servant of Master *Grolo*, who had an Effracture on the coronall bone, by a grievous blow, given him with the foot of a Mule; which when I understood, I divided the musculous skin with a three cornered section in that place, with an intent to apply a Trepan there; wherefore the day following, the bone being bored, and when I thought to draw it forth, yea verily endeavoured to pluck it forth, being already divided with the Trepan, I perceived a fearefull production of an Effracture; by the moveableness of the bone shaking under my hand; for it reached from the midst of the forehead, to the lesser corner of the eye. Wherefore omitting both my determination and endeavour to pull it forth, I thought I should do sufficiently for the patient, if I should only raise up the bone which was depresst; for so it did not trouble the *Crassa meninx* by pressing it, and the matter, and filth, were let forth by a passage made with a saw. So that in conclusion, he recovered perfectly, but that he lost one of his eyes which was adjoyning to the fracture. A History.

CHAP. VII.

Of a Seat, being the fourth kind of a broken Scull.

Hippocrates calls a Seat that kind of Fracture of the scull, when the weapon so falls upon the scull, that the fracture retaining the print thereof, is neither stretched forth any further, nor contracted to any lesse space. What a Seat is.

And seeing there be many forms hereof, they all whether they shall be superficiary, or shall pierce even to the *Diploe*, or else pass through both the Tables, whether it be with any loss of the bony substance, whether it run long wayes, or else be but short; or otherwise are dilated to some breadth, or else be but narrow; whether they shall be done with a cut, or with a prick with a dagger, styletto, lance or other kind of weapon, whether they shall have this or that accident joined with them, I say all of them, how many and various soever they be, ought and must be cured by some of the formerly described Instruments and means. Yet this must be noted, which as yet we have not remembred, that if it happen by a violent stroak, & great wound, that a portion of the bone is wholly so cut off, that it is clean severed from the rest of the scull, and hang only by the *Pericranium* and musculous skin; yet you must not pluck it from the *Pericranium*, and cast it away as unprofitable, but restore it to its proper seat and place, so by the force of nature, to be glewed by a *Callus*, as *Celsus* hath observed. The cure. *Lib.8. cap.4.*

I have tryed the truth of this experiment, in captain *Hydron*, not very long agoe. He had the middle part of the *Os Coronale*, of the bredth, and length of three fingers, so cut with a sharp sword, that it stuck not to the rest of the bone; but scarse adhering to the *Pericranium* and musculous skin; but lay turned down over his face, so that the *Dura Mater* was plainly seen; wherefore I prepared to pluck it from the skin, and cast it away, but that I remembred *Hippocrates* precept, where he bids, that the Brain should not be robbed of its cover and left bare. Wherefore first of all I wiped away the blood which was fallen upon the *Dura Mater*, whose motion you might plainly see, then I restored the portion of the bone to its place, and fastned it on the upper side with a suture consisting of three stitches; and that the residue of the matter might have passage forth, I filled the places between each stitch with lint, by this means, he by the mercie of God recovered, though at the same time he received many other large wounds in his body; which is a certain experiment, that we must cast away no part of the scull, nor of the *Pericranium*, no not of the musculous skin, unless necessity urge; therefore much less to leave the brain naked and despoiled of its coverings. A History.

CHAP. VIII.

Of a Resonitus, *or Counter-fissure, being the fifth kind of Fracture.*

Sometimes the fracture is made in the part opposite to that which received the blow; as if the right side be struck, the left is cloven; this kind of fracture is very dangerous, because we cannot find it out by any certain sign, as it is written by *Hippocrates Lib. de vulu. Capitis*. Wherefore if at any time the patient dye of such a fracture, the Chirurgeon must be pardoned. What a *Resonitus* is.

And although *Paulus Ægineta* laugh at this kind of fracture and thinks that it cannot happen to a mans head, as that which is hard and full, as it happens in empty glass bottles, yet I have sometimes seen and observed it. *Lib.6. cap.90.*

Neither is their reason of any validity, who think nature therefore to have framed the head of many bones knit together by sutures, lest the fracture of the one side, should be stretched to the other. For peradventure this may take place, in such as have expresse sutures, seated and framed according to nature. But it takes no place in such as either want them, or have them not seated according to nature, or have them very close and so defaced that it may seem one bone growne together of many; This shall be made manifest by recitall of the following Historie. In whom the fracture may take place in divers bones of the scull.

A servant of *Messus* the Post-master had a grievous blow with a stone, upon the right *Bregma*, A History.

Bregma, which made but a ſmall wound, yet a great contuſion and Tumor. Wherefore that it might more plainly appear, whether the bone had received any harme, and alſo that the congealed blood might be preſſed forth, the wound was dilated, the skin being opened by *Theodore Hereus* the Chirurgeon, who as he was a skilfull workman and an honeſt man, omitted nothing which Art might do for his cure. When he had divided the skin, the bone was found whole, although it was much to be feared, that it was broken, becauſe he fell preſently to the ground with the blow, vomited and ſhewed other ſignes of a factured ſcull; ſo it happened that he dyed on the one and twentieth day of his ſicknes. But I being called to learn, and ſearch how he came by his death, dividing the ſcul with a ſaw, found in the part oppoſite to the blow, a great quantity of *Sanies* or bloody matter, and an Abſceſs in the *Craſſa meninx*, and alſo in the ſubſtance of the very brain, but no ſutures, but the two ſcaly ones. Therefore that is certain which is now confirmed by the authority of *Hippocrates*; as alſo by reaſon and experience, that a blow may be received on the one ſide, and the bone may be fractured on the oppoſite, eſpecially in ſuch as have either no ſutures, or elſe ſo firmly united and cloſed, that they are ſcarſe apparent.

The *Reſonius* may be in the ſame bone of the ſcull.

Neither is it abſurd, that the part, oppoſite to that which received the ſtroak, of the ſame bone and not of divers bones may be cloven, and in thoſe men who have their ſculs well made, and naturally diſtinguiſhed and compoſed with ſutures; and this both was, and is, the true meaning of *Hippocrates*. That this may be the better underſtood, we muſt note that the oppoſite part of the ſame bone may be underſtood two manner of wayes. Firſt, when the fracture is in the ſame ſurface of the ſmitten bone, as if that part of one of the bones of the *Bregma* which is next to the Lambdall ſuture be ſmitten, and the other part next to the Coronall ſuture be cloven. Secondly, when as not the ſame ſuperficies and table which receives the blow, but that which lyes under it is cleft, which kind of fracture I obſerved,

A Hiſtory.

in a certain Gentleman a Horſman of Captain *Stempans* troop; He in defending the breach of the wall of the Caſtle of *Hiſdin* was ſtruck with a Musket bullet upon the *Bregma*, but had his helmet on his head; the bullet dented in the helmet but did not break it, no nor the muſculous skin, nor ſcull, for as much as could be diſcerned, yet notwithſtanding he died apoplectick upon the ſixt day after.

But I being very deſirous to know, what might be the true cauſe of his death, dividing his ſcull; obſerved that the ſecond table was broken, and caſt off ſcales and ſplinters, wherewith as with needles the ſubſtance of the brain was continually pricked, the firſt and upper table being whole, for all this: I afterwards ſhewed the like example to *Capellanus* and *Caſtellanus* the King and Queens chief Phyſitians in the expedition of *Roane*.

Why *Hippocrates* ſet downe no way to cure a *Reſonius*.

But *Hippocrates* preſcribes no method of curing this fifth kind of fracture, by reaſon he thinks it cannot be found out by any circumſtance, whence it happens that it is for the moſt part deadly: Yet muſt we endeavour to have ſome knowledg and conjecture of ſuch a fracture, if it ſhall at any time happen. Wherefore having firſt diligently ſhaven away the haire, we muſt apply an Emplaiſter of Pitch, Tar, Wax, Turpentine, the powder of *Iris*, or flower deluce roots, and maſtich; now if any place of the head ſhall appeare more moiſt, ſoft and ſwoln, it is ſomewhat likely that the bone is cleft in that place, ſo that the Patient, though thinking of no ſuch thing, is now and then forced to put his hand to that part of the ſcull. Confirmed with theſe and other ſigns formerly mentioned, let him call a counſell of learned Phyſitians; and foretell the danger to the Patients friends which are there preſent, that there may no occaſion of calumnie remain, then let him boldly perforate the ſcull; for that is far better, than forſake the Patient ready to yeeld to the greatneſs of the hidden diſeaſe, and ſo conſequently to dye within a ſhort while after. There are foure ſorts, or conditions of fractures, by which the Chirurgeon may be ſo deceived, that when the ſcull is broken indeed, yet he may think there is no fracture. The firſt is when the bone is ſo depreſſed, that it preſently riſes up into its true place, and native equability. The ſecond is when the fiſſure is only capillary. The third is when the bone is ſhaken on the inſide, the utter ſurface nevertheleſs remaining whole, foraſmuch as can be diſcerned. The fourth is, when the bone is ſtricken on the one ſide and cleft on the other.

The manner to know when the ſcull is fractured by a *Reſonius*.

CHAP. IX.

Of the moving, or Concuſſion, of the Brain.

Gal. lib. 2. de comp. medic. cap. 6. & Com. ad Aph. 58. ſect. 7.

BEſides the mentioned kinds of fractures by which the brain alſo ſuffers; there is another kind of affect beſides nature, which alſo aſſailes it by the violent incurſion of a cauſe, in like manner, externall; they call it the Commotion or ſhaking of the brain, whence Symptomes like thoſe of a broken ſcull enſue. Falling from aloft upon a ſolid and hard body, dull and heavy blows, as with ſtones, clubs, ſtaves, the report of a peece of Ordnance, or crack of Thunder, and alſo a blow with ones hand.

Lib. 5. Epidem.

Thus as *Hippocrates* tells, that beautifull damoſell the daughter of *Nerius*, when ſhe was twenty yeeres old, was ſmitten by a woman, a friend of hers, playing with her, with her flat hand upon the fore part of the head, and then ſhe was taken with a giddines, and lay without breathing, and when ſhe came home, ſhe fell preſently into a great Feaver, her head

aked,

aked, and her face grew red. The ſeventh day after there came forth ſome two or three Ounces of ſtinking and bloody matter about her right eare, and ſhe ſeemed ſomewhat better and to be at ſomewhat more eaſe. The feaver encreaſed again, and ſhe fell into a heavy ſleepineſs, and loſt her ſpeech, and the right ſide of her face was drawn up, and ſhe breathed with difficulty, ſhe had alſo a convulſion and trembling; both her tongue failed her, and her eyes grew dull, on the ninth day ſhe died. But you muſt note, that though the head be armed with a helmet, yet by the violence of a blow, the Veines, and Arteries may be broken, not only theſe which paſs through the ſutures, but alſo thoſe which are diſperſed between the two tables in the Diploe, both that they might bind the *Craſſa meninx* to the ſkull, that ſo the brain might move more freely, as alſo that they might carry the alimentary juyce to the brain wanting marrow, that is, blood to nouriſh it, as we have formerly ſhewed in our Anatomie.

The veſſels of the brain broken by the commotion thereof.

But from hence proceeds the efflux of blood running between the ſkull, and membranes, or elſe between the membranes and brain; the blood congealing there, cauſeth vehement pain, and the eyes become blind, vomiting is cauſed, the mouth of the ſtomach ſuffering together with the brain, by reaſon of the Nerves of the ſixt conjugation, which run from the brain thither, and from thence are ſpread over all the capacity of the ventricle; whence becoming a partaker of the offence it contracts it ſelf, and is preſently as it were overturned; whence firſt, theſe things that are contained therein are expelled, and then ſuch as may flow, or come thither from the neighbouring and common parts, as the Liver and Gall; from all which choler, by reaſon of its naturall levity and velocity, is firſt expelled and that in greateſt plenty; and this is the true reaſon of that vomiting, which is cauſed and uſually followes upon fractures of the ſkull and concuſſions of the brain.

Signes.

Celſus.

The cauſe of vomiting when the head is wounded.

Within a ſhort while after inflammation ſeizes upon the membranes and brain it ſelf, which is cauſed by corrupt and putrid blood proceeding from the veſſels broken by the violence of the blow, and ſo ſpread over the ſubſtance of the brain. Such inflammation communicated to the heart, and whole body by the continuation of the parts, cauſes a feaver. But a feaver, by altering the brain cauſes Doting; to which if ſtupidity ſucceed, the Patient is in very ill caſe, according to that of *Hippocrates*; Stupidity, and doting, are ill in a wound, or blow upon the head. But if to theſe evills, a ſphacell, and corruption of the brain enſue, together with a great difficulty of breathing, by reaſon of the diſturbance of the Animall faculty, which from the brain imparts the power of moving to the muſcles of the Cheſt, the inſtruments of reſpiration, then death muſt neceſſarily follow.

Aph. 14. ſect. 7.

A great part of theſe accidents appeared in King *Henry* of happy memory, a little before he dyed. He having ſet in order the affaires of France, and entred into amitie with the neighbouring Princes, deſirous to honour the marriages of his daughter, and ſiſter, with the famous and noble exerciſe of Tilting, and he himſelf running in the Tilt-yard, with a blunt lance received ſo great a ſtroak upon his breſt, that with the violence of the blow, the viſour of his helmet flew up, and the trunchion of the broken Lance hit him above the left eye-brow, and the muſculous skin of the forehead was torn even to the leſſer corner of the left eye, many ſplinters of the ſame trunchion being ſtruck into the ſubſtance of the fore mentioned eye, the bones being not touched or broken; but the brain was ſo moved and ſhaken, that he dyed the eleaventh day after the hurt. His skull being opened after his death, there was a great deal of blood found between the *Dura*, and *Pia Mater*, poured forth in the part oppoſite to the blow, at the middle of the ſuture of the hind part of the head; & there appeared ſigns by the native colour turned yellow, that the ſubſtance of the brain was corrupted, as much as one might cover with ones thumb. Which things cauſed the death of the moſt Chriſtian King, and not only the wounding of the eye, as many have falſly thought. For we have ſeen many others, who have not dyed of farre more grievous wounds in the eye.

A Hiſtory.

What was the neceſſary cauſe of the death of King Henry the ſecond of France.

The hiſtory of the Lord Saint *Iohns* is of late memory: he in the Tilt-yard, made for that time before the Duke of *Guiſes* houſe, was wounded with a ſplinter of a broken Lance, of a fingers length and thickneſſe, through the viſour of his Helmet, it entring into the Orbe under the eye, and piercing ſome three fingers bredth deep into the head; by my help and Gods favour he recovered, *Valeranus* and *Duretus* the Kings Phyſitians and *James* the Kings Chirurgeon aſſiſting me.

A Hiſtory.

What ſhall I ſay of that great and very memorable wound of *Francis* of *Loraine* the Duke of *Guiſe*? He in the ſight of the City of *Bologne* had his head ſo thruſt through with a Lance, that the point entring under his right eye by his noſe, came out at his neck between his ear and the *Vertebræ*, the head or Iron being broken and left in by the violence of the ſtroak, which ſtuck there ſo firmly, that it could not be drawn or plucked forth, without a pair of ſmiths pincers. But although the ſtrength and violence of the blow was ſo great, that it could not be without a fracture of the bones, a tearing and breaking of the Nerves, Veines, Arteries and other parts; yet the generous Prince by the favour of God recovered.

A Hiſtory.

By which you may learn, that many dye of ſmall wounds; and other recover of great, yea, very large and deſperate ones. The cauſe of which events is chiefly and primarily to be attributed to God, the author and preſerver of mankind; but ſecondarily to the variety

Why ſome dye of ſmall wounds and others recover of great.

variety and condition of temperaments. And thus much of the commotion or concuſſion of the brain; whereby it happens that although all the bone remains perfectly whole, yet ſome veins broken within by the ſtroak, may caſt forth ſome blood upon the membranes of the brain, which being there concrete may cauſe great pain, by reaſon whereof it blinds the eys; if ſo be that the place can be found againſt which the pain is, and when the skin is opened, the bone look pale, it muſt preſently be cut out, as *Celſus* hath written. Now it remains, that we tell you how to make your prognoſticks, in all the forementioned fractures of the skul.

CHAP. X.

Of Prognoſticks to be made, in fractures of the skull.

Hip. de vul. cap.

WE muſt not neglect any wounds in the head, no not theſe which cut or bruiſe but only the hairly ſcalp; but certainly much leſs, theſe which are accompanied by a fracture in the skull; for oft-times all horrid ſymptomes follow upon them, and conſequently death it ſelf, eſpecially in bodies ful of ill humors, or of an ill habit, ſuch as are theſe which are affected with the *Lues venerea*, leproſie, dropſie, Pthiſick, conſumption, for in theſe, ſimple wounds are hardly or never cured; for union is the cure of wounds, but this is not performed, unleſs by the ſtrength of nature, and ſufficient ſtore of laudable blood: but thoſe which are ſick of hectick feavers and conſumptions, want ſtore of blood, and thoſe bodies which are repleat with ill humors, and of an ill habit, have no afflux or plenty of laudable blood: but all of them want the ſtrength of nature; the reaſon is almoſt the ſame in thoſe alſo which are lately recovered of ſome diſeaſe.

Whether the wounds of children, or old people are better to heal.

Thoſe wounds which are bruiſed are more difficult to cure, than thoſe which are cut. When the skull is broken, then the continuity of the fleſh lying over it muſt neceſſarily be hurt and broken, unleſs it be in a *Reſonitus*. The bones of children are more ſoft, thin, and repleniſhed with a ſanguine humidity, than thoſe of old men, and therefore more ſubject to putrefaction; Wherefore the wounds which happen to the bones of children, though of themſelves, and their own nature they may be more eaſily healed, (becauſe they are more ſoft, whereby it comes to paſs, that they may be more eaſily agglutinated, neither is there fit matter wanting for their agglutination by reaſon of the plenty of blood laudable both in conſiſtence and quality) than in old men, whoſe bones are dryer and harder, and ſo reſiſt union, which comes by mixture, and their blood is ſerous, and conſequently a more unfit bond of unity and agglutination; yet oft-times through occaſion of the ſymptomes which follow upon them, that is, putrefaction and corruption, which ſooner ariſe in a hot and moiſt body, and are more ſpeedily encreaſed in a ſoft and tender, they uſually are more ſuſpected and difficult to heal.

The Patient lives longer of a deadly fracture in the skull, in Winter than in Summer, for that the native heat is more vigorous in that time than in this; beſides, alſo the humors putrefie ſooner in Summer, becauſe unnaturall heat is then eaſily inflamed and more predominant, as many have obſerved out of *Hippocrates*.

Aph. 15 ſect. 1.

The wounds of the brain and of the *Meninges* or membranes thereof are moſt commonly deadly, becauſe the action of the muſcles of the cheſt, and others ſerving for reſpiration, is divers times diſturbed and intercepted, whence death inſues. If a ſwelling happening upon a wound of the head preſently vaniſh away, it is an ill ſign, unleſs there be ſome good reaſon therefore, as blood-letting, purging, or the uſe of reſolving locall medicines, as may be gathered by *Hippocrates* in his Aphoriſms. If a feaver inſue preſently after the beginning of a wound of the head, that is, upon the fourth or ſeventh day, which uſually happens, you muſt judg it to be occaſioned by the generating of *Pus* or Matter, as it is recited by *Hippocrates*. Neither is ſuch a feaver ſo much to be feared, as that which happens after the ſeventh day, in which time it ought to be terminated; but if it happen upon the tenth or fourteenth day with cold or ſhaking, it is dangerous, becauſe it makes us conjecture that there is putrefaction in the brain, the *Meninges*, or skul, through which occaſion it may ariſe, chiefly if other ſigns ſhall alſo concur, which may ſhew any putrefaction, as if the wound ſhall be pallid and of a faint yellowiſh colour, as fleſh looks after it is waſhed.

Apher. 65. ſect. 5.

Aph. 47. ſect 2.

Wounds which are dry, rough, livid and black are evill.

For, as it is in *Hippocrates Aphoriſ. 2. ſect. 7.* It is an ill ſign if the fleſh look livid, when the bone is affected; for, that colour portends the extinction of the heat, through which occaſion, the lively, or indifferently red colour of the part, faints and dyes, and the fleſh thereabout is diſſolved into a viſcid *Pus* or filth.

Commonly another worſe affect follows hereon, wherein the wound becoming withered and dry, looks like ſalted fleſh, ſends forth no matter, is livid and black, whence you may conjecture, that the bone is corrupted, eſpecially if it become rough, whereas it was formerly ſmooth and plain; for it is made rough when *Caries* or corruption invades it; but as the *Caries* increaſes, it becomes livid and black, ſanious matter with all ſweating out of the *Diploe*, as I have obſerved in many: all which are ſigns that the native heat is decayed, and therefore death at hand; but if ſuch a feaver be occaſioned from an *Eryſipelas* which is either preſent or at hand, it is uſually leſs terrible. But you ſhall know by theſe ſigns, that the feaver is cauſed by an *Eryſipelas* and conflux of cholerick matter; if it keep the form of a Ter-

The ſigns of a a feaver cauſed by an *Eryſipelas*.

tian

...rists, if the fa... the cholerick ... somewhat fiery ... stiffe, that he can ... pricking pain, ... position generated ...

The first is by reason of ... the rarity of the skin of theſe parts.

The cure of ſuch an affect muſt be performed by two means, that is, by evacuation, and cooling with humectation. If choler abound, ... blood, but we muſt purge it ... monedes, you muſt draw blood from ... always a fit ... gerating and humecting ... Lettuce, Navell wort, Water Lentils, ... handfuls of Sorrell boyled in fair water, ... ment of Roſes, or ſome ſuch ... the like remedies muſt be given, and ſo long ... guiſhed. But we muſt be carefull to abſtain from all unctuous and oyly things, becauſe they may eaſily be inflamed, and ſo increaſe the diſeaſe. Now we muſt come to reſolving medicines; but it is good when any thing comes from within, ſo without; but on the contrary it is ill, when it returns from without inwards, as experience and the Authority of *Hippocrates* teſtifie: If when the bone is laid bare, ... by the dropping down of the ſerous filth or matter by the holes of the pales upon the tongue, which lyes under. Now when this ſymptome appears, few eſcape. Alſo it is deadly when one becomes dumb and ſtupid, that is, *Apoplectick* by a ſtroak or wound on the head; for it is a ſigne that not only the bone, but alſo the brain it ſelf is hurt. But oftentimes the hurt of the brain proceeds ſo far, that from convulſion it turns to a Sphacell, in which caſe, they all have one only paſſion on their tongue, but ſome of them dye ſtupid and mute, otherſome with a convulſion of the opponent part. As yet have I obſerved any which have dyed with ſigns of both ſymptomes, by reaſon of a wound in the head, who have not had the ſubſtance of their brain corrupted with a Sphacell, as it hath appeared when their ſkulls have been opened after their death.

Why an Eryſipelas chiefly affects the face. The cauſe of all Eryſipelas of the head.

Why oyly things muſt not be uſed in an Eryſipelas of the face. *Aph. 24. ſect. 6.*

Deadly ſigns in wounds of the head.

CHAP. XI.

Why, when the brain is hurt by a wound of the head, there may follow a Convulſion of the oppoſite part.

MAny have to this day enquired, how as yet as far as I know is hath not been ſufficiently explained, why a convulſion in wounds of the head ſeizes on the part oppoſite to the blow. Therefore I have ... good to add that controverſie in this place. My reaſon is this, that kind of ſymptome happens in the ſound part by reaſon of emptineſs and dryneſs, but the cauſe and that wholly in the Wounded part, of this emptineſs and dryneſs of the ſound or oppoſite part; to wit, pain and the concourſe of the ſpirits and humours thither by the occaſion of the wound, and by reaſon of the pains drawing and ſtretching violently ... to the affected part.

A convulſion is cauſed by dryneſs.

A twofold cauſe of contrary affect dryneſs.

The ſound part exhauſted by this means both of the ſpirits and humours, eaſily falls into a Convulſion.

Lib. 4. de uſu partium.

For then *Galen* writes, God the Creator of nature hath ſo knit together the triple ſpirituous ſubſtance of our bodies, which are two, and ſeated in the ſame, and by the ſame paſſages; to wit of Nerves, Veins, and Arteries, that if one of theſe ſhould ſay part, the reſt preſently neglect it, whereby ... and by little and little dyes, through defect of nouriſhment. But if any ... poſe, that when one part is ... and neceſſity: but I ſay, this ... For it hath not every where ... for the nouriſhment of the ... *Tercelet*, by which when the left part is ... right and ſound part, and though that ... dryneſs. Verily it is true, that ... in ... other by ...

For the ſame parts of the ... belongs ... either part of ... Which ...

Opinion of *Dalechampius*

Franc. Dalechampius in his French Chirurgery [illegible] That, (saith he) the truth of this proposition may [illegible] that the convulsion of the opposite part mentioned by Hippocrates, doth [illegible] when by reason of the greatness of the inflammation at the hurt part of the [illegible] hath already inferred corruption, and a Gangrene to the brain and members [illegible] and within a short time is ready to cause a sphacell in the skull, is that the disease [illegible] terminated by death; for in this defined state of the disease, and these conditions, the sense and motion must necessarily perish in the affected part, as we see it happens in other Gangrens, through the extinction of the native heat. Besides, the passage of the animall spirit must necessarily be so obstructed by the greatness of such an inflammation or phlegmon, that it cannot flow from thence to the parts of the same side lying there under, and to the neighbouring parts of the brain; and if it should flow thither, it will be unprofitable to carry the strength and faculty of sense and motion, as that which is infected and changed by admixture of putrid and Gangrenous vapours. Whereby it comes to pass, that the wounded part destitute of sense, is not stirred up to expell that which would be troublesome to it, if it had sense; wherefore neither are the Nerves thereof any [illegible] seised upon, or contracted by a Convulsion.

It furthermore comes to pass, that because these same nerves are depryved of the presence and comfort of the animall spirit, and in like manner the parts of the same side, drawing from thence their sense and motion are possessed with a palsie; for a palsie is called either by the cutting or obstruction of a Nerve, or the madefaction, or mollification thereof by a thin and watry humor, or so affected by some vehement distemper, that it cannot receive the Animall spirit.

But for the opposite part and the convulsion thereof, it is known and granted by all, that a convulsion is caused either by repletion which shortens the Nerves by dilating them into bredth, or by inanition, when as the native and primitive heat of the Nerves being wasted, their proper substance becoming dry is wrinckled up and contracted; or else it proceeds from the vellication, and acrimonie of some vapour, or sanious and biting humor, or from vehemency of pain. So we have known the falling sickness caused by a vehemate exhalation carried from the foot to the brain. Also we know that a convulsion is caused in the puncture of the Nerves, when as any acrid and sanious humor is shut up therein, the orifice thereof being closed; but in wounds of the Nerves when any Nerve is half cut, there happens a convulsion by the bitterness of the pain.

But verily in the opposite part, there are manifestly two of these causes of a convulsion; that is to say, a putrid and carrionlike vapour, exhaling from the hurt and Gangrenate part of the brain; and also a virulent, acrid and biting *Sanies*, or filth, sweating into the opposite sound part, from the affected and Gangrenous; the malignity of which *Sanies*, *Hippocrates* desirous to decipher, in reckoning up the deadly signs of a wounded head, hath expressed it by the word *Ichor*; and in his book of fractures he hath called this humor *Dacrodes et non Pyon.* [that is, *weeping and not digested.*] Therefore it is no marvell if the opposite and sound part endued with exquisite and perfect sense, and offended by the flowing thereto of both the vaporous and sanious matter, using its owne force, contend and labour as much as it can, for the expulsion of that which is troublesome thereto. This labouring or concussion is followed (as we see in the falling sickness) by a convulsion, as that which is undertaken in vain, death being now at hand; and nature over-ruled by the disease. Thus (saith *Dalechampius*) must we in my judgement determine of that proposition of *Hippocrates* and *Avicen.*

But he adds further, in wounds of the head, which are not deadly, practitioners observe that sometimes the hurt part is taken with the palsie and the sound with a convulsion, otherwhiles on the contrary, the wounded part is seised by a Convulsion and the sound by a Palsie; otherwhiles both of them by a convulsion or Palsie, and somewhiles the one of them by a convulsion or Palsie, the other being free from both affects; the causes of all which belong not to this place to explain. Thus much *Dalechampius.*

CHAP. XII.

A Conclusion of the deadly signs in the Wounds of the head.

The signes of a deadly wound from the depraved faculties of the minde.

NOw that we may returne to our former discourse; you may certainly foretell that the patient will dye, when his reason and judgement being perverted, he shall rave madly; when his memory fails him; when he cannot governe his tongue; when his sight growes dark and dim; his ears deaf; when he would call himself backward from his bed, or else lyes therein without any motion; when he hath a continuall delirium; when the tongue becalls out in pustles, when it is drawn and becomes black by reason of too much dryness; when the mouth grows dry, and casts forth [illegible] matter; when as the colour of the wound which was formerly fresh, is now become

From habite of the body.

falted flesh yellow and pale; when the Urine, and other excrements suppress, when the palsie, convulsion, apoplexie; and lastly, often sowning, with a shall and unequall pulse, invade him. All such signs sometimes appear presently after the wound, otherwhiles some few dayes after; therefore when as the brain is hurt and wounded by the violence of the incision, or fissure, of the contusion, compression, puncture, concussion, or any other fracture, the forementioned signs appear presently in the first dayes; but when they do not appear till many dayes after the blow, you may know that they rise and appear, by reason of an inflammation and phlegmon in the brain, occasioned by the putrefaction of the blood poured forth upon it. *From the time that such signs appear,*

But we must observe this by the way, which also belongs to the prognosticks, that flesh is easily regenerated, and restored in all parts of the head, except in that part of the forehead, which is a little above that which lies between the eye-brows, so that it will be ulcerated ever after, and must be covered with a Plaister. I believe that in that place there is an internall cavity in the bone, full of air, which goes to the five-like bones of the nose, by which the growth of flesh may be hindered; or else that the bone is very dense or compact in that place, so that there can scarse sufficient juice sweat forth, which may suffice for the regeneration of flesh; add hereunto a great conflux of excrements flowing to this ulcer, which should otherwise be evacuated by the eyes and nose, which hinder by that means the dryness of the ulcer, and consequently the healing thereof. *Celsus lib. 8. cap. 4.*

Hence certainly it comes to pass, that if you desire the Patient thus affected to breath, shutting his mouth and nose, the air or breath will come forth of the ulcer with such force, as it will easily blow forth a lighted candle of an indifferent bigness held thereto. Which thing I protest, I observed in a certain man, whom I was forced to trepan in that place, by reason the bone of the forehead was broken and depressed.

CHAP. XIII.

Of salutary signs in wounds of the head.

BUt on the contrary there are salutary signs, when the Patient hath no feaver, is in his right mind, is well at the application or taking of any thing, sleeps well, hath his belly soluble, the wound looks with a fresh and lively colour, casts forth digested and laudable matter, the *Crassa Meninx* hath its motion free and no way hindred.

Yet we must note, which also is observed by the Ancients and confirmed by experience, that we must think none past danger, and free from all chance, untill the hundreth day be past. Wherefore the Physitian ought so long to have a care of his Patient, that is, to consider how he behaves and governs himself in meat, drink, sleep, venery and other things. *When the Patients are out of danger.*

But let the Patient diligently avoid and shun cold, for many when they have been cured of wounds of the head, by careless taking cold have been brought into danger of their lives. Also you must know that the *Callus* whereby the bones of the skull are knit together, requires almost the space of forty or fifty dayes to its perfect coagmentation and concretion. Though in very deed one cannot set down a certain number of dayes, by reason of the variety of bodies, or tempers: For it is sooner finished in young men, and more slowly in old. And thus much may serve for prognosticks. Now will we treat as briefly and perspicuously as we can of the cure both in generall and particular; wherefore beginning with the generall we will first prescribe a convenient diet by the moderate use of the six things not naturall. *The Patient must beware of cold.*

CHAP. XIIII.

Of the generall cure of a broken skull, and of the Symptomes usually happening thereupon.

THe first cure must be, to keep the Patient in a temperate air; and if so be, that it be not such of it self and its own proper nature, it must be corrected by Art. As in winter he must have a clear fire made in his chamber, lest the smoak cause sneesing and other accidents; and the windows and doors must be kept shut to hinder the approach of the cold air and wind. All the time the wound is kept open to be dress't, some body standing by shall hold a chasendish full of coals or a heated Iron bar over the wound, at such a distance, that a moderate heat may pass thence to the wound, and the frigidity of the encompassing air may be corrected by the breathing of the diffused heat. For cold according to the opinion of *Hippocrates*, is an enemy to the Brain, Bones, Nerves, and spinall marrow; it is also hurtfull to ulcers, by suppressing their excrements; which suppress'd do not only hinder suppuration, but also by corrosion makes them sinuous. Therefore *Galen* rightly admonisheth us, to keep cold from the brain, not only in the time of trepanning, but also afterwards. For there can be no greater, nor more certain harm befall the fractured skull, than by admitting the air, by such as are unskilfull: For if the air should be hotter than the brain, then it could not thence be refrigerated, but if the brain should be laid open to the air, in the midst of summer, when it is at the hottest, yet would it be refrigerated, and unless it were relieved with hot things, take harm; this is the opinion of *Galen*, whereby you may understand that many who have their skulls broken, dye more through default of skill in the curing, than by the greatness of the fracture. *How the air ought to be.* *Aphor. 14. sect. 4.* *Lib. 2. de usu part. cap. 2.* *The Air though in summer is colder than the brain.*

But when the wound is bound up with the pledgets, cloths, and towlers, as is fit; if the air chance to be more hot, than the Patient can well indure, let it be amended by sprinkling and strewing the chamber with cold water, or verdure, the branches of Willows and Vine. Neither is it sufficient to shun the too cold air, unless also you take heed of the over light, chiefly untill such time as the most feared and malign symptomes are past.

For a too great light dissipates the spirits, increases pain, strengthens the feaver and symptomes. *Hippocrates* wholly forbids wine, therefore the Patient instead thereof must drink barly-water, salt water boyled and tempered with Julep of Roses, syrup of Violets, vinegar and the like waters where- *The discommodities of too much light.*

What his drink must be.

in bread crums have been steeped, water and sugar with a little juyce of Lemons, or pomecitron added thereto, and such like as the ability and taste of the Patient shall require. Let him continue such drinks untill he be free from malign symptoms, which usually happen within fourteen dayes.

Almonds increase the pain of the head.

His meat shall be pap, ptisan, shunning Almond milks; (for Almonds are said to fil the head with vapours and cause pain) stued damask Prunes, Raisons and currants, seasoned with sugar, and a little cinnamon (which hath a wonderfull power to comfort the stomach, and revive and exhilarate the spirits) Chickens, Pidgeons, Veal, Kid, Leverets, birds of the fields, Pheasons, black-birds, Turtles, Partridges, Thrushes, Larks and such like meats of good digestion, boiled with lettuce, purslain, sorrell, borage, bugloss, succory, endive and the like, are thought very convenient in this case. If he desire at any time to feed on these meats rosted, he may only dipping them in verjuice, in the acid juices of Oranges, Citrons, Lemons, or Pomegranats, sometimes in one, and sometimes in another, according to his tast and ability. If any have a desire to eat fish, he must mak choyce of Trouts, Gudgeons, Pikes and the like, which live in running and clear waters, and not in muddy; he shall eschew all cold sallets and pulse, because they fly up and trouble the head: it will be convenient after meat to use common dridg powder, or Aniseed, Fennellseed or Coriander comfits, also conserve of Roses, or Marmilate of Quinces to shut up the orifice of the Ventricle, left the head should be offended with vapours arising from thence.

What fish he may eat.

Aphor. 13. & 14. *sect.* 1.

Children must eat often, but sparingly; for children cannot fast so long as those which are elder, because their naturall heat is more strong, wherefore they stand in need of more nourishment; so also in winter all sorts of people require more plentifull nourishment, for that then their stomachs are more hot than in Summer.

Aphor. 15. *sect.* 2.

When the foureteenth day is past, if neither a feaver, nor any thing else forbid, he may drink wine moderately, & by little and little, encrease his diet, but that respectively to each ones nature, strength and custome. He shall shun, as much as in him lyes, sleep on the day time, unless it happen that a *Phlegmon* seise upon the brain or *Meninges*. For in this case it will be expedient to sleep on the day time, especially from morning till noon, for in this season of the day, as also in the spring blood is predominant in the body, according to the opinion of *Hippocrates*. For it is so vulgarly known, that it need not be spoken, that the blood when we are awake is carried into the habit and surface of the body; but on the contrary by sleep it is called into the noble parts, the Heart and Liver. Wherefore if that the blood by the force of the Sun casting his beams upon the earth at his rising is carryed into the habit of the body, should again be more and more diffused by the strength & motion of watching, the inflammation in the brain and *Meninges* would be much encreased. Wherefore it will be better, especially then to stay by sleep the violence of the blood running into the habit of the body, when it shall seem to rage and more violently to affect that way. Watching must in like manner be moderate; for too much depraves the temper of the brain and of the habit of the whole body, it causes crudities, pains and heavines of the head, and makes the wounds dry and maligne.

Why sleep upon the day time is good for the brain being inflamed.

Lib. 2. Epidem.

The discommodities insuing immoderate Watching.

But if the Patient cannot sleep by reason of the vehemency of the inflammation of the brain and *Meninges*, *Galen* wishes, to wash, besmear and anoint the head, nose, temples and ears with refrigerating and humecting things, for these stupefie, and make drowsie the Brain and membranes thereof, being more hot than they ought to be. Wherefore for this purpose let the temples be anointed with *Vnguentum populeon*, or *Vnguentum Rosatum* with a little rose vinegar, or oxycrate; let a sponge moistned in the decoction of white or black poppie seed, of the rinds of the roots of Mandrages, of the leaves of Henbane, lettuce, purslane, plantain, night-shade and the like. He may also have a broath or barly cream, into which you may put an emulsion made of the seeds of white Poppy, or let him have a potion made with ℥ i, or ℥ i ß, of the syrup of poppy, with ℥ ij, of Lettuce water; Let the Patient use these things 4. houres after meat, to procure sleep. For sleep doth much help concoction, it stayes the efflux of the triple substance caused by watching asswageth pain, refresheth the weary, mitigates anger and sorrow, restores the depraved reason, so that for these respects it is absolutely necessary that the Patient take his naturall rest.

Gal. Meth. 18.

Medicines procuring sleep.

The commodities of sleep.

If the Patient shall be plethorick, let the plenitude be lessened by blood-letting, purging and a slender diet, according to the disertion of the Physitian who shall oversee the cure. But we must take heed of strong purgations, in these kinds of wounds, especially at the beginning, left the feaver, inflammation, pain, and other such like symptoms be increased by stirring up the humors.

Lib. 4. meth.

Phlebotomy, according to *Galens* opinion, must not only be made respectively to the plenty of blood, but also agreeable to the greatnes of the present disease, or that which is to come, to divert, and draw back that humor which flows down, by a way contrary to that which is impact in the part; and which must be there evacuated, or drawn to the next. Wherefore for example, if the right side of the head be wounded, the Cephalick vein of the right arm shall be opened, unless a great Plethora or plenitude cause us to open the *Basilica*, or Median, yet if neither of them can be fitly opened, the *Basilica* may be opened, although the body is not plethorick. The like course must be observed in wounds of the left side of the head; for that is far better by reason of the straitnes of the veins, than to draw blood on the opposite side; in performance whereof you must have diligent care of the strength of the Patient, still feeling his pulse, unless a Physitian be present, to whose judgment you must then commit all that busines. For the pulse is, in *Galens* opinion, the certainest shewer of the strength. Wherefore we must consider the changes and inequalities thereof, for as soon as we find it to become lesser and more slow, when the forehead begins to sweat a little, when he feels a pain at his heart, when he is taken with a desire to vomit, or go to stool, or with yawning, and when he shall change his colour and his lips look pale, then you must stop the blood as speedily as you can, otherwise there will be danger left he poure forth his life together with his blood. Then he must be refreshed with bread steeped in wine, and put into his mouth, and by rubbing his temples and

Lib. de cur. per sanguinis miss.

with ſtrong vinegar, and by lying upon his back. But the part ſhall be eaſed and freed from ſome portion of the impact and conjunct humor by gently ſcarifying the lips of the wound, or applying of Leeches. But it ſhall be diverted, by opening theſe veins which are nigheſt to the wounded part, as the *Vena puppis*, or that in the midſt of the forehead, or of the temples, or theſe which are under the tongue; beſides alſo cupping-glaſſes ſhall alſo be applyed to the ſhoulder ſometimes, with ſcarification, ſometimes without; neither muſt ſtrong and long frictions, with courſe clothes, of all the whole body, the head excepted, be omitted during the whole time of the cure, for theſe will be available, though but for this; that is, to draw back and diſſipate by inſenſible tranſpiration the vapours which otherwiſe would aſcend into the head, which matters certainly in a body that lyes ſtill and wants both the uſe and benefit of accuſtomed exerciſe, are much increaſed. The uſe of Fractures.

But it ſhall be made manifeſt by this following and notable example, how powerfull blood-letting is, to leſſen and mitigate the inflammation of the Brain, or the membranes thereof in wounds of the head. I was lately called into the ſuburbs of Saint *German*, there to viſit a young man twenty eight yeeres old, who lodged there in the houſe of *John Martiall*, at the ſign of Saint *Michaell*. This young man, was one of the houſhold ſervants of Maſter *Doucador*, the ſteward of the Lady *Admirall* of *Brion*. He fell down headlong upon the left *Bregma*, upon a marble pavement, whence he received a contuſed wound, without any fracture of the ſkull, and being he was of a ſanguin temperature, by occaſion of this wound, a feaver tooke him on the ſeaventh day with a continuall *delirium* and inflamation of phlegmonous tumor of the wounded *Pericranium*. This ſame tumor poſſeſſing his whole head and neck by continuation and ſympathy of the parts, was grown to ſuch a bigneſs, that his viſage was ſo much altered, that his friends knew him not; neither could he ſpeak, heare, or ſwallow any thing but what was very liquid. Which I obſerving, although I knew, that the day paſt, which was the eight day of his diſeaſe, he had foure faucers of blood taken from him by *Germaine Agace* Barber-ſurgeon of the ſame ſuburbs; yet conſidering the integrity and conſtancy of the ſtrength of the Patient, I thought good to bleed him again; wherefore I drew from him fourteen faucers at that one time; when I came to him the day after, & ſaw that neither the feaver, nor any of the fore mentioned ſymptomes were any whit remitted, or aſſwaged, I forthwith took from him foure faucers more; which in all made two and twenty; the day following when I had obſerved, that the ſymptomes were no whit leſſened, I durſt not preſume by my own only advice, to let him the fourth time blood as I deſired. Wherefore I brought unto him, that moſt famous Phyſitian Doctor *Violene*, who as ſoon as he felt his pulſe, knowing by the vehemency thereof, the ſtrength of the Patient, and moreover conſidering the greatneſs of the inflammation & tumor which offered it ſelf to his ſight, he bid me preſently take out my Lancet and open a vein. But I lingred on ſet purpoſe, and told him, that he had already twenty two faucers of blood taken from him. Then ſaid he, Grant it be ſo, and though more have been drawn, yet muſt we not therefore deſiſt from our enterpriſe, eſpecially ſeeing the two chiefe Indications of blood-letting yet remain, that is, the greatneſs of the diſeaſe, and the conſtant ſtrength of the Patient. I being glad of this, tooke three faucers more of blood, he ſtanding by, and was ready to take more but that he wiſhed me to defer it untill the after noon; wherefore returning after dinner I filled two faucers more, ſo that in all, this young man to his great benefit, loſt twenty ſeaven faucers of blood at five times, within the ſpace of foure dayes. Now the enſuing night was very pleaſing to him, the feaver left him about noon, the tumor grew much leſſe, the heat of the inflammation was aſſwaged in al parts, except in his eyelids, and the laps of his ears, which being ulcerated caſt forth a great quantity of Puſ or matter. I have recited this hiſtory purpoſely, to take away the childiſh feare which many have to draw blood in the conſtant ſtrength of the Patient, and that it might appear how ſpeedy and certain a remedy it is in inflammations of the head and brain. A Hiſtory. The two chief Indications in blood-letting.

Now to return from whence we digreſſed, you muſt note that nothing is ſo hurtfull in fractures and wounds of the head, as venery; not only at that time the diſeaſe is preſent, but alſo long after the cure thereof. For great plenty of ſpirits are contained in a ſmall quantity of ſeed, and the greateſt part thereof flowes from the brain; hence therefore all the faculties, but chiefly the Animall, are reſolved, whence I have divers times obſerved death to enſue in ſmall wounds of the head, yea when they have been agglutinated and united. All paſſions of the mind muſt in like ſort be avoided, becauſe they by contraction and diſſipation of the ſpirits cauſe great trouble in the body and mind. Let a place be choſen for the Patient as far from noiſe as can be, as from the ringing of bells, beatings and knockings of Smiths, Coopers, and Carpenters, and from high-wayes through which they uſe to drive Coaches; for noiſe encreaſes pain, cauſes a feaver, and brings many other ſymptomes. The diſcommoditie of venery in wounds of the head. How hurtfull noyſe is to the fractures of the skull.

I remember when I was at *Hiſdin* at the time that it was beſieged by the forces of *Charles* the fifth, that when the wall was beaten with the Cannon, the noiſe of the Ordnance cauſed grievous torment to all thoſe which were ſick, but eſpecially thoſe that were wounded on their heads, ſo that they would ſay; that they thought at the diſcharging of every Cannon that they were cruelly ſtricken with ſtaves on that part which was wounded, and verily their wounds were ſo angred herewith, that they bled much, and by their pain and feavers encreaſed, were forced with much ſighing to breath their laſt. Thus much may ſerve to be ſpoken of the cure in generall, now we will out of the monuments of the ancients, treat of the particular. A Hiſtory.

CHAP. XV. *Of the particular cure of wounds of the head, and of the muſculous skin.*

LEt us begin with a ſimple wound, for whoſe cure the Chirurgeon muſt propoſe one only ſcope, to wit, Union; for unleſſe the wound pierce to the skull, it is cured like other wounds of the fleſhy parts of our bodies. But if it be compound, as many wayes as it is complicate, ſo many indications ſhew themſelves. In theſe the chiefeſt care muſt be had of the more urgent order and cauſe. Of a ſimple wound of the fleſh and the skin.

Therefore if the wound ſhall be ſimple and ſuperficiary, then the haire muſt firſt be ſhaven away, then a plaiſter applyed made of the white of an egge, bole Armenick and Aloes. The following day you muſt apply *Emplaſtrum de Ianua* or elſe *de gratia Dei*, untill the wound be perfectly healed. But if it be deeper and penetrate even to the *Pericranium*, the Chirurgeon ſhall not do amiſs, if at the ſecond dreſſing he apply a digeſtive medicine (as they call it) which may be made of Venice Turpentine, the yolks of egges, oyl of Roſes, and a little Saffron, and that ſhall be uſed ſo long, untill the wound come to maturation; for then you muſt add honey of Roſes and Barly floure to the digeſtive. Hence muſt we paſs to theſe medicines, into whoſe compoſition no oyly or unctuous bodie enters, ſuch as this; ℞ *Terebinth. venetæ*, ℥ ij, *ſyrupi roſar.* ℥ j, *pul. aloes, Myrrhæ, & maſtich. an.* ʒ ß. Let them all be incorporated and made into an unguent, which ſhall be perfectly regenerated, then it muſt be cicatrized with this following powder. ℞, *Aluminis combuſti, corticis granatorum combuſt. an* ʒ j, *Miſceantur ſimul & fiat pulvis*: but if the wound be ſo large that it require a ſuture, it ſhall have ſo many ſtitches, with a needle, as need ſhall ſeem to require.

A digeſtive medicine.

A ſarcotick medicine.

An Epulotick.

Whilſt I was at *Hiſdin*, a certain ſouldier, by falling of the earth whilſt he undermined, had the Hairy ſcalp ſo preſſed down even to the *Pericranium*, and ſo wholly ſeparated from the beginning of the hind part of his head, even to his forehead, that it hung over his face. I went about the cure in this manner; I firſt waſht all the wound with wine, a little warmed, that ſo I might waſh away the congealed blood mixed with the earth; then I dryed it with a ſoft linnen cloth, and laid upon it Venice-Turpentine mixed with a little *Aqua-vitæ* wherein I had diſſolved ſome *Sanguis Draconis*, Maſtick and Aloes; then I reſtored the hanging skin to its former place, and there ſtaied it with ſome ſtitches, being neither too ſtrait, nor too cloſe together, for fear of pain and inflammation, (which two chiefly happen whilſt the wound comes to ſuppuration) but only as much as ſhould ſerve to ſtay it on every ſide, and to keep forth the air, which by its entrance doth much harm to wounds: the lower ſides of the wound, I filled with ſomewhat long and broad tents, that the matter might have paſſage forth. Then I applyed this following cataplaſm to all the head. ℞, *farinæ hord. & fabarum an.* ℥ vi. *olei roſati*, ʒiij, *aceti quantum ſufficit, fiat cataplaſma ad formam pultis*; this hath a faculty to dry, cool, repell, mitigate pain and inflammation and ſtay bleeding.

A Hiſtory.

What things we muſt obſerve in ſewing.

I did not let him blood, becauſe he had bled much, eſpecially at certain arteries which were broken neer his temples; he being dreſſed after this manner grew well in a ſhort time. But if the wound be made by the biting of a wild beaſt, it muſt be handled after another manner, as ſhall appear by this following hiſtory. As many people on a time ſtood looking upon the Kings Lyons, who were kept in the Tilt-yard at *Paris*, for the delight of King *Henry* the ſecond, and at his charges: it happened that one of the fierceſt of them broke the things wherein he was tyed, and leaping amongſt the company, he with his paws threw to the ground a Girl of ſome twelve yeers old, and taking her head in his mouth, with his teeth wounded the muſculous skin in many places, yet hurt not the skul. She ſcarſe at length delivered by the Maſter of the Lyons from the jaws of Death and the Lyon, was committed to the cure of *Rowland Claret* Chirurgeon; who was there preſent by chance at the ſame time; ſome few dayes after, I was called to viſit her; ſhe was in a feaver, her head, ſhoulders, breſt, and all the places where the Lyon had ſet his teeth, or nails, were ſwoln, all the edges of the wound were livid, and did flow with a wateriſh, acrid, virulent, cadaverous, dark green and ſtinking matter, ſo that I could ſcarſe indure the ſmell thereof; ſhe was alſo oppreſt with pricking, biting and very great pain; which I obſerving, that old ſaying came into my mind, which is; That all wounds made by the bitings of beaſts, or of men alſo, do ſomewhat participate of poyſon. Wherefore there muſt principally great care be had of the venenate impreſſion left in the wounds by the nails & teeth, and therefore ſuch things muſt be applyed, as have power to overcome poyſon. Wherefore I ſcarified the lips of the wounds in divers places, and applyed Leeches to ſuck out the venenate blood, and eaſe the inflammation of the parts, then I made a Lotion of *Ægyptiacum* Treacle and Mithridate after the following manner.

When we muſt not let blood in wounds.

A Hiſtory.

The bitings of man and beaſts are venenate.

Theriacall topick Medicines.

℞, *Mithrid.* ℥ j, *theriac.* ℥ ij, *ægyptiac.* ℥ ß, *diſſolvantur omnia cum aqua vitæ, & Cardui ben.* Let the wounds be fomented and waſhed with it warm; beſides alſo Treacle and Mithridate were put in all the medicines which were either applyed or put into the wound; and alſo of the ſame with the conſerves of Roſes and Bugloſs diſſolved in the water of Sorrell and *Carduus benedictus*, potions were made to ſtrengthen the heart and vindicate it from malign vapors.

A Cordiall Epithema.

For which purpoſe alſo this following *Epithema* was applyed to the region of her heart. ℞, *aquæ roſar. & nenuphar, an.* ℥ iiij, *aceti ſcillitici* ℥ j, *coralforum, ſantalorum albor. & rubrorum, roſar. rub. pulveris, ſudii. an.* ℥ j, *Mithridatii, theriacæ an.* ʒ ij, *ſto. cordial. pulveriſatorum* ℈. ij, *croci* ʒ j, diſſolve them all together, make an Epitheme and apply it to the heart with a ſcarlet cloth or ſponge, and let it be often renued. Verily ſhe dreſt after this manner, and the former remedies but once uſed, pain, inflammation and all the malign ſymptomes were much leſſened; to conclude, ſhee recovered, but lingred and was lean ſome two years after, yet at length ſhe was perfectly reſtored to her health and former nature. By which you may underſtand, that ſimple wounds muſt be handled after another manner, than theſe which have any touch of poiſon.

The cure of the Hairy ſcalp when it is contuſed.

But now that we may proſecute the other affects of the hairy ſcalp; ſay that it is contuſed with a blow without a wound, that which muſt be firſt and alwayes done, (that ſo the affect may better appear, and the remedies which are applyed may take more effect) the hair muſt be ſhaven away, and at the firſt dreſſing a repelling medicine applyed, ſuch as this following *Oxyrh odinum*. ℞. *el. roſ.* ℥ iij, *albun ovorum nu.* ij, *pulveris nucum cypreſſi, balauſt. alumin. ſcobæ roſar. rub. an.* ℥ j. Let them be all incorporated, and make a medicine for the former uſe, or in ſtead thereof you may apply the cataplaſm preſcribed before conſiſting of *Farina hordei, fabarum, aceto & oleo roſaceo*. But ſuch medicines muſt be often renued. When the pain and defluxion are appeaſed, we muſt uſe diſcuſſing medicines for diſſipation of

A repelling medicine.

that

that humor which remains impacted in the part; R*e Emplastri de mucilagin.* ℥ij. *oxicrocei, & emp. de melilo-to, an.* ℥j. *olei chamem. & anethi, an.* ℥ß. *malaxentur simul et fiat emplastrum ad usum dictum.* Such a fomentation will also be good. R*e vini rub. lib.* iiij. *lixivii. cum lib.* ij. *nuces cupressi contus. nu.* x. *pul. myrtillorum* ℥j. *roser. rub. abſinth. fol. ſalviæ, majoranæ, ſtechados, florum chamem. melil. an. M.* ß. *aluminis rothæ, radicis cyperi, calami aromatici an.* ℥ß. *bulliant omnia ſimul,* and make a decoction to foment the grieved part. After somewhat a long fomenting it, whereby it may the better discusse, dry and exhaust the concrete humor; the head must be dryed and more discussing things applyed, such as the Cerate described by *Vigo* called *de minio*; which hath an emollient and digestive faculty in this form. R*e Olei chamem. lilior. an.* ℥x. *olei maſtich.* ℥ij. *pinguedinis vervecis lib.* j. *litharg. auri,* ℥viij. *minii* ℥ij. *vini boni cyathum unum, bulliant omnia ſimul baculo agitando, primum quidem lento igne, mox verò luculentiore, donec tota maſſa colorem nigrum vel ſubnigrum contrahat; adde in fine coctur. Terebinth. lib.* ſ. *pulveris maſtich.* ℥ij. *gum. elemi* ℥j. *cer. quantum ſufficit, bulliant rurſus una ebullitione & fiat empl. molle.* But if the humor be not thus discussed, but onely grow soft, then the tumor must be quickly opened, for when the flesh is inflamed and putrefied through occasion of the contained humor, the bone under it putrefies also by the contagion of the inflamation and the acrimony of the matter falling upon the bone. When you have opened it, wash away the filth of the ulcer with this following detersive medicine. R*e. ſyrupi ros. & abſinth. an.* ℥j. *terebinth.* ℥ ß. *pul. ireos, aloes, maſtichis, myrrhæ, farinæ hordei an.* ß. In stead hereof if there be great putrefaction, *Ægyptia* either by it selfe, or mixt with an equall quantity of *Unguentum apoſtolorum* may be put into the ulcer. When the ulcer is clensed it will be time to use scarcotick and cicatrizing medicines.

A discussing Fomentation.

Cerœum de Minio.

Detersive or cleansing medicines.

CHAP. XVI. *Of the particular cure of a fracture or broken skull.*

IF the skull be broken, so that it be needfull to trepan it, or to elevate and lift it up, or scrape it away, the musculous skin being cut as we formerly noted, the *Pericranium* shall be plucked from the skull, as we said before; which because it can hardly be done without great pain, by reason of its exquisite sense and connexion with the membranes of the braine, we must labour to mitigate the paine for feare of inflammation and other accidents. Therefore the first dressing ended & the corners of the wound drawn each from other; at the second dressing put to the wound, a digestive (as they terme it) made of the yolk of an egge, and oyle of Roses, but you must apply no humid thing to the bone, because we desire to keep it sound and whole. For *Galens* opinion is, that bared bones must not be touched with unctuous things; but rather on the contrary all dry things must be applyed to them, which may consume the superfluous humidity. Therefore we must lay some lint and the cephalick powders which we shall hereafter describe, upon the bone we intend to preserve, and must have diligens care that it be not offended either by the ayre, or touch of humid medicines. You must in Trepaning have a speciall care of the *Crassa meninx*. For I have often observed a great quantity of blood to have flowed from some broken vessell, which adhered to the second Table: neither must we presently and forthwith stay such bleeding, but suffer it to flow according to the plenitude and strength of the patient; for thus the feaver, and together therewith the rest of the symptomes are diminished. For the opinion of *Hippocrates*, in every green wound it is good to cause often bleeding, except in the bellies; for thus the vehemency of pain, inflamation and other accidents will be lesse troublesome; also it is not amisse too for old ulcers to bleed much, for so they are freed from the burden of the impact humors. When you think it hath bled sufficiently, it may be stanched with this following medicine described by *Galen*.

Why the *Pericranium* hath such exquisite sense.

Gal. 6. meth. The bones are offended with the application of humid things.

Lib. de ulcer.

R*e pulveris Aloes* ℥ij. *thuris maſtiches, an.* ℥ß. *albumina ovorum nu.* ij. *agitentur ſimul cum pilis leporinis minutim inciſis, fiat medicamentum.* When the bleeding is stayed, you shall for the asswaging of pain, drop upon the *Meninx* some Pigeons blood, yet warme by opening a Vein under the wing, then it shall be strewed over with this following powder. R*e Aloes, thuris, myrrhæ, ſanguinis draconis an.* ℥j. *Miſce, fiat pulvis ſubtilis.* Also you may make an irrigation with Rose Vinegar, or some repelling medicine; such as is a cataplasme *ex farinis, & olео roſaceo.* Which may be applyed untill the fourth day to asswage and mitigate pain.

Gal. 6. meth.

Vigoes Cerate will be of good use in this case, as that which in my opinion is most fit for fractures of the skull, because it draws powerfully, resolves and dryes moderately, and by reason of the smell refreshes the animall spirits, and strengthens the brain and membranes thereof, as you may easily perceive by things which enter into the composition thereof. R*e Olei roſ. Omphacini, vini, gummi Elemi, an.* ℥ij. *Maſtiches* ℥iß *pinguedinis vervecis caſtrei* ℥iß. ß. *foliorum betæ, caprifol. endiv. an. M.j. ammoniaci* ß. *granorum tinctorum* ℥x. *liquata pinguedine eterendæ ſeorſim, & ammoniacum ſimul cum aceto ſcillitico, eliquetur; deinde bulliant omnia ſimul in lib.* ij. *vini boni, lento igne uſque ad conſumptionem vini; deinde exprimantur; cum expreſſione addantur terebinth. Ven.* ℥iiij. *cer. albæ quantum ſufficit, fiat cerotum molle ad uſum prædictum.* Also let the neck, and all the spine of the back be anointed with a liniment, which hath force of mollifing the Nerves, lest they should suffer convulsion, such is this.

Vigoes Cerate good for a broken skull.

A liniment good against convulsions.

R*e Rutæ, marrubii, roriſmar. ebulor ſalviæ, herb. paralyſ. an. M.j. rad. Ireos, cyperi, baccarum lauri, an.* ℥j. *florum chamæ. melil. hyperici, an. M.j. piſtentur & macerentur omnia in vino albo per noctem, deinde coquantur in vaſe duplici cum olео lumbricorum, liliorum, de terebinthina, axungiæ, anſeris & hum. an.* ℥ij. *uſque ad conſumptionem vini, poſtea colentur. & in colatura adde terebinth. veneti.* ℥iij *aquæ vitæ* ß. *cer. quantum ſufficit fiat linimentum ſecundum artem.*

But when the pain is asswaged, we must abstain from all such unctuous things, lest they make the wound become sordid and malign, and putrefie the adjacent parts, and consequently the *Crassa meninx* and skull, for the integrity of all parts may be preserved by their like, and such are dry things in a fracture of the skull. Wherefore all humid and oyly things must be shunned in the cure thereof, unless peradventure there shal be some need to mitigate pain & bring the humor to suppuration.

For according to *Galen*, we are oft forc'd for a time to omit the proper cure of the disease, so to

Gal. 4 meth.

How farre humid things are good for a fractured skull.

reſiſt the ſymptomes; furthermore *Hippocrates* would have us not to foment the skull, no not with wine, but if we do, to let it be but with very little. *Vidius* interprets that little to be, when there is fear of inflamation; for wine if it be red, tart and aſtringent, hath a repreſſing, refrigerating and drying faculty: for otherwiſe all wine although it heats and dryes by its faculty, yet it actually humects and cools, both which are very hurtfull in wounds of the head, or a fractured skull, eſpecially when the bone is bare; for from too much cooling of the brain there is fear of a convulſion, or ſome other evill ſymptome. Wherefore let this be ratified, that is, We muſt not uſe humid and unctuous medicines in wounds of the head, except for curing of an inflamation, or the mitigation of pain cauſed thereby. Therefore let the bared skull be ſtrewed with catagmatick and cephalick powders, (being ſo called by the Ancients, for that they are convenient and good in fractures of the skull and the reſt of the bones) for by their dryneſs they conſume the ſuperfluous humidity, and by that means help nature in the ſeparating of the broken bones, and the regenerating of fleſh. Such powders uſually conſiſt of ſuch things as theſe enſuing. *Thus, radix Iridos florent. farina hordei, & Erui, pulvis Aloes Hepatici, ſanguis Draconis, maſtiche, Myrrha, rad. Ariſtolochiæ, Gentianæ*: and generally all ſuch ſimples as have a drying and an abſtergent faculty without biting; but you muſt not uſe theſe things before the pain, inflamation and apoſtumation be paſt; that is then, when the membranes muſt be cleanſed, the bones filled, and the fleſh generated. For the skul by how much it is the dryer, by ſo much it requires and more eaſily endures more powerfull and dryer medicines than the *Dura Mater* or *Pericranium*, as that which in quickneſs of ſenſe comes far ſhort of theſe two. Wherefore when you would apply the forementioned cephalick powders to the *Meninges*, they muſt be aſſociated and mixed with hony, ſyrup of roſes or of wormwood and ſuch other like, that ſo their too violently drying faculty may be allayed and tempered.

Why Cephalick or Catagmatick powders are good.

When to be uſed. How to be mixed when they are to be applyed to the *Meninges*.

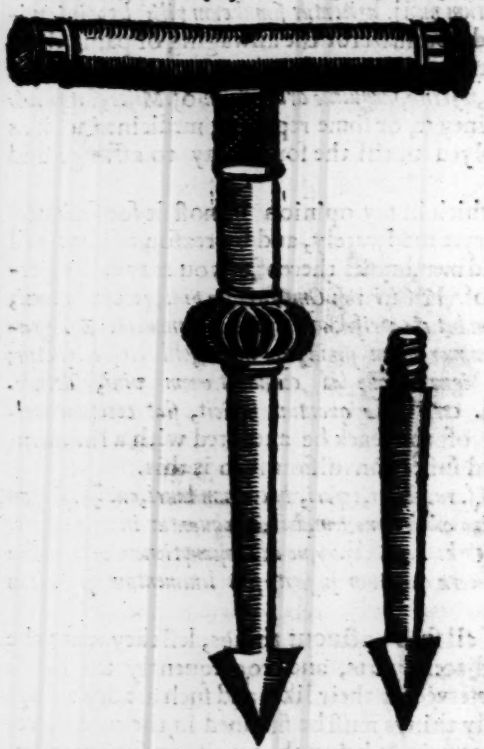
CHAP. XVII. *Why we uſe Trepaning, in the Fractures of the Skull.*

THere are four cauſes of this remedy. The firſt is, to raiſe up the depreſt bones, and take forth their fragments, which preſs upon the *Meninges*, or alſo upon the ſubſtance of the brain. The ſecond is, that the *Sanies* or matter may be evacuated, cleanſed, waſhed, and dryed up, which by the breaking of any veſſell is poured forth upon the Membranes, whereby they are, and not they only, but the brain alſo is in great danger of corruption. The third is, for the fitter application of medicines, convenient for the wound and fracture. The fourth is, that ſo we may have ſomething whereby we may ſupply the defect of a Repelling Ligature, & ſuch an one as may hinder defluxions; for ſuch a Ligature cannot take place here as it may in the other parts of the body, by reaſon of the Sphæricall or Round figure of the head, which doth not eaſily admit binding; & then the denſity and hardneſs of the interpoſed skull is a means that the veſſels lying under it (by which uſually the defluxion comes) cannot eaſily be bound with a rowler ſufficiently to repell the running blood. And the externall veſſels, (to whom the force of the Ligature may come) cannot be bound without great pain, and danger of inflamation. For by ſuch a compreſſion the pulſation of the Arteries would be intercepted, and the efflux of the fuliginous excrements which uſeth to paſs through the ſutures of the skull, would be ſuppreſt, by reaſon of the conſtriction of theſe ſutures.

Why a repelling Ligature cannot be uſed in fractures of the skull.

The ſhape of this Inſtrument is not much different from a Gimblet, but that the point is three-ſquare, and not twined like a ſcrew; as you may perceive, by this following figure.

A Gimblet or piercer to perforate the skull, before the ſetting on of the Trepan.



A. Shews the handle. *B.* The point which may be ſcrewed and fixed into the handle.

How the patient muſt be placed when you Trepan him.

What to be done before the application of the Trepan.

Beſides alſo, the blood would thus be forced from the wounded part without, to within into the Membranes and Brain; when pain, inflammation, a Feaver, Abſceſs, Convulſion, Palſie, Apoplexie, and laſtly, death it ſelf would inſue.

And theſe are the chief cauſes, that Trepaning is neceſſary in fractures of the skull, and not ſo in the fractures of other bones.

But before you apply or put to your Trepan, the Patient muſt be fitly placed or ſeated, and a double cloth muſt be many times wrapped about his head, and then his head muſt be ſo laid, or preſſed upon a Cuſhion or pillow, that when you come to your operation, it may not ſink down any further, but remain firm and ſtedy. Then you muſt ſtop the Patients ears with Cotten-wooll, that ſo he may not hear the noiſe made by the Trepan or any other Inſtrument.

But before you put to your Trepan, the bone muſt be pierced with an Inſtrument, having a three ſquare point, that ſo it may be the more ſpeedily and certainly perforated. The point thereof muſt be no bigger then the pin of a Trepan, that ſo the Trepan which is forthwith to be applyed may ſtand the more ſtiffer, and not play to and again in too wide a hole.

CHAP.

CHAP. XVIII. *A Description of Trepans.*

Trepans are round saws, which cut the bone circularly more or less according to their greatness; they must have a pin standing in the [illegible] so to stay and hold fast the [illegible] tred and you have cut through the first table at the least: then you must take forth the pin, lest going quite through the bone, it may prick or hurt the *Dura Mater*. Wherefore when you have taken forth the pin, you may safely turn it about until you have cut through both the tables; Your Trepans must also have a cap, or somewhat to stir or incumber them, lest no way hindred they cut more of the bone than we would, and in conclusion run into the Membrane. They must also be anointed with oyl, that so they may cut the more readily and gently, for thus Carpenters use to grease their saws. But you must, during the time of the operation, often dip them in cold water, lest the bone by attrition become too hot: for all hard solid bodies by quick and often turning about, become hot; but the bone made more hot and dry, is altered and changed in its nature, so that after it is cut, more of it scales and falls away. Now you must know that the bone, which is touched with the Trepan, of the Air, always casts off scales, for the speedier helping forwards whereof, you must strew upon it powders made of Rocket, Briony, wild Coucumber & *Aristolochia* roots. When the bone is sufficiently scaled, let this following powder be put upon it, which hath a faculty to cover the bone with flesh, and to harden it with dryness convenient to its kind: ℞ *Pulver. Irevs Illyricæ, Aloes, Mannæ thuris, Myrrhæ, aristolochiæ an.* ʒ j. Flesh being by this means generated, let it be cicatrized by strewing upon it the rinds of Pomegranats and Alum burnt.

The hurt the bone receives by being heated with the Trepan: What things hasten the scaling of the bone.

Neither shall the Chirurgeon forcibly take away these scales, but commit that whole work to nature, which useth not to cast them off before that it hath generated flesh under them. For otherwise if he do any thing rashly, he brings new corruption to the bone; as we shall more at large declare, when we come to treat of *Caries* or rottenness of bones.

The bone must not be forcibly scaled.

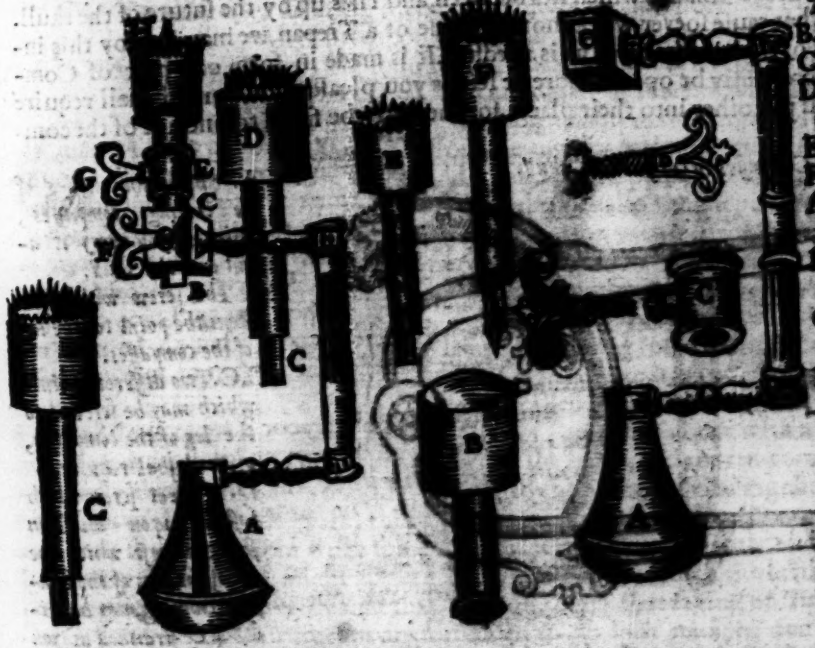
He which useth the Trepan, must consider this, that the head is of a round figure, and also the Trepan cuts circularly, and therefore it is impossible to cut the bone so equally on every side, as if it were performed upon a plain body. Furthermore the thickness of the skull is not alike in all places; wherefore you must look, and mark whether the Trepan go not more deep on one side than on the other, which you may do by measuring it now and then with a pin or needle, and if yet find that it is cut deeper on one side, than on the other, you must press down the Trepan more powerfully upon the opposite part.

A caution in Trepaning.

But seeing there are many sorts of Trepans invented and exercised by many men, yet if you weigh and rightly consider them all, you shall find none more safe than that I invented and have here delineated. For it cannot pierce one jot further into the skull, than he pleases that uses it, and therefore it cannot hurt either the *Meninges* or the Brain. An Iron head or cover stayes it as a bar, that it can penetrare no further than you shall think it requisite. This head or cover is to be drawn up and down, and set higher and lower, as he which uses it shall think good, and so it will stay the Trepan that it shall not goe a hairs bredth beyond your intended depth. So that hencforwards there shall be no Chirurgeon, howsoever ignorant in the performance of his Art, which by the benefit of such a Trepan may not perform this operation without any danger or fear of danger of touching the *Dure Mater*, the hurting whereof, puts the life in jeopardy.

A safe and convenient Trepan.

The figure of our Trepan opened and taken in pieces.



The figure of the same Trepan fitted and put together.

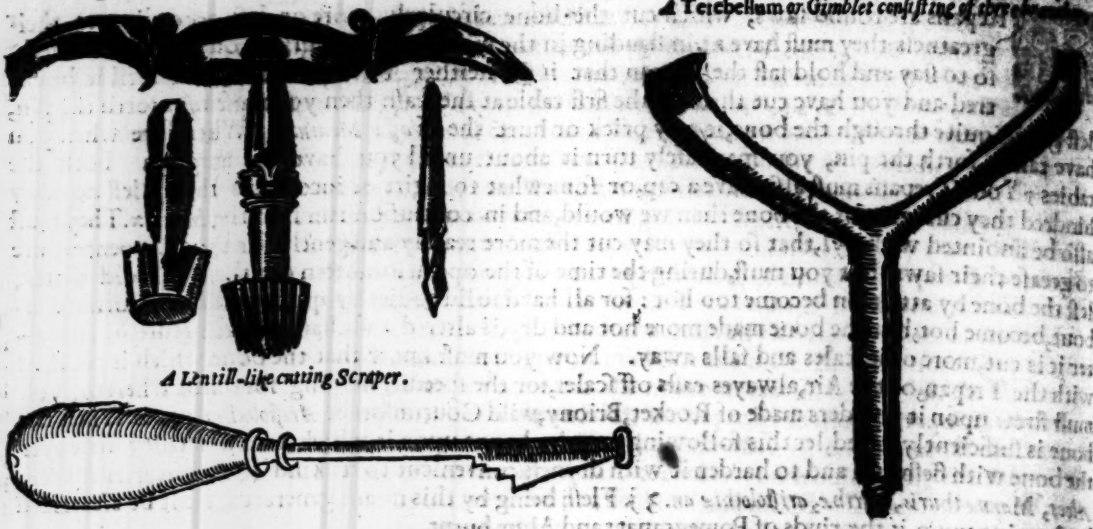
B. The place into which the Trepan is put and fitted.
C.C.C. The upper end of the trepan which is to be fitted and put into the Brain.
D. The Trepan with its cover or cap upon it.
E. The ferule.
F. A screw pin by the twining whereof the Trepan is fastened in the Brace.
G. Another screw pin which fastens the ferule closer to the Trepan.
H. The three square pins.

In ſtead of the other Trepan ſet forth by the Author, I have thought fit to give you the figure of that Trepan that is here moſt in uſe, and the fitteſt therefore, as it is ſet forth by Mr. Doctor *Crook*.

A Terebellum or Gimblet conſiſting of three [illegible]



A Lentill-like cutting Scraper.

All theſe particulars of the Trepan taken in ſunder, you may ſee united and fitted together in the other figure. But when you cannot bring out the bone which you have cut off with your Trepan, then you may take it forth with the *Terebellum* or Gimblet here expreſt, that is, ſcrewing the point thereof into the hole made by the threeſquare pin; the handle of this Inſtrument may alſo ſerve in ſtead of a Levatory. When with the Gimblet you have drawn or taken forth that part of the skull which was cut away by the Trepan; if there ſhall be any ſharp ſplinters in the ſecond table, which may hurt and prick the *Meninx*, when it is heaved up by the motion of the brain, they muſt be ſhaved away and planed with this Lentill faſhioned ſcraper, being ſo called, becauſe it hath the head thereof faſhioned and ſmooth like a Lentill, leſt being ſharpe it ſhould hurt and prick the membrane in the ſmoothing thereof.

The uſe of a Leaden Mallet.

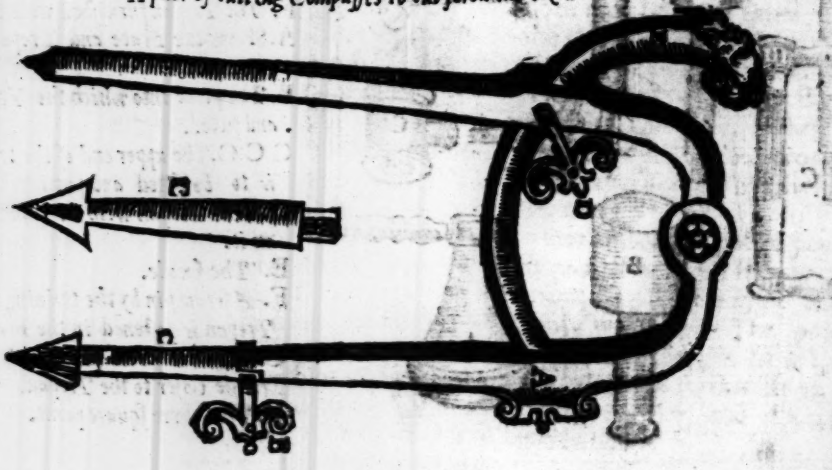
But if by reaſon of the thickneſs, the skull cannot be cut with this Lentill-like ſcraper, you may uſe the cutting ſcrapers and a Mallet. The mallet muſt be of lead, that ſo it may ſhake the brain as little as may be. But you muſt diligently with your mullets take forth the ſharp ſplinters, and peeces of the bone. But if the fractured part of the ſkul be ſuch, that it will not admit that ſection which is requiſite for the bared bone, as when the fracture is upon the temporall muſcle, or at the ſutures; then in the ſtead of one Trepan, two or three muſt be applyed, if the neceſſity of the preſent caſe ſo require, and that within a very ſmall compaſs; but they muſt not be applyed to the fractureed part, but nigh thereto, as we ſhall ſhew more at large in the following chapter. But the Trepans ſhall be applyed ſo neer to each other, that the ring of the ſecond may be joyned with the ring of the firſt and third. But if a fracture ſhall happen to light upon a ſuture, then you muſt not apply a Trepan to it, but uſe two thereto on each ſide; he that ſhall do otherwiſe, ſhall tear in ſunder the nervous and membranous fibers, and alſo the veins and arteries by which the *Dura Mater* is faſtened to the skull, and yeelds matter to the *Pericranium*. He which ſhall apply one Trepan, that is, but upon one ſide of the ſuture, he ſhall not be able to get forth all the *ſanies* which is fallen down on both ſides by reaſon of the partition of the *Craſſa Meninx*, which lies between, and riſes up by the ſuture of the skull.

VVhy a Trepan muſt not be applyed to the ſutures.

VVhy two Trepans are to be uſed to a fractured ſuture.

To conclude, when for what cauſe ſoever we cannot make uſe of a Trepan, we may imploy this inſtrument, if ſo be as much of the bone be bared as is needfull. It is made in form of a pair of Compaſſes, and by means of a ſcrew may be opened more or leſs as you pleaſe. You as need ſhall require may change the points, and put other into their places, for they may be fitted to one ſide of the compaſs with a ſcrew.

A pair of cutting Compaſſes to cut forth the skull.



A. Shews the one leg of the cutting compaſſes, which as you carry it about cuts the skull.

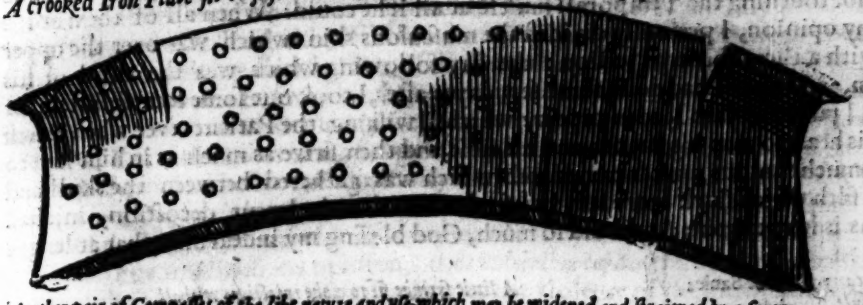
B. The ſcrew which faſtens the point to the leg of the compaſſes.

C. C. Two different points which may be ſcrewed to the leg of the compaſſes, as need ſhall require.

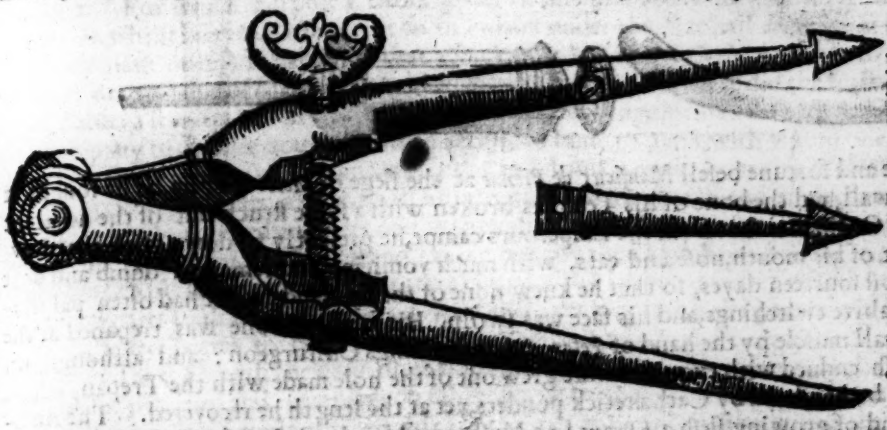
D. A great ſcrew which faſtens upon an Iron ſtring, alongſt which the one of the legs of the compaſs running, may be widened & ſtraitned as you pleaſe.

More-

A crooked Iron Plate fit to sustain and hold steddy one leg of the compass upon the head.



Another pair of Compasses of the like nature and use, which may be widened and straitned by a screw.



Moreover it is fit that the one leg of such cutting compasses should stand firm and steddy, whilst the other is drawn circularly to cut. Wherefore it is fit you have an Iron plate made full of little holes, wherein you may firmly stay that leg of the compass, lest it waver against your will; it is requisite that this plate be crooked, (because the head is round) that so it may be fitted to any part thereof.

CHAP. XIX. *Of the places of the skull whereto you may not apply a Trepan.*

FIrst of all, you shall not apply a Trepan, to a bone that is so broken that it is wholly, or in the greater part thereof divided from the skull by the violence of the stroak, lest by your weight & pressing of the trepan, you force it down upon the membrane. Secondly, you must not apply one to the fractured Sutures, for the reasons mentioned in the former chapter. Thirdly, nor to that part of the forehead which is a little above the eye-browes, for these reasons we gave you before in the twelfth chapter. For there is in that place under the first table of the skull it selfe, a large cavity replenished with a certain white and tough humor, as also with a certain spirituous and ayrie substance, placed there by nature, to prepare the aire which ascends to the brain by the Nostrills: unlesse the Chirurgeon observe and be mindfull hereof, he may be deceived, suppoſing this cavity to be an Effracture of the bone and a depression thereof. Fourthly, neither in the lowest parts of the skull, lest the marrowy substance of the Brain, by reason of its weight, should slide through the hole made by the Trepan. Fifthly, neither to the *Bregma* bones of Children, as those which as yet have not acquired just solidity, to endure the impression of a Trepan. Sixtly, nor to the temples by reason of the Temporall muscle, the cutting whereof in the opinion of *Hippocrates* causes convulsion of the opposite part. For being cut athwart it loses its proper action, that is, to move and lift up the lower law; but then the opposite Temporall muscle being whole and perfect, using its strength, (his antagonist suffering it, and not resisting or labouring any thing at al to the contrary) it draws the same law to it, whereupon the mouth and all the parts of the face are drawn awry, and suffer a Convulsion towards the sound part, the other being resolved according to *Hippocrates* his rule. For as often as the muscles of one kind are equall in number, magnitude and strength on each side, the resolution of the one part, causes the Convulsion of the other.

A bone almost severed from the skull must not be trepaned.

A notable cavity in the forehead bone.

Lib. de Vul.

A rule out of *Hippocrates*.

Neither doth this danger alone arise from the cutting of the Temporall muscle, but also another, which is, that this muscle when we eat and speak, is in perpetuall motion, whereby it comes to pass, that being once cut it is scarse ever united again, besides also the commissure or joyning together of the stony bones lye under it. But by the second caution we are forbid to trepan upon the sutures; moreover also many veins, arteries and nerves are spred over the substance thereof, so that by cutting of them, there is danger of many and malign symptomes, as pain, inflamation, a feaver, a convulsion not only of the part it self, but also of the whole body, whence lastly death insues. Wherefore let no Chirurgeon be so fool hardy, as to attempt the cutting of this muscle so to trepan the bone which lies under it; rather let him apply his Trepan above it, or on the side thereof, or as neer to the affected part as he can, as I did in a Gentleman called *Monsieur dela Bretesche*. He in the triumphant entrance of King *Henry* the second, into the City of *Paris*, was so hurt with a stone, that the *Os Petrosum* or scaly bone, was broken with the violence of the blow, and the temporall muscle was vehemently contused, yet without any wound. I being called the next day (viewing the manner of the hurt, & the condition of the wounded part) thought good to bring some Physitians, and Chirurgeons with me to consult hereof, of whom when some thought it expedient presently to divide the temporal muscle that baring the bone we might apply a Trepan, and so take forth the broken bones: I on the contrary, begun earnestly to withstand that opinion, citing that saying of *Hippocrates, ex libro de vulneribus Capitis*, wherein Chirurgeons are forbidden to cut such muscles, for fear of the forementioned symptomes; also I cited experience, how that I had often observed all those which had this muscle

What discommodities arise from cutting the temporall muscles.

A History.

cut

cut,dyed with a convulſion;but that it ſhould be far better, that neer above the fracture the bone ſhould be trepaned, not touching the Temporall muſcle at all if he could. When all of them at the laſt had inclined to my opinion, I preſently divided the muſculous skin which was over the upper part of the fracture with a three cornered ſection: the day following which was the third of his diſeaſe,I trepaned him, and after I had done,ſome few dayes after,I took out ſome four ſplinters of the broken bone;and I put in a plain leaden pipe,by which(I wiſhing the Patient ever when I dreſt him to hold down his head,to ſtop his mouth and his noſe,and then ſtrive as much as in him lay to put forth his breath)much ſanious matter came forth,which was gathered between the skull and *Craſſa Meninx*.Other filth which ſtuck more faſt, I waſhed out with a detergent decoction, injected with ſuch a ſyringe as is here expreſt; And I did ſo much, God bleſſing my indeavours,that at length he recovered.

A plaine leaden pipe for to carry forth the Sanies *gathered under the skull.*

A little ſyringe fit to make injections withall.

A hiſtory.

The like chance and fortune befell *Monſieur de Pienne* at the ſiege of *Mets*. For he as he fought at the breach of the wall,had the bone of his Temples broken with a ſtone ſtruck out of the adjacent wall,by a peece of Ordinance ſhot from the Emperours campe,he preſently fel down with the blow, and caſt blood out of his mouth,noſe and ears, with much vomiting,and remained dumb and as it were ſenſleſs almoſt fourteen dayes, ſo that he knew none of the by-ſtanders. He had often palpitations ; and convulſive twitchings,and his face was ſwoln. His forehead bone was trepaned at the ſide of the temporall muſcle by the hand of *Peter Aubert* the Kings Chirurgeon: and although on the 25.day,ſoft fleſh endued with exquiſite ſenſe grew out of the hole made with the Trepan, whoſe growth could not be hindered by Cathæretick pouders,yet at the length he recovered. The Ancients called this kind of growing fleſh a *Fungus* [*i.*a Muſhrome] for that it is ſoft, and grows with a ſmall root and broad top like a muſhrome:but it increaſes and decreaſes,according to the plenty of the flowing matter, and induſtry of the Chirurgeon hindering by art the growth thereof. This fleſh ſtinks exceedingly,they commonly call it*Ficus ſancti Fiacrii* [*i.*the fig of S. *Fiacre*.]This diſeaſe commonly hath its original after this manner.Even as in the bodies of trees from the excrements of nouriſhment,a certain half putrid,groſs and viſcous humor ſweats through the bark, and gathered together by little and little grows into a Muſhrom,ſo blood melancholy both in temper and conſiſtence,ſprings from the broken veſſells of the skull and *Craſſa Meninx*,which alſo is ſent ſometimes by nature for the neceſſary repairing of the fleſh in theſe parts, whereupon a certain *fungus* breeds, which in *Galens* opinion,favors or partakes of the nature & conditionof the parts to which it grows though in generall it be of the nature of malign warts, or excreſcences. But for to take away ſuch *Fungi*,you muſt apply medicines which have a ſpecifick faculty to waſt ſuperfluous fleſh; ſuch are theſe which ſtrongly dry,and gently waſt and eat,ſuch as this which follows.℞ *Sabinæ* ʒ ij.*ocreæ* ʒj.*pulveriſentur ſimul, aſpergatur caro excreſcens*. Or elſe ℞ *Hermodactylorum combuſtorum* ʒʃʃ, make a pouder for the ſame uſe. But if ſo be that this fungous fleſh come to ſuch growth,(as it often happens)as to equall the bigneſs of an egg, it muſt be tied and ſtrait twitched, cloſe to the root with a ſilken thred,and when it ſhall fall away by reaſon of this binding,the place muſt be ſtrewed with the forementioned pouders, for ſo it will be more certainly cured,than with more acrid cathæreticks.

The generation of a *Fungus*.

CHAP. XX. *Of the corruption and* Caries, *or rottenneſs of the bones of the Head.*

Why when the skull is broken the bones ſometimes become ſoul or rotten.

THere ſometimes follows a corruption and Sphacell of the fractured bones of the skull upon wounds of the head;which happens either becauſe they are touched by the air,which they are not ſenſible of; or for that the *Sanies* putrefying and detained under them,hath infected them with like putrefaction;or by the cure unskilfully handled,they by the raſh application of ſuppurating and oyly medicines becoming more moiſt,and ſo undergoing an unnaturall change of their proper complexion and native temper,as we ſhall ſhew more at large, when we ſhall treat of the reaſon of the *Caries* in the *Lues venerea*.We ſhall know this unnaturall change and corruption,partly by ſight,that is,when from white they become to be yellowiſh,livid and black;partly alſo by putting down a Probe,when as it meets with nothing ſmooth and ſlippery, but feels rough in many places,and beſides alſo when it enters and eaſily penetrates with a ſmall thruſting down into their ſubſtance,as if it were fungous. Yet this laſt ſign may often deceive you,for I have divers times obſerved rotten bones, which being bare had long ſuffered the injury of the air, to become ſo hard that a Trepan would ſcarſe pierce them ; for it is putrid humidity which makes the bones ſoft and fungous;but the air by drying them exhauſts this humidity, and laſtly dryes it, whence follows ſuch contumacious harndeſs.This ſign will be far more certain, if the fleſh which is grown upon the bone be more ſoft than is fit,looſe and have little or no ſenſe of feeling. You may correct and amend this corruption of the bone with cauteries as well actuall,as potentiall,or with the powders of Aloes, Gentian, *Ariſtolochia*,centaury, *cortex pini*, as ℞, *radic.Ircos,Flor. ariſtolochiæ aa.* ʒ j. *centaur.* ʒ ij,*corticis pini* ʒ ʃ,*Miſce & fiat pulvis ſubtiliſsimus oſsi inſpergendus*. But if it be much corrupted,it muſt be ſcraped forth with your *Scalpra*.And you muſt expect the falling or ſcaling of the corrupt bone from the ſound,and not forcibly procure it; for otherwiſe the ſound bone,which lies under it,being as yet covered with no fleſh growing over it,would be corrupted by the appulſe, or touch of the air. Yet you ſhall by little and little gently move and ſhake rotten bones with your probe,

Corrupt bones are ſometimes hard.

probe, that so they may more easily scale and with less trouble to nature. But note by the way, that the scaling of the bone which hath invironed the Trepan, is commonly performed in the space of forty or fifty dayes. So long also will that caused by the unusuall appulse or touch of the air, or application of a cautery, or the aspersion of the Cephalick ponders; besides also in the same number of dayes broken bones may be united and joyned together by a *Callus*, which is to them as a scar, yet sometimes sooner, somewhiles later, according to the variety of the ages, tempers and habits of divers men. But if the *Caries* or *rottennesse* can neither by these fore-mentioned remedies be orecome and amended, neither the loosed continuity agglutinated nor united, you must give the Patient a vulnerary potion, for hence I have found happy success in many. But sometimes not only a certain portion of the bone, is taken with a *Caries*, but also the whole is often seised upon with sphacell, and all fals out. For in *Hippocrates* opinion, *Lib. de vulneribus capitis*, the bone of the skull being broken falls from the sound more or less, according to the violence of the blow; which also is confirmed by experience. For which purpose I think good in this place to recite a History, whereof I was an eye-witness, whilst I served as Chirurgeon in *Piemont* under the Marshall *de Montejan* (who was the Kings Lieftenant there.) It happened that a Lackey of *Monsieur de Goulaines* came to me to be cured; he had the *Bregma* bone of the left side broken with a sword, neither yet did the fracture come to the second Table; a few dayes after his recovery the bone being agglutinated and united, it came to pass that a company of *Gascoine* souldiers his countrymen came to *Turin*, with whom one morning he eat plentifully Tripe fryed with Onions and spices, and drunk a great quantity of strong wine. Whereupon he presently fell into a continuall Feaver, and lost his speech and understanding; his head swelled, his eyes looked red and fiery and as though they would have started out of his head. Which things being considered, I let him blood, having first (by the Physitians advice) given him a Glyster, and applyed to his head such things as were fit; and also I laboured with Frictions and Ligatures of the extream parts to draw the humors downwards; yet for all this the part of the head which was formerly affected begun to impostumate; which being opened, there came forth a great quantity of matter, and at the length the musculous skin and *Pericranium* sinking down, both the Tables of the skull became putrefied and rotten, as you might know by their blackness and stench. Now to take away this corruption, I applyed at certain times actuall cauteries, both to amend the corruption and separate that which was altered; but mark, after some monthes space, a great number of worms came forth by the holes of the rotten bones from underneath the putrefied skull; which moved me to hasten the separation and falling away of the putrid bones. Which being done, upon the very *Crassa Meninx*, which is more strange, in that place, which nature had covered with flesh, I observed three cavities of the largeness of ones thumb filled with worms about the bigness of a points tag, with black heads, diversly wrapped amongst themselves. The bone which nature separated was of the bigness of the palm of ones hand, so that it was strange that so large a portion of the skull should be cast off by nature, and yet the Patient not dye thereof; for he recovered yet beyond all mens expectation, but after the agglutination of the wound the scar remained very hollow according to the decree of *Hippocrates*. For flesh doth not easily grow upon a *Callus*, because it is a thing strange and supposititious by nature; besides, as a scar is a thing more dense than the skin, so is a *Callus* than the bone, so that through the more compact substance thereof, the blood can neither freely nor plentifully sweat through for matter to regenerate flesh. Hence it is, that wheresoever any portion of the skull is wanting, you may there by putting to of your hand perceive and feel the beating of the brain, wherefore the skull must needs be much weaker in that place. Now to help this infirmity, I willed this Lacky to were a Cap made of thick leather, so more easily to withstand externall injuries: and verily thereby he grew much better. Now I think good in this place to lay open the deceit and craft of some Impostors falsly stiling themselves Chirurgeons, who when they are called to cure wounds of the head, wherein any part of the skull is lost, perswade the Patient and his friends, that they must first put a plate of gold in the place of the skull which is wanting. Wherefore they hammer it, in the presence of the Patient, & turne it divers wayes & apply it to the part, the better to fit it; but presently after they slily convey it into their purses, and so leave the patient thus cousened. Others brag that they are able to put the dryed rind of a gourd into the place of the lost bone, and soften it on to defend the part; and thus they grossely abuse those which are ignorant in the Art. For this is so far from being done that nature will not suffer nor endure so much as an haire, or any other small body to be shut up in a wound when it is cicatrised; neither is the reason alike of a leaden bullet which shot into the body lies there for many years without any harm to the patient; for although lead have a certain familiarity with mans body, yet is it at length (unless the density of the opposed flesh, ligament, tendon, or some other such like substance hinder) thrust forth by nature impatient of all strange bodies. And thus much of the rottennesse and corrupcion of fractured bones; now must we speak of the discommodities which befall the *Meninges* by wounds whereby the skull is broken.

The benefit of a vulnerary potion.

A History.

A great falling away of a corrupt bone.

Aph. 25. Sect. 6.

The covetous craft of impostors.

CHAP. XXI. *Of the discommodities which happen to the Crassa Meninx by fractures of the skull.*

MAny discommodities chiefly happen to the *Crassa meninx* by a fracture of the skull and rash trepaning thereof, for it sometimes chances to be cut and torn. Agglutination is a remedy for this disease, which *Hippocrates* wishes to be procured with the juice of *Nepeta* [that is, of that calamint, which smells like Penny-royall] mixed with barly flour. Instead whereof this following powder having the like faculty may take place.

℞ *Calaphon.* ʒiij. *Myrrhæ, aloes, sanguinis Draconis, an.* ʒj. *corticis sarcocollæ an.* ʒß. *misce & fiat pulvis subtilis.* But to purge the blood and matter which is gathered and lyes between the *Crassa meninx* and skull, you shall put in a Tent made of a rag twined up some foure or five double, and steped in syrup

Remedies for the Crassa Meninx.

rup of Roſes or wormwood and a little *Aqua vitæ*; for thus you ſhal preſs down both the *Craſſa Meninx*, leſt lifted up by the accuſtomed and native pulſation of the brain, it ſhould be hurt by the edges of the skull, yet rough by reaſon of the ſharp ſplinters of the bone lately trepaned, and give freer paſſage forth for the matter there contained. But as oft as you ſhall dreſs the Patient, you ſhall remue the forementioned Tent, untill all the matter be purged forth. And ſo often alſo you ſhall preſs down with the following inſtrument the *Dura Mater*, and bid the Patient to ſtrive to put forth his breath, ſtopping his mouth and noſe, that ſo the matter may more eaſily be evacuated. This Inſtrument wherewith you ſhall hold down the *Dura Mater*, muſt have the end round, poliſht and ſmooth as it is here expreſt.

A fit Inſtrument to preſs and hold down the Dura Mater, *ſo to make way for the paſſage forth of the* Sanies *or Matter.*

And let there be laid upon the *Dura Mater* ſtrewed over with the formerly mentioned powder, a ſponge moiſtened and wrung forth of a drying decoction made of aromatick and cephalick things, ſuch as this which followes. ℞ *Fol. ſalviæ, majoran. betonicæ, roſar. rub. abſinth. Myrtil. florum chamæm. melil. ſtœchad. citri uſque an. M.* iij. ß. *rad. cyperi, calam. aromat. ireos, caryophyllatæ, angelicæ, an.* ℥ß. *bulliant omnia ſecundum artem cum aqua fabrorum & vino rubro, fiat decoctio ad uſum dictum.* And in ſtead hereof you may uſe claret with a little *aqua vitæ*, that ſo the contained matter may be evacuated and dryed up. A ſponge is fitter for this purpoſe to draw than a linnen rag or any other thing, both becauſe it is good of it ſelf to draw forth the humidity, as alſo for that by its ſoftnes it yeelds to the pulſation of the Brain. Then apply to the wound & all the adjoining parts, an emplaſter of *Diacalcitheos* diſſolved with vinegar, or wine, or oyl of Roſes, that ſo the plaſter may be the more cold and ſoft. For in *Hippocrates* opinion, nothing which is any thing heavy or hard muſt be applyed to wounds of the head, neither muſt it be bound with too ſtrait, or hard a ligature, for fear of pain and inflammation.

A ſponge fit to foment withall.

Lib. de vuln. cap.

Lib. de faſciis.

The diſcommodities of too ſtrait binding of the head.

What cloathes we muſt uſe.

How the patient muſt lye in his bed.

For *Galen* tells (as he had it from *Mantias*) that a certain man had loſt his eyes by inflammation and impoſtumation ariſing, for that an Apothecary had uſed too ſtrait a ligature to his head and face; for this ſtrait ligature ſo preſſed the ſutures, that the fuliginous vapours, which uſed to paſs through them and the pores of the skull, were ſtopped from paſſing that way; beſides, the beating of the Arteries was intercepted and hindered; by which means the pain and inflammation ſo encreaſed, that his eyes were rent and broke in ſunder and fell forth of their orb. Wherefore *Hippocrates* rightly commends an indifferent ligature: alſo he fitly wiſheth us to let the emplaſters be ſoft which are applyed to the head, as alſo the cloaths wherewith it is bound up, to be of ſoft and thin linnen, or of Cotton, or wooll. When the patient is in dreſſing, if there come much matter out of the wound, you ſhall wiſh him if he can, to lye upon the wound, and now and then by fits to ſtrive to breath, ſtopping his mouth and noſe, that ſo the brain lifted and ſwoln upwards, the matter may be the more readily caſt forth; otherwiſe ſuffer him to lye ſo in his bed, as he ſhall beſt like of, & ſhall be leaſt troubleſome to him. You may with good ſucceſs put upon the *Craſſa Meninx* oyl of Turpentine with a ſmall quantity of *aqua vitæ* and a little Aloes and Saffron finely powdred, to cleanſe or draw forth the *Sanies*, or matter. Or elſe, ℞ *Mellis roſar.* ℥ij, *farinæ hord. pulver. aloes, maſtich. & Ireos florem, an.* ℥ß. *aqua vitæ parum*; let them be incorporated together & make a deterſive medicine for the foreſaid uſe.

Paulus lib. 6. cap. 90.

Sometimes alſo the *Craſſa Meninx* is inflamed after Trepaning, and ſwoln by a *Phlegmon*, that impatient of its place, it riſes out of the hole made by the Trepan, and lifts it ſelf much higher then the skull, whence grievous ſymptoms follow. Wherefore to prevent death, of which then we ought to be afraid, we muſt inlarge the former hole with our cutting mullets, that the matter contained under the skull, by reaſon of whoſe quantity the membrane ſwells, may the more freely breath and paſs forth; and then we muſt goe about by the preſcript of the Phyſitian to let him bleed again, to purge and diet him. The inflammation ſhall be reſiſted by the application of contrary remedies, as this following fomentation. ℞ *Sem. lini, althæ, fœn. græci, ſiſimbrii, roſ. rub. an.* ℥j. *folani, plantag. an. M.* j. *bulliant in aquæ tepida communi, ex qua fiat fotus.* Anodyne and repelling medicines ſhall be dropped into his eares, when it is exceedingly ſwoln, that the tumor may ſubſide, you ſhall caſt upon it the meal or floure of lentills, or vine leaves beaten with Gooſe greaſe. With all which remedies if the tumor doe not vaniſh, and withall you conjecture that there is *Pus* or matter contained therein, then you muſt open the *Dura Mater* with your inciſion knife, holding the point upwards & outwards, for ſo the matter will be poured forth and the ſubſtance of the brain not hurt nor touched. Many other Chirurgeons, and I my ſelf have done this in many patients with various ſucceſs. For it is better in deſperate cauſes to try a doubtfull remedy then none at all; alſo it oft-times happens, whether by the violence of the contuſion and blow, or concretion or clotting of the blood which is ſhed, or the appulſe of the cold ayre, or the raſh application of medicines agreeing neither in temper nor complexion with the *Craſſa Meninx*, or alſo by the putrefaction of the proper ſubſtance, that the *Dura Mater* it ſelf becomes black. Of which ſymptome the Chirurgeon muſt have a great and ſpeciall care.

Remedies for the inflammation of the *Craſſa Meninx.*

How we muſt open the *Craſſa Meninx* when it is impoſtumate.

The cauſes and remedies of the blackneſs of the *Dura Mater.*

Therefore that thou mayſt take away the blackneſs, cauſed by the vehemency of the contuſion, you ſhall put upon it oyl of egges with a little *Aqua vitæ*, and a ſmall quantity of Saffron and Orris roots in fine powder; you ſhall alſo make a fomentation of diſcuſſing and aromatick things boyled in water and wine, and *Vigoes* Cerat formerly deſcribed ſhall be applyed. But if the harm come from congealed blood, you ſhall withſtand it with this following remedie. ℞ *Aquæ vitæ* ℥ij. *croci tinctorum in tenuem pulverem tritorum* ℥ijſß. *croci*, ʒi. *Mellis roſat.* ℥ſß. *ſarcocol.* ℥iij. *Leviter & ſimul bulliant omnia, & de colatura infundatur, quouſque nigrities fuerit obliterata.* If this effect come by the touch of the ayre, it ſhall be helped with this following remedy. ℞ *Tereb. ven.* ℥iij. *Mellis roſ.* ℥ij. *Vitellum ovi*

Remedies for contuſion.

For congealed blood.

num farin. hordei ʒiij. *croci* ℈j. *sarcocol.* ʒij. *aq. vitæ* ʒij. *Incorporentur simul, & bulliant paululum.* This remedy shall be used untill the blackness be taken away, and the membrane recover its pristine colour.

For the hurt received by the ayre.

But if this affect proceeds from the rash use of medicines, it must be helped by application of things contrary. For thus the offence caused by the too long use of moist and oyly medicines, may be amended by using catagmatick and cephalick powders; but the heat and biting of acrid medicines, shall be mitigated by the contrary use of gentle things; for both humid and acrid things somewhat long used make the part look black, that truly by generating and heaping up filth, but this by the burning and hardening heat. But when such blackness proceeds from putrefaction, *John de Vigo* commends the following remedy. ℞ *aquæ vitæ* ʒij. *mellis rosat.* ʒß. But if the affect be grown so contumacious that it will not yeeld to this gentle remedy, then this following will be convenient. ℞ *Aq. vitæ* ʒiij. *mellis rosat.* ʒj. *pulver. Mercur.* ʒij. *unica ebullitione bulliant simul ad usum dictum.* Or ℞ *aquæ vit.* ʒjß. *syrup. absinth. & mellis rosat. an.* ʒij. *unguenti ægyptiaci* ʒjß. *sarcocol. myrrhæ, aloes, an.* ʒj. *vini albi boni & odoriferi,* ʒj. *bulliant leviter omnia simul, colentur ad usum dictum.* But if the force of the putrefaction be so stubborn, that it will not yeeld to these remedies, it will be helped with *Ægyptiacum* (made with plantain water in stead of Vinegar) used alone by it self, or with the powder of Mercury alone by it self, or mixt with the powder of Alome. Neither must we be afraid to use such remedies especially in this extream disease of the *Dura Mater*; for in *Galens* opinion the *Crassa Meninx* after the skull is trepaned delights in medicines that are acrid, that is, strong and very drying, especially if it have no *Phlegmon*; and this for two reasons; the first is, for that hard and dry bodies, such as membranous bodies are, be not easily affected unless by strong medicines; the other is, which must be the chiefe and prime care of the Physitian, to preserve and restore the native temper of the part by things of like temper to it. But if the auditory passage not onely reaching to the hard membranes of the Brain, but also touching the Nerve which descends into it from the brain, suffer most vehement medicins, though it be placed so neer; certainly the *Crassa Meninx* will endure them far more easily and without harm. But if by these means the putrefaction be not restrained, and the tumor be encreased so much, that the *Dura Mater* rising far above the skull, remains unmoveable, black and dry, and the patients eyes look fiery, stand forth of his head and rowl up and down with unquietness and a phrensie, and these so many ill accidents be not fugitive, but constant; then know that death is at hand, both by reason of the corruption of the gangren of a noble part, as also by extinction of the native heat.

Medicins against that putrefaction of the *Meninx*.

VVhy the *Crassa Meninx* easily endures acrid medicins.

Signs of death at hand.

CHAP. XXII. *Of the cure of the Brain being shaken, or moved.*

WE have formerly declared the causes, signes and symptomes of the concussion, or shaking of the Brain, without any wound of the musculous skin, or fracture of the bone; wherefore for the present I will treat of the cure. Therefore in this case, for that there is fear that some vessell is broken under the skull, it is fit presently to open the cephalick vein. And let blood be plentifully taken according to the strength of the Patient, as also respectively to the disease both which is present, and like to ensue, taking the advice of a Physitian. Then when you have shaven away the haire, you shall apply to the whole head and often renue the forementioned cataplasme, ℞ *farinæ, olei rosacei, oxymelitis*, and other like cold and moist repelling medicins. But you must eschew dry, and too astringent medicins must be shunned, such as are *Unguentum de bolo* and the like; for they obstruct too vehemently, and hinder the passage forth of the vapours both by the sutures and the hidden pores of the skull. Wherefore they doe not only not hinder the inflammation, but fetch it when it is absent, or encrease it, when present. The belly shall be loosed with a clyster, and the acrid vapours drawne from the head; for which purpose also it will be good, to make frictions from above downwards, to make straight ligatures on the extream parts, to fasten large cupping-glasses with much flame to the shoulders and the originall of the spinall marrow, that so the revulsion of the blood running violently upwards to the brain, and ready to cause a phlegmon, may be the greater. The following day it will be convenient to open the *Vena Puppis*, which is seated upon the Lambdall suture, by reason of the community it hath with the veins of the brain; & shutting the mouth and nose to strive powerfully to breath. For thus the membranes swell up, and the blood gathered between them and the skull is thrust forth; but not that which which is shut up in the brain and membranes, of which if there be any great quantity, the case is almost desperate, unless nature assisted with stronger force, cast it forth turned into *Pus*. But also after a few dayes the *vena frontis* or forehead vein may be opened, as also the Temporall Arteries and Veins under the tongue, that the conjunct matter may be drawn forth by so many open passages. In the mean space the Patient must keep a spare diet, and abstain from wine, especially untill the fourteenth day, for that untill that time the fearfull symptomes commonly reign. But repelling medicins must be used untill the fourteenth day be past, then we must come to discussing medicins, beginning with the more milde, such as is this following decoction. ℞ *rad. Alth.* ʒvj. *ireos cæsari, salomi eram. an.* ʒij. *fol. salviæ, majoranæ, betonicæ, chamæmeli, meliloti, rub. tinctorum an. M.ß. flor. com.* ʒiij. *bulliant omnia simul secundum artem cum aquæ fabrorum fiat decoctio.* Let the head be washed therewith, twice a day with a spunge, but yet when you do this, see that the head be not too much heated by such a fomentation, or any such like thing, for fear of pain and inflammation. Then you shall apply the cerate of *Vigo* which hath power to discusse, indifferently to dry, and draw forth the humors which are under the skull, and by its aromatick force and power to confirme and strengthen the brain; it is thus described. ℞ *unguentum rosatum* ʒiij. *farinæ hordei* ʒij. *olei rosacei* ʒß. *vitellum ovi crudum, an.* ʒj. *salom. recentis* ʒiij. *chamæmeli, meliloti M.ß. succi cucumeris* ʒij. *olei violacei & chamæmeli* ʒiij. *ceræ albæ* ʒiij. *thuris pulverisati* ʒij. *mastichis* ʒij. *in pulverem quæ redigi debent reducendo liquefactis olei cum cera omnia misceantur simul & fiant extra, quæ erit inter formam emplastri & ceroti.*

What the concussion of the brain is.

The opening of the *Vena Puppis*.

A caution in fomenting the head.

A description of *Vigos* Cerate.

A History. *Vigo* ſaith, that one of the Duke of *Urbins* Gentlemen found the urine hereof to his great good. He fell from his horſe with his head downwards upon hard Marble, he lay as if he had been dead, the blood guſht out of his noſe, mouth and ears, and all his face was ſwollen and of a livid colour; he remained dumb twenty dayes, taking no meat but diſſolved gellies, and Chicken and Capon broths with ſugar; yet he recovered, but loſt his memory, and faultered in his ſpeech all his life after. To which purpoſe is that Aphoriſm in *Hippocrates*; Thoſe which have their Brain ſhaken by what cauſe ſoever, muſt of neceſſity become dumb; yea alſo, as *Galen* obſerves in his Commentary, loſe both their ſenſe and motion. That Cerat is not of ſmall efficacy, but of marvellous and admirable force, which could hinder the generating of an abſceſs, which was incident to the brain by reaſon of the fall. Yet there be many men ſo far from yeelding to reaſon, that they ſtiffly deny, that any impoſtumation can be in the brain; and augmenting this errour with another, they deny that any who have a portion of the brain cut off can recover, or riſe again; but the authority of ancient writers and experience do abundantly reſell the vanity of the reaſons whereon they rely. Now for the firſt, in the opinion of *Hippocrates*; If thoſe which have great pain in their heads have either *Pus*, water or blood flowing from their Noſe, mouth or ears, it helps their diſeaſe.

Aph. 58. *ſect.* 7.

That there may be an abſceſs in the brain. *Aph.* 10. *ſect.* 6.

Gal. lib. de inæqual. intemp. Rhaſ. cap. 4. *continent. Avicen. cap. de exit. ſen.* 3. *lib.* 4. *cap.* 20.

But *Galen*, *Rhaſis*, and *Avicen* affirm that *Sanies* generated in the brain disburdens it ſelf by the noſe, mouth or ears; and I my ſelf have obſerved many who had the like happen to them.

A History. I was told by *Prothais Coulen*, Chirurgeon to *Monſieur de Lingey*, that he ſaw a certain young man in the town of *Mans*, who often uſed to ring a great bell; he once hanging in ſport upon the rope, was ſnatcht up therewith and fell with his head full upon the pavement: he lay mute, was deprived of his ſenſes and underſtanding, & was beſides hard bound in his belly. Wherefore preſently a feaver and *delirium* with other horrid ſymptomes aſſayled him, for he was not trepaned becauſe there appeared no ſign of fracture in the skull: on the ſeaventh day he fell into a great ſweat with often ſneeſing, by violence whereof a great quantity of matter and *Pus* flowed forth of his ears, mouth and noſe, then he was eaſed of all his ſymptomes, and recovered his health.

Lib. 8. *de uſu part. & com. ad aph.* 18. *ſect.* 6.

Now for the ſecond, *Galen* affirms that he ſaw a boy in *Smyrna* of *Ionia* that recovered of a great wound of the brain, but ſuch an one as did not penetrate to any of the ventricles. But *Guido* of *Cauliac* ſaith, he ſaw one which lived and recovered after a great portion of the brain fell out by reaſon of a wound received on the hind part of his head. In the year of our Lord 1538. while I was Chirurgeon to the Marſhall of *Montejan* at *Turin*, I had one of his Pages in cure, who playing at quoits received a wound with a ſtone upon the right *Bregma* with a fracture, and ſo great an Effracture of the bone, that the quantity of half a haſell Nut of the brain came forth thereat. Which I obſerving, preſently pronounced the wound to be deadly; a Phyſitian which was preſent contradicted my opinion, affirming that ſubſtance was no portion of the brain, but a certain fatty body. But I with reaſon and experience in preſence of a great company of Gentlemen, convinced the pertinacy of the Man, with reaſon; for that fat cannot be generated under the skull, for although the parts there contained be cold, yet becauſe they are heated by the abundance of the moſt hot and fubtle animall ſpirits, and the heat of vapours riſing thither from all the body, they do not ſuffer fat to concreat about them. But with experience, for that in the diſſecting of dead bodies, there was never any fat obſerved there; beſides alſo fat will ſwim on the top of water; but this ſubſtance as marrowy, caſt into the water preſently ſunk to the bottome.

Why fat cannot be generated under the skull.

Signs of a fatty ſubſtance.

Laſtly, fat put to the fire becomes liquid and melts; but this ſubſtance being laid upon a hot iron, became dry, ſhrunk up and contracted it ſelf like a peece of leather; but diſſolved not at all. Wherefore all thoſe which were preſent cryed out, that my judgment was right of that ſubſtance that came forth of the skull. Yet though it was cut away, the Page recovered perfectly, but that he continued deaf all his life after.

CHAP. XXIII. *Of the wounds of the face.*

Why we treat in particulat of wounds of the face.

HAving treated of the wounds of the head by their cauſes, ſigns and cure, it follows that we now ſpeak of the wounds of the face, if but for this, that when they are carelefly handled, they leave deformed ſcars in the moſt ſpecious and beautifull part of the body. The cauſes are the ſame which are incident to the skull; that is, externall. But this may be added to the kinds and differences of the wounds, that the life may be out of danger though any one whole part of the face, (as the ear, eye, noſe, lip) may be cut away by a wound, but not ſo in the head or skull. Wherefore beginning at the wounds of the eye-brows, we will proſecute in order the wounds of the other parts of the face.

A thing to be obſerved in wounds of the eye-brows.

This is chiefly to be obſerved in wounds of the eye-brows, that they are oft-times cut ſo overthwart, that the muſcles, and fleſhy pannicle which move and lift them up, are wholly rent and torn. In which caſe the eye-lids cannot be opened, and the eyes remain covered, and as it were ſhut up in the caſes of their lids; ſo that even after the agglutination of the wound, if the Patient would look upon any thing, he is forc'd to hold up the eye-lids with his hand; with which infirmity I have ſeen many troubled, yet oft-times not ſo much by the violence of the wound, as by the unskilfulneſs of the Chirurgeon who cured them; that is, by the negligent application of the bolſters, an unfit ligature and more unfit future. In this caſe the skilfull Chirurgeon which is called to the Patient ſhall cut off as much of the skin and fleſhy pannicle as ſhall ſerve the eye-lids, that ſo they may by their own ſtrength hold and keep open, without the help of the hand: then he ſhall cloſe the wound as is fit, with ſuch a ſtitch as the Furriers and Glovers uſe; and then he ſhall pour thereon ſome of the baſſome of my deſcription, and ſhall lay ſuch a medicine to the neighbouring parts.

sar. ʒ ß, *albumin. ovor. nu.* ij. *boli armeni, sanguinis Draconis, Mastich. an.* ʒ j. *agitentur simul, fiat medicamentum.* Then let the part be bound with a fitting Ligature. Afterwards you shall use *Emplast. de gratia Dei, Empl. de Betonica, Diacalcitheos*, or some other like, untill the wound be cicatrized. But such like and all other wounds of the face may be easily healed, unless they either be associated with some malign symptomes, or the Patients body be repleat with ill humors.

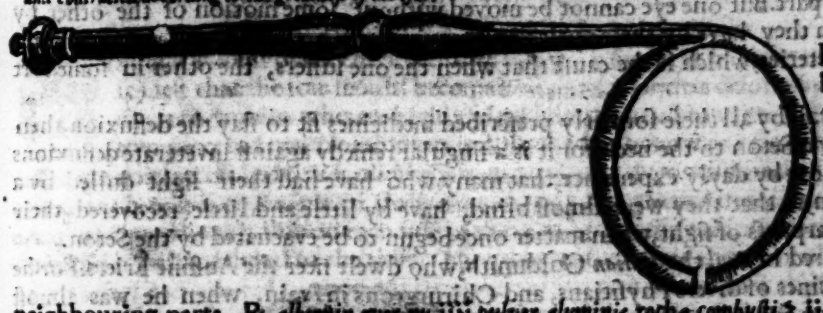
There sometimes happens a quite contrary accident in wounds of the eye-brows, that is, when the eye-lids stand so up that the Patient is forc'd to sleep with eyes open, wherefore those which are so affected are called by the Greeks *Lagophthalmi*. The cause of this affect is often internall, as a carbuncle or other kind of abscess, as a blow or stroak. It shall be cured by a crooked or semicircular incision made above the eye-lids, but so that the extreams of the semicircle bend downwards, that they may be prested down and joyned as much as is needfull to amend the stifness of the eye-lid. But you must not violate the gristle with your Instrument, for so they could no more be lifted up; the residue of the cure must be performed as is fit.

Lagophthalmia is a quite contrary to the falling down of the eye-lids.

CHAP. XXIIII. *Of the wounds of the eyes.*

WOunds of the eyes are made by the violence of things pricking, cutting, bruising, or otherwise loosing the continuity. But the cure must alwayes be varied according to the variety of the causes and differences. The first head of the cure is, that if any strange and heterogeneous body shall be fallen into the eyes, let it be taken forth as soon as you can, lifting and turning up the eyelid with the end of a *spatula*. But if you cannot discern this moat or little body, then put three or four seeds of *Clary*, or *Oculus Christi* into the pained eye. For these seeds are thought to have a faculty to cleanse the eyes and take out the moats, which are not fastned deep in, nor do too stubbornly adhere to the membranes. For in this case, you shall use this following instrument, for herewith we open the eye-lids the further, putting it between them and the eye, and also keeping the eye steddy by gently pressing it, that so with our mullets we may pull out the extraneous body; this is the figure of such an Instrument.

The delineation of a Speculum oculi, to dilate and hold asunder the eye-lids, and keep the eye steddy, as it is so much, that it may be dilated and contracted according to the greatness of the eye.



All strange bodies taken out, let this medicine be put into the eye. Take the strains of a dozen egs, let them be beaten in a leaden Mortar, with a little Rose water, and so put into the eye; but let this repercussive be laid upon the eye and the neighbouring parts. R. *albumin. ovor. nu.* iiij. *pulver. aluminis rothe combusti* ʒ ij. *sanguinis Draconis* ʒ j. *aquæ rosar. & plantag. an.* ʒ ij. *agitentur simul*, make a repercussive, which you may frequently use. Or else apply cheese curds well wrung, mixed with rosewater, the white of an egge, and as much *acacia* as shall suffice. This which followeth doth more powerfully stay the flowing humor. R. *gum arab. & tragac. an.* ʒ ij. *psilii, cydon. semin. portul. plant. sumach. an.* ʒ ij *fiat mucag. cum aqua plantag. solan. & rosar. concinnetur collyrium*, of which you may drop some both within and about the eye.

A repercussive to be put into the eye.

Divers repercussives to be applyed to the eye.

But note, that all such remedies must be applyed warm, both that they may the better penetrate by their moderate heat, as also for that all actuall cold things are hurtfull to the eyes and sight, because they dull the sight by incrustating the vitrive spirits. For I have known many who have become dull of sight by the frequent using of medicines actually cold to the eyes. I have on the contrary seen not a few, who have recovered with the fit use of such like medicines, who have had any part of their eye (so it were not the *pupilla* or apple of the eye) so pricked with a needle or bodkin, that much of the waterish humor ran forth thereat.

Things actually cold are hurtfull to the eyes.

The milk of a woman which suckles a girl (for that is reputed the cooler) mitigates pain and cleanses, if it be milked out of the Dug into the eye; to which purpose also the blood of Turtles, Pigeons or Chickens much conduces, being droped into the eye by opening a vein under their wings. Also this following cataplasm allwageth pain and inflammation, and hinders defluxion, being applyed to the eye and the adjacent parts. R. *Carnis panorum sub cinere calido decoctorum* ʒ v. *vitellos ovorum num.* iij. *casiæ fistulæ recenter extractæ* ʒ ß, *mucaginis psilii, altheæ & cydon. an.* ʒ j. *farin. hordei parum, incorporentur omnia simul, fiat cataplasma.* Also sheeps lungs boyled in milk and applyed warm, and changed as they grow cold, are good to allwage pain. But if the too violent heat and pain, shall not yeeld to such medicines, but require more vehement, then *Foliorum Hyoscyami, m. j. sub. cineribus coquatur, atque in mortario cum mucagine seminis psilii, & cydoniæ exactis in aqua solani & plantag. pistetur.* then let this medicine be wrapped in a linnen cloth and applyed to the eyes and temples. The mucilages of *Psilium*, or Fleawort, and Quince seeds extracted in a decoction of Poppy heads and mixed with a little *Opium* and Rose water, are used for the same purpose. But when there is need of detergent and sarcoticke medicines, then R. *syrup. rosar. sicc.* ʒ j. *aq. fenic. & rutæ an.* ʒ ij. *aloes lotæ, olibani an.* ʒ ß. mix them for the foresaid use. The galls of Scates, Hares, and Partridges dissolved in Eye-bright, and Fennill water, are fit for cleansing such wounds; as also this following *Collyrium*. R. *aquæ hordei* ʒ j. *mellis despumati*, ʒ iij. *aloes ter lotæ in aqua plantaginis & sacchari cand. an.* ʒ j. *fiat collyrium.* Also this insuing medicine is very sarcoticke. R. *mucag. gummi olibani, arabici, tragacanth. & sarcocol. in aq. hordei extract. an.* ʒ iij.

Anodyne medicines for the eyes.

Narcoticks.

Detergent medicines.

A sarcoticke medicine for the eyes.

aloes: ter lotæ in aq. roſarum. ℥ j. *ceruſ. uſtæ & lotæ, tutiæ prepar. an.* ℥ ß. *fiat collyrium.* But here you muſt note, that the coat *Adnata* often ſwells ſo much by reaſon of a wound or ſome other injury, and ſtands ſo forth by the falling down of humors, acceſs and mixture of flatulencies, that it hides the whole *Pupilla*, and hangs forth of the eye-lids, like as if it were an unnaturall fleſhy excreſcence, and it looſes the native colour, and looks very red, ſo that the eye can neither be ſhut nor opened.

Wherewith a young Chirurgeon being deceived, determined to cut away this protuberancy of the *Adnata*, as though it had been ſome ſuperfluous fleſh, and then to waſh it with cathæretick powders, had I not forbidden him, telling him of the certain danger of blindneſs which would thereupon befall the Patient. Wherefore I preſcribed a fomentation of chamomile, melilote, Roſe leaves, wormwood, rue, fennill, and aniſeeds boyled in milk with the roots of Orris and Marigolds. Then I preſently added this following fomentation, being more powerfull and drying. ℞ *Rutæ, caprifol. gallar. balauſt. an.* ℥ j. *plantag. abſinth. hippuris, flo. chamæm. roſ. rub. an. M.* ß. *buſſiani ſimul cum aqua fabrorum fiat decoctum pro fotu cum ſpongia.* Beſides alſo you may apply a cataplaſm made of barly and bean flowre, the powders of Maſtick, Myrrhe, and Aloes, and ſome of the laſt deſcribed decoction. The tumor beginning to decline, I dropt the flowing liquor into the eye, which hath a very aſtringent, drying and ſtrengthening faculty. Roaſt a new laid egge in Embers untill it be hard, then pill off the ſhell, take forth the yolk, and in place thereof put a ſcruple of Roman Vitriol in fine powder, then ſet it in a linnen cloth and wring it hard forth into ſome clean thing, and drop thereof for three dayes into the eye, with a little Smiths water wherein Sumach and Roſe leaves have been boyled. I have found by experience the certain force of this remedy; but if notwithſtanding there be a true fleſhy excreſcence upon the coat *Adnata*, it may be taken away by this following powder. ℞ *Oſſ. ſepiæ, & teſtæ ovorum calcinatæ an* ℥ j. *fiat pulvis.* Calcined Vitriol, burnt Alum and the like may be commodiouſly uſed to this purpoſe. Yet you muſt warily make uſe of all ſuch things, and alwayes lay repercuſſives about the eye, that no harm inſue thereof. For divers times acrid humors fall down into the eye with ſuch violence, that they break the Horny coat, whereupon the humors of the eye are poured out. Remember alſo, that in diſeaſes of the eyes, the Patient lye with his head ſomewhat high, and that he keep ſhut not only the pained, but alſo the ſound eye, becauſe reſt is alwayes neceſſary for the grieved part. But one eye cannot be moved without ſome motion of the other by reaſon of the connexion they have by their optick and moving nerves, both the *Meninges* and the *Pericranium*, Veins and arteries; which is the cauſe that when the one ſuffers, the other in ſome part partakes therewith.

A drying fomentation.

A medicine to conſume a fleſhy excreſcence without biting.

But if we cannot prevail by all theſe formerly preſcribed medicines fit to ſtay the defluxion, then it remains, that we apply a Seton to the neck; for it is a ſingular remedy againſt inveterate defluxions into the eyes. For we know by dayly experience, that many who have had their ſight dulled by a long and great defluxion, ſo that they were almoſt blind, have by little and little recovered their former ſplendour and ſharpneſs of ſight, when matter once begun to be evacuated by the Seton.

A Seton, a good remedy againſt inveterate defluxions into the eyes.

A Hiſtory.

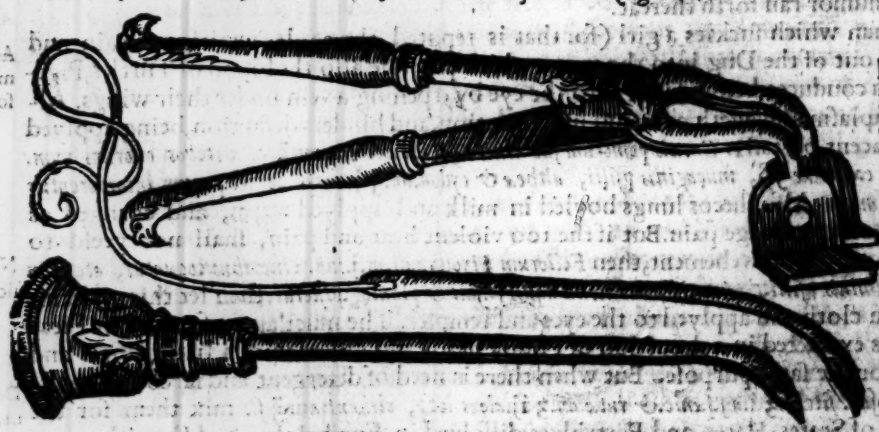
The truth hereof appeared in *Paul* the *Italian* Goldſmith, who dwelt neer the Auſtine Friers. For he having uſed many medicines of divers Phyſitians, and Chirurgeons in vain, when he was almoſt blind, he applying a Seton, by mine advice, began by little and little to ſee better, according to the quantity of the matter which was evacuated, untill at length he perfectly recovered his ſight. But at laſt growing weary of the Seton which he had worn for a year (although matter came dayly forth thereof) yet he would have it taken forth, and healed up; but this way of evacuation being ſhut up, and the humor again beginning to flow into his eyes, ſo that he was in danger to become blind, he called me and made me again to apply the Seton in his neck, Whereby recovering his former ſoundneſs and perfection of ſight, he yet wears the Seton.

A Seton good againſt the falling ſickneſs.

I alſo once freed by this kind of remedy, by the appointment of the moſt learned Phyſitian *Horſtius*, a certain young man of twenty years old, from the falling ſickneſs, who before had many fits thereof; the Ichorous humors, the feeders of this diſeaſe, being by this means, as it is moſt probable, drawn away and evacuated.

A figure of the Pincers, actuall Cautery and Needle uſed in making a Seton.

The manner of making a Seton.



Wherefore ſeeing a Scton is of this uſe, I have thought good in this place to ſet down in writing and by figure, the manner of making thereof, for the behoof of young practitioners: wiſh the Patient to ſit on a low ſtool, and to bend down his head, that ſo the skin and fleſhy pannicle may be relaxed; then muſt you with your fingers pluck up and ſever the skin from the muſcles, and take hold of as much hereof as you can with your pincers, not touching the muſcles of the neck for fear of a convulſion and other ſymptomes; you ſhall then twitch the skin which is held in the pincers, moſt hard, when you ſhall thruſt the hot iron through

through the holes made in the midſt of them; that alſo the nerves being ſo twitched, the dolorifick ſenſe may the leſs come to the part. The wound muſt be made or burnt in long wayes, and not twharting, that ſo the matters may be the better evacuated by the ſtrait fibers. But the cautery or hot Iron muſt have a three or elſe a four-ſquare point & that ſharp, that ſo it may the more eaſily and ſpeedily enter. Then keeping the pincers immoveable, let him draw through the paſſage made by the cautery a needle thred with a three or four doubled thred of Cotton [or rather a skean of ſilk] moiſtened in the white of an egge and oyl of Roſes; then after you have applyed pledgets dipped in the ſame medicine, bind up the part with a convenient ligature. The day following the neck muſt be anointed with oyl of Roſes, and the pledgets dipped in the former medicine applyed for ſome dayes after. But it will be convenient to moiſten the Seton with a digeſtive made of the yolk of an Egge and oyl of Roſes, untill the ulcer caſt forth much matter; then you ſhall anoint the Cotton tired with this following remedy. ℞ *terebinthinæ ven.* ʒ iiij. *ſyrupi roſat. & abſinthii an.* ʒ ß. *pulveris Ireos, diacrydii, agarici trochiſcati, & Rhei, an.* ʒ ß. *incorporentur omnia ſimul & fiat medicamentum.* Which you ſhall uſe ſo long, as you intend to keep open the ulcer. For it hath a faculty to draw the humors from the face, and cleanſe without biting.

I have found not long ſince by experience, that the apertion made with a long thick Triangular needle of a good length like to a large pack-needle, is leſs painfull than that which is performed with the actuall cautery, which I formerly mentioned. Wherefore I would advice the young Chirurgeon, that he no more uſe the foreſaid actuall cautery. I have here given you the figure of the needle.

The Figure of a Triangular Needle.

CHAP. XXV. *Of Wounds of the Cheek.*

SEeing a wound of the cheek ſeems to require a ſuture, it muſt have a dry ſuture (as they term it) leſt that the ſcar ſhould become deformed. For that deformity is very grievous to many, as to women who are highly pleaſed with their beauties. Therefore you ſhall ſpread two peeces of new cloath of an indifferent fineneſs, and proportionable bigneſs with this inſuing medicine. ℞. *pulveris maſtichini, ſanguinis Draconis, thuris, farinæ volatilis, tragacanthæ contuſæ, gypſi, picis, ſarcocollæ an.* ʒ ij. *picis nigræ* ʒ i ß. *albumina ovorum quæ ſufficiant, fiat medicamentum.* Apply the peeces of cloth ſpread with this on each ſide of the wound one, ſome fingers breadth aſunder, and let it alone till it be hard dryed to the skin. Then you ſhall ſo draw them together with your needle and thred, that the fleſh by their ſticking may alſo follow, and be mutually adjoined, as you may ſee it here expreſt. The wound ſhall be agglutinated by this means, together with the uſe of fit medicines, pledgets, ligatures. But all the ligatures and ſtayes which ſhall be uſed for that purpoſe muſt be faſtened to the Patients night-lap.

The uſe of a dry ſuture.

How to make a dry ſuture.

But when the wound is great and deep, and the lips thereof are much diſtant the one from the other, there can be no uſe of ſuch a dry ſuture. Wherefore you muſt uſe a three or four ſquare needle (that ſo it may the more readily and eaſily enter into the fleſh) being thred with a waxed thred; and with this you muſt thruſt through the lips of the wound, and leave the needle ſticking in the wound, & then wrap the thred to and again over the ends thereof eight or ten times, juſt after that manner which women uſe to faſten a needle with thred in it, upon their ſleeves, or Tailors to their hats or caps, that they may not loſe them.

A Suture fit for hare-lips.

The manner thereof

The needle thus faſtened, ſhall be there untill the perfect agglutination of the wound; this kind of future is uſed in the wounds of the lips, as alſo in hare-lips, for ſo we commonly call lips which are cleft from the firſt conformation in the wombe by the error of the forming faculty. But ſuch a future will help nothing to agglutination, if there lye or remain any skin between the lips of the wound

What hare lips are.

wound; Wherefore you ſhall cut away whatſoever thereof ſhall be there, otherwiſe you muſt expect no union. Other kind of ſutures are of no great uſe in wounds of theſe parts, for out of the neceſſity of eating and ſpeaking, they are in perpetuall motion; wherefore a third would cut the fleſh, for which reaſon you ſhall take up much fleſh with ſuch Needles mentioned in this laſt deſcribed kind of Suture as this following figure ſhewes.

The figure of the future fit for cloven or hare lips; as alſo the dilineation of the Needle about whoſe ends the thred is wrapped over and under, to and again.

A Hiſtory.

A decoction good to waſh away putrefaction.

To this purpoſe I will recite a hiſtory, to the end, that if any ſuch thing happen to come to your hands, you may do the like. A certain Gaſcoin in the battell at Saint *Laurence* had his upper jaw cut overthwart even to his mouth, to the great diſfiguring of his face. The wound had many wormes in it and ſtank exceedingly, becauſe he could get no Chirurgeon untill three dayes after he was hurt. Wherefore I waſhed it with a decoction of wormwood, Aloes, and a little *Ægyptiacum*, both to kill the wormes and to fetch away all the putrid matter; I diſcuſſed the tumor with a diſſolving fomentation and cataplaſm, I joyned together the lips of the wound with the laſt deſcribed ſuture. But I applyed this following medicine to the whole part. ℞ *Terebinth. venet.* ℥vj. *gummi elemi.* ℥ij. *pulveris boli armeni, ſan. drac. Maſtiches, myrrhæ, aloes, an.* ʒß. *incorporentur ſimul. fiat medicamentum.* The wound was agglutinated within a few dayes, but that there remained a certain little hole at the joyning of the lower jaw with the upper, wherein you could ſcarce put the head of the pin; out whereof nevertheleſſe much ſerous and thin moyſture flowed, eſpecially when he either eat or ſpake; which I have alſo obſerved in many others. But for ſtaying of this wateriſh humidity I dropped *Aqua fortis* into the bottome of the ulcer, and divers times put therein a little of the powder of burnt vitriol. Thus by Gods grace he recovered and became whole.

A ſmall hole remaining after the cure of great wounds.

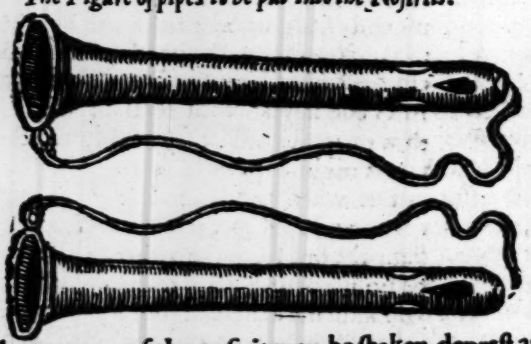
CHAp. XXVI. *Of the wounds of the Noſe.*

How many wayes the noſe may be hurt.

THe Noſe many wayes ſuffers ſolution of continuity; as by a wound, fracture and contuſion, and it is ſometimes battered & broken on the upper part; which when it happens, you ſhall reſtore the depreſt bones to their native ſeat and figure, with the end of a *ſpatula* or ſit ſtick wrapped about with towe, cotton or a linnen rag. Then with pledgets dipped in an aſtringent medicine compoſed *ex albumine ovi, maſtich. bolo armeno, ſanguin. drac. & Alumine uſto*, and applyed to the ſide of the noſe, he ſhall labour to ſtrengthen the reſtored bones, and then bind them with a convenient ligature, which may not preſſe them too much, leſt the noſe ſhould become flat, as it happens to many through the unskilfulneſs of Chirurgeons.

The cure of a broken noſe.

The Figure of pipes to be put into the Noſtrils.



The uſe of pipes in broken noſes.

Then muſt you put little pipes into the noſtrills, and theſe not exactly round, but ſomewhat flat and depreſt, tyed to the night-cap on each ſide with a thred, leſt they ſhould fall out. By the help of theſe pipes the bones of the noſe will be kept in their place, and there will be paſſage forth for the matter, and for inſpiration and exſpiration. But if all the noſe, or ſome portion thereof ſhall be wholly cut off, we muſt not hope to reſtore it. But if the Noſe be ſo cut, that as yet it adheres to much of the adjacent fleſh, from whence it may receive life and nouriſhment, then ſow it up. For the lower part of the noſe it may be ſhaken, depreſt and wreſted aſide, ſeeing it is griſtly; but it cannot be broken as the other which is of a bony nature.

CHAP. XXVII. *Of the Wounds of the Tongue.*

How many wayes the continuity of the tongue may be looſed.

THe tongue may be ſo wounded, that either it may be wholly cut off and deprived of ſome portion of the ſubſtance, or only ſlit long wayes or atwhart. The loſſe of the ſubſtance cannot be repaired, becauſe every part ſeparated and pluckt from the living body, from whence it had life, ſpirit and blood, preſently dyes. For as the Philoſophers ſay, *A privatione ad habitum non eſt regreſſus.* But when it is cut or ſlit longwayes or ſidewayes, it is eaſily reſtored by ſuture, if ſo be that the cloven part yet adhere to the living body from whence it may draw both matter and form of life. Therefore a carefull ſervant ſhall ſtraitly hold with a ſoft and clean linnen cloth the body of the tongue, leſt it ſhould ſlip away by reaſon of its ſlipperineſs, whilſt the Chirurgeon ſtitch it above and below; when he thinks he hath ſufficiently ſowed it, let him cut off the thred as neer to the knot as he can, leſt being left too long it might be tangled with the teeth as he eats, and ſo cauſe a hurtfull laceration or rending of the ſowed parts. In the mean time let the patient eat barly creams, almond milks, Gellyes, cullifſes and broths, and the yolks of egs; and let him often hold in his mouth Sugar of Roſes and ſyrup of Quinces; for ſuch things beſides their nouriſhing faculty, perform the part of an agglutinating and detergent medicine. I have learned theſe things I have here ſet down, neither from my maſters whom I have heard with attention, nor by reading

The cure of a cloven tongue.

of books, but they have been such as I have tryed with happy success in many; as in the son of Monsieur *de Marigny* President of the Inquisition, in *Iohn Piot* a Carpenter dwelling in the suburbs of Saint *German*.

But most apparently in a child of three years old, the son of the great Lawyer Monsieur *Covet*, who fell with his chin upon a stone, and so cut off a large peece of the end of his tongue, which chanced to be between his teeth, it hung but at a very small fiber of flesh, so that I had very little or no hope to agglutinate and unite it, which thing almost made me to pluck it quite away; yet I changed that determination by considering the loss of the most noble action of speaking, which would thereupon ensue, and weighing the providence of nature often working wonders and such things as exceed the expectation of the Physitian in curing diseases. I also thought thus with my self, the flesh of the tongue is soft, loose, fungous and spungy, neither is it altogether obvious to the externall injuries of the ayr; wherefore after that I had once or twice thrust through the needle and thred upwards and downwards, and for the rest ordered the child to be used and dieted after the manner I lately mentioned, he grew well within a short time, and yet remains so, speaking well and distinctly.

A History. Nature oft doth strange things in the cures of diseases.

CHAP. XXVIII. *Of the Wounds of the Eares.*

THe eares are sometimes wholly cut off, sometimes but in part, otherwhiles they are only slit, so that the rent portion as yet adhering to the rest, is joyned with it in communion of life. In this last case it is fit to use a future; but yet so that you touch not the gristle with your needle; for thence there would be in danger of a gangrene which happens to many by foolish curing; therefore you shall take up and comprehend with your needle only the skin, and that little flesh which encompasses the gristle. You shall perform the rest of the cure with pledgets and ligatures artificially fitted, and shall resist inflammation and other symptomes with fit medicins. But you must take speciall care that no superfluous flesh grow in the auditory passage, which may hinder the hearing; wherefore you shall keep that passage free by stopping it with a peece of spunge. But you shall procure agglutination and consolidation of the gristly part (and therefore next to a bone most dry) with dry medicins. But those who have their ears quite cut off, can do nothing but hide the deformity of their mis-hap with a cap, stuffed with cotton on that side.

How many wayes the unity of ears may be violated. How to sow a wounded Eare.

CHAP. XXIX. *Of the Wounds of the neck and throat.*

THe Wounds of the neck and throat are somewhiles simple, as those which only loose the continuity of the muscles; otherwhiles compound, such as those which have conjoyned with them a fracture of the bones, as of the *Vertebræ*, or hurt of the internall and externall jugular Veins, or sleepy Arteries; sometimes the *Trachea Arteria*, or Weazon, and the *œsophagus* or gullet are wounded; sometimes wholly cut off, whence present death ensues. Wherefore let not the Chirurgeon meddle with such wounds, unless he first foretell the danger of death, or the loss of some motion to those that are present. For it often happens that some notable nerve or tendon is violated by a wound in the neck, whence a palsie ensues, and that absolutely incurable, if the wound shall penetrate to the spinall marrow, also hurt therewith. Wounds of the gullet and Weazon are difficultly cured because they are in perpetuall motion; and chiefly of the latter by reason it is gristly and without blood. The wounds of the gullet are known, by spitting of blood, by the breaking forth of meat & drink by the wound; but if the gullet be quite cut asunder, the patient cannot swallow at all. For the cut parts are both contracted in themselves, the one upwards, and the other downwards. But we know the weazon is hurt, by casting up blood at the mouth with a continuall cough, and by the coming forth of the breath or winde by the Wound. The Wounds of the jugular Veins and sleepy Arteries, if they be great, are usually deadly, because they cannot be straitly bound up; for you cannot bind the throat hard without danger of choaking or strangling the patient. But for defect of a strait ligature in this case the flux of blood proves deadly. If the recurrent Nerve of either side be cut, it makes the voice hoarse; if cut on both sides, it takes away the use of speech, by hurting these instruments which impart motion to the muscles of the *Larinx*. For the cure if the wound be small, and not associated with the hurt of any notable vessel, nor of the Weazon and gullet, it is speedily and easily cured; and if there shall be need you shall use a future, then you shall put therein a sufficient quantity of Venice Turpentine mixed with bole-Armenick; or else some of my Balsam of which this is the receipt. ℞ *Terebinth. venet.æ* ℔ ß. *gvm. elemi* ℥iij. *olei hypericonis* ℥iij. *boli armeni, & sang. draconis an.* ℥j. *aquæ vitæ* ℥ij. *liquefiant simul omnia lento igne, & fiat Balsamum ut artis est, addendo pulveris ireos florent. aloes, Mastiches, myrrhæ an.* ℥j. I have done wonders with this Balsame in the agglutination of simple wounds, wherein no strange body hath been. Now when you have put it in, lay upon it a plaister of *Diacalcitheos* dissolved in oyl of Roses & vinegar, as that which hath power to repress the flowing down of humors, and hinder inflammation, or in stead thereof you may apply *Emp. de Gratia Dei*, or *Emp. de Ianua*. But if the jugular veins and sleepy Arteries be cut, let the bleeding be stayed, as we have shewed in a chapter, treating thereof. When the Weazon or Gullet are wounded, the Chirurgeon shall sow them up as neatly as he can, and the Patient shall not endeavour to swallow any hard thing, but be content to be fed with gellyes and broths. When a gargarisme is needfull, this following is very good. ℞ *hordei M.j. florum roſar. p.j. passul. mund. jujubarum an.* ℥ß. *glycyrhizæ* ℥j. *bulliant omnia simul, addendo mellis roſ. & sulph. roſ. an.* ℥ij. *fiat gargarisma, ut artis est.* With which being warm the Patient shall moysten his mouth, and throat, for it will mitigate the harshnesse of the part, asswage pain, cleanse and agglutinate, and make him breath more freely. But that the Chirurgeon may not despaire of, or leave any thing unattempted in such like wounds, I have thought good to demonstrate by some examples how wonderfull the works of nature are, if they be assisted by Art.

The differences of wounds of the neck & throat. The palsie followes upon wounds of the neck. Signes that the gullet is wounded. The wounds of the jugular veins and sleepy Arteries are deadly by accident. By hurting the recurrent Nerve the voice is hurt. The description of the Authors Balsam. The faculty of *Diacalcitheos*. The cure of the wounded Weazon and gullet. A gargarisme. The manifold use thereof.

A

A Hiſtory. A certain ſervant of Monſieur *de Champaigne*, a gentleman of *Anjou*, was wounded in the throat with a ſword, whereby one of the jugular veins was cut together with his Weazon. He bled much and could not ſpeak, and theſe ſymptomes remained, untill ſuch time as the wound was ſowed up, and covered with medicines. But if the medicins at any time were more liquid, he as it were ſucked them by the wound and ſpaces between the ſtitches, and preſently put forth at his mouth that which he had ſucked or drawn in. Wherefore more exactly conſidering with my ſelf, the greatneſs of the Wound, the ſpermatick, and therefore dry and bloodleſs nature unapt to agglutination, of the affected part, but chiefly of the Weazon and jugular vein; as alſo for that the rough Artery is obnoxious to theſe motions which the gullet performs in ſwallowing, by reaſon of the inner coat, which is continued to the coat of the gullet, by which means theſe parts mutually ſerve each other with a reciprocall motion, even as the ropes which run to the wheel of a pulley; furthermore weighing that the Artery was neceſſary for the breathing, and tempering the heat of the heart, as the jugular veins ſerved for the nouriſhment of the upper parts; and laſtly weighing with my ſelf the great quantity of blood he had loſt, which is as it were the treaſure of nature, I told thoſe which were preſent, that death was neer and certainly at hand. And yet beyond expectation, rather by divine favour then our Art, he recovered his health.

A ſtrange Hiſtory. Equally admirable is this hiſtory following, Two Engliſhmen walked out of the City of *Paris* for their recreation to the wood of *Vincenne*; but one of them lying in wait to rob the other of his money and a maſſie chain of gold which he wore ſet upon him at unawares, cut his throat and robbed him, and ſo left him amongſt the Vines which were in the way, ſuppoſing he had kill'd him, having with his dagger cut the Weazon and gullet. This murderer came back to the city; the other half dead, crawled with much adoe to a certain Peaſants houſe, and being dreſſed with ſuch medicines as were preſent and at hand, he was brought to the City, and by his acquaintance committed to my cure to be cured. I at the firſt, as diligently as I could, ſowed up the Weazon which was cut quite aſunder, and put the lips of the wound as cloſe together as I could; I could not get hold of the gullet becauſe it was fallen down into the ſtomach, then I bound up the wound with medicins, pledgets and fit ligatures. After he was thus dreſt he begun to ſpeak, and tell the name of the villain the author of this fact, ſo that he was taken and faſtened to the wheel, and having his limbs broken loſt his wretched life, for the life of the innocent wounded man who dyed the fourth day after he was hurt.

Another Hiſtory. The like hurt befell a certain Germane, who lay at the houſe of one *Perots* in the ſtreet of Nuts: he being frantick, in the night cut his throat with a ſword: I being called in the morning by his friends who went to ſee him, dreſt him juſt after the ſame manner as I dreſſed the Engliſhman. Wherefore he preſently recovered his ſpeech, which before could not utter one ſyllable, freed from ſuſpition of the crime and priſon the ſervant, who lying in the ſame chamber with him, was upon ſuſpition committed to priſon, and confeſſing the thing as it was done, lived foure dayes after the wound being nouriſhed with broths put into his fundament like clyſters, and with the gratefull vapour of comfortable things, as bread newly drawn out of the Oven and ſoaked in ſtrong wine. Having thus by Art of Chirurgery made the dumb ſpeak for the ſpace of foure dayes.

CHAP. XXX. *Of the Wounds of the Cheſt.*

The differences of wounds of the Cheſt. SOme wounds of the Cheſt are on the fore ſide, ſome behind, ſome penetrate more deep, others enter not into the capacity thereof, other ſome pierce even to the parts contained therein, as the *Mediaſtinum*, Lungs, heart, midriffe, hollow vein, and aſcendent artery; Other ſome paſſe quite through the body; whereby it happens that ſome are deadly, ſome not.

The ſignes. You ſhall thus know that the wound penetrates into the capacity of the Cheſt, if that when the patients mouth and noſe be ſhut, the breath, or wind breaks through the wound with noiſe, ſo that it may diſſipate, or blow out a lighted candle being held neer it. If the patient can ſcarſe either draw, or put forth his breath, which alſo is a ſigne that there is ſome blood fallen down upon the *Diaphragma*.

Signes that the heart is wounded. By theſe ſignes you may know that the heart is wounded: If a great quantity of blood guſh out, if a trembling poſſeſſe all the members of the body; if the pulſe be little and faint, if the colour become pale, if a cold ſweat and frequent ſowning aſſail him, and the extream parts become cold, then death's at hand.

A Hiſtory. Yet when I was at *Turin* I ſaw a certain Gentleman who fighting a duell with another, received a wound under his left breſt which pierced into the ſubſtance of his heart, yet for all that he ſtruck ſome blowes afterwards, and followed his flying enemy ſome two hundred paces untill he fell down dead upon the ground; having opened his body, I found a wound in the ſubſtance of the heart, ſo large as would contain ones finger; there was only much blood poured forth upon the midriffe.

Signes that the Lungs are wounded. Theſe are the ſignes that the Lungs are wounded, for the blood comes foamy or frothy out of the wounds, the Patient is troubled with a cough, he is alſo troubled with a great difficulty of breathing and a pain in his ſide, which he formerly had not; he lyes moſt at eaſe when he lyes upon the wound, and ſometimes it comes ſo to paſs, that lying ſo he ſpeaks more freely and eaſily, but turned on the contrary ſide, he preſently cannot ſpeak.

Signes that the midriffe is wounded. When the *Diaphragma*, or midriffe is wounded, the party affected is troubled with a weight or heavineſs in that place, he is taken with a *Delirium*, or raving by reaſon of the ſympathy of the Nerves of the ſixth conjugation which are ſpread over the midriffe, difficulty of breathing, a cough & ſharp pain troubles the patient, the Guts are drawn upwards; ſo that it ſometimes happens by the

vehemency of breathing, that the ſtomach and guts are drawn through the wound into the capacity of the Cheſt, which thing I obſerved in two.

The one of theſe was a Maſon, who was thruſt through the midſt of the midriffe, where it is nervous, and dyed the third day following, I opening his lower belly, and not finding his ſtomach, thought it a monſtrous thing; but at length ſearching diligently, I found it was drawn into the Cheſt, through the wound which was ſcarſe an inch broad. But the ſtomach was full of wind, but little humidity in it. A Hiſtory.

The other was called captain *Francis of Alona* a Native of *Xantoigne*, who before *Rochell* was ſhot with a Muſket Bullet, entring by the breaſt-bone neer to the ſword-like Griſſle, and paſſing through the fleſhy part of the midriffe, went out at the ſpace between the fifth and ſixth baſtard ribs. The wound was healed up on the out ſide, yet for all that there remained a weakneſs of the ſtomach, whereupon a pain of the guts like to the colick took him, eſpecially in the Evening, and on the night; for which cauſe he durſt not ſup but very ſparingly. But on the eighth month after, the pain raging more violently in his belly then it was accuſtomed, he dyed; though for the mitigating of the vehemency thereof *Simon Mahuel* and *Anthony de Val* both learned Phyſitians omitted no kind of remedy. The body of the diſeaſed was opened by the skilfull Chirurgeon *James Guillemeau*, who found a great portion of the colick gut ſwelled with much wind gotten into the Cheſt, through the wound of the *Diaphragma*, for all it was ſo ſmall that you could ſcarſe put your little finger in thereat. But now let us return from whence we digreſſed. Another Hiſtory.

We underſtand that there is blood poured forth into the capacity of the Cheſt by the difficulty of breathing, the vehemency of the increaſing feaver, the ſtinking of the breath, the caſting up of blood at the mouth, and other ſymptomes which uſually happen to theſe who have putrefied and clotted blood poured out of the veſſels into the belly, infecting with the filthy vapour of the corrupt ſubſtance, the parts to which it ſhall come. But alſo, unleſs the Patient cannot lye upon his back, he is troubled with a deſire to vomit, and covets now and then to riſe, whence he often falls into a ſwound, the vitall faculty which ſuſtains the body being broken and debilitated both by reaſon of the wound, and concreat or clotted blood, for it putting on the quality of poyſon, it greatly diſſipates and diſſolves the ſtrength of the heart. Signs that there is blood poured into the capacity of the Cheſt.

It is a ſign the ſpinall marrow is hurt, when a Convulſion or Palſie, that is, a ſodain loſs of ſenſe and motion in the parts thereunder, an unvoluntary excretion of the Urine and other excrements, or a totall ſuppreſſion of them, ſeizes upon the Patient. When the hollow vein and great Artery are wounded, the Patient will dye in a ſhort time, by reaſon of the ſodain and aboundant effuſion of the blood and ſpirits, which intercepts the motion of the Lungs and heart, whence the party dyes ſuffocated. Signs that the ſpine is wounded.

CHAP. XXX. *Of the cure of the Wounds of the Cheſt.*

WE have read in *Iohn de Vigo*, that it is diſputed amongſt Chirurgeons concerning the conſolidation of wounds of the Cheſt. For ſome think that ſuch wounds muſt be cloſed up, and cicatrized with all poſſible ſpeed, leſt the cold air come to the heart, and the vitall ſpirits fly away and be diſſipated. Others on the contrary think that ſuch wounds ought to be long kept open; and alſo if they be not ſufficiently large of themſelves, that then they muſt be inlarged by Chirurgery, that ſo the blood poured forth into the capacity of the Cheſt may have paſſage forth, which otherwiſe by delay would putrefie, whence would enſue an increaſe of the feaver, a fiſtulous ulcer, and other pernicious accidents. The firſt opinion is grounded upon reaſon and truth, if ſo be that there is little or no blood poured forth into the capacity of the Cheſt; But the latter takes place where there is much more blood contained in the empty ſpaces of the Cheſt. Which leſt I may ſeem raſhly to determin, I think it not amiſs to ratifie each opinion with a hiſtory thereto agreeable.

Whilſt I was at *Turin*, Chirurgeon to the Marſhall of *Montejan*, the King of *France* his Generall, I had in cure a Souldier of *Paris*, whoſe name was *Levelque*, he ſerved under captain *Renvoart*. He had three wounds, but one more grievous than the reſt, went under the right breſt, ſomewhat deep into the capacity of the Cheſt, whence much blood was poured forth upon the midriffe, which cauſed ſuch difficulty of breathing, that it even took away the liberty of his ſpeech, beſides through this occaſion he had a vehement feaver, coughed up blood, and a ſharp pain on the wounded ſide. The Chirurgeon which firſt dreſt him, had ſo bound up the wound with a ſmall and thick ſuture, that nothing could flow out thereat. But I being called the day after, and weighing the preſent ſymptomes which threatned ſpeedy death, judged that the ſowing of the wound muſt ſtraight be looſed; which being done there inſtantly appeared a clot of blood at the orifice thereof, which made me to cauſe the Patient to lye half out of his bed, with his head downwards, and to ſtay his hands on a ſettle which was lower than the bed, and keeping himſelf in this poſture, to ſhut his mouth and noſe that ſo his Lungs ſhould ſwell, the midriffe be ſtretched forth, and the intercoſtall muſcles and thoſe of the *Abdomen* ſhould be compreſſed, that the blood poured into the Cheſt might be evacuated by the wound; but alſo that this excretion might ſucceed more happily, I thruſt my finger ſomewhat deep into the wound, that ſo I might open the orifice thereof being ſtopped up with the congealed blood, and certainly I drew out ſome ſeven or eight ounces of putrefied & ſtinking blood by this means. When he was laid in his bed, I cauſed frequent injections to be made into the wound of a decoction of Barly with Honey of Roſes and red Sugar, which being injected I willed him to turn firſt on the one, and then on the other ſide, and then again to lye out of his bed as before, for thus he evacuated ſtill but very many clots of blood, together with the liquor lately injected; which being done, the ſymptomes were mitigated, & left him by little and little. The next day I made another more detergent injection, adding thereto wormwood, centaury, and Aloes, but ſuch a bitterneſs did riſe up to his mouth together with a deſire to caſt, that he could not longer indure it. Then it came into my mind that formerly I had obſerved the like effect of the like remedy in the ſpleen. Why bitter things muſt not be caſt into the Cheſt.

ſpitall of *Paris*, in one who had a fiſtulous ulcer in his Cheſt. Therefore when I had conſidered with my ſelf that ſuch bitter things may eaſily paſs into the Lungs, and ſo may from thence riſe into the Weazon and mouth, I determined that thence forwards I would never uſe ſuch bitter things to my Patients, for the uſe of them is much more troubleſome than any way good and advantagious. But at the length this Patient by this and the like means recovered his health beyond my expectation.

Read the Hiſtory of *Maryllus* in *Galen. lib. 7. de Anatom. adminiſtra.*

But on the contrary, I was called on a time to a certain *Germain* gentleman who was run with a ſword into the capacity of his Cheſt, the neighbouring Chirurgeon had put a great tent into the wound at the firſt dreſſing, which I made to be taken forth, for that I certainly underſtood there was no blood powred forth into the capacity of the Cheſt becauſe the Patient had no feaver, no weight upon the *Diaphragma*, nor ſpitted forth any blood. Wherefore I cured him in few dayes by only dropping in ſome of my balſame and laying a plaiſter of *Diacalcitheos* upon the wound. The like cure I have happily performed in many others. To conclude, this I dare boldly affirm, that wounds of the Cheſt by the too long uſe of tents degenerate into Fiſtula's. Wherefore if you at any time ſhall undertake the cure of wounds which penetrate into the capacity of the Cheſt, you ſhall not preſently ſhut them up at the firſt dreſſing, but keep them open for two or three dayes; but when you ſhall find that the Patient is troubled with none or very little pain, and that the midriffe is preſſed down with no weight, and that he breaths freely, then let the tent be taken forth, and the wound healed up as ſpeedily as you can by covering it only with lint dipped in ſome balſame which hath a glutinative faculty, and laid ſomewhat broader than the wound; never apply liniments to wounds of this kind, leſt the Patient by breathing draw them into the capacity of the Cheſt. Wherefore alſo you muſt have a care that the tent put into thoſe kinds of wounds may be faſtened to the pledgets, and alſo have ſomewhat a large head, leſt they ſhould be drawn as we ſaid into the capacity of the Cheſt, for if they fall in, they will cauſe putrefaction and death. Let *Emplaſt. Decalcitheos* or ſome ſuch like be applyed to the wound. But if on the contrary, you know by proper, and certain ſigns, that there is much blood fallen into the ſpaces of the Cheſt, then let the orifice of the wound be kept open with larger tents, untill all the *Sanies* or bloody matter, wherein the blood hath degenerated, ſhall be exhauſted. But if it happen at any time, as aſſuredly it ſometimes doth, that notwithſtanding the Art and care of the Phyſitian, the wound degenerates into a *Fiſtula*, then the former evill is become much worſe. For *Fiſtula's* of the Cheſt are ſcarce cured at any time, and that for divers cauſes. The firſt is, for that the muſcles of the Cheſt are in perpetuall motion; Another is, becauſe they on the contrary inſide are covered only with the membrane inveſting the ribs, which is without blood. The third is, for that the wound hath no ſtay, by means whereof it may be compreſſed, ſowed, and bound, whereby the lips being joyned together, the wound may at length be repleniſhed with fleſh and cicatrized.

What harm enſues the too long uſe of tents.

No liniments muſt be uſed in wounds of the Cheſt.

Wounds of the Cheſt eaſily degenerate into a *Fiſtula*.

But the reaſon why wounds of the Cheſt do every day heap up and pour forth ſo great a quantity of matter, ſeems to be their vicinity to the heart, which being the fountain of blood, there is a perpetuall efflux thereof from thence to the part affected. For this is natures care in preſerving the noble parts, that continually and aboundantly without meaſure or mean it ſends all its ſupplyes of blood and ſpirits to the aid. Add hereto, that the affected parts by pain, heat, and continuall motion of the Lungs and midriffe, draw and allure much blood to themſelves. Such like blood defiled by the malignity and filth of the wound, is ſpeedily corrupted; whence it is that from the perpetuall afflux of blood, there is a continuall efflux of matter or filth, which at the laſt brings a man to a conſumption; becauſe the ulcerated part like a ravenous wolf conſumes more blood by the pain, heat and motion than can be miniſtred thereto by the heart. Yet if there be any hope to cure and heal the *Fiſtula*, it ſhall be performed, (after the uſe of diet, phlebotomy, and according to the preſcript of the Phyſitian) by a vulnerary potion, which you ſhall find deſcribed when we treat of the *Caries* or rottenneſs of the bones. Wherefore you ſhall make frequent injections therewith into the *Fiſtula*, adding and mixing with it *ſyrupus de roſis ſiccis* and *mel roſarum*. Neither do I, if the putrefaction be great, fear to mix therewith *Ægyptiacum*. But you muſt have a care to remember & obſerve the quantity of the injected liquor, that you may know whether it all come forth again after it hath performed its detergent office. For if any thereof remain behind in the corners and crooked paſſages, it hurts the part, as corrupted with the contagion thereof.

VVhy there flows ſuch plenty of matter out of wounds of the Cheſt.

The cure of a *Fiſtula* in the Cheſt.

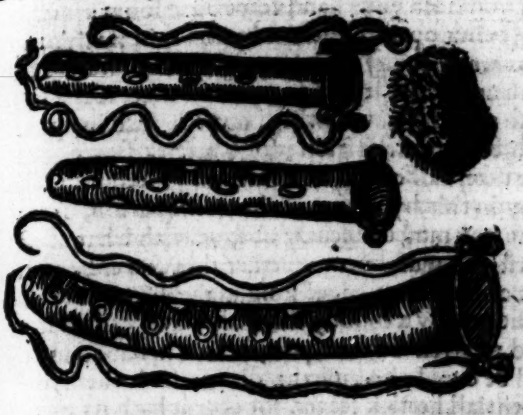
VVhen *Ægyptiacum* muſt be put into the injections.

The form of a Syringe fit to make injection, when a great quantity of liquor is to be injected into any part.

After the injected liquor is come forth, a pipe of gold, ſilver or lead, ſhall be put into the fiſtulous ulcer; and it muſt have many holes in it, that ſo the filth may paſs forth at them; it muſt be faſtened with ſtrings, that it may not fall into the capacity of the Cheſt. A great ſponge ſteeped in *aqua vitæ*, and wrung forth again, ſhall be laid hot to the end or orifice thereof, both to hinder the entrance of the air into the Fiſtulous ulcer, as alſo to draw forth the filth there by its gentle heat, the which thing the Patient ſhall much further if often times both day and night he hold his breath, ſtopping his mouth and noſe, and lying upon the diſeaſed ſide, that ſo the *Sanies* may be the more forcibly evacuated: neither muſt we leave the putting in the pipe, before that this fiſtulous ulcer ſhall be almoſt dry, that is whole, as when it yeelds little, or no matter at all; then it muſt be cicatrized. But if the orifice of this fiſtulous ulcer being in the upper part hinder the healing thereof, then by a chirurgicall Section a paſſage ſhall be made in the bottome, as we ſaid before in an *Empyema*.

The

The delineation of the pipes with their strings and spunges.



The Reader must note that the pipes which are fit for this use, need not have so many holes as these here express; but only two or three in their ends: for the flesh growing and getting into the rest, make them that they cannot be plucked forth without much pain.

A wound made in the Lungs admits cure, unless it be very large, if it be without inflammation; if it be on the skirts of the Lungs, and not on their upper parts; if the Patient contain himself from coughing much, and contentious speaking, and great breathing: for the wound is inlarged by coughing, and thence also arises inflammation; the *Pus* and *Sanies* whereof, whilst the lungs again indeavour to expell by coughing, by which means they are only able to expell that which is hurtfull and troublesome to them, the ulcer is dilated, the inflammation augmented, the Patient wastes away, and the disease becomes incurable. What wounds of the Lungs are curable.

The harm that insues upon coughing in wounds of the Lungs.

There have bin many *Eclegma's* described by Physitians for to cleanse the ulcer, which when the Patient useth, he shall lye on his back, to keep them long in his mouth, so to relax the muscles of the *Larinx*; for thus the medicine will fall by little and little alongst the coats of the weazon, for if it should fall down in great quantity, it would be in danger to cause coughing. Cows, Asses, or Goats milk with a little hony, lest they should corrupt in the stomach, are very fit remedies for this purpose; but womans milk exceeds the rest. How *Eclegma's* must be swallowed.

But Sugar of Roses is to be preferred before all other medicines, in the opinion of *Avicen*, for that it hath a detergent, and also an astrictive and strengthening faculty, than which nothing is more to be desired in curing of ulcers. When you shall think it time to agglutinate the cleansed ulcer, you must command the Patient to use emplastick, austere, and astringent medicines, such as are *Terra sigillata*, *bolus armenus*, *hypocystis*, plantain, knot-grass, *Sumach*, *acacia* and the like, which the Patient shall use in his broaths and *Eclegma's*, mixing therewith honey of roses, which serving for a vehicle to the rest, may carry away the impacted filth which hinders agglutination. But seeing an hektive feaver easily follows upon these kinds of wounds, and also upon the affects of the Chest and lungs, it will not be amiss to set down somewhat concerning the cure thereof, that so the Chirurgeon may know to administer some help to his Patient, whilst a Physitian is sent for, to overcome this disease with more powerfull and certain remedies. The utility of Sugar of roses in ulcerated or wounded Lungs.

CHAP. XXXII. *Of the differences, causes, signs and cure of an Hektive Feaver.*

Hektive feaver is so called, either for that it is stubborn and hard to cure and loose, as things which have contracted a habit; for *Hexis* in Greek signifies a habit; or else for that it seises upon the solid parts of our bodies called by the Greeks *Hexeis*; both which the Latin word *Habitus* doth signifie. The reason of the name.

There are three kinds, or rather degrees of this feaver. The first is when the hectick heat consumes the humidity of the solid parts. The second is, when it feeds upon the fleshy substance. The third and uncurable is, when it destroyes the solid parts themselves. For thus the flame of a lamp first wastes the oyl, then the proper moisture of the welk. Which being done there is no hope of lighting it again what store of oyl soever you poure upon it. This feaver very seldome breeds of it self, but commonly follows after some other. The differences thereof.

Wherefore the causes of a hektive feaver are, sharp and burning feavers not well cured, especially if their heat were not repressed with cooling epithemes applyed to the heart and *Hypochondria*. If cold water was not fitly drunk. It may also succeed a Diary feaver which hath been caused and begun by some long, great and vehement grief or anger, or some too violent labour, which any of a slender and dry body hath performed in the hot sun. It is also oft-times caused by an ulcer or inflammation of the Lungs, an *empyema* of the Chest, by any great and long continuing *Phlegmon* of the Liver, stomach, meisentery, wombe, kidneys, Bladder, of the guts *Ieiunum* and *Colon*, and also of the other Guts, if the *Phlegmon* succeed some long *Diarrhœa*, *Lienteria* or bloody flux, whence a consumption of the whole body, and at last a hectick feaver, the heat becoming more acrid, the moisture of the body being consumed. The causes.

This kind of feaver as it is most easily to be known, so is it most difficult to cure, the pulse in this feaver is hard, by reason of the dryness of the Artery which is a solid part; and it is weak by reason of the debility of the vitall faculty, the substance of the heart being assaulted. But it is little and frequent because of the distemper and heat of the heart, which for that it cannot by reason of its weakness cause a great pulse to cool it self, it labours by the oftenness to supply that defect. The signs.

But for the pulse, it is a proper sign of this feaver, that one or two houres after meat the pulse feels stronger than usuall; and then also there is a more acrid heat over all the Patients body. The heat of this flame lasts untill the nourishment be distributed over all the Patients body; in which time the dryness of the heart in some sort tempered and recreated by the appulse of moist nourishment, the heat increases no otherwise than lime which a little before seemed cold to the touch, but sprinkled and moistened with water grows so hot, as it smeaks and boyls up. At other times there is a perpetuall equality of heat & pulse in smallness, fulness, obscurity, frequency, and hardness, without any exacerbation, so that the Patient cannot think himself to have a feaver, yea he cannot complain of any thing, he feels no pain, which is another proper sign of an hectick feaver. The cause that the heat doth not Why in hectick the heat is most acrid after meat.

The signes of a hectick joyned with a putrid feaver.

ſhew its ſelf is, it doth not poſſeſſe the ſurface of the body, that is, the ſpirits and humors, but lyes as buried in the earthy groſsneſſe of the ſolid parts. Yet if you hold your hand ſomewhat long, you ſhal at laſt perceive the heat more acrid and biting, the way being opened thereto by the skin ratifyed by the gentle touch of the warm and temperate hand. Wherefore if at any time in theſe kind of feavers the Patient feel any pain, and perceive himſelf troubled with an inequality and exceſſe of heat, it is a ſign that the hectick feaver is not ſimple, but conjoined with a putrid feaver, which cauſeth ſuch inequality, as the heat doth more or leſſe ſeiſe upon matter ſubject to putrefaction; for a hectick feaver of it ſelf is void of all equality, unleſſe it proceed from ſome externall cauſe, as from meat; Certainly if an Hippocratique face may be found in any diſeaſe, it may in this, by reaſon of the colliquation, or waſting away the triple ſubſtance. In the cure of this diſeaſe, you muſt diligently obſerve with what affects it is entangled, and whence it was cauſed. Wherefore firſt you muſt know whether this feaver be a diſeaſe; or elſe a ſymptome. For if it be ſymptomaticall, it cannot be cured, as long as the diſeaſe the cauſe thereof, remains uncured; as if an ulcer of the guts occaſioned by a bloody flix ſhall have cauſed it, or elſe a fiſtulous ulcer in the Cheſt cauſed by ſome wound received on that part, it will never admit of cure, unleſſe firſt the fiſtulous or dyſenterick ulcer ſhall be cured; becauſe the diſeaſe feeds the ſymptomes, as the cauſe the effect. But if it be a ſimple and eſſentiall hectick feaver, for that it hath its eſſence conſiſting in an hot and dry diſtemper, which is not fixed in the humors, but in the ſolid parts; all the counſell of the Phyſitian muſt be to renue the body, but not to purge it; for only the humors require purging, and not the defaults of the ſolid parts. Therefore the ſolid parts muſt be refrigerated and humected; which we may doe by meditins taken inwardly and applyed outwardly.

The cure.

A ſymptomaticall hectick.

An eſſentiall hectick.

Things to be taken inwardly.

The things which may with good ſucceſs be taken inwardly into the body for this purpoſe, are medicinall nouriſhments. For hence we ſhall find more certain and manifeſt good, than from altering medicins, that is, wholly refrigerating and humecting without any manner of nouriſhment.

The benefit of medicinall nouriſhments.

For by reaſon of that portion fit for nutriment which is therewith mixed they are drawn and caried more powerfully to the parts, and alſo converted into their ſubſtance: whereby it comes to paſſe that they do not humect and coole them lightly and ſuperficially, like the medicins which have only power to alter and change the body, but they carry their qualities more throughly even into the innermoſt ſubſtance. Of theſe things ſome are herbs, as violets, purſlain, bugloſs, endive, duckſ-meat, or water lentill, mallowes, eſpecially when the belly ſhall be bound. Some are fruits, as gourds, cowcumbers, apples, prunes, raiſons, ſweet almonds, and freſh or new pine-apple kernells; in the number of ſeeds are the foure greater and leſſer cold ſeeds, and theſe new, for their native humidity, the ſeeds of poppyes, berberies, quinces. The flowers of bugloſs, violets, water lillies, are alſo convenient; of all theſe things let broth be made with a chicken, to be taken in the morning for eight or nine dayes, after the firſt concoction.

The choice of meats.

For meats; in the beginning of the diſeaſe, when the faculties are not too much debilitated, he ſhall uſe ſuch as nouriſh much and long, though of hard digeſtion; ſuch as the extream parts of beaſts, as the feet of Calves, Hogs feet not ſalted, the fleſh of a Tortois, which hath lived ſo long in a garden, as may ſuffice to digeſt the excrementitious humidity; the fleſh of white Snails, and ſuch as have been gathered in a vineyard, of frogs, river Crabs, Eels taken in clear waters, and well cooked, hard egs eaten with the juyce of Sorrell without ſpices; Whitings and ſtockfiſh. For all ſuch things becauſe they have a tough and glutinous juice, are eaſily put, and glutinated to the parts of our body, neither are they ſo eaſily diſſipated by the feaveriſh heat. But when the patient languiſheth of a long hectick, he muſt feed upon meats of eaſie digeſtion, and theſe boyled rather than roaſted; for boyled meats humect more, & roaſted more eaſily turn into choler. Wherefore he may uſe to eat Veal, Kid, Capon, Puller, boiled with refrigerating and humecting herbs; he may alſo uſe Barly creams, Almond milks, as alſo bread crummed and moiſtened with roſe water and boyled in a decoction of the foure cold ſeeds with ſugar of roſes; for ſuch a Panada cools the liver, and the habit of the whole body, & nouriſheth withall. The Teſticles, wings, and livers of young cocks, as alſo egs and raiſons. But if the Patient at length begin to loath and grow weary of boyled meats, then let him uſe roaſt, but ſo that he cut away the burnt & dryed part thereof, and feed only on the inner part thereof, & that moiſtned in roſe water, the juice of Citrons, Oranges or Pomegranats. Let him abſtain from ſalt and dry fiſhes, and chuſe ſuch fiſhes as live in ſtony waters, for the exerciſe they are forc'd to undergoe in ſhunning the rocks beaten upon by the waves. Aſſes milk newly milked and ſeaſoned with a little ſalt, ſugar, honey, or ſenell, that it may not corrupt, nor grow ſowre in the ſtomach; or womans milk ſucked from the dug by the Patient, to the quantity of halfe a pint, is much commended; verily womans milk is the more wholſome, as that which is more ſweet and familiar to our ſubſtance, if ſo be that the nurſe be of a good temper and habit of body. For ſo it is very good againſt the gnawings of the ſtomach, and ulcers of the Lungs, from whence a Conſumption often proceeds. Let your milch Aſſe be fed with barly, oats, oakleaves; but if the Patient chance to be troubled with the flux of the belly, you ſhall make the milk ſomewhat aſtringent by gently boiling it, and quenching therein pebble ſtones heated red hot. But for that all natures cannot away with Aſſes milk, ſuch ſhall abſtain from it, as it makes to have ſoure belchings, difficulty of breathing, a heat and rumbling in the *Hypochondria*, and pain of the head. Let the Patient temper his wine with a little of the waters of Letruce, purſlain and water-lillies, but with much bugloſs water, both for that it moyſtens very much, as alſo for that it hath a ſpecifick power to recreate the heart, whoſe ſolid ſubſtance in this kind of diſeaſe is grievouſly afflicted. And thus much of things to be taken inwardly.

How Aſſes milk muſt be uſed in a hectick.

VVomans milk more wholſome than Aſſes.

Things to be outwardly applyed.

These things which are to be outwardly applyed, are inunctuous baths, epithemes, clyſters, unctions are divers, according to the various indication of the parts whereto they are applyed. For *Celſus* anoints all the ſpine with cooling and moderate aſtringent things, as which may [illegible]

then the parts, and hinder their wasting, & not let the transpiration; for if it should be letted, the heat would become more acrid, by suppressing the vapours. Oyl of roses, water lillies, Quinces, the mucilages of Gum tragacanth and arabick extracted into water of nightshade, with some small quantity of camphire, and a little wax if need require; but on the contrary, the parts of the breast must be annointed with refrigerating and relaxing things; by refrigerating I mean things which moderately cool, for cold is hurtfull to the breast. But astringent things would hinder the motion of the muscles of the chest, and cause a difficulty of breathing. Such inunctions may be made of oyl of Violets, willowes, of the seeds of lettuce, poppies, water-lillies, mixing with them the oyl of sweet almonds to temper the astriction which they may have by their coldness. But you must have great care that the Apothecary for covetousness in stead of these oyls newly made give you not old, rancid and salted oyls, for so in stead of refrigerating, you shall heat the part; for wine, honey and oyl acquire more heat by age; in defect of convenient oyls, we may use butter well washed in violet and nightshade water. The use of such inunctions, is to cool, humect and comfort the parts whereto they are used; they must be used evening and morning, chiefly after a bath.

A caution in the choice of Oyles.

Now for Baths, we prescribe them either only to moisten, and then plain warm water wherein the flowers of Violets and water lillies, willow leaves and barly have beed boyled, will be sufficient; or else not only to moisten, but also to acquire them a fairer and fuller habit, and then you may adde to your bath the decoction of a sheeps head and Gather, with some butter. But the Patient shall not enter into the bath fasting, but after the first concoction of the stomach, that so the nourishment may be drawn by the warmness of the bath into the whole habit of the body, for otherwise he which is sick of a consumption and shall enter the bath with his stomach empty, shall suffer a greater dissipation of the triple substance, by the heat of the bath, then his strength is well able to endure. Wherefore it is fit thus to prepare the body, before you put it into the bath. The day before in the morning let him take an emollient clyster, to evacuate the excrements baked in the guts by the hectick dryness; then let him eat to his dinner some solid meats about nine of the clock; and let him about foure of the clock eat somewhat sparingly, meats of easie digestion to his supper. A little after midnight let him sup off some chicken broth or barly cream, or else two rear egs tempered with some rose water and sugar of roses in stead of salt. Some 4 or 5 houres after, let him enter into the bath, these things which I have set down, being observed. When he comes out of the bath, let him be dryed and gently rubbed, with soft linnen cloaths, and anointed as I formerly prescribed, then let him sleep if he can for two or three houres in his bed: when he wakes let him take some Ptisan, or some such like thing, and then repeat his bath after the foresaid manner. He shall use this bath thrice in ten dayes; But if the Patient be subject to crudities of the stomach, so that he cannot sit in the bath without fear of sowning and such symptomes, his stomach must be strengthned with oyl of Quinces, Wormwood and mastich, or else with a crust of bread tosted, and steeped in muskadine, and strewed over with the powders of Roses, Sanders, and so laid to the stomach, or behind neer to the thirteenth *vertebra* of the back, under which place, Anatomy teaches, that the mouth of the stomach lyes. Epithemes shall be applyed to the liver and heart, to temper the too acrid heat of these parts, and correct the immoderate dryness by their moderate humidity. Now they shall be made of refrigerating and humecting things, but chiefly humecting; for too great coldness would hinder the penetration of the humidity into the part lying within. The waters of bugloss, and Violets, of each a quartern with a little white wine is convenient for this purpose. But that which is made of French barly, the seeds of gourds, pompions, or Cowcumbers of each three drams in the decoction, and mixed with much tempering with oyl of Violets, or of sweet almonds, is most excellent of all other. Let cloaths be dipped and steeped in such epithemes, and laid upon the part, and renued as oft as they become hot by the heat of the part. And because in hectick bodies, by reason of the weakness of the digestive faculty, many excrements are usually heaped up, and dryed in the guts, it will be convenient, all the time of the disease to use frequently clysters made of the decoction of cooling and humecting herbs, flowers, and seeds wherein you shall dissolve *Cassia* with sugar and oyl of Violets, or water-lillies. But because there often happen very dangerous fluxes in a confirmed hectick feaver, which shew the decay of all the faculties of the body, and wasting of the corporeall substance, you shall resist them with refrigerating and assisting medicins; and meats of grosser nourishment, as Rice, and Cicers; and application of astringent and strengthening remedies; and using the decoction of Oats or parched barly for drink. Let the Patient be kept quiet and sleeping as much as may be, especially if he be a child. For this feaver frequently invades children by anger, great and long fear, or the two hot milk of the nurse, overheating in the Sun, the use of wine and other such like causes; they shall be kept in a hot and moist ayre, have another Nurse, and be anointed with oyl of violets; to conclude, you shall apply medicins which are contrary to the morbifick cause.

CHAP. XXXIII. *Of the wounds of the* Epigastrium *and of the whole lower belly.*

THe wounds of the lower belly are sometimes before, sometimes behind, some only touch the surface thereof, others enter in; some passe quite through the body, so that they often leave the weapon therein; some happen without hurting the contained parts; others grievously offend these parts, the liver, spleen, stomach, guts, kidneys, womb, bladder, ureters, and great vessells; so that oft-times a great portion of the Kall, falls forth. We know the Liver is wounded, when a great quantity of blood comes forth of the wound, when a pricking pain reaches even to the sword-like griftle, to which the Liver adheres. Oft-times more choler is cast up by vomit, and the Patient lyes on his belly with more ease and content.

Their differences.

Signs of a wounded liver.

Signs that the stomach and smaller guts are wounded.

When the stomach or any of the small guts are wounded, the meat & drink break out at the wound, the *Ilia* or flanks swell and become hard, the hicket troubles the Patient, and oft-times he casts up more

choler, aud grievous pain wrings his belly, and he is taken with cold ſweats, and his extream parts wax cold.

Signs to knowwhen the greater guts are wounded.

If any of the greater guts ſhall be hurt, the excrements come forth at the wound: When the Spleen is wounded, there flows out thick and black blood, the Patient is oppreſſed with thirſt, and there are alſo the other ſigns, which we ſaid uſe to accompany the wounded Liver. A difficulty of making water troubles the Patient whoſe reins are wounded, blood is piſſed forth with the Urine, and he hath a pain ſtretched to his groins and the regions of the Bladder and Teſticles.

Signs that the Kidneyes are hurt.

The Bladder or Ureters being wounded, the flanks are pained, and there is a Tenſion of the *Pectes* or ſhare, blood is made in ſtead of urine, or elſe the urine is very bloody, which alſo divers times comes forth at the wound. When the wombe is wounded, the blood breaks forth by the privities, and the Symptomes are like thoſe of the Bladder.

Signs that the Bladder is wounded.

Signs that the wombe is wounded.

The wounds of the liver are deadly, for this part is the work-houſe of the blood, wherefore neceſſary for life; beſides by wounds of the liver the branches of the Gate or Hollow veins are cut, whence enſues a great flux of blood not only inwardly, but alſo outwardly, and conſequently a diſſipation of the ſpirits and ſtrength.

Prognoſticks. *Lib. 6. cap. 88.*

But the blood which is ſhed inwardly amongſt the bowels putrefies and corrupts, whence follows pain, a feaver, inflammation, and laſtly death. Yet *Paulus Ægineta* writes, that the lobe of the Liver may be cut away without neceſſary conſequence of death. Alſo the wounds of the Ventricle and of the ſmall Guts, but chiefly of the *Jejunum* are deadly; for many veſſells run to the *Jejunum* or empty Gut, and it is of a very nervous and ſlender ſubſtance, and beſides it receives the cholerick humor from the bladder of the Gall. So alſo the wounds of the Spleen, Kidneys, Ureters, Bladder, Womb and Gall, are commonly deadly, but alwayes ill, for that the actions of ſuch parts are neceſſary for life; beſides, divers of theſe are without blood and nervous others of them receive the moiſt excrements of the whole body, and lye in the innermoſt part of the body, ſo that they do not eaſily admit of medicins. Furthermore, all wounds which penetrate into the capacity of the belly, are judged very dangerous, though they do not touch the contained bowels; for the encompaſſing and new ayr entring in amongſt the bowels, greatly hurts them, as never uſed to the feeling thereof; adde hereto the diſſipation of the ſpirits which much weakens the ſtrength. Neither can the filth of ſuch wounds be waſted away according to the mind of the Chirurgeon, whereby it happens, they divers times turn into fiſtula's, as we ſaid of wounds of the Cheſt, and ſo at length by collection of matter cauſe death. Yet I have dreſſed many who by Gods aſſiſtance & favour have recovered of wounds paſſing quite through their bodies.

A Hiſtory.

I can bring as a witneſs the ſteward of the Portingall Embaſſadour, whom I cured at *Melun*, of a wound made with a ſword ſo running through his body, that a great quantity of excrements came forth of the wounded Guts, as he was a dreſſing, yet he recovered.

Another Hiſtory.

Not long agoe *Giles le Maiſtre* a Gentleman of *Paris* was run quite through the body with a Rapier, ſo that he voided much blood at his mouth and fundament divers dayes together, whereby you know the Guts were wounded; and yet he was healed in twenty dayes. In like ſort the wounds of the greater veſſels are mortall, by reaſon of the great effuſion of blood and ſpirits which enſues thereupon.

CHAP. XXXIIII. *The cure of wounds of the lower belly.*

THe firſt cogitation in curing of theſe wounds ought to be whether they pierce into the capacity of the Belly; for thoſe which paſſe no further than the *Peritonæum* ſhall be cured like ſimple wounds which only require union. But thoſe which enter into the capacity muſt be cured after another manner. For oft times the Kall or Guts, or both fall forth at them.

The cure of a wounded Gut.

A gut which is wounded muſt be ſowed up with ſuch a ſeam as Furriers or Glovers uſe, as we formerly told you; and then you muſt put upon it a powder made of Maſtich, Myrrh, Aloes and Bole. Being ſowed up, it muſt not be put up boyſterouſly together and at once into its place, but by little and little, the Patient lying on the ſide oppoſite to the wound. As for example, the right ſide of the Guts being wounded and falling out by the wound, the Patient ſhall lye on his left ſide, for the more eaſy reſtoring of the faln down Gut, and ſo on the contrary. If the lower part of the Guts being wounded ſlide through the wound, then the Patient ſhall lye with his head low down, & his buttocks raiſed up by putting a pillow under them; If the upper part be hurt, then muſt he lye quite contrary, that the Guts falling downwards by ſuch a ſite, may give way to theſe which are faln out through the wound. But often in this caſe, the Guts having taken cold by the encompaſſing ayre, ſwell up and are diſtended with wind, the which you muſt diſcuſs before you put them into their place, with a fomentation of the decoction of camomill, melilot, aniſeeds and fennell applyed with a ſpunge, or contained in a bladder; or elſe with chickens, or whelps cut alive in the midſt and laid upon the ſwelling; for thus they do not only diſcuſs the flatulency, but alſo comfort the afflicted part. But if the inflation cannot thus be diſcuſſed, the wound ſhal be dilated, that ſo the Guts may return the more freely to their place.

The cure when the Kall falls out. *Hip. Apb. 58. ſect. 6.*

If the Kall ſhall fall out, it muſt be ſpeedily reſtored to its place, for it is very ſubject to putrefie; for the fat, whereof for the moſt part it conſiſts, being expoſed to the ayre, eaſily loſes its native heat, which is ſmall and weak, whence a mortification enſues. Hence is that of *Hippocrates*; If the Kall fall out, it neceſſarily putrefies. The Chirurgeon ſhall know whether it putrefie, or not, by the blackneſſe and the coldneſs you may perceive by touching it; neither muſt you when it putrefies preſently reſtore it to its place, for ſo the contagion of the putrefaction would ſpread to the reſt of the parts: but whatſoever thereof is putrefied ſhall be twitched and bound hard with a ſtring and ſo cut off, and the reſt reſtored to his proper place: but it's good after cutting of it away to leave the ſtring ſtill hanging thereat, that ſo you may pluck and draw forth whatſoever thereof may by being too ſtrait bound fall away into the capacity of the belly. Some think it to be better to let the Kall thus bound to hang forth until

till that portion thereof which is putrefied fall away of it self, and not to cut it off. But they are much deceived, for it hanging thus would not cover the guts, which is the proper place. The Guts and Kall being put up, if the wound be great and worth speaking of, it must be sowed with that suture which is termed *Gastrorraphia*; but this kind of suture is thus made. The needle at the first putting in must only take hold of the *Peritonæum*, and then on the opposite side only of the flesh, letting the *Peritonæum* alone, & so go along putting the needle from without inwards, and from within outwards, but so that you only take the musculous flesh & skin over it, & then only the *Peritonæum*, until you have sowed up all the wound. He which doth otherwise shall undergo this danger, that whereas the coat *Peritonæum* is of it self without blood, it being divided, or wounded cannot of it self be united to it self, therefore it requires an intercourse of flesh: otherwise unless it be thus united by the benefit of the flesh intermixed therewith, there would remain an uncurable tumor after the wound is cicatrized on the outside. But that which we said before according to *Galens* mind, that all the wounds must be sowed, it is not so to be taken as if that the wound must be sowed up to the very end; for in the lower part of the wound there must be left a certain small vent by which the quitture may pass forth, which being wholly cleansed and exhausted, the wound must be quite healed up. But the wounds which shall penetrate into the substance of the liver, spleen, ventricles, and other bowells, the Chirurgeon shall not suffer them to be without medicines as if they were desperate, but here shall spare neither labour nor care to dress them diligently. For doubtfull hope is better then certain despair. The bladder, womb, & right gut being wounded, detergent and agglutinative injections shal be put up by their proper passages. I have read nothing as yet in any Author of the wounds of the fat, for al of them refer the cure therof to the wounds of the Muscles. Yet I wil say this by the way, that wounds of the fat how deep soever they be, if they be only simple, may be dressed wihout putting in of any Tent, but only dropping in some of my balsam, and then laying upon it a plaister of *Gratia Dei*, or some such like, for so they will heal in a short time. *Lib. 5. Meth. cap. 4.* *The cure of the wounded fat.*

CHAP. XXXV. *Of the wounds of the Groins, Yard and Testicles.*

WHen the Groins and neighbouring parts are wounded, we must first consider whether they pierce to within: and if they do penetrate, to what inward parts they come, whether to the bladder, the womb, or right gut: for these parts are such neer neighbours that oft-times they are all wounded with one blow. But for the wounds of the Testicles, and genitall parts, because they are necessary instruments for the preserving the *species* by generation, or a succession of individualls, and to keep all things quiet at home, therefore the Chirurgeon ought to be very diligent and carefull for their preservation. Wherefore if they should chance at any time to be wounded, they shall be dressed as we have formerly delivered, the medicines being varied according to the state of the wound, and the appearing and happening symptoms; for it would be a thing of immense labour to handle all things in particular.

CHAP. XXXVI. *Of the Wounds of the Thighes and Legs.*

WOunds which have been received on the inside of the Thighes, have often caused sodain death, if they have come to the vein *Sapbena*, or the great Artery, or the Nerves, the associates of these vessels. But when they are simple, there is nothing which may alter the usuall manner of cure. Yet the Patient must be carefull to lye in his bed: for the vulgar *Italian* proverb is true: *La mano al petto, la gamba al letto*, [that is, the hand on the breast, and the leg on the bed.] But when they penetrate more deeply into the substance of the part, they bring horrid and fearfull symptomes, as an inflammation, an abscess, from whence oft-times such abundance of matter issues forth, that the Patient falls into an *Atrophia* and consumption. Wherefore such wounds and ulcers require a carefull & industrious Chirurgeon, who may fitly make incisions necessary for the corrupt parts, & callosity of the fistulous ulcer. Some Chirurgeons have been so bold as to sow together the end of the Tendons of the Ham, and of other joints, when they have been quite cut asunder. But I durst never attempt it for fear of pain, convulsions and the like horrid Symptoms. For the wounds of that large tendon which is composed in the calf of the Leg by the concourse of three muscles, and goes to the heel, I have observed that when it hath been cut with the sword, that the wounds have been long and hard to cure; and besides when at the last they have been healed, as soon as the Patient hath got out of his bed, and indeavoured to go, they have grown ill and broke open again. Wherefore in such like wounds let the Patient have a care that he begin not to go or too boldly to use his hurt leg before it be perfectly cicatrized and the scar grown hard. Therefore that the Patient may be in more safety, I judg it altogether necessary, that he use to go with Crutches, for a good while after the wound is perfectly healed up.

Why wounds of the inside of the thigh are oft-times deadly.

The large Tendon of the heel hard to consolidate.

CHAP. XXXVII. *Of the Wounds of the Nerves and nervous parts.*

THe continuity of the nervous parts is divers wayes loosed by the violent incursion of external things; as by things which contuse, batter and grind in sunder, as by the blow of a stone, cudgell, hammer, lance, bullet out of a gun, or crosbow; by the biting of greater teeth; or the pricking of some sharpe thing, as a needle, bodkin, penknife, arrow, splinter; or the puncture of some venemous thing, as of a Sea Dragon; or the edg of some cutting thing, as a sword or rapier; or of stretching things which violently tear asunder the nervous bodies. Hence therefore it is, that of such wounds some are simple, others compound, and the compound, some more compound than other. For of these some are superficiary and short, others deep and long, some run alongst the nervous body, others run broadwayes, some cut the part quite asunder, others only a portion thereof. The symptomes which follow upon such wounds are, vehement pain, and defluxion, inflammation, abscess, fever, *deliri-*

Differences drawn from things wounded.

Their symptomes.

um, ſowning, convulſion, gangrene, ſphacell; whence often death inſues by reaſon of that ſympathy, which all the nervous parts have with the brain. Amongſt all the wounds of the nervous parts, there is none more to be feared then a puncture, or prick, nor any which cauſeth more cruell and dangerous ſymptomes. For by reaſon of the ſtraitneſs of the wound, medicines can neither be put in, nor the ſanious matter paſs forth; now the ſanious matter by long ſtay acquires virulency, whereby the nervous parts are tainted and ſwoln, ſuffer pain, inflammation, convulſions, and infinite other ſymptomes; of theſe the wounds are moſt dangerous, by which the nervous and membranous bodies are but half cut aſunder. For the portion thereof which remains whole, by its drawing & contracting it ſelf towards the originall, cauſeth great pain and convulſion by ſympathy. The truth hereof is evident in wounds of the head, as when the *pericranium* is half cut, or when it is cut to apply a trepan. For the cutting thereof infers far greater pain, than when it is cut quite aſunder. Wherefore it is ſafer to have the nervous body quite cut off, for ſo it hath no community, nor conſent with the upper parts, neither doth it labour, or ſtrive to reſiſt the contraction of its ſelf; now this contrariety, and as it were fight, is the cauſe of pain, yet there ariſes another miſery from ſuch a wound, for the part whereinto the nerve which is thus cut inſunder paſſes, thence forwards loſeth its action.

Why a puncture of a nerve is deadly.

CHAP. XXXVIII. *Of the cure of Wounds of the Nervous parts.*

A wound of of the nervous parts indicates contrary to the general cure of wounds.

IT is the ancient doctrine of the antient Phyſitians, that the wounds of the nervous parts ſhould not preſently be agglutinated (which notwithſtanding the generall and firſt indication uſually taken from the ſolution of continuity requires) but rather, chiefly if they be too ſtrait, that the punctures ſhould be dilated, by cutting the parts which are above them, and let them be kept long open that the filth may paſs freely forth, and the medicine enter well in. Yet I in many cures have not followed this counſel, but rather that which the common indication requires.

A Hiſtory.

That cure is in freſh memory which I performed upon *Monſeur le Cocq*, a Proctor of the ſpirituall court, who dwelt in our Ladies ſtreet; he gathering and binding up ſome looſe papers, run a penknife which was hid amongſt them, through his hand. Alſo one of his neighbours who went to ſpit a piece of beef, thruſt the ſpit through the midſt of his hand; But I preſently agglutinated both their wounds, without any danger, dropping preſently in at the firſt dreſſing a little of my balſam warm, and putting about it a repelling and aſtringent medicine, and by this means they were both of them healed in a ſhort time, no ſymptome thereupon happening. Yet I would not have the young Chirurgeon to run this hazard, for firſt he muſt be well practiſed and accuſtomed to know the tempers and habits of men; for this manner of curing would not do well in a plethorick body, or in a body replete with ill humors, or indued with exquiſite ſenſe. Therefore in ſuch a caſe it will be ſafer to follow the courſe here ſet down. For wounds of the nerves do not only differ from other wounds, but alſo among themſelves in manner of curing. For although all medicines which draw from far, and waſte ſanious humors, may be reputed good for the wounds of the nerves; yet thoſe which muſt be applyed to punctures and to thoſe nerves which are not wholly laid open, ought to be far more powerful, ſharp & drying, yet ſo that they be not without biting, that ſo penetrating more deep they may draw forth the matter, or elſe conſume and diſcuſs that which either lies about the nerves, or moiſtens their ſubſtance. On the contrary, when the ſinews are bared from fleſh and adjoyning particles, they ſtand in need but of medicines, which may only dry. Here you may furniſh your ſelves with ſufficient ſtore of medicines good for the nerves howſoever pricked. As ℞. *Terebinth.ven.& olei veteris an.* ℥ j. *aquæ vitæ parum.* Or ℞. *olei Terebinth.* ℥j. *aquæ vitæ* ℥ j. *euphor.* ℥ ß. Or ℞ *radicces Dracontiæ, Briomiæ, valerianæ, & gentianæ exſiccatas, & in pulverem redactas, miſce cum decocto centaurii, aut oleo, aut exungia veteri*; drop hereof warm into the wound as much as ſhall ſuffice. Or elſe put ſome Hogs, Gooſe, Capons, or Bears greaſe, old oil, oil of Lillies or the like, to *Galbanum*, pure Rozin, *opopanax* diſſolved in *aqua vitæ* and ſtrong vinegar. Or ℞. *olei hypericonis ſambuti, & de euphorbio an.* ℥ j. *ſulphuris vivi ſubtiliter pulveriſati* ℥ ß, *gummi ammoni. bdellii an.* ℥ ij. *aceti boni* ℥ ij. *vermium terreſt. præparat.* ℥ j. *bulliant omnia ſimul ad conſumptionem aceti.* Let as much hereof as ſhall ſuffice be dropped into the wound; then apply this following cerate, which draws very powerfully. ℞. *olei ſupraſcripti* ℥ j. *terebinth. venet.* ℥ ß. *diachylonis albi cum gummi*, ℥ x. *ammoniac. bdellii in aceto diſſolutorum, an.* ℥ ij. *reſin. pini, gum. elemi, picis navalis an.* ℥ v. *ceræ quod ſufficit, fiat ceratum ſatis molle.* We muſt uſe ſome whiles one, ſome whiles another of theſe medicines in punctures of the Nerves with choiſe and judgment, according to their conditions, manner, depth, and the temperaments and habit of the wounded bodies. But if the pain yeeld not to ſuch remedies, but rather increaſe, with the inflammation of the affected part, a ſwelling of the lips of the wound, and ſweating forth of a ſerous, thin and virulent matter or filth, then you ſhall poure into it ſcalding oil, and ſhall touch three or four times not only the ſurface of the wound but the bottom thereof with a rag dipped therein and tyed to the end of a *ſpatula*. For this will take away the ſenſe from the Nerve, Tendon, or Membrane, like as if they were burnt with a cautery, and ſo the pain will be eaſed. So in the moſt grievous pains of rotten teeth, the thruſting of an hot iron into their roots, or ſtopping them with cotten dipped in oyl of Vitrioll, or *aqua vitæ*, gives moſt certain eaſe; for by burning the nerve which is inſerted into their roots, the ſenſe and ſo conſequently the pain is taken away. So alſo in malignant, gnawing, eating, and ſpreading ulcers, which are alwaies aſſociated with much pain, the pain ceaſes by applying an Eſcharotick, as the powder of Alum, or Mercury, or *ægyptiacum* made ſomewhat more ſtrong than uſuall. That the young Chirurgeon may be more ready for this practiſe and the uſe of the former medicines, I have thought good to inſert the following Hiſtory both for the lateneſs of the thing and the pleaſing memory of the moſt laudable Prince.

Medicins fit for wounds of the nerves.

VVhat wounds of the Nerves muſt be burnt.

A certain Anodyne in pain of the teeth.

VVhy Eſcharoticks muſt be uſed to ſpreading ulcers.

A famous hiſtory.

Charles the ninth, the French King, being ſick of a Feaver, *Monſieur Chapellat* and *Caſtellan* his Phyſitians thought it fit he ſhould be let blood; for the performance whereof, there was called a Chirurgeon wondrous famous for that buſineſs; but when as he by chance had pricked a nerve in ſtead of a vein, the

King

King cryed out, that he felt a mighty pain in that place. Then I bid, that the ligature should straightwaies be loosed, otherwise the arm would presently be much swelled. But he going slowly about it, behold the arm began to swel with such contraction, that he could not bend it, nor put it forth, and cruel pain molested not only the pricked particle, but all the whole member besides. I forthwith laid upon the wound a plaister of *Basilicon*, to hinder the agglutination thereof, & then I wrapped al the arm in a double linnen cloth dipped in oxycrate, putting upon it an expulsive ligature, which beginning at the wrist and ending at the top of the shoulder, might keep the blood and spirits from fear of defluxion and inflammation. This being thus performed, we went aside to consult what was necessary to be done, both to asswage the pain, as also to divert the other symptoms, which usually happen upon punctures of the nerves. I being desired, thus delivered my opinion, that in my mind, there were nothing better, then presently to drop into the wound some oyl of Turpentine warmed and mixed with a little *aqua vitæ*. And then all the arm should be covered with a plaister of *Diacalcitheos* dissolved in vinegar and oyl of Roses, bound over and besides with the expulsive ligature, which we formerly mentioned. For the oyl and *aqua vitæ* have a faculty to penetrate into the bottome of the wound, and to exhaust and dry up the serous and virulent humor, which sweats from the substance of the pricked nerve; and also to mitigate the pain by its actuall heat. Furthermore the emplaister *Diacalcitheos* hath a faculty to dissolve the humor which hath already fallen down into the arm, and to hinder the entrance and defluxion of any new matter. And the ligature is such as by its moderate astriction would serve to strengthen the muscles, and to press out and repell the humors which were fallen down into the upper part, and to prohibit that which is ready to fall down. Mine advice being approved of the Physitians both in word and deed, the pain was mitigated. But the humor stayed in the part, for the dissolving and drying whereof, this following remedy was used. ℞. *far. hordei & orobi an.* ʒ ij. *flor. chamæm. & melilot. an.* p. ij. *butyr. recentis sine sale* ʒ i. ß. *lixivii barbitonsoris quod sufficit, fiat cataplasma ad formam pultis.* By these remedies the King at the last after 3. months space was perfectly healed, so that there remained no sign of the depraved action in the part. But if at any time there shall be so great contumacy, that it will not yeeld to these means, but that there is imminent danger of a convulsion; it will be better to cut it in sunder whether Nerve, Tendon or Membrane, than to expose the Patient to the danger of a deadly convulsion; for thus indeed the peculiar action of that part will be lost, but the whole body preserved thereby; for so we had determined by common consent, that if the pain which afflicted the King would not yeeld to the prescribed remedies, either to poure in scalding oyl, or else to cut the sinew quite asunder.

A discussing and drying cataplasme.

For the late and sad memory of Mistris *Courtin* dwelling in the street of the holy-Cross was in our minds, who of a vein not well opened in her arm fell into a Gangrene and totall mortification of that whole part, of which she dyed, because she was not dressed with the formerly mentioned medicins. Yet we must abstain from these too powerfull remedies, when the pricked nerve shall lye bare, for else the pain would be increased, & more grievous symptoms follow. Wherefore as I formerly wished, more mild medicins must be applyed, which may dry up the serous humor without biting or acrimony, as ℞. *terebinth. venet. in aq. ros. lot.* ʒ ij. *boli armeni subtiliter pulveri sati,* ʒ ij. *incorporentur simul.* Our Balsam also is excellent in this case, and this of *Vigons* which follows. ℞ *olei rosar. omphacini* ʒ j ß. *olei de terebinth.* ʒ iij. *succi plantag.* ʒ ß. *semin. hyperici ana aliquantulum contriti, m.* ß. *tutiæ præpar.* ʒ iij. *calcis decies lotæ cum aqua plantag.* ʒ ij. *antimonii* ʒ j. *sevi hircini, & vitulini, an.* ʒ v. *vermium terrestrium cum vino lotorum* ʒ j ß. *bulliant omnia simul dempta tutia in cyatho decoctionis hordei, ad consumptionem aquæ & vini, colentur, rursumq; igni admoveantur, addendo tutiam, & fiat linimentum cum cera alba, q.* ʒ ß. *croci.* This liniment asswages pains, & covers the bared nerves with flesh. This cure of punctured nerves, may with choise and judgment and observing the proportion of the parts be transferred to the pricked Tendons and membranes. But take this as a generall & common rule, that all nervous bodies howsoever hurt, are to be comforted by anointing them with hot oyls, such as the oyls of Bayes, Lillies, of Worms, Sage, or some other such like remedy being applyed to their originalls and more notable passages; as to the originall of the spinall marrow, the armpits and groins. Neither do I think it fit in this place to omit an affect which sometimes happens to the large Tendon of the heel, of which we formerly made mention. For it oft-times is rent or torn by a small occasion without any sign of injury or solution of continuity apparent on the outside as by a little jump, the slipping aside of the foot, the too nimble getting on horseback, or the slipping of the foot out of the stirrop in mounting into the saddle. When this chance happens it will give a crack like a Coachmans whip, above the heel, where the tendon is broken, the depressed cavity may be felt with your finger, there is great pain in the part, and the party is not able to go. This mischance may be amended by long lying and resting in bed, and repelling medicins applyed to the part affected in the beginning of the disease, for fear of more grievous symptomes, and then applying the Black plaister, or *Diacalcitheos* or some other such, as need shall require, neither must we hereupon promise to our selves or the Patient certain or absolute health. But on the contrary at the beginning of the disease we must foretell that it will never be so cured but that some reliques may remain, as the depression of the part affected and depravation of the action and going; for the ends of this broken or relaxed Tendon by reason of its thickness and contumacy cannot easily be adjoined, nor being adjoined, united.

A History.

An anodyne and Sarcotick Balsam.

A generall rule for all wounds of all Nervous parts.

CHAP. XXXIX. *Of the wounds of the joynts.*

Why wounds of the joynts are malignant,

BEcause the wounds of the joynts have something proper and peculiar to themselves, besides the common nature of wounds of the Nerves, therefore I intend to treat of them in particular. Indeed they are alwayes very dangerous, and for the most part deadly by reason of the nervous productions and membranous Tendons wherewith they are bound and ingirt and into which the Nerves are inserted: whereby it comes to pass, that the exquisite sense of such like parts will easily bring malign symptomes, especially if the wound possess an internall, or as they term it, a domestique part of them; as for example, the armpits, the bending of the arm, the inner part of the wrist

wriſt,and ham,by reaſon of the notable Veins,Arteries,and Nerves of theſe parts,the looſed continuity of all which brings a great flux of blood,ſharpe pain and other malignant ſymptomes; all which we muſt reſiſt according to their nature and condition,as a flux of bloud with things ſtaying, bleeding;pain with anodynes.If the wound be large and wide,the ſevered parts ſhall be joined with a ſuture,leaving an orifice in the lower part,by which the quitture may paſs forth.This following powder of *Vigoes* deſcription muſt be ſtrewed upon the ſuture. ℞. *thuris ſang.draconis,boli armen.terræ ſigill.an.* ʒ ij. *aloes,maſtich.an.*ʒ j.*fiat pulvis ſubtilis.* And then the joynt muſt be wrapped about with a repercuſſive medicine compoſed of the whites of Egs,a little oil of Roſes,Bole,Maſtich,and barly flowre. If it be needfull to uſe a Tent,let it be ſhort,and according to the wound thick,leſt it cauſe pain:and moreover let it be anointed with the yolk of an eg,oil of Roſes, waſhed turpentine and a little ſaffron. But if the wound be more ſhort & narrow,it ſhal be dilated,if there be occaſion,that ſo the humor may paſs away more freely.You muſt reſt the part,and beware of uſing cold,relaxing,mollifying,humecting,and unctuous medicines,unleſs peradventure the ſharpneſs of the pain muſt be mitigated. For on the contrary,aſtringent and deſiccant medicins are good,as this following cataplaſm. ℞. *ſurfur. macri, farin. hordei,& fabarum.an.*ʒ iiij.*florum chamæ.& melil.an.*m.ß.*terebinth.*ʒ iij.*mellis communis*ʒ ij.*ol. myrtin.* ʒ j. *oxymelitis, vel oxycrat.vel lixivii com.quantum ſufficit,fiat cataplaſma ad formam pultis.*Or you may compoſe one of the lees of wine,Wheat bran,the powder of Oaken bark,cypreſs nuts,galls and Turpentine, and ſuch like,that have an aſtringent,ſtrengthening and drying quality,and thereby aſſwaging pain, and hindering the defluxion of humors. This following medicine is aſtringent and agglutinative.℞ *terebinth. venet.*ʒ ij.*aq.vitæ parum,pulveris maſtich.aloes,myrrhæ,boli armen.an.*ʒ ij.And alſo our balſam wil be good in this caſe,if ſo be that you add hereto ſo much powder which dryes without acrimony,as occaſion ſhal ſerve.I admoniſhed you before to take heed of cold, and now again ; for it is hurtfull to all wounds and ulcers,but eſpecially to theſe,of the nervous parts;hence it is that many dye of ſmal wounds in the winter,who might recover of the ſame wounds though greater in the Summer.For cold according to *Hippocrates* is nipping to ulcers,hardens the ſkin, and hinders them from ſuppuration, extinguiſheth naturall heat,cauſes blackneſs,cold aguiſh fits,convulſions,and diſtentions.Now divers excrements are caſt forth of wounds of the joynts,but chiefly albugineous,that is,reſembling the white of an eg, and mucous,and ſometimes a very thin water,all which ſavour of the nature of that humor which nouriſheth theſe parts.For to every part there is appropriate for his nouriſhment and conſervation, a peculiar balſam,which by the wound flows out of the ſame part,as out of the branches of the vine,when they are pruned,their radicall moiſture or juyce flows;whence alſo a *Callus* proceeds in broken bones. Now this ſame mucous,& albugineous humor,ſlow & as it were frozen flowing from the wounded joynts,ſhews the cold diſtemper of the parts,which cauſe pain,not to be orecome by medicins only potentially hot. Wherefore to correct that,we muſt apply things actually hot,as beaſts and ſwines bladder half full of a diſcuſſing decoction,or hot bricks quenched in wines.Such actuall heat helps nature to concoct and diſcuſs the ſuperfluous humor impact in the joynts,and ſtrengthens them;both which are very neceſſary,becauſe the naturall heat of the joynts is ſo infirm that it can ſcare actuate the medicin unleſs it be helped with medicins actually hot. Neither muſt the Chirurgeon have the leaſt care of the figure and poſture of the part, for a vicious poſture increaſes ill ſymptomes,uſes to bring to the very part though the wound be cured,diſtortion,numneſs, incurable contraction;which fault leſt he ſhould run into,let him obſerve what I ſhall now ſay;If the forepart of the ſhoulder be wounded, a great boulſter muſt be under the armpit,and you muſt carry your arm in a ſcarf, ſo that it may bear up the lower part of the arm,that ſo the top of the ſhoulder may be elevated ſomewhat higher, and that ſo it may be thereby more ſpeedily and happily agglutinated and conſolidated.If the lower part be wounded, when fleſh begins to be generated and the lips of the wound to meet,you muſt bid the Patient to move and ſtir his arms divers wayes ever & anon,for if that be omitted or negligently done,when it is cicatrized,then it will be more ſtiffe and leſs pliable to every motion ; and yet there is a further danger leſt the arm ſhould totally loſe its motion.If the wound be upon the joynt of the elbow,the arm ſhal be placed and ſwathed in a middle poſture,that is,which neither too ſtraitly bows it,nor holds it too ſtiffly out; for otherwiſe when it is cicatrized,there will be an impediment either in the contraction or extention. When the wound is in the wriſt, or joints of the fingers either externally or internally,the hand muſt be kept half ſhut,continually moving a ball therein.For if the fingers be held ſtraight ſtretched forth,after it is cicatrized,they will be unapt to take up or hold any thing,which is their proper faculty.But if after it is healed, it remain half ſhut, no great inconveniency will follow thereon;for ſo he may uſe his hand divers wayes to his ſword, pike, bridle and in any thing elſe. If the joints of the Hip be wounded,you muſt ſo place the Patient that the thigh bone may be kept in the cavity of the huckle-bone,and may not part a hairs breadth there from,which ſhall be done with linnen boulſters and ligatures applyed as is fitting,and lying full upon his back.When the wound ſhall begin to cicatrize, the Patient ſhall uſe to move his thigh every way, leſt the head of the thigh-bone ſtick in the cavity of the huckle-bone without motion.In a wound of the knee,the leg muſt be placed ſtraight out,if the Patient deſire not to be lame.When the joints of the feet and toes are wounded,theſe parts ſhall neither be bended in nor out,for otherwiſe he will not be able to go. To conclude,the ſite of the foot and leg, is quite contrary to that of the arm and hand.

The cure.

An aſtringent and drying caplaſm.

*Aphor.*20. *ſect.*5.

VVhat matter uſually flows from wounds of the joynts.

VVhy things actually hot muſt be applyed to the wounded joynts.

Of the ſite and poſture of wounded joints.

CHAP. XL. *Of the wounds of the Ligaments.*

THe wounds of the Ligaments,beſides the common manner of curing theſe of the Nerves, have nothing peculiar,but that they require more powerfull medicins, for their agglutination,deſiccation and conſolidating;both becauſe the Ligamentall parts are harder,and dryer, and alſo for that they are void of ſenſe.Therefore the foreſaid cure of Nerves,and joints may be uſed for theſe wounds:for the Medicins in both are of the ſame kind,but here they ought to be ſtronger

Ligaments more dry than Nerves,and without ſenſe.

ſtronger and more powerfully drying. The Theory and cure of all the ſymptomes which ſhall happen thereupon have been expreſſed in the Chapter of curing the wounds of the nervous parts, ſo that here we ſhall need to ſpeak nothing of them, for there you may find as much as you will. Wherefore here let us make an end of wounds, and give thankes to God the author and giver of all good for the happy proceſſe of our labours, and let us pray that that which remaines may be brought to a happy end, and ſecure for the health and ſafety of good people.

The end of the tenth Booke.

Of Wounds made by Gunſhot, other fiery Engines, and all ſorts of Weapons.

THE ELEVENTH BOOK.

The Preface.

I Have thought good here to premiſe my opinion of the originall, encreaſe, and hurt of fiery Engines, for that I hope it will be an ornament and grace to this my whole treatiſe: as alſo to intice my Reader, as it were with theſe junckets, to our following Banquet ſo much ſavouring of Gunpowder. For thus it ſhall be known to all whence Guns had their originall and how many liabies and ſhapes they have acquired from poore and obſcure beginnings; & laſtly how hurtfull to mankind the uſe of them is. *Polydore Virgill* writes that a Germane of obſcure birth and condition was the inventor of this new engin which we term a Gun, being induced thereto by this occaſion. He kept in a mortar covered with a tyle, or ſlate, for ſome other certain uſes a powder (which ſince that time for its chief and new known faculty, is named Gunpowder.) Now it chanced as he ſtruck fire with a ſteel and flint, a ſpark thereof, by accident fell into the mortar, whereupon the powder ſuddainly catching fire, caſts the ſtone or tyle which covered the mortar up on high; he ſtood amazed at the novelty & ſtrange effect of the thing, and withall obſerved the formerly unknown faculty of the powder; ſo that he thought good to make experiment thereof in a ſmall Iron trunk framed for that purpoſe according to the intention of his mind. When all things were correſpondent to his expectation, he firſt ſhewed the uſe of his engine to the Venetians, when they warred with the Genoveſes about *Foſſa Clodia*, in the year of our Lord 1380. Yet in the opinion of *Peter Meſſia*, their invention muſt have been of greater antiquity; for it is read in the Chronicles of *Alphonſus* the eleventh King of *Caſtile*, who ſubdued the Iſles *Argezires*, that when he beſieged that chiefe Town in the year of our Lord 1343. The beſieged Moores ſhot as it were thunder againſt the aſſailants, out of Iron mortars. But we have read in the Chronicles written by *Peter* Biſhop of *Leon* of that *Alphonſus* who conquered *Toledo*, that in a certain ſea fight fought by the King of *Tunis*, againſt the Mooriſh King of *Sivill*, whoſe part King *Alphonſus* favoured, the *Tunetans* caſt lightning out of certain hollow Engins or Trunks with much noiſe. Which could be no other, than our Guns, though not attained to that perfection of art and execution which they now have.

Lib. 2. de inuent. rerum.

Cap. 8. prim. part. var. lect.

I think the deviſer of this deadly Engin hath this for his recompence, that his name ſhould be hidden by the darkneſs of perpetuall ignorance, as not meriting for this his moſt pernicious invention, any mention from poſterity. Yet *Andrew Thevet* in his Coſmography publiſhed ſome few years agone, when he comes to treat of the *Suevi*, the inhabitants of Germany, brings upon the authority and credit of a certain old Manuſcript, that the Germane the inventer of this warlike Engine was by profeſſion a Monk and Philoſopher or Alchimiſt, born at *Friburg*, and named *Conſtantine Anclzen*. How ſoever it was, this kind of Engine was called *Bombarda* (*i*) a Gun, from that noiſe it makes, which the Greeks and Latines according to the ſound call *Bombus*; then in the following ages, time, art and mans maliciouſneſs added much to this rude and unpoliſht invention. For firſt for the matter, Braſſe and Copper, metalls farre more ductable, fuſible and leſſe ſubject to ruſt, came as ſupplies to Iron. Then for the form, that rude and undigeſted barrell, or mortar-like maſſe, hath undergone many formes and faſhions, even ſo far as it is gotten upon wheels, that ſo it might run not only from the higher ground, but alſo with more rapid violence to the ruin of mankind; when as the firſt and rude mortars ſeemed not to be ſo nimbly traverſed, nor ſufficiently cruell for our deſtruction by the only caſting forth of Iron and fire. Hence ſprung theſe horrible monſters of Canons, double Canons, Baſtards, Muſquits, Field peeces; hence theſe cruell and furious beaſts, Culverins, Serpentines, Baſiliſques, Sackers, Falcons, Falconets, and divers other names not only drawn from their figure and making, but alſo from the effects of their cruelty. Wherefore certainly I cannot ſufficiently admire the wiſdome of our Anceſtors, who have ſo rightly accommodated them with names agreeable to their natures; as thoſe who have not only taken them from the ſwifteſt birds of prey, as Falcons; but alſo from things moſt harmfull and hatefull to mankind, ſuch as Serpents, Snakes, and Baſiliſques. That ſo we might clearly diſcern, that theſe engines were made for no other purpoſe, nor with other intent, but only to be imployed for the ſpeedy and cruell ſlaughter of men; and that by only hearing them named we might deteſt and abhor them, as pernicious enemies of our lives. I let paſſe other engines of this offspring, being for their quantity ſmall, but ſo much the more pernicious & harmfull, for that they neerer aſſail our lives, may traiterouſly and forthwith ſeize upon us not thinking nor feating any ſuch thing; ſo that we can ſcarſe

VVho the inventor of Guns.

The reaſon of the name.

have

The danger of Pistols.

have any means of escape; such are Pistols and other small hand-guns, which for shortness you may carry in your pocket, and so privily and suddainly taking them forth oppress the careless and secure. Fowling peeces which men usually carry upon their shoulders, are of the middle rank of these engines, as also Muskets and Calcevers, which you cannot wel discharge unless lying upon a Rest, which therefore may be called Breast-guns for that they are not laid to the cheek, but against the Breast by reason of their weight and shortness; All which have been invented for the commodity of footmen, and light horsemen. This middle sort of engine we call in Latine by a generall name *Sclopus*, in imitation of the sound, and the Italians who term it *Sclopetere*; the French call it *Harquebuse*, a word likewise borrowed from the Italians, by reason of the the touch-hole by which you give fire to the peece, for the Italians call a hole *Buzio*. It is tearmed *Arcus (i)* a Bow, for that at this present it holds the same place in martiall affaires, as the Bow did of old; and as the Archers formerly, so at this day the Musquetiers are placed in front. From the same wretched shop and magazine of cruelty, are all sorts of Mines, Countermines, pots of fire, trains, fiery Arrowes, Lances, Crossebowes, barrels, balls of fire, burning faggots, Granats, and all such fiery engines and Inventions, which closely stuffed with fuell and matter for fire, and cast by the defendants upon the bodies, and Tents of the assailants, easily take fire by the violence of their motion. Certainly a most miserable and pernicious kind of invention, whereby we often see a thousand of heedlesse men blown up with a mine by the force of Gunpowder; otherwhiles in the very heat of the conflict you may see the stoutest souldiers seised upon with some of these fiery Engines, to burn in their harnesse, no waters being sufficiently powerfull to restrain and quench the raging and wasting violence of such fire cruelly spreading over the body and bowells. So it was not sufficient to have armes, Iron and fire to mans destruction, unlesse also that the stroak might be more speedy, we had furnished them, as it were with wings, so to fly more hastily to our own perdition, furnishing fell-bearing death with wings so more speedily to oppress man, for whose preservation, all things contained in the world were created by God. Verily when I consider with my self all the sorts of warlike Engines, which the ancients used, whether in the field in set battles, as Bowes, Darts, Crossbowes, Slings, or in the assault of Cities, & shaking or overturning their walls, as Rams, Horses, woodden towres, slings and such like; they seem to me certain childish sports & games made only in imitation of the former. For these modern inventions are such as easily exceed all the best appointed and cruell Engines which can be mentioned or thought upon, in the shape, cruelty and appearance of their operations. For what in the world is thought more horrid or fearfull than thunder and lightning? and yet the hurtfulnes of thunder is almost nothing to the cruelty of these infernall Engines; which may easily appear by comparing together both their effects. Man alone of all creatures is not alwayes killed by being touched with thunder; but it immediatly killeth all other things which are subject to be toucht therewith. Nature bestowing this honour upon him, seeing so many creatures exceed him in strength: For all things ly contrary to man; and man, unless he be overthrown with it, doth not dye thereof. But these fire-spitting Engines do no more spare man, then they do other creatures, and kill without difference from whence soever they come, whither soever they are carryed, and howsoever they touch. There are many, but more are said to be the remedies against thunder; for beside the charms whereby the ancient Romans did suppose they might be driven away, they never penetrate deeper into the ground than five foot, therefore such as was fearfull thought the deeper caves most safe. Of those things which grow out of the earth, they do not touch the Bay tree, and that was the cause that it was counted a sign of Victory both in ancient and moderne times. Wherefore *Tiberius Cæsar* otherwise a contemner of God and religion, as he who indued with the Mathematicall sciences thought all things governed by Fate, yet because he exceedingly feared thunder, he alwayes carried a Lawrell wreath about his neck when the aire was troubled, for that this kind of leafe is reported not to be touched by thunder. Some report that he made him tents of Seales skinnes, because it toucheth not this kinde of creature of all these things that live in the Sea, as neither the Eagle amongst birds, which for that is fained to be *Ioves* squire. But on the contrary, charmes, the victorious Bay, the Seale or Sea-calfe, the Eagle or any such thing profits nothing against the violence of these fiery engines; no, not a wall of ten foot thick will advantage. Lastly, this argues the immense violence of brasen Cannons above thunder, for that thunder may be dispersed and driven away with the noise and ringing of Bells, the sounding of Trumpets, the tinkling of brasen kettles, yea also by the shooting of such great Ordnance; to wit, the clouds, by whose collision and fight the Thunder is caused, being dispersed by this violent agatation of the air, or else driven further to more remote parts of the skies. But their fury once provoked, is stayed by no opposition, appeased by no remedy. As there are certain seasons of the year, so also there are certain Regions of the earth, wherein Thunder is seldome or never heard. Thunders are rare in Winter and Summer, and that for contrary causes; for that in Winter the dense air is thickned with a thicker coat of clouds, and the frosty and cold exhalation of the earth extinguisheth what fiery vapours so ever it receives; which thing keeps *Scythia* and the cold countries about it free from Thunder. And on the contrary, too much heat preserves *Egypt*. For hot and dry exhalations of the earth are condensed into very thin, subtile and weak clouds. But as the invention, so also the harm and tempest of great Ordnance, like a contagious pestilence is spread and rages over all the earth, and the skies at all times sound again with their reports. The Thunder and Lightning commonly gives but one blow, or stroke, and that commonly strikes but one man of a multitude; But one great Cannon at one shot may spoil and kill a hundred men. Thunder, as a thing naturall, falls by chance, one while upon a high oak, another while upon the top of a mountain, and somewhiles on some lofty towre, but seldom upon man. But this hellish Engine tempered by the malice and guidance of man, assailes man only, and takes him for his only mark, and directs his bullets against him. The Thunder by its noise as a messenger sent before, foretells the storm at hand; but, which is the chief mischief, this infernall Engine roars

A comparison of the antient weapons with the modern.

The wondrous force of great Ordnance.

Plin. Lib. 2. Cap. 50.

juyce therein: then he strained it through a towell without much pressing; and added the Turpentine, roars as it strikes, and strikes as it roars, sending at one and the same time the deadly bullet into the breast, and the horrible noise into the ear. Wherefore we all of us rightfully curse the author of so pernicious an Engine; on the contrary praise those to the skies, who endeavour by words and pious exhortations to dehort Kings from their use, or else labour by writing and operation to apply fit medicins to wounds made by these Engins. Which hath moved me, that I have written hereof almost with the first of the French. But before I shall do this, it seemeth not amisse, so to facilitate the way to the treatise I intend to write of wounds made by Gunshot, to premise two Discourses, by which I may confute and take away certain erroneous opinions which have possessed the mindes of divers; for that unless these be taken away, the essence and nature of the whole disease cannot be understood, nor a fitting remedy applyed by him which is ignorant of the disease.

The first Discourse which is dedicated to the Reader, refells and condemnes by reasons and examples the method of curing prescribed by *John de Vigo*, whereby he cauterizeth the wounds made by Gunshot, supposing them venenate; and on the contrary proves that order of curing which is performed by suppuratives, to be so salutary and gentle, as that prescribed by *Vigo* is full of errour and cruelty. The second dedicated to the King, teaches that the same wounds are of themselves void of all poison, and therefore that all their malignity depends upon the fault of the air, and ill humors predominant in the bodies of the patients.

The arguments of the following discourses.

The first discourse wherein Wounds made by Gunshot, are freed from being burnt, or cauterized according to Vigoes *Method.*

IN the year of our Lord 1536. *Francis* the French King, for his acts in war and peace stiled the Great, sent a puissant Army beyond the Alpes, under the government and leading of *Anne* of Mommorancy high Constable of France, both that he might relieve *Turin* with Victualls, souldiers, and all things needfull, as also to recover the Cities of that Province taken by the Marquis of *Guast* Generall of the Emperours forces. I was in the Kings Army the Chirurgeon of Monsieur of *Montejan* Generall of the foot. The Imperialists had taken the straits of *Suze*, the Castle of *Villane*, and all the other passages; so that the Kings army was not able to drive them from their fortifications but by fight. In this conflict there were many wounded on both sides with all sorts of weapons, but chiefly with bullets. I will tell the truth, I was not very expert at that time in matters of Chirurgery; neither was I used to dress wounds made by Gunshot. Now I had read in *John de Vigo* that wounds made by Gunshot were venenate or poisoned, and that by reason of the Gunpowder. Wherefore for their cure, it was expedient to burn or cauterize them with oil of Elders scalding hot, with a little Treacle mixed therewith. But for that I gave no great credit neither to the author, nor remedy, because I knew that caustick could not be powred into wounds, without excessive pain; I, before I would run a hazard, determined to see whether the Chirurgeons, who went with me in the army, used any other manner of dressing to these wounds. I observed and saw that all of them used that Method of dressing which *Vigo* prescribes; and that they filled as full as they could, the wounds made by Gunshot with Tents and pledgets dipped in this scalding Oil, at the first dressings; which encouraged me to do the like to those, who came to be dressed of me. It chanced on a time, that by reason of the multitude that were hurt, I wanted this Oil. Now because there were some few left to be dressed, I was forced, that I might seem to want nothing, and that I might not leave them undrest, to apply a digestive made of the yolk of an egge, oil of Roses, and Turpentine. I could not sleep all that night, for I was troubled in mind, and the dressing of the precedent day, (which I judged unfit) troubled my thoughts; and I feared that the next day I should find them dead, or at the point of death by the poison of the wound, whom I had not dressed with the scalding oil. Therefore I rose early in the morning, I visited my Patients, and beyond expectation, I found such as I had dressed with a digestive only, free from vehemency of pain to have had good rest, and that their wounds were not inflamed nor tumified; but on the contrary the others that were burnt with the scalding oil were feaverish, tormented with much pain, and the parts about their wounds were swolne. When I had many times tryed this in divers others, I thought this much, that neither I nor any other should ever cauterize any wounded with Gunshot. When we first came to *Turin*, there was there a Chirurgeon far more famous than all the rest in artificially and happily curing wounds made by Gunshot; wherefore I laboured with all diligence for two yeers time to gain his favour and love, that so at the length, I might learn of him, what kind of Medicine that was, which he honoured with the glorious title of Balsam, which was so highly esteemed by him, and so happy and successfull to his patients; yet could I not obtain it. It fell out a small while after that the Marshall of *Montejan* the Kings Lieftenant, Generall there in *Piemont* dyed, wherefore I went unto my Chirurgeon, and told him that I could take no pleasure in living there, the favourer and *Mecenas* of my studies being taken away; and that I intended forthwith to return to *Paris*, and that it would neither hinder, nor discredit him to teach his remedy to me, who should be so far remote from him. When he heard this, he made no delay, but presently wished me to provide two Whelpes, 1 pound of earthwormes, 2 pounds of oil of Lillies, six ounces of Venice Turpentine, and one ounce of *aqua vitæ*. In my presence he boyled the Whelpes put alive into that oil, untill the flesh came from the bones, then presently he put in the Wormes, which he had first killed in white wine, that they might so be cleansed from the earthy drosse wherewith they are usually repleat, and then he boiled them in the same oil so long, till they became dry, and had spent all their juice

Lib. 1. de vulner. Cap. 8.

What chance may do in finding out of remedies.

The description of oil of Whelpes.

to it, and lastly the *aqua vitæ*. Calling God to witness, that he had no other Balsam, wherewith to cure wounds made with Gunshot, and bring them to suppuration. Thus he sent me away as rewarded with a most precious gift, requesting me to keep it as a great secret, and not to reveal it to any. When I came to *Paris*, I went to visit *Silvius* the Kings professor of Physick, wel known by name to all scholars for his great learning; he kept me long that so I might dine with him, and diligently enquires of me, if I had observed any new Method of curing wounds made by Gunshot, and combustions occasioned by Gunpouder. Then I affirmed to him that Gunpouder did not participate any thing of poyson, for that none of these things whereof it is compounded are poysonous; which reason ought to free the whole composition from suspition of poyson. And that experience confirmed this reason, for I had seen many souldiers, who would drink a great quantity of this pouder with Wine, because they were perswaded, that this drink would free them from malign symptomes when they were wounded; yet I give no credit to this perswasion; and lastly, for that many without any harm, strew this pouder upon rebellious ulcers. For the Bullets, I affirm, that they cannot conceive such heat, as to become caustick. For if you shoot them out of a Gun against a hard stone, yet you may presently take them up without any harm in your hands, though by striking upon the stone, they should become more hot. For the combustions caused by Gunpouder, I observed no speciall nor peculiar remedy, which might make their cure different from other combustions. To which purpose I related this insuing history.

Gunpouder not poysonous.

Bullets shot out of a Gun do not burn.

A History.

One of the Marshall of *Montejan* his Kitchin boyes, fell by chance into a Caldron of Oil being even almost boyling hot; I being called to dress him, went to the next Apothecaries to fetch refrigerating medicines commonly used in this case: there was present by chance a certain old countrey woman, who hearing that I desired medicins for a burn, perswaded me at the first dressing, that I should lay two raw Onions beaten with a little salt; for so I should hinder the breaking out of blisters or pushules, as she had found by certain and frequent experience. Wherefore I thought good to try the force of her Medicine upon this greasie scullion. I the next day found those places of his body whereto the Onions lay, to be free from blisters, but the other parts which they had not touched, to be all blistered.

A medicine hindering blistring in burns, or scalds.

A History.

It fell out a while after, that a *German* of *Montejan* his guard had his flasque full of Gunpouder set on fire, whereby his hands and face were grievously burnt: I being called, laid the Onions beaten as I formerly told you, to the middle of his face, and to the rest I laid medicins usually applyed to burns. At the second dressing I observed the part dressed with the Onions quite free from blisters & excoriation, the other being troubled with both; wherby I gave credit to the Medicin. Besides also, I lastly told him this, that I had observed, that that was the readiest to draw forth Bullets shot into the body, which sets the Patient in the same posture and site, as he was when he received his hurt. Which things when I had told him, together with many other handled at large in this work, the good old man requested me to publish in print my opinions concerning these things, that so the erroneous and hurtfull opinion of *Vigo* might be taken out of mens minds. To whose earnest intreaty when I had assented, I first of all caused to be drawn and carved many Instruments fit to draw forth Bullets and other strange bodies; then a short while after I first published this work in the year of our Lord 1545. which when I found to be well liked and approved by many, I thought good to set it forth the second time somewhat amended in the year 1552. And the third time augmented in many particulars in the year 1564. For I having followed many Wars, and detained as Chirurgeon in besieged Cities, as *Metz* and *Hesdin*, had observed many things under five Kings, whom I served with diligence and content. I had learnt many things from most expert Chirurgeons, but more from all learned Physitians, whose familiarity and favour for that purpose I alwayes laboured to acquire with all diligence and honest Arts; that so I might become more learned and skilfull by their familiarity and discourse, if there was any thing especially in this matter and kind of wounds, which was hid from me, or whereof I was not well assured. Of which number I have known very few, who any thing seen in this kind of operation either by study, or experience in Wars, who have not thought that Wounds made by Gunshot ought to be dressed at the first with suppurative medicins, and not with scalding and Caustick oil. For this I affirm, which then also I testified to this good man, that I have found very many Wounds made in the fleshy parts by Gunshot, as easily cured as other Wounds, which be made by contusing things. But in the parts of the body where the bullet meets with bones and nervous particles, both because it tears and rends into small peeces those things which resist, not only where it touches, but further also, through the violence of the blow, therefore it causeth many and grievous symptomes, which are stubborn and difficult, and oft-times impossible to cure, especially in bodies replete with ill humors, in an ill constitution of the heaven and air, such as is hot, moist and foggy weather, which therefore is subject to putrefaction; & in like manner a freezing and cold season, which uses to mortifie the wounded parts not only of those that are hurt with Bullets, but in like sort with any other weapon; not only in bony and nervous particles, but also in musculous. Whereby you may understand, that the difficulty of curing proceeds not from the venenate quality of the Wounds; nor the combustion made by the Gunpouder, but the foulness of the Patients bodies, and the unseasonableness of the air.

Wounds made by Gunshot must be dressed with suppuratives.

The causes of difficulty in this cure.

A History.

For proof whereof, I will set down, that which I not long agone, observed in a Scottish Nobleman the Earl of *Gordon*, Lord of *Achindon*, whom I cured at the appointment of the Queen-Mother. He was shot through both his thighes with a Pistoll, the bone being not hurt nor touched; and yet the 32 day after the Wound he was perfectly healed, so that he had neither feaver nor any other symptom which came upon the Wound. Whereof there are worthy witnesses, the Archbishop of *Glasco*, the Scottish Embassadour, *Francis Brigart*, and *John Altine* Doctors of Physick, as also *James Guillemeau* the Kings Chirurgeon, and *Giles Buzet* a Scottish Chirurgeon, who all of them wondred that this Gentleman was so soon healed, no acrid medicin being applyed. This I have thought good to recite and set down, that the Readers may understand, that I for 30. years ago had found the way to cure Wounds made by Gunshot, with-

without ſcalding oil or any other, more acrid medicin; unleſs by accident the ilneſs of the Patients bodies and of the air cauſed any malign ſymptomes, which might require ſuch remedies beſides the regular and ordinary way of curing, which ſhall be more amply treated of in the following diſcourſe.

VVhat makes Chirurgeons ſometimes uſe cauſticks in curing wounds made by Gunſhot.

Another Diſcourſe of theſe things, which King Charles *the Ninth, returning from the expedition and taking of* Roven, *inquired of me concerning Wounds made by Gunſhot.*

FOr that it pleaſed your Majeſty one day, together with the Queen Mother, the Prince of the *Rock upon Ton*, and many other Noble men, and Gentlemen, to inquire of me, what was the cauſe that the far greater part of the Gentlemen and common Souldiers which were wounded with Guns, and other warlike Engines, all remedies uſed in vain, either dyed, or ſcarſe and that with much difficulty recovered of their hurts, though in appearance they were not very great, and though the Chirurgeons diligently performed all things requiſite in their Art: I have made bold to premiſe this Diſcourſe to that Tractate which I determin to publiſh concerning wounds made by Gunſhot; both to ſatisfie the deſires of the Princes and of many Gentlemen, as alſo the expectation they have of me, as being the Kings chief Chirurgeon, (which place being given me by *Henry* the Second, *Charles* the Ninth, a Son moſt worthy of ſuch a Father, had confirmed) neither make I any queſtion, but that many who too much inſiſt upon their own judgment, and not throughly conſider the things themſelves, will marvail, and think it far from reaſon; that I departing from the ſteps of my anceſtors, and diſſenting wholly from the formerly received opinions, am far from their Tenents, who lay the cauſe of the malignity of wounds made by Gunſhot, upon the poyſon brought into the body by the Gunpouder, or mixed with the bullets whilſt they are tempered or caſt. Yet for all this, if they will curteouſly and patiently weigh my reaſons, they ſhall either think as I do, or at leaſt ſhall judg this my indeavour and pains taken for the publike good, not to be condemned nor contemned. For I ſhall make it evident by moſt ſtrong reaſons drawn out of the writings of the Ancients both Philoſophers and Phyſicians, and alſo by certain experiments of my own, and other Chirurgeons, that the malignity and contumacy which we frequently meet withall in curing wounds made by Gunſhot, is not to be attributed either to the poyſon carryed into the body by the Gunpouder or Bullet, nor to burning imprinted in the wounded part by the Gunpouder. Wherefore to come to our purpoſe, that opinion muſt firſt be confuted, which accuſeth wounds made by Gunſhot of poyſon; and we muſt teach, that there is neither any venenate ſubſtance, nor quality in Gunpouder, neither if there ſhould be any, could it impoyſon the bodies of ſuch as are wounded. Which that we may the more eaſily perform, we muſt examin the compoſition of each pouder, and make a particular inquiry of each of the ſimples, whereof this compoſition conſiſts, what eſſence they have, what ſtrength and faculties; and laſtly, what effects they may produce. For thus by knowing the ſimples, the whole nature of the compoſition conſiſting of them, will be apparently manifeſt.

The occaſion of writing this diſcourſe.

The argument of this diſcourſe.

Gunpouder is not poyſonous.

The ſimples which enter the compoſition of Gunpouder are only three, Charcoals of Sallow or Willow, or of Hemp ſtalks, Brimſtone, and Salt-peter, and ſometimes a little *aqua vitæ*. You ſhall find each of theſe, if conſidered in particular, void of all poyſon and venenate quality. For firſt in the Charcoal you ſhall obſerve nothing but dryneſs, & a certain ſubtlety of ſubſtance, by means whereof it fires ſo ſodainly, even as Tinder. *Sulphur* or Brimſtone is hot and dry, but not in the higheſt degree, it is of an oily & viſcid ſubſtance, yet ſo that it doth not ſo ſpeedily catch fire as the coal, though it retain it longer being once kindled, neither may it be ſo ſpeedily extinguiſhed. Salt-peter is ſuch, that many uſe it for ſalt, whereby it is evidently apparent that the nature of ſuch ſimples is abolutely free from all poyſon, but chiefly the Brimſtone, (which notwithſtanding is more ſuſpected than the reſt.) For *Dioſcorides* gives Brimſtone to be drunk, or ſupped out of a rear Egg to ſuch as are Aſthmatick, troubled with the cough, ſpit up purulene matter, and are troubled with the yellow Jaundiſe. But *Galen* applyes it outwardly to ſuch as are bitten by venemous Beaſts, to ſcabs, teaters, & leproſies. For the *aqua vitæ*, it is of ſo tenuous a ſubſtance that it preſently vaniſheth into air, and alſo very many drink it, and it is without any harm uſed in frictions of the exteriour parts of the body. Whence you may gather, that this pouder is free from all manner of poyſon, ſeeing theſe things whereof it conſiſts and is compoſed, want all ſuſpition thereof. Therefore the *Germane* horſemen, when they are wounded with ſhot, fear not to drink off cheerfully half an ounce of Gunpouder diſſolved in Wine; hence perſwading themſelves freed from ſuch malign ſymptomes as uſually happen upon ſuch wounds; wherein whether they do right or wrong I do not here determin; the ſame thing many *French* ſouldiers forced by no neceſſity, but only to ſhew themſelves more courageous, alſo do without any harm; but divers with good ſucceſs uſe to ſtrew it upon ulcers, ſo to dry them. Now to come to theſe, who think that the venenate quality of wounds made by Gunſhot, ſprings not from the pouder, but from the bullet wherewith ſome poyſon hath been commixt or joyned, or which hath been tempered or ſteeped in ſome poyſonous liquor. This may ſufficiently ſerve for a reply; that the fire is abundantly powerfull to diſſipate all the ſtrength of the poyſon, if any ſhould be poured upon or added to the Bullet. This much confirms my opinion which every one knows, The Bullets which the Kings Souldiers uſed to ſhoot againſt the Townſmen in the ſiege of *Roven*, were free from all poyſon; and yet for all that they of the Town thought that thay were all poyſoned, when they found the Wounds made by them, to be uncurable and deadly. Now

Of what it is made.

Lib. 5. Cap. 73. Lib. 6. Simpl. Cap. 36.

Bullets cannot be poyſoned.

on

on the other ſide the Townſmen were falſly ſuſpected guilty of the ſame crime by the Kings Army, when as they perceived all the Chirucgrons labour in curing Wounds made by the Bullets ſhot from *Roven*, to be fruſtrated by their contumacy and malign nature; each ſide judging of the magnitude and malignity of the cauſe from the unhappy ſucceſs of the effect in curing. Even as amongſt Phyſitians according to *Hippocrates*, all diſeaſes are termed peſtilent, which ariſing from whatſoever common cauſe, kill many people; ſo alſo Wounds made by Gunſhot, may in ſome reſpect be called peſtilent, for that they are more refractory, and difficult to cure than others, and not becauſe they partake of any poyſonous quality, but by default of ſome common cauſe, as the ill complexions of the Patients, the infections of the air, & the corruption of meats and drinks. For by theſe cauſes wounds acquire an evil nature, and become leſs yeelding to medicins. Now we have by theſe reaſons convinced of error that opinion which held Wounds made by Gunſhot for poyſonous; let us now come to overthrow that which is held concerning their combuſtion.

As *Galen* notes *ad ſent.* 20. & 21. *ſect.* 3. *lib.* 3. *Epid.*

Wounds made by Gunſhot are not burnt.

Firſt, it can ſcarſe be underſtood how bullets which are commonly made of Lead, can attain to ſuch heat, but that they muſt be melted, and yet they are ſo far from melting, that being ſhot out of a Muſket they wil pierce through an armour and the whole body beſides, yet remain whole, or but a little diminiſht. Beſides alſo, if you ſhoot them againſt a ſtone wall, you may preſently take them up in your hand without any harm, and alſo without any manifeſt ſenſe of heat; though their heat by the ſtriking upon the ſtone ſhould be rather increaſed if they had any. Furthermore, a Bullet ſhot into a barrell of Gunpouder, would preſently ſet it all on fire, if the bullet ſhould acquire ſuch heat by the ſhooting, but it is not ſo. For if at any time the pouder be fired by ſuch an accident, we muſt not imagine that it is done by the bullet bringing fire with it, but by the ſtriking and colliſion thereof againſt ſome Iron, or ſtone that oppoſes or meets therewith, whence ſparks of fire proceeding as from a flint, the pouder is fired in a moment. The like opinion we have of thatched houſes, for they are not fired by the bullet which is ſhot, but rather by ſome other thing, as linnen rags, brown paper and the like, which rogues and wicked perſons faſten to their bullets. There is another thing which more confirms me in this opinion, which is; take a bullet of Waxe, and keep it from the fire, for otherwiſe it would melt, and ſhoot it againſt an inch board, and it will go through it; whereby you may underſtand that Bullets cannot become ſo hot by ſhooting, to burn like a cautery. But the Orifices (may ſome ſay) of ſuch Wounds are alwayes black. This indeed is true, but it is not from the effect of heat brought thither by the bullet, but the force of the contuſion. Now the contuſion is exceeding great, both becauſe the bullet is round, and enters the body with incredible violence. Of which thoſe that are wounded will give you ſufficient teſtimony, for there is none of them, which thinks not preſently upon the blow, that as it were ſome poſt, or thing of the like weight, falls upon the affected member, whence great pain and ſtupidity poſſeſs the part, whereby the native heat and ſpirits are ſo much diſſipated, that a Gangrene may follow. But for the Eſchar which they affirm is made by the blow, and falls away afterwards, they are much miſtaken. For certain particles of the membranes and fleſh contuſed and torn by the violence of the bullet beguiles them; which preſently putrefying are ſevered from the ſound parts by the power of nature and the ſeparating heat, which thing uſually happens in all great Contuſions. But for all that theſe ſo many and weighty reaſons may free the Pouder from all ſuſpition of Poiſon, and the bullet from all thought of burning; yet there are many who inſiſting upon Philoſophicall arguments raiſe new ſtirs. For (ſay they) the diſcharging a peice of Ordinance is abſolutely like Thunder and Lightning, which the rent and torn clouds caſt from the middle region upon the earth; wherefore the Iron bullet which is ſhot out of the Cannon muſt needs have a venenate and burning faculty. I am not ignorant that Lightning generated of a groſs and viſcous exhalation, breaking the cloud wherewith it is incompaſſed, never fals upon the earth, but brings fire with it, one while more ſubtile, another while more groſs, according to the various condition of the matter whence the exhalation hath ariſen. For *Seneca* writes that there are three ſeverall kinds of Lightning differing in burning, condition and plenty. One of them penetrates or rather perforates by the tenuity of the matter of the object which it touches. The other with a violent impetuoſity breaks in ſunder and diſſipates the objects, by reaſon it hath a more denſe, compact & forcible matter, like as Whirlwinds have. The third, for that it conſiſts of a more terreſtriall matter, burns what it touches, leaving behind it the impreſſion of the burning. Alſo I know that Lightning is of a peſtilent & ſtinking nature, occaſioned by the groſneſs and viſcidity of the matter whereof it is; which matter taking fire ſends forth ſo lothſome & odious a ſmel, that the very wild beaſts cannot indure it, but leave their Dens, if they chance to be touched with ſuch a lightning. Beſides alſo we have read in the Northern hiſtory of *Olaus Magnus*, that in ſome places after a Lightning, you ſhall find a whole Plain ſpread over with Brimſtone, which Brimſtone notwithſtanding is extinguiſhed, unprofitable, and of no efficacy. But grant theſe things be thus, yet muſt we not therefore conclude, that the Bullets of the great Ordnance carry poyſon and fire with them into the wounds. For though there be many things like in Lightning and diſcharging great Ordnance, yet they have no ſimilitude either in matter or ſubſtance, but only in effects, whereby they ſhake, break in ſunder and diſperſe the bodies which withſtand them; For lightning and thunder do it by means of fire, & oft-times of a ſtone generated in them, which is therefore tearmed, a thunderbolt; but Ordnance by the Bullet carried by the force of the air, more violently driving and forcing it forwards. Neither if any ſhould by more powerfull arguments force me to yeeld that the matter of the lightning and ſhooting of Ordnance are alike, yet will I not therefore be forced to confeſs that Wounds made by Gunſhot are combuſt. For according to *Pliny*, there are ſome lightnings which conſiſting of a moſt dry matter, do ſhattter in ſunder all that withſtands them, but do not burn at all; others which are of ſomewhat a more humid nature, burn no more than the former, but only black ſuch things as they touch. Laſtly, otherſome of a more ſubtile and tenuous matter, whoſe nature (as *Seneca* ſaith) we muſt not doubt to be divine, if but for this reaſon, that they will melt gold & ſilver, not harming the purſe; a ſword, not hurting

The reaſon why wounds made by Gunſhot look black.

The reaſons of our adverſaries refelled. *Quæſt. nat. lib.* 2. *cap.* 49.

The ſtinking ſmell of Lightning.

Lib. 2. *cap.* 51. The wonderfull nature of ſome lightning.

ing the purse; a sword, not hurting the scabbard; the head of a Lance, not burning the wood, and shed wine not breaking the vessell. According to which decree I can grant, that these Lightnings which break in sunder, melt and dissipate, and performe other effects so full of admiration, are like in substance to the shot of great Ordnance; but not these which carry with them fire and flame.

In proofe whereof there comes into my mind the history of a certain Souldier, out of whose thigh I remember I drew forth a Bullet wrapped in the taffety of his breeches, which had not any sign of tearing or burning. Besides, I have seen many who not wounded, nor so much as touched, yet notwithstanding have with the very report and wind of a Cannon bullet, sliding close by their ears, faln down for dead, so that their members becomming livid and black, they have dyed by a Gangrene ensuing thereupon. These and such effects are like the effects of Lightnings which we lately mentioned, and yet they bear no sign nor mark of poison. From whence I dare now boldly conclude, that Wounds made by Gunshot are neither poisoned, nor burnt. But seeing the danger of such Wounds in these last civill wars hath been so great, universall and deadly to so many worthy personages and valiant men, what then may have been the cause thereof, if it were neither combustion, nor the venenate quality of the Wound? This must we therefore now insist upon and somewhat hardily explain. Those who have spent all their time in the learning and searching out the mysteries of Naturall Philosophy, would have all men think and beleeve, that the foure Elements have such mutuall sympathy, that they may be changed each into other; so that they not only undergoe the alterations of the first qualities which are heat, coldnesse, drynesse and moisture, but also the mutation of their proper substances by rarefaction and condensation. For thus the fire is frequently changed into air, the air into water, the water into air, and the water into earth; and on the contrary, the earth into water, the water into air, the air into fire; because these 4. first bodies have in their common matter enjoyed the contrary and fighting, yet first and principall qualities of all.

A History.

Why the wounds made by Gunshot some few years agone were so deadly.

The cause of the transmutation of the Elements.

Whereof we have an example in the * Ball-bellowes brought out of Germany, which are made of brasse, hollow and round; and have a very small hole in them, whereby the water is put in, and so put to the fire; the water by the action thereof is rarified into air, and so they send forth wind with a great noise, and blow strongly as soon as they grow throughly hot. You may try the same with Chesnuts, which cast whole and undivided into the fire, presently fly asunder with a great crack; because the watry and innate humidity turned into wind by the force of the fire, forcibly breaks his passage forth. For the air or wind raised from the water by rarifaction, requires a larger place, neither can it now be contained in the narrow filmes, or skins of the Chesnut, wherein it was formerly kept. Just after the same manner Gunpouder being fiered, turnes into a far greater proportion of air, according to the truth of that Philosophicall proposition, which saith, Of one part of earth, there are made ten of water; of one of water, ten of air; and of one of air are made ten of fire. Now this fire not possible to be pent in the narrow space of the place, wherein the pouder was formerly contained, endeavours to force its passage with violence, and so casts forth the Bullet lying in the way, yet so that it presently vanishes into air, and doth not accompany the Bullet to the mark, or object, which it batters, spoiles and breaks asunder. Yet the Bullet may drive the obvious air with such violence, that men are often sooner touched therewith than with the bullet, and dye by having their bones shattered and broken without any hurt on the flesh which covers them; which as we formerly noted, it hath common with Lightning. We find the like in Mines, when the pouder is once fiered, it removes & shakes even mountains of earth.

* These bellowes here mentioned by the Author, are Bals made of Brasse in form of a pear, with a very smal hole in their lesser ends: when you would fill them with water you must heat them very hot, and so the air which is contained in them wil be exceedingly rarified, which by putting them presently into water will be condensate as much, and so wil draw in the water to supply the place, *ne detur vacuum*. Then put them into the fire, & it again rarifying the water into air will make them yeeld a strong, continued and forcible blast. The cause of the report and blow of a Cannon.

In the year of our Lord 1562. a quantity of this pouder which was not very great taking fire by accident in the Arcenall of Paris, caused such a tempest, that the whole City shooke therewith, but it quite overturned divers of the neighbouring houses, and shook off the tyles and broke the windowes of those which were further off; & to conclude, like a storme of Lightning it laid many here and there for dead, some lost their sight, others their hearing, and others some had their limbs torn asunder as if they had been rent with wild horses; and all this was done by the only agitation of the air into which the fired Gunpouder was turned; but after the same manner as windes pent up in hollow places of the earth which want vents. For in seeking passage forth, they vehemently shake the sides of the Earth, and raging with a great noise about the cavities, they make all the surface thereof to tremble; so that by the various agitation one while up, another down, it overturnes or carries it to another place. For thus we have read that *Megara* and *Ægina* anciently most famous Cities of Greece were swallowed up and quite overturned by an earthquake; I omit the great blusterings of the windes striving in the cavities of the earth, which represent to such as heare them at some distance, the fierce assailing of Cities, the bellowing of Bullets, the horrid roarings of Lions, neither are they much unlike to the roaring reports of Cannons. These things being thus premised let us come to the thing we have in hand. Amongst things necessary for life, there is none causes greater changes in us than the air; which is continually drawn into the Bowells appointed by nature, and whether we sleep, wake, or what else soever we do, we continuall draw in, and breath it out. Through which occasion *Hippocrates* calls it Divine, for that breathing through this mundane Orbe, it embraces, nourishes, defends and keeps in quiet peace all things contained therein, friendly conspiring with the stars from whom a divine vertue is infused therein. For the air diversly changed and affected by the stars, doth in like manner produce various changes in these lower mundane bodies. And hence it is that Philosophers and Physitians do so seriously wish us to behold and consider the culture and habit of places, and constitution of the air, when they treat of preserving of health, or curing diseases. For in these the great power and dominion of the air is very apparent, as you may gather by the foure seasons of the year; for in summer the air being hot and dry, heats and dryes our bodies; but in winter it produceth in us the effects of winters qualities, that is, of cold and moisture; yet by such order and providence of nature, that although according to the varieties of seasons our bodies may be variously altered, yet shall they receive no detriment

A History. The cause of an Earthquake.

How the air becomes hurtfull.

triment thereby, if ſo be that the ſeaſons retain their ſeaſonableneſs; from whence if they happen to digreſs, they raiſe and ſtir up great perturbations both in our bodies and minds; whoſe malice we can ſcarſe ſhun, becauſe they encompaſs us on every hand, and by the law of nature enter together with the air into the ſecret cabinets of our bodies both by occult and manifeſt paſſages. For who is he, that doth not by experience find both for the commodity and diſcommodity of his health, the various effects of winds, (wherewith the air is commixt) according as they blow from this or that Region, or quarter of the world. Wherefore ſeeing that the South wind is hot and moiſt; the North wind cold and dry; the East wind clear and freſh; the Weſt wind cloudy; it is no doubt but that the air which we draw in by inſpiration carries together therewith into the bowells the qualities of that wind which is then prevalent. When we read in *Hippocrates*, that changes of times, whether they happen by different winds, or viciſſitude of ſeaſons, chiefly bring diſeaſes; For northerly winds do condenſe, and ſtrengthen our bodies, and make them active, well coloured and daring, by reſuſcitating and vigorating the native heat. But ſouthern winds reſolve and moiſten our bodies, make us heavy headed, dull the hearing, cauſe giddineſs, and make the eyes and body leſs agile; as the Inhabitants of *Narbon* find to their great harme, who are otherwiſe ranked among the moſt active people of France. But if we would make a compariſon of the ſeaſons and conſtitutions of a year, by *Hippocrates* decree, Droughts are more wholeſome and leſs deadly than Rains; I judg for that too much humidity is the mother of putrefaction, as you learn by theſe countries which are blown upon by a wind from Sea. For in theſe fleſh which is kept for food, putrefies in the ſpace of an houre; and ſuch ulcers as in other places are eaſily and quickly healed, do there by the conflux and collection of matter become inveterate & contumacious. Therefore as when the ſeaſons of the year ſucceſſively fall out agreeable to their nature, & when each ſeaſon is ſeaſonable, then either we are not ſick at all, or aſſuredly with leſs danger. So on the contrary the perfect conſtitution and health of our bodies becomes worſe and decaies, when the ſeaſons of the year are depraved and perverted in time and temper. Now ſeeing that theſe many years the four ſeaſons of the year have wanted their ſeaſonableneſs, the ſummer wanting his uſuall heat, and the winter its cold, and all things by moiſture and the dominion of the ſouthern winds have been humid and languid, I think there is none ſo ignorant in naturall Philoſophy and aſtrology, who will not think that the cauſes of the malignitie and contumacy of thoſe diſeaſes which have ſo long afflicted all France, are not to be attributed to the air and Heavens. For otherwiſe, whence have ſo many peſtilent and contagious diſeaſes tyrannized over ſo many people of every age, ſex and condition? whence have ſo many catarrhes, coughs and heavineſſes of the head, ſo many pluriſies, tumors, ſmall poxes, meazells, and itches not admitting of digeſtion and remedies preſcribed by Art? Whence have we had ſo many venemous creatures, as Toads, Graſhoppers, Caterpillars, Spiders, Waſpes, Hornets, Beetles, Snailes, Vipers, Snakes, Lizards, Scorpions and Eſts or Nutes, unleſs from exceſſive putrefaction which the humidity of the air, our native heat being liquid and dull, hath cauſed in us, and the whole kingdome of France? Hence alſo proceeds the infirmity of our native heat, and the corruption of the blood and humors whereof we conſiſt, which the rainy Southwind hath cauſed with its ſultry heat. Wherefore in theſe laſt years I have drawn little blood, which hath not preſently ſhewed the corruption of its ſubſtance by the black or greeniſh colour, as I have diligently obſerved in all ſuch as I have bled by the direction of Phyſitians, either for prevention of future, or cure of preſent diſeaſes. Whence it comes to paſſe that the fleſhy ſubſtance of our bodies could not but be faulty both in temper and conſiſtence; ſeeing that the blood whence it is generated had drawn the ſeeds of corruption from the defiled air. Whence it fell out, that the Wounds which happend with loſſe of ſubſtance could be ſcarſe healed or united, becauſe of the depraved nature of the blood. For ſo the Wounds and ulcers of theſe which are troubled with the Dropſie, whoſe blood is more cold or wholly wateriſh; ſo of Leprous perſons, whoſe blood is corrupt, and laſtly of all ſuch as have their bodies replete with ill juice, or elſe are Cachectick, will not eaſily admit of cure. Yea aſſuredly if but the very part which is hurt ſwerve from its native temper, the Wound will not eaſily be cured. Therefore ſeeing all theſe things, both the putrefaction of the Air, and depraved humors of the body, and alſo the diſtemper of the affected parts conſpired together to the deſtruction of the wounded, what marvail was it, if in theſe late civill warres, the Wounds which were for their quantitie ſmall, for the condition of the wounded parts but little, have cauſed ſo many and grievous accidents and laſtly death it ſelf? Eſpecially, ſeeing that the Air which encompaſſeth us, tainted with putrefaction corrupts and defiles the Wounds by inſpiration and expiration, the body and humors being already diſpoſed, or inclined to putrefaction. Now there came ſuch a ſtink, which is a moſt aſſured ſign of putrefaction, from theſe Wounds, when they were dreſſed, that ſuch as ſtood by could ſcarſe endure it, neither could this ſtink be attributed to the want of dreſſing, or fault of the Chirurgeon; for the Wounds of the Princes and Nobility ſtunk as ill as theſe of the common Souldiers. And the corruption was ſuch, that if any chanced to be undreſt for one day, which ſometimes happened amongſt ſuch a multitude of wounded perſons, the next day the Wound would be full of wormes. Beſides alſo, which furthermore argues a great putrefaction of humors, many had abſceſſes in parts oppoſite to their Wounds, as in the left knee, when as the right ſhoulder was wounded; in the left arm, when as the right leg was hurt. Which I remember befell the King of *Navarre*, the Duke of *Nevers*, the Lord *Rendan* and divers others. For all men had nature ſo overcharged with abundance of vicious humors, that if it expelled not part thereof by impoſtumes to the habit of the body, it certainly otherwiſe diſpoſed of it amongſt the inner parts of the body; for in diſſecting dead bodies, we obſerved that the Spleen, Liver, Lungs, and other Bowells were purulent, and hence it was that the patients by reaſon of vapours ſent from them to the heart were troubled with continuall feavers. But the Liver and all the veinous parts being polluted, & ſo the generation of the laudable blood hindred, they languiſhed for want of fitting nouriſhment. But when the Brain by vapours was drawn in to ſympathize with the reſt,

Aphor. 17. *ſect.* 3.

Fleſh quickly putrefies in maritime places.

In what bodies ulcers and wounds are not eaſily cured.

An argument of great putrefaction of the humors.

reſt, they were moleſted with Ravenings and Convulſions. Wherefore if any thing ſucceeded unproſperouſly in ſo great malignancy of wounds, the Chirurgeon was not to be blamed, for that it were a crime to fight againſt God and the Air, wherein the hidden ſcourges of the divine juſtice lye hid. Therefore if according to the mind of the great *Hippocrates*, who commands to bring all contuſed Wounds to ſuppuration, that ſo they may be healed, we indeavoured to cure with ſuch medicins Wounds made with Gunſhot, and therefore contuſed; who can rightly be angry with us, if we performed it not ſo well, by reaſon of theſe putrefactions, gangrenes, and mortifications which proceeded from the corrupt Air, for all that we uſed not only ſuppuratives, but were oft-times forced to uſe other medicins; ſo long turning aſide from the cure of the diſeaſe, untill we had orecome the ſymptomes which much indanger the Patient, and cuſtomarily happen upon ſuch Wounds, as alſo upon thoſe which are made with a ſword or any other kind of weapon; as ſhall plainly appear in the following treatiſe, to which it now ſeems high time that we betake our ſelves.

All contuſed wounds muſt be brought to ſuppuration

CHAP. I. *A diviſion of wounds drawn from the variety of the wounded parts, and the Bullets which wound.*

ALl Wounds which are made in mans body by Gunſhot, whether ſimple or compound, are accompanied with contuſion, dilaceration, diſtemper and ſwelling. I ſay, all theſe poſſeſs either the noble parts, or ignoble, the fleſhy, nervous or bony, ſome whiles with rending and tearing aſunder the larger veſſells, ſometimes without harming them. Now theſe Wounds are only ſuperficiary, or elſe pierce deep and paſs quite through the body. But there is alſo another diviſion of theſe Wounds taken from the variety of the Bullets wherewith they are made. For ſome Bullets are bigger, ſome leſs, ſome between both, they are uſually made of lead, yet ſometimes of ſteel, iron, braſs, tin, ſcarſe any of Silver, much leſs of Gold. There ariſes no difference from their figure; for almoſt all kinds of Wounds of this nature are round. From theſe differences, the Chirurgeon muſt take his Indications what to do, and what medicins to apply. The firſt care muſt be, that he think not theſe horrid and malign ſymptoms, which uſually happen upon theſe kinds of Wounds, to ariſe from combuſtion, or poyſon carried with the Bullet into the wounded part, and that for theſe reaſons we have formerly handled at large. But rather let him judg they proceed from the vehemency of the contuſion, dilaceration and fracture, cauſed by the Bullets too violent entry into the nervous and bony bodies. For if at any time the Bullet ſhall only light upon the fleſhy parts, the Wounds will be as eaſily cured, as any other Wound uſually is, which is made with a contuſing and round kind of weapon, as I have often found by frequent experience, whilſt I have followed the wars, and performed the part of a Chirurgeon to many Noblemen and common Souldiers, according to the counſell of ſuch Phyſitians as were there overſeers of the cure.

A diviſion of wounds from the variety of the wounded parts. From the difference of Bullets. Wounds made by Gunſhot are uſually round.

CHAP. II. *Of the ſigns of Wounds made by Gunſhot.*

WOunds made by Gunſhot are known by their figure, which is uſually round; by their colour, as when the native colour of the part decayes, and in ſtead thereof a livid, greeniſh, violet or other colour ſucceeds; by the feeling or ſenſe of the ſtroke, when in the very inſtant of the receiving thereof, he feels a heavy ſenſe as if ſome great ſtone, or piece of timber, or ſome ſuch other weighty thing had fal'n upon it; by the ſmall quantity of bloud which iſſues out thereat, for when the parts are contuſed, within ſome ſmall while after the ſtroak they ſwell up, ſo that they will ſcarſe admit a Tent, whence it is that the blood is ſtopped, which otherwiſe would flow forth of the orifice of the Wound; by heat, which happens either by the violentneſs of the motion, or the vehement impulſion of the air, or the attrition of the contuſed parts, as the fleſh and nerves. Alſo you may conjecture that the Wounds have been made by Gunſhot, if the bones ſhall be broken, and the ſplinters thereof by pricking the neighbouring bodies cauſe defluxion and inflammation. But the cauſe that the Bullet makes ſo great a contuſion is, for that it enters the body not with any points or corners, but with its round and ſpherical body, which cannot penetrate but with mighty force; whence it cometh to paſs that the wound looks black, & the adjacent parts livid: hence alſo proceed ſo many grievous ſymptoms, as pain, Defluxion, Inflammation, Apoſtumation, Convulſion, Phrenſie, Palſie, Gangrene and mortification, whence laſtly death enſues. Now the Wounds do often caſt forth virulent and very much ſtinking filth, by reaſon of the great contuſion, and the rending and tearing of the neighbouring particles. A great abundance of humors flow from the whole body, and fall down upon the affected parts, which the native heat thereof being diminiſhed, forſakes, and preſently an unnaturall heat ſeiſes upon it. Hither alſo tend an univerſall or particular repletion of ill humors, chiefly if the Wounds poſſeſs the nervous parts as the joints. Verily neither a Stag with his horn, nor a flint out of a ſling can give ſo great a blow, or make ſo large a Wound, as a Leaden or Iron Bullet ſhot out of a Gun, as that which going with mighty violence, pierces the body like a Thunderbolt.

Signs of wounds from their figure. From their colour. From the feeling the blow. From the bleeding. From the heat of the wound. Whence theſe wounds are ſo much contuſed.

CHAP. III. *How theſe Wounds muſt be ordered at the firſt dreſſing.*

THe Wound muſt forthwith be inlarged, unleſs the condition of the part reſiſt, that ſo there may be free paſſage forth both for the *Sanies*, or matter, as alſo for ſuch things as are farced, or otherwiſe contained therein; ſuch as are pieces of their cloaths, bombaſt, linnen, paper, pieces of Mail or Armour, Bullets, Hail-ſhot, ſplinters of bones, bruiſed fleſh and the like, all which muſt be plucked forth with as much celerity and gentleneſs as may be. For preſently after the receiving of the Wound the pain and inflammation are not ſo great, as they will be within a ſhort time after. This is the principall thing in performance of this work, that you place the Patient juſt in ſuch a poſture as he was in at the receiving of the Wound; for otherwiſe the various motion and turning

Strange bodies muſt firſt be pulled forth.

The manner how to draw them forth.

ing of the Muscles will either hinder or straiten the passage forth of the contained bodies. You shall if it be possible, search for these bodies with your finger, that so you may the more certainly and exactly perceive them. Yet if the bullet be entred somewhat deep in, then you shall search for it with a round and blunt probe, lest you put the Patient to pain; yet oftentimes you shall scarce by this means find the Bullet. As it happened to the Marshall of *Brissac* in the siege of *Parpignan*, who was wounded in his right shoulder with a Bullet, which the Chirurgeons thought to have entered into the capacity of his body. But I, wishing the Patient to stand just in the same manner as he did when he received the Wound, found at length the place where the Bullet lay, by gently pressing with my fingers, the parts near the Wound, and the rest which I suspected; as also by the swelling, hardness, pain and blackness of the part, which was in the lower part of the shoulder near unto the eight or ninth spondill of the back. Wherefore the Bullet being taken forth by making incision in the place, the Wound was quickly healed, and the Gentleman recovered. You shall observe this, and rather beleeve the judgment of your fingers, than of your Probe.

CHAP. IIII. *A description of fit Instruments to draw forth Bullets and other strange bodies.*

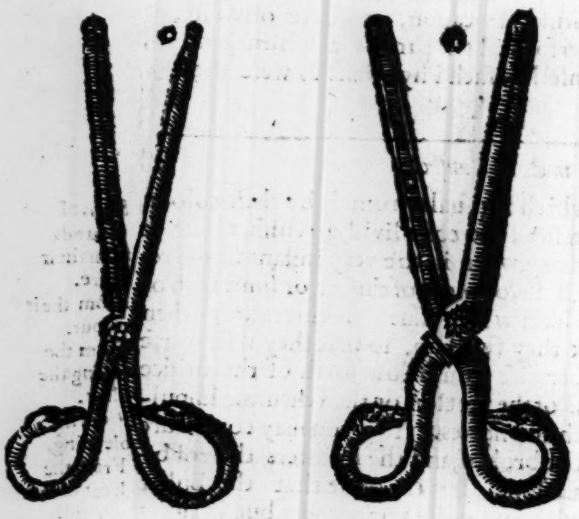
BOth the magnitude and figure of Instruments fit for drawing forth of Bullets and other strange bodies, are various according to the diversity of the incident occasions. For some are toothed, others smooth, others of another figure and bigness; of all which sorts the Chirurgeon must have divers in a readiness, that he may fit them to the bodies and Wound, and not the Wounds and bodies to his Instruments.

The Delineation of such like Instruments.

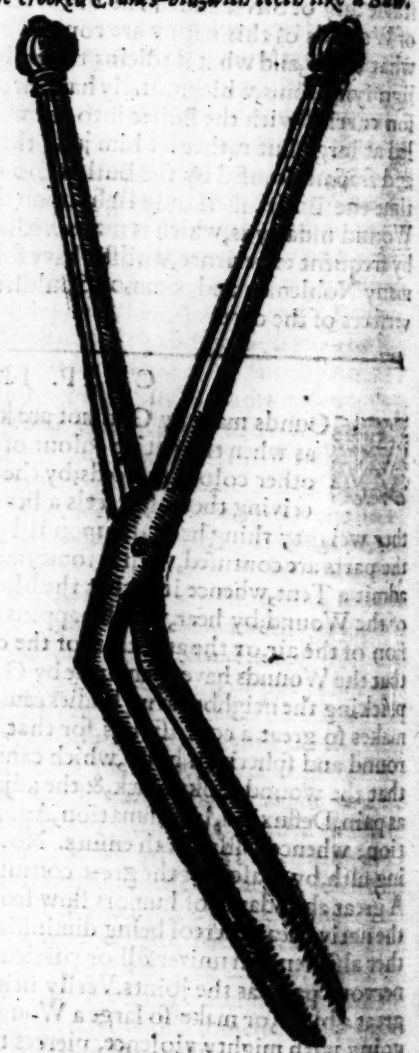
The straight Cranes-bill being also toothed, fit for drawing forth hail-shot, pieces of armour, splinters of bones, and such things as lye deep within.

The Ducks-bill.

The crooked Cranes-bill, with teeth like a Saw.

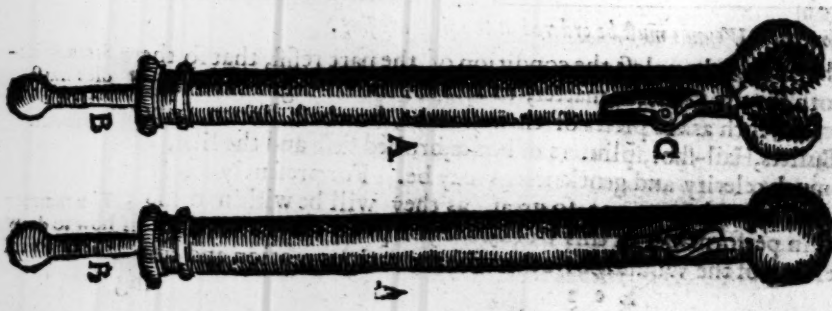


This Ducks-bill hath a large round and toothed cavity in the end, for so it more easily taketh hold of the Bullet when it lies amongst much Flesh.



A toothed Crowes-Bill.

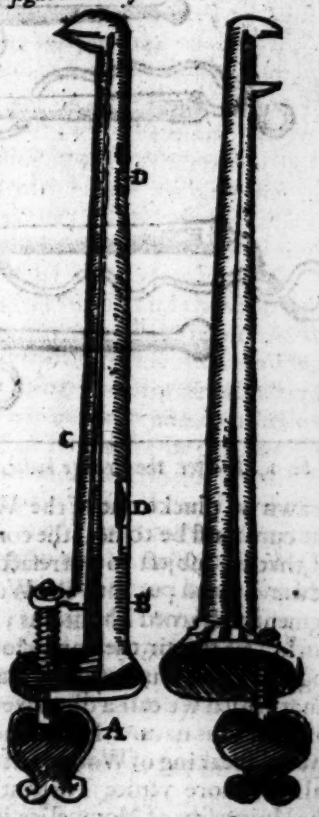
Another Instrument fit for drawing forth of Bullets, which may be tearmed a Catch-Bullet.



A. *Shews the Trunk.*
B. *Shews the rod, or string which opens and shuts the joint.*
C. *The joint.*

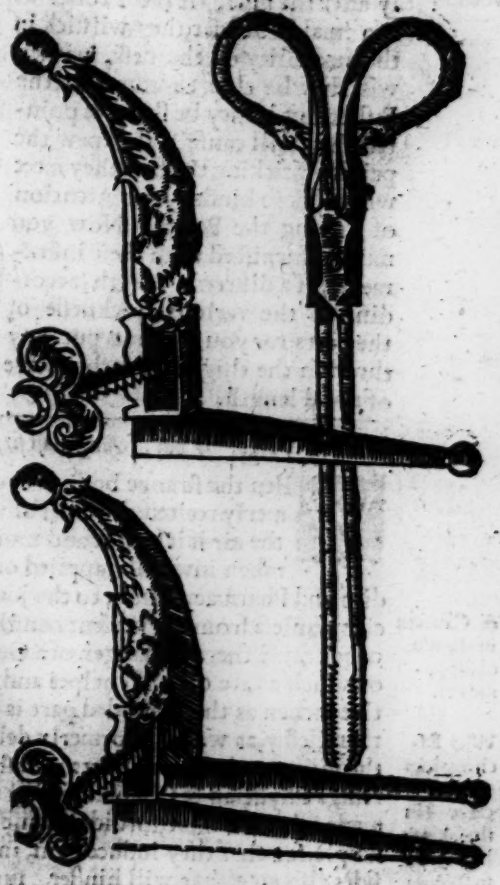
Another Catch-Bullet called a Lizards-nose, made for drawing out of bullets which are somewhat flatted, by striking upon a bone.

The Parrots-beak is made for drawing forth pieces of mail thrust into the flesh, or bones; and this is the figure thereof.



A. Shews the screw pin. B. The hollowed part which receives the round part noted with. C. Which is opened and and shut by the screw. D. D. Falls, or steyes, which govern the running branch.

The Swans bill opens with a screw, you may with this dilate the Wounds, and so put in a straight Cranes-bill, or pincers to pluck forth strange bodies. The figure of both are here expresst.

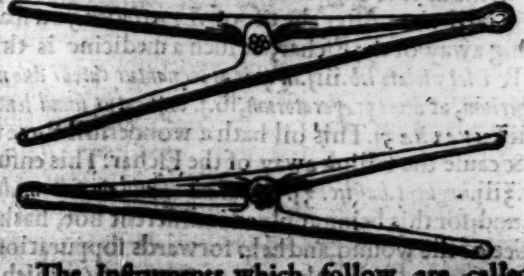


But if these strange bodies, especially bullets and hail-shot, be not too deep in the Wound, they may be taken forth with your Levatory, or else by the help of these Gimblets. These Gimblets are screwed into their pipes, or canes, and enter with their screwed points into the Bullets, if that they be of Lead or Tin, and of no harder metall; and so being fastened in them, bring them out with them.

The figure of the Gimblet with his pipe or cane.

Besides the Swans-bill which we lately mentioned, there are also other instruments fit to dilate and open the Wounds, therefore called Dilaters, by whose help the Wound may be held open, that so the hidden bodies may be seen; for when you press together the two ends of this Instrument, the other two open and dilate themselves. You may also use them in dilating divers other parts of the body, as the Nostrils, Fundament, and such like.

Dilaters.

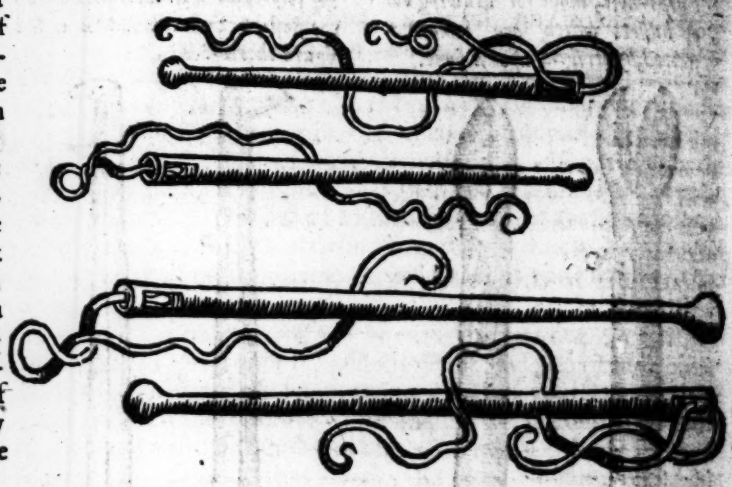


The Instruments which follow are called Seton needles, or Probes; whose use is, to draw through a fannula, so to keep the Wound open, that you may the better take forth any strange body. Besides also we use the same needles to search, or as it were to sound the deepness of the Wounds, and to find out the Bullets. For they cannot put one to much pain because they have smooth and round ends. So also all Probes wherewith we search

What probes fit to search the se wounds,

search for Bullets, must have somewhat large, smooth and round ends. For seeing that the verges of the Wound meet together presently after the hurt, if the Probes be too smal or slender, they will slick in the inequality of the flesh, neither will they be able to come to the Bullet. But if they be sharp & pointed, they will cause and renew the pain by pricking the flesh they meet withall, & so hinder your intention of finding the Bullet; Now you must be furnished with these instruments of a different length, according to the various thickness of the parts; for you cannot put any through the thigh but such as are of good length.

Probes for to put flamulaes through a Wound withall.



CHAP. IX. *What dressing must first be used, after the strange bodies are pluckt or drawn out of the Wound.*

WHen the strange bodies are drawn or pluckt out of the Wound, by these means we have formerly recited, the chief of the cure must be to heal the contusion, and amend the distemper of the air if it be hot and moist, that is, subject to putrefaction. This shall be done by medicins taken inwardly, applied outwardly, and put into the Wound. Things to be inwardly used in diet and Pharmacy I leave to the judgment of learned Physitians; for the particular and topick medicins, (unless from the present constitution of the air, the condition of the wounded part, or from some other cause there be danger of a Gangrene) you must use suppuratives, as you usually do in contusions; such as are oil of Whelpes and that which we call a digestive; you must chiefly forbear suppuratives, when as the wounded part is of a nervous nature. For all nervous parts require dryer medicins than fleshy, as we have formerly delivered speaking of Wounds of the joints; wherefore in Wounds of the joints and nervous parts you shall use more venice Turpentine than oil. *Laurentius Iobertus* the Kings Physitian & Chancellour of the University of Mompelier, in a treatise which he writ of Wounds made with Gunshot, forbids the use of Escharoticks both actuall and potentiall, in these Wounds, if simple; for that they induce pain, inflammation, a feaver, Gangrene and other deadly symptomes. Besides also an eschar will hinder suppuration, which is to be defired in this kind of Wounds, that so the contused flesh may be severed from the sound, lest it be drawn to putrefaction by contagion. Which easily happens when an Eschar is drawn, as a bar over it, for then the excrementitious humor remains longer in the part, and the putredinous vapours hindred from passing forth, are encreased, and carryed from the lesser vessels to the bigger, and so over all the body. Wherefore, when you suspect putrefaction, letting alone suppuratives, use in the first place such things as resist putrefaction, as this following ointment. ℞ *pulver. alumin. rochæ, viridis æris, vitrioli romani, mellis tosat. an.* ℥ij. *aceti boni quantum sufficit, bulliant omnia simul secundum artem, & fiat medicamentum ad formam mellis.* This by reason of the heat and subtlety of the substance, hath a faculty to induce and attenuate the humors, as also to call forth the native heat drawn in & dissipated by the violent and forcible entrance of the Bullet into the body; furthermore also it corrects the venemous contagion of the virulent humor. Now this medicine shall be used, dissolved in Venegar or *aqua vitæ*, and be put into the Wound with tents, or pledgets. The tents which shall be used at the first dressing must be somewhat long and thick, that by dilating the Wound, they may make way for application of other remedies; otherwise you may make injection with a syringe, that so it may penetrate the more powerfully. But this described *Ægyptiacum* shal be tempered according to the condition of the affected parts, for the nervous parts will be offended with it as being too acrid; but it may be qualified by admixture of oil of Turpentine & Saint Iohn-wort. Also we may well be without this *Ægyptiacum* when there is no such pestilent constitution of the air, as was seen in the late Civill wars. After the use of *Ægyptiacum* you shall with emollient & lenitive medicins procure the falling away of the Eschar, & such a medicine is this following oil, being somewhat more than warm. ℞ *Olei violati lib.* iiij. *in quibus coquantur catelli duo nuper nati, usque ad dissolutionem ossium, addendo vermium terrestrium, ut decet præparatorum,* ℔ j. *coquantur simul lento igne, deinde fiat expressio ad siccum, addendo terebinth. venet.* ℥iij. *aquæ vitæ* ℥j. This oil hath a wonderfull force to assuage pain, to bring the Wound to suppuration, & cause the falling away of the Eschar. This ensuing oil is made more easily. ℞ *olei seminis lini, & lilior. an.* ℥iij. *unguent. basilic.* ℥j. *liquefiant simul & fiat medicamentum*; put of this a sufficient quantity into the Wound; for this being applyed indifferent hot, hath power to assuage Pain, to soften and digest the orifice of the wound, and help forwards suppuration, which is the true manner of curing these kind of Wounds, according to the rule of *Hippocrates*, which wishes every contused wound to be presently brought to suppuration, for so it will be lesse subject to a Phlegmon; and besides, all the rent & bruised flesh must putrefie, dissolve and turn to quitture, that new and good flesh may be generated in stead thereof. *Laurentius Iaubertus* much commends this following medicine, of whose efficacy, as yet, I have made no triall. ℞ *pulver. mercur. bis calcinati,* ℥j. *adipis porci recentis, vel butyri recentis,* ℥viij. *Camphoræ in aqua vitæ dissolutæ,* ℥ij. *misce omnia simul, addendo tantillum olei liliorum, aut lini.* Experience taught him, and reason also shewes, that this kind of remedy is very commendable; for the powder of Mercury, if mixed with

A Caution in the use of suppuratives,

Why Escharoticks must be eschewed in these kinds, if they be simple.

Howan Eschar may cause putrefaction.

The faculties of the powder of Mercury.

a grosse and humecting matter, doth in a short space turn the bruised flesh into *pus*, without causing any great pain. For the Camphire, whether it be hot or cold, in temper, it much conduces to that purpose, by reason of the subtlety of the parts, whereof it consists. For by means of this quality the medicines enter with more facility into the affected bodies, and perform their parts; besides also Camphire resists putrefaction. Some drop into the Wound *aqua vitæ*, wherein they have dissolved some calcined vitriol. Which kind of remedy is not suppurative, but yet much resists putrefaction, so that we may use it with good success, when the weather is hot, moist, and foggie. But when the Wound is made very neer at hand, it cannot but be burnt by the flame of the powder; in which remedies used for burns, will be usefull, not omiting such as are fit for contusions. But for these parts which lye next the Wound, you shall not, unless at the first dressing, apply refrigerating and astringent things, but rather emollient and suppurative. For those things which have a refrigerating faculty, weaken the part, and hinder suppuration. For astringents constipate the skin, which is the cause, that the putrid vapours shut up and hindred from transpiration and passage forth, a gangrene and mortification easily seise upon the part. But if the contusion be great and diffuse it self more largely over the flesh, the part must be much scarified; that so the contused and concreat blood, and therefore subject to putrefaction, may be evacuated. But for these parts, which somewhat further distant from the Wound encompasse the contused flesh, they require refrigerating and strengthening medicins, so to hinder the falling down and setling of the humor in that part which is this ensuing medicine. ℞ *pul. boli. armen. sanguin. Dracon. Myrrhæ, an.* ℥j. *succi solan. sempervivi, portulac. an.* ℥iſs. *albumin* iiij. *ovorum. oxyrhodin. quantum sufficit; fiat linimentum, ut decet.* You may use this, & the like untill the suspected symptome be past fear. Neither must you have less care, of binding up and rolling the part, than of your medicins; for it doth not a little conduce to the cure, to bind it so fitly up as it may be without pain. The Wound at the beginning of the cure, must be dressed but once in 24 houres, that is, untill the Wound come to suppuration; but when the quitture begins to flow from it, and consequently the pain and feaver are encreased, it shall be dresst twice a day, that is, every twelve houres. And when the quitture flowes more abundantly than usuall, so that the collection thereof is very troublesome to the Patient, it will be requisite to dresse it every 8 houres; that is, thrice a day. Now when as this abundant efflux is somewhat slaked, and begins to decrease, it will suffice to dresse it twice a day. But when the ulcer is filled with flesh, and consequently casts forth but little matter, it will serve to dresse it once a day, as you did at the first.

CHAP. VI. *How you shall order it at the second dressing.*

AT the second and following dressings, unless you suspect putrefaction, and a Gangrene, you shall only put into the Wound some of the oils formerly described, adding to them the yolks of some egs and a little saffron; and use this medicin, untill the Wound come to perfect suppuration. Here you must note this, that these kinds of Wounds are longer before they come to suppuration, than other Wounds made by any other sort of weapon; both for that the bullet, as also the air which it violently carries before it, by much bruising the flesh, on every side, dissipates the native heat, and exhausts the spirits of the part. Which things hinder digestion, and often cause the matter to stink, as also many other pernicious symptomes. Yet most usually *pus* or quitture appears within three or four dayes, sooner and later according to the various complexion, and temperament of the Patients bodies, and the condition of the ambient air in heat and cold. Then by little and little you must come to deterſives, adding to the former medicin some Turpentine washed in Rose, Barly, or some other such like water, which may wash away the biting thereof. If the incompassing air be very cold, you may to good purpose, add some *aqua vitæ*; for by *Galens* prescript, we must not use hot medicins in winter, & less hot in summer. Then in the next place use deterſives, as ℞. *aquæ decoctionis hordei quantum sufficit, succi plantaginis, apii, agrimon. centaurei minoris, an.* ℥j. *bulliant omnia simul; in fine decoctionis adde terebinthinæ venetæ* ℥ iij. *mellis rosat.* ℥ ij. *farin. hordei* ʒ iij. *croci* ℈ j. Let them be all well mixed together and make a Mundificative of an indifferent consistence. Or ℞ *succi clymeni, plantag. absinth. apii, an.* ℥ ij. *tereb. venet.* ℥ iiij. *syrup. absinth. & mellis rosat. an.* ℥ ij. *bulliant omnia secundum artem, postea colentur, in colatura adde pulver. aloes, masticches, Ireos Florent. far. hord. an.* ℥ j. *fiat Mundificativum ad usum dictum.* Or else ℞. *terebinth. venet. lotæ in aq. rosat.* ℥ v. *olei rosat.* ℥ j. *mellis rosat.* ℥ iij. *myrrhæ, aloes, masticch. aristoloch. rotundæ, an.* ʒ i ℈ ſs. *far. hord.* ℥ iij. *misce.* Make a Mundificative, which you may put into the Wound with tents, but such as are neither too long, nor thick, lest they hinder the evacuation of the quitture and vapours, whence the wounded part will be troubled with erosion, pain, deflaxion, inflammation, abscess, putrefaction; all which severally of themselves, as also by infecting the noble parts, are troublesome both to the part affected, as also to the whole body besides. Wherefore you shall put into the Wound no tents, unless small ones, and of an indifferent consistence, lest (as I said) you hinder the passing forth of the matter, or by their hard pressing of the part, cause pain, and so draw on malign symptomes. But seeing tents are used both to keep open a Wound so long, untill all the strange bodies be taken forth, as also to carry the medicins, wherewithall they are anointed: even to the bottom of the Wound. Now if the Wound be sinuous and deep, that so the medicin cannot by that means arrive at the bottom and all the parts thereof, you must do your business by injections made of the following decoction. ℞. *aq. hord. lib. 4. agrimon. centaur. minor. pimpinellæ, absinth. plantag. M.* ℈ ſs. *rad. aristoloch. rotund.* ℥ ſs. *fiat decoctio ad lib. j. in colatura expressa dissolve aloes hepatice,* ʒ iij. *mellis rosat.* ℥ ij. *bulliant modicum.* Inject some of this decoction three or four times into the Wound, as often as you dress the Patient; and if this shall not be sufficient to cleanse the filth, and wast the spongious, putrid and dead flesh, you shall dissolve therein as much *Ægyptiacum* as you shall think fit for the present necessity; but commonly you shall dissolve an ounce of *Ægyptiacum* in a pint of the decoction. Verily *Ægyptiacum* doth powerfully consume the proud flesh which lies in the capacity

Why wounds made by Gunshot are so long before they come to suppuration.

Why tents must be neither too long nor thick.

When you must use injections.

The injection.

The quantity of *Ægyptiacum* to be used in an injection.

pacity of the Wound; besides also it only works upon such kind of flesh. For this purpose I have also made triall of the powder of Mercury, and burnt Alum equally mixed together, and found them very powerfull, even almost as sublimate, or Arsenick, (but that these cause not such pain in their operation.) I certainly much wonder at the largeness of the Eschar which arises by the aspersion of these powders. Many Practitioners would have a great quantity of the injection to be left in the cavities of sinuous ulcers, or Wounds; which thing I could never allow of. For this contained humor causeth an unnatural tension in these parts, and taints them with superfluous moisture, whereby the regeneration of flesh is hindered; for that every ulcer as it is an ulcer, requires to be dryed, in *Hippocrates* opinion. Many also offend in the too frequent use of Tents; for as they change them every houre, they touch the sides of the Wound, cause pain, and renew other malign symptomes; wherefore such ulcers as cast forth more abundance of matter, I could wish rather to be dressed with hollow tents, like those I formerly described to be put into Wounds of the Chest. You shall also press a linnen boulster to the bottom of the Wound, that so the parts themselves may be mutually condensed by that pressure and the quitture thrust forth; neither will it be amiss to let this boulster have a large hole fitted to the orifice of the Wound and end of the hollow tent and pipe, that so you may apply a spunge for to receive the quitture, for so the matter will be more speedily evacuated and spent, especially if it be bound up with an expulsive ligature, beginning at the bottom of the ulcer, and so rapping it up to the top. All the boulsters and rowlers, which shall be applyed to these kinds of Wounds, shall be dipped in Oxycrate or red wine, so to strengthen the part, and hinder defluxion. But you must have a speciall care, that you do not bind the Wound too hard, for hence will arise pain, hindering the passage forth of the putredinous vapours and excrements, which the contused flesh casts forth; and also fear of an *Atrophia*, or want of nourishment, the alimentary juyces being hindered from coming to the part.

VVhy none of the injection must be left in the wound.

Hollow tents or pipes.

The manner of binding up the wound.

CHAP. VII. *By what means strange bodies, left in at the first dressing, may be drawn forth.*

IT divers times happens, that certain splinters of bones, broken and shattered asunder by the violence of the stroak, cannot be pulled forth at the first dressing, for that they either do not yeeld or fall away, or else cannot be found by the formerly described instruments. For which purpose this is an approved medicin to draw forth that which is left behind. ℞ *radic. Irens Floren. panac. & cappar. an.* ℥ iij. *aristoloch. rotund. manna, thuris, an.* ℥ j. *in pollinem redacta incorporentur cum melle rosar. & terebinth. venet. an.* ℥ ij. or ℞ *resin. pini ficcæ* ℥ iij. *pumicis combusti & extincti in vino albo, radic. Irei, aristolochiæ, an.* ℥ ß. *thuris* ℥ j. *squamæ æris,* ℥ ij. *in pollinem redigantur, incorporentur cum melle rosato, fiat medicamentum.*

Two causes that make strange bodies hard to be taken forth.

CHAP. VIII. *Of Indications to be observed in this kind of Wounds.*

THe ulcer being clensed and purged, and all strange bodies taken forth; natures indeavours to regenerate flesh, and cicatrize it, must be helped forwards with convenient remedies, both taken inwardly, and applyed outwardly. To which things we may be easily and safely carryed by indications drawn, first from the essence of the disease, then from the cause; if as yet present it nourish the disease For that which *Galen* sayes, *Lib.* 3. *Meth.* that no indication may be taken from the primitive cause and time; must be understood of the time past, and the cause which is absent. And then from the prineipal times of the disease, the beginning, increase, state, and declination; for each of these four require their remedies. Others are taken from the temperament of the Patient, so that no Chirurgeon need doubt, that some medicins are fit for cholerick, others some for phlegmatick bodies. Hither refer the indication taken from the age of the Patient; also it is drawn from his diet, for no man must prescribe any slender diet to one who is alwayes feeding, as to him who is accustomed to eat once, or twice a day. Hence it is that a diet consisting only of *Panada's* is more fit for *Italians* than for *French* men; for we must give somewhat to custome, which is as it were another nature. Vocations and dayly exercises, are referred to diet, for other things befit Husbandmen & labourers, whose flesh is dense and skin hardened by much labour, than idle and delicate persons. But of all other, have diligent regard of that indication which is drawn from the strength of the Patient; for we must presently, (all else being neglected) succor the fainting, or decaying strength; wherefore if it be needfull to cut off a member that is putrefied, the operation must be deferred if the strength of the Patient be so dejected, that he cannot have it performed without manifest danger of his life. Also indication may be drawn from the incompassing air, under which also is comprehended that, which is taken from the season of the yeer, region, the state of the air and soil, and the particular condition of the present and lately by-past time. Hence it is we read in *Guido*, that Wounds of the head are cured with far more difficulty at *Paris*, than at *Avignion*; where notwithstanding on the contrary, the Wounds of the legs are cured with more trouble, than at *Paris*; the cause is, the air is cold and moist at *Paris*; which constitution seeing it is hurtfull to the brain and head, it cannot, but must be offensive to the Wounds of these parts. But the heat of the ambient air at *Avignion*, attenuates and dissolves the humors, and makes them flow from above downwards. But if any object that experience contradicts this opinion of *Guido*, and say, that Wounds of the head are more frequently deadly in hot countries; let him understand that this must not be attributed to the manifest and naturall heat of the air; but to a certain malign and venenate humor, or vapor dispersed through the air, and raised out of the Seas; as you may easily observe in those places of *France* and *Italy* which border upon the Mediterranean Sea. An indication may also be drawn from the peculiar temper of the wounded parts, for the musculous parts must be dressed after one, and the bony parts after another manner. The different sense of the parts, indicates and requires

The Indication which is drawn from the strength of the Patient is the chiefest of all other.

VVhy wounds of the head at *Paris*, and of the legs at *Avignion* are hard to be cured.

the

the like variety of remedies; for you shall not apply so acrid medicins to the Nerves and Tendons, as to the ligaments which are destitute of sense. The like reason also for the dignity and function of the parts needfull for the preservation of life; for oft-times wounds of the brain, or of some other of the naturall & vitall parts, for this very reason that they are defixed in these parts, divert the whole manner of the cure, which is usually and generally performed in wounds. Neither that without good cause, for oft-times from the condition of the parts, we may certainly pronounce the whole success of the disease; for wounds which penetrate into the ventricles of the brain, into the heart, the large vessels, the chest, the nervous parts of the midriffe, the liver, ventricle, small guts, bladder, if somewhat large are deadly; as also these which light upon a joynt in a body repleat with il humors, as we have formerly noted. Neither must you neglect that indication which is drawn from the situation of the part, and the commerce it hath with the adjacent parts, or from the figure thereof, seeing that *Galen* himself would not have it neglected. But we must consider in taking these forementioned Indications, whether there be a composition, or complication of the diseases; for as there is one and that a simple indication, of one and that a simple disease, so must the indication be various of a compound and complicate disease. But there is observed to be a triple composition, or complication of affects besides nature; for either a disease is compounded with a disease, as a wound, or a phlegmon with a fracture of a bone; or a disease with a cause, as an ulcer with a defluxion; or a disease with a symptome, as a wound with pain, or bleeding. It sometimes comes to pass, that these three, the disease, cause, and symptome, concur in one case or affect. In artificially handling of which, we must follow *Galens* counsell, who wishes in complicated and compounded affects, that we resist the more urgent; then let us withstand the cause of the disease, and lastly that affect, without which the rest cannot be cured. Which counsell must well be observed; for in this composure of affects, which distracts the Emperick; but on the contrary, the rationall Physitian hath a way prescribed in a few & these excellent words, which if he follow in his order of cure, he can scarse miss to heal the Patient. Symptomes truly as they are symptomes, yeeld no indication of curing, neither change the order of the cure; for when the disease is healed, the symptome vanishes, as that which follows the disease, as a shadow follows the body. But symptomes do oftentimes so urge and press, that perverting the whole order of the cure, we are forced to resist them in the first place, as those which would otherwise increase the disease. Now al the formerly mentioned indications may be drawn to two heads; the first is, to restore the part to its native temper; the other is, that the blood offend not either in quantity or quality; for when those two are present, there is nothing which may hinder the repletion, or union of wounds nor ulcers.

An indication to be drawn from the quick and dull sense of the wounded part.

Gal. lib. 7. Meth. & 2. ad Glauc.

Gal. lib. 7. Meth.

How and when we must take indication of curing from a symptome.

CHAP. IX. *What remains for the Chirurgeon to do in this kind of Wounds.*

THe Chirurgeon must first of all be skilfull and labour to assuage pain, hinder defluxions, prescribe a diet in these six things we call not naturall, forbidding the use of hot & acrid things, as also of wine; for such attenuateth humors and make them more apt for defluxion. Therefore at the first let his diet be slender, that so the course of the humors may be diverted from the affected part; for the stomach being empty and not well filled, draws from the parts about it, whereby it consequently follows, that the utmost and remotest parts are at the length evacuated; which is the cause, that such as are wounded, must keep so spare a diet for the next dayes following. Venery is very pernicious, for that it inflames the spirits and humors far beyond other motions; whereby it happens that the humors waxing hot, are too plentifully carried to the wounded and over heated part. The bleeding must not be stanched presently upon receiving of the wound, for by the more plentifull effux thereof the part is freed from danger of inflammation and fulness. Wherefore if the wound bleed not sufficiently at the first, you shall the next day open a vein, and take blood according to the strength and plenitude of the Patient; for there usually flows no great store of blood from wounds of this nature; for that by the greatness of the contusion and vehemency of the moved air, the spirits are forced in, as also I have observed in those who have one of their limbs taken away with a Cannon bullet. For in the time when the wound is received, there flows no great quantity of blood, although there be large veins and arteries torn in sunder thereby. But on the 4, 5, 6. or some more dayes after, the blood flows in greater abundance, and with more violence, the native heat and spirits returning into the part. The belly must be so qualified, that he may have at the least one stool a day, either by nature, or Art; and if by Art, then rather with a Clyster than purging medicins taken by the mouth, for that the agitation of humors, chiefly in the first dayes of the disease, is to be suspected, lest we increase the defluxion falling down upon the wounded part. Yet *Galen* writes that both the evacuations are here needfull, that is, blood-letting and purging; though the Patient be neither plethorick, nor repleat with il humors. But the care hereof must be committed to the judgment of the learned Physitian; pain, if joyned with inflamation shall be mitigated, by anointing the parts neer unto the wound with *unguent. nutritum*, composed with the juyce of Plantain, Housleek, Nightshade, and the like. *Vnguentum Diacalcitheos* described by *Galen* dissolved with vinegar, oil of Poppyes and Roses is of no less efficacy; nor *unguent. de bolo*, nor divers other things of the same faculty, though properly no anodynes, as those which are not hot and moist in the first degree, but rather cold, but yet not so as to have any narcotick faculty. Now these forementioned things assuage pain for that they correct the hot distemper, and stay the acrid and cholerick defluxions, whose violence is more than cold. After the use of repercussives, it will be good to apply this following cataplasm. *℞. Mice panis infuse in lacte vaccino ℔ j ß. bulliant parum addendo olei violacei, & rosar. an. ʒ iij. vitellos ovorum nu. iiij. pulver. rosar. rub. flor. chamem. & meliloti, an. ʒ ij. farin. fabar. & hordei an. ʒ j. misce, fiat cataplasma secundum artem.* Also in this case you may easily make a medicin, of bread crums boyled in Oxycrate and oil of Roses. The cure of Tumors if any associate the wound, may be

Why such as are wounded must keep a slender diet.

Why we must open a vein in such as are wounded by Gunshot.

An anodine and ripening Cataplasm.

be found in their proper place. Natures motion, whether to ſuppuration, or any ſuch thing, muſt ſtill be obſerved, and helped by the Phyſitian and Chirurgeon, as the miniſters and ſervants thereof.

CHAP. X. *Of Bullets which remain in the body, for a long time after the Wound is healed up.*

VVhy Leaden Bullets lye in the body ſo many years without doing any harm.

LEaden Bullets lye in ſome parts of the body ſome whiles ſeaven, eight or more years, ſo that they neither hinder the agglutination of the Wound, neither doth any other ſymptome happen thereupon, as I have divers times obſerved; untill at length by the ſtrength of nature forcing them, and their proper weightineſs bearing them downwards, they ſhew themſelves in ſome lower part, by their ſwelling or bunching forth, and ſo muſt be taken forth by the hand of the Chirurgeon. For they ſay lead hath a certain ſympathy and familiarity with mans body, chiefly the fleſhy parts thereof. Wherefore it neither putrefies it ſelf, nor cauſeth the fleſh to putrefie; beſides it hath an excellent faculty in cicatrizing old ulcers. But bullets of ſtone, iron and of any other metall, are of another nature, for they cannot remain any long time in the body without hurt; for Iron will grow ruſty, and ſo corrode the neighbouring bodies, and bring other malign ſymptomes. Yet a Leaden bullet cannot remain any long time in nervous, or noble parts without danger.

CHAP. XI. *How to correct the conſtitution of the air, ſo that the noble parts may be ſtrengthened, and the whole body beſides.*

Cordialls to ſtrengthen the noble parts.

BUt becauſe as we have formerly told you, there are ſome times wherein even ſmall Wounds made by Gunſhot prove deadly, not by their own fault, but the fault of the air; therefore alſo the Chirurgeon muſt have this care, that he correct the aire with all diligence, & reduce it to a certain quality and moderation of ſubſtance, and ſtrengthen the noble parts and whole body beſides, which may be performed by the following medicins, which are to be taken inwardly and applyed outwardly. In the morning three houres before meat let the Patient take ſome certain quantity as the Phyſitian ſhall think fit of the electuary *Diarrhodon Abbatis*, or *Aromaticum roſatum, triaſantalon, biamoſchum, Letificans Galeni*, or ſome ſuch other like. And you ſhall apply ſome ſuch Epitheme as is here deſcribed to the heart and Liver.

A cordiall Epithem.

℞ *aquæ roſar.* ℥iiij, *aquæ bugloſſæ, aceti boni, an.* ℥ij. *coriandri præparati* ℥ß. *caryophill. cortic. citri an.* ℥j. *ſant. rub.* ℥ß. *coralli utriuſque* ℥ß. *camphoræ* ℈j. *croci* ℈ß. *pulver. diarrhod. abbat.* ʒij. *theriacæ & Mithridatii an.* ℥ß. *pul. flo. chamæm. & melil. an.* ℥iij. *miſce, fiat epithema.* Let it be applyed warm by dipping a ſcarlet cloath therein. You ſhall frequently put odoriferous and refrigerating things to the Patients noſe, to ſtrengthen the animall faculty, as; ℞ *aquæ roſar. & aceti boni an.* ℥iij. *caryophyllorum, nucis moſchat. cinamomi conquaſſatorum, & Theriacæ Galeni, an.* ʒj. Let a linnen rag dipped herein, be now and then put to the Patients noſe; for the ſame purpoſe he ſhall carry a Pomander about him, and often ſmell there.

Pomanders.

As ℞ *roſ. rub. violar. an.* ʒiij. *baccarum myrti, juniperi, ſantal. rub. an.* ʒijß. *ſtyracis calamit.* ʒij. *aq. roſarum quantum ſatis eſt: liquefiat ſimul cum ceræ albæ quod ſufficit, fiat ceratum ad comprehendendos ſupradictos pulveres cum piſtillo calido, & ducatur in pomum.* Or ℞ *rad. Ireos Florent. majoran. calam. aromat. ladani, benzoini, rad. cyperi, cariophyl. an.* ʒij. *Moſchi. gra. 4. fiat pulvis cum gummi tragacanth. quod ſufficit.* Or elſe. ℞ *ladani puri* ℥j. *Benzoini* ℥ß. *ſtyracis calamit.* ʒvj. *ircos Flor.* ℥ß. *caryophyll.* ʒiij. *majoran. roſ. rub. calami aromat. an.* ℥ß. *in pollinem redigantur omnia, & bulliant cum aqua roſ. quantum ſufficit; colentur, colata liquefiant cum juſta ceræ albæ quantitate, ſtyracis liquidæ,* ℥j, *fiat ad modum cerati, & cum piſtillo fiat pomum, addita moſchi* ʒj. Alſo you may corroborate the animall faculty by application of frontalls, as alſo procure ſleep, and eaſe the pain of the head; as ℞ *aq. roſ.* ℥ij. *olei roſ. & papav. an.* ℥iß. *aceti boni,* ℥j. *trochiſ. de camphora,* ℥ß. *fiat frontale.* Linnen rags dipped herein may be applyed to the temples of the forehead, and often renewed; otherwiſe by their heat, dryneſſe, and hardneſs, they will cauſe watching in ſtead of ſleep. Neither muſt you in the mean time bind the head too hard, leſt by intercepting and hindring the pulſation of the temporall Artery, you encreaſe the pain of the head. You ſhall make a fire, in the Patients chamber of odoriferous woods, as Iuniper, Bay-tree, the prunings or cuttings of Vines, Roſemary, and Orris roots. For the ſame purpoſe, you may ſprinkle the floore with ſweet water; if the Patient be able to undergoe ſuch coſt. As, ℞ *majoranæ, menthæ, radic. cyperi, calami aromat. ſalviæ, lavendulæ, fœnicul. thymi, ſtœchad. flor. chamæm. melilot. ſatureiæ, baccarum lauri, & juniperi, an. M.* iij. *pulv. caryophyll. nucis Moſchat. an.* ℥j. *aquæ roſar. & vitæ, an. lib.* ij. *vini albi boni & odorifici. lb.* x. *bulliant omnia in balneo Mariæ ad uſum dictum.* You may alſo make perfumes to burn in his chamber, as thus; ℞. *carbonis ſalicis* ʒviij. *ladani puri* ℥ij. *thuris maſculi, ligni & baccarum Iuniperi, an.* ℥j. *xyloloes, benjoini, ſtyracis calamit. an.* ℥ß *Nucis moſchatæ, ſantal. citrin. an.* ʒiij. *caryophyll. ſtyracis liquidæ, an.* ʒij. *xedoariæ, calami aromat. an.* ʒj. *gummi tragacanth. aqua roſar. ſoluti, quod ſit ſatis;* Make hereof perfumes in what faſhion you pleaſe. For the rottennes and corruption of bones we will treat thereof hereafter in its due place.

Frontalls to cauſe reſt, and ſtrengthen the animall faculty.

A ſweet water.

Perfumes to burn.

CHAP. XII. *Certain memorable Hiſtories.*

The malign ſymptomes which uſually happens upon wounds made by Gunſhot.

HEre I thinke good for the benefit of young practitioners, to illuſtrate by examples the formerly preſcribed Method of curing Wounds made by Gunſhot. The famous and moſt valiant Count of Mansfelt, Governour of the Dutchy of *Luxembourg*, Knight of the order of Burgundy, comming to the aide of the French King, was at the battell of Moncontour, where in the conflict he received ſo great a Wound at the joint of the left arme with a Piſtoll bullet, that the bones were ſhivered and broken in ſo many peeces, as if they had been laid upon an Anvill and ſtruck with an hammer: hence proceeded many malign ſymptomes, as cruell and tormenting pain, inflammation, a feaver, an œdematous and flatulent tumor of the whole arm even to the fingers end, and a certain inclination to a Gangræne: which to reſiſt, *Nicolas Lambert*, and *Richard Hubert* the Kings Chirurgeons, had

had made many and deep ſcarifications. But when I came to viſit and dreſs him, by the Kings appointment, and had obſerved the great ſtench, and putrefaction, I wiſhed that they would uſe lotions of *Ægyptiacum* made ſomewhat ſtronger than ordinary, and diſſolved in vinegar and *aqua vitæ*, and do other things more largely ſpoken of in the chapter of a Gangræne. For the Patient had alſo a *Diarrhœa* or flux, whereby he evacuated the purulent, and ſtinking filth which flowed from his Wound. Which how it might come to paſs we will ſhow at large when we come to treat of the ſuppreſſion of the Urine. For this ſeemed very abſurd to many, becauſe that if this purulent humor flowed out of the arm into the belly, it muſt needs flow back into the veins, be mixed with the blood, and by its pernicious and contagious paſſage through the heart and liver, cauſe exceeding ill ſymptomes, and laſtly death. Indeed he often ſwounded by the aſcent of the filthy vapours raiſed from the ulcer to the noble parts; which to reſiſt, I wiſhed him to take a ſpoonfull of *aqua vitæ* with ſome Treacle diſſolved therein. I endeavoured to repreſs the œdematous and flatulent Tumor, poſſeſſing all the arme with ſtoups dipped in oxycrate, to which was put a little ſalt and *aqua vitæ*; theſe ſtoups I ſtayed and held to the part with double cloaths, ſowed as ſtrait as I could. Such a compreſſion held the broken bones in their places, preſſed their *Sanies* from the ulcers, and forced back the humors flowing to the part into the center of the body. If at any time I omitted this compreſſion, the tumor was ſo encreaſed, that I was in a great deal of fear, leſt the native heat of the part ſhould be ſuffocated. Neither could I otherwiſe bind up the arm by reaſon of the exceſſive pain which moleſted the Patient upon the leaſt ſtirring of the Arm. There were alſo many Abceſſes about his elbow and over all his arm beſides. For the letting forth of whoſe matter I was forced, to make new inciſions; which he endured very ſtoutly. At length I cured him with uſing a vulnerary potion, and by cleanſing the ulcers, and correcting the putrefaction with *Ægyptiacum* diſſolved in wine or honey of roſes, and ſo poured into the ulcers, and repreſſing the growth of proud fleſh, with the powder of burnt Alums, drying it after the deterſion with liniments. Now this I can truly affirm and profeſs, that during the time of the cure, I took out above threeſcore ſplinters of bones, and thoſe neceſſarily, amongſt which there was one of the length of ones finger; yet by Gods aſſiſtance at length he became ſound in all things, but that he could not put forth, or draw in his arm.

Matter may flow from the wounded limbes into the belly.

A briefe recitall of the manner of the cure.

Not long after by the Kings command I went to ſee *Charles Philip* of Croy, Lord of Autet, the Duke of Aſchos brother, not far from Mounts a City of Henalt. He kept his bed ſeaven months by reaſon of a Wound made by a Bullet the ſpace of three fingers above his knee. When I came to him, he was afflicted with theſe ſymptomes, intolerable pain, a continuall feaver, cold ſweats, watchings, excoriation of the hippes by reaſon of his long lying upon them, his appetite dejected with much thirſt. He oft ſunk down as if he had the falling ſickneſs, had a deſire to vomit, and a continuall trembling or ſhaking ſo that he could not put one hand to his mouth without the aſſiſtance of the other: he ſwounded frequently by reaſon of the vapours aſcending to the noble parts. For the thighbone was broken longwayes and ſidewayes with many ſplinters of bones, whereof ſome were plucked out and others remained ſticking faſt in. He beſides alſo had an ulcer in his groin which reached to the midſt of his thigh, & many other ſinuous ulcers about his knee. All the muſcles of his thigh and leg were ſwoln with a flegmatick, cold and flatulent humor, ſo that almoſt all the native heat of thoſe parts ſeemed extinct. All which things being conſidered, I had ſcarſe any hope to recover him, ſo that I repented my coming thither. Yet at length putting ſome confidence in his ſtrength, and prime of youth, I began to have better hopes. Therefore with his good liking, firſt of all I make two inciſions, ſo to let forth the matter, which lying about the bone did humect the ſubſtance of the muſcles. This had happy ſucceſs, and drew out a great quantity of matter; then I with a ſyringe injected much *Ægyptiacum* diſſolved in wine, and a little *aqua vitæ* into theſe inciſions, ſo to reſtrain and amend the putrefaction, repreſſe the ſpungie, looſe and ſoft fleſh, reſolve the œdematous and flatulent tumor, aſſwage the pain, and ſtir up and ſtrengthen the native heat almoſt oppreſt by the aboundance of excrementitious humors, ſo that it could ſcarſely aſſimilate any nouriſhment and adjoin it to the parts. Then I fomented the affected part with Sage, Roſe-mary, Time, Lavander, Chamomile and Melilot flowers and Red-roſe leaves boyled in white wine, and lye made of Oake-aſhes, adding thereto as much ſalt and vinegar as I judged requiſite. This fomentation did attenuate & draw forth the morbfiick humor. Now we uſed them long & often, ſo to waſt the humor more by drying up and breathing thorow the paſſages of the skin, more thereof than fell into the part. For this ſame purpoſe, we ordained that he ſhould uſe frictions with hot linnen clothes, and that theſe ſhould be made from above downwards, from below upwards, and ſo on every ſide, and ſomewhat long withall: For a ſhort friction drawes more humor into the part than it can reſolve: I wiſhed that each other day they ſhould lay bricks heated hot in the fire about his leg, thigh, & ſoal of his foot; but they were to be ſomewhat quenched, and ſprinkled with wine and vinegar, with a ſmall quantity of *aqua vitæ*. Much watriſh moiſture by this moiſt heat, did ſweat out of theſe parts, the tumor was leſſened, and the native heat by little and little reſtored. Then ſtoups dipped in lye made of Oake-aſhes, wherein Sage, Roſemary, Lavander, ſalt, and cloves, were boyled, ſome *aqua vitæ* added, were applyed thereto; but the rowlers were ſo gently, and artificially wrapped about, that he did eaſily endure them without any pain, and that with ſuch happy ſucceſs, that if they were omitted but for one day, the tumor became very great. But thick linnen boulſters were laid upon the lower cavities of the ulcers; that ſo the *ſanies* or filth might be more eaſily preſſed forth. But I had alwayes a ſpeciall care that the orifices of the ulcers ſhould be kept open with hollow Tents or pipes put therein: and ſometimes this following cataplaſm was applyed to reſolve the tumor. ℞ *Far. hord. faban. & orobi, an.* ℥vj. *melilis com. & tereb. an.* ℥ij. *ſto. chamæm. melil. & roſ. rub. an.* ℥ß. *pulv. rad. Ireos, Fior. typer. Maſt. an.* ℥iij. *oxymel. ſimp. quantum ſufficit; fiat cataplaſma ad formam pultis ſatis liquidæ.* And *emplaſtrum de Vigo* without Mercury was applyed thereto, whereby the pain was much aſſwaged, and the tumor leſſened: yet were they not applyed before the parts were throughly heated by the fomentation, frictions, and evaporations; for

Horrid ſymptome occaſioned by a wound made by Gunſhot.

otherwayes

otherwayes this Emplaster could never have been activated, by reason of the excessive coldness of the affected parts. Neither did we omit catagmatick powders, fit for the taking, and drawing forth of broken bones. He used a vulnerary potion for 15 dayes. Also besides the particular frictions of the affected parts, I appointed other generall frictions of the whole body, which was become very lean; for by these, blood together with the spirit was drawn to the parts, and the acrid, and fuliginous vapours were breathed forth. To conclude, his feaver and pains being asswaged, his appetite restored, by feeding plentifully upon good meats according to his strength, he in a short time became more lusty; and lastly by the singular mercy of God, recovered his health perfectly, but that he could not very well bend his knee. I thought good to recite these things, not to glory or brag of the happy successe of those Patients, which have recovered by my means, and the favour of God; but that thus I may more fully and perfectly by familiar examples instruct young practitioners, in the operations of Chirurgery.

CHAP. XIII. *An Apologie concerning wounds made by Gunshot.*

The occasion of writing this Apologie.

THere lately came to my hands a book written by a certain Physitian, whereby he endeavours to disprove and overthrow, that which I have hitherto writ, of the cure of wounds made by Gunshot. Assuredly if there were no other harm, but the loss of my credit ensuing thereon, I would willingly hold my peace, and stop his mouth by modest silence. But seeing the safety of so many men, lyes upon the judgement of this point, I have thought good to withstand this errour, lest it, to the great destruction of mankind, spread and diffuse it self any further.

The chiefe heads of our adversaries Treatise.

The use (saith he) of suppurative medicins, have killed many who have been but lightly wounded with Gunshot, but acrid medicins, as *Ægyptiacum*, have killed more. Neither is the counsell of *Hippocrates* to be observed in curing this sort of wounds, who bids that every contused wound be brought to suppuration. For seeing this is a new kind of wound, it requires new, and not anciently used medicines. Now the temper of the air changed from the naturall constitution ought not to indicate change of medicines; but much lesse must thunder, and lightning be compared to the shooting of Great Ordinance. These are the chief heads of this his book, which because they dissent from the truth, and these

All wounds made by Gunshot are contused.

things I have formerly delivered, I have thought good here to confute. First, seeing Leaden Bullets which are usually shot out of Guns are round, obtuse and weighty, they cannot wound the body without contusion and attrition; Now no contusion can be cured without suppuration, not only according to the opinion of *Hippocrates*, but also of *Galen* and all others who have written of Physick. Neither must we invent new remedies, for these new kinds of wounds; for the lawes of the sacred and divine Art of Physick are not obnoxious to change, nor subject to the humor of men or times, as the decrees of Kings and Emperours are. For these are stablished with immutable necessity, which constancy neither consuming time, nor age, nor tyranny can pervert. Wherefore neither those who with great praise are Physitians to Kings and Princes, I mean *Ioubert* and *Potallus*, think it lawfull for them to depart from the rules of *Hippocrates*. And this they not only do and follow in curing and doing the works of Art, but much and highly commend, confirm and propound to be diligently observed by all, in their books which they have published concerning the cure of these kinds of wounds. And yet these Physitians are such, as dayly conversant in Armies and Kings houses have healed and dayly cure as many wounded by Gunshot as this Physitian our Antagonist hath seen in all his life. Neither only do these whom I have named thus cure these wounds, but almost all that dresse such kind of wounds do the like, so that if there be nothing which may hinder, or indicate to the contrary, they presently apply suppuratives.

A suppurative medicine of tryed efficacy.

And I wonder that he hath not observed how his neighbour *Doublet* the Emperick cures desperate wounds of this nature, with no other than a suppurative medicine, composed of Lard, the yolk of an Egge, Turpentine and a little Saffron. In the year 1538. there was at *Turin* whilest I was Chirurgeon there to the Marshall of *Montejan* the Kings Lieutenant Generall in *Piemont* a certain Chirurgeon wondrous famous for curing these wounds, and yet he used nothing else but the oil of Whelpes, (the description whereof I at length obtained of him with much intreaty and expence) and he used it not scalding hot, as some have imagined, but powred it scarse warm into their wounds, and so did mitigate their pain, and happily bring them to suppuration. Which afterwards almost all Chirurgeons, after they had got the description hereof, when I first published this Work, have used and daily doe use with happy successe.

The force of *Ægyptiacum* against putrefaction.

But in contemning and condemning *Ægyptiacum*, I think he hath no partaker; seeing there as yet hath been found no medicine more speedy and powerfull to hinder putrefaction, if beginning; or correct it, if present. Now these wounds often degenerate into virulent, eating, spreading, and maligne ulcers, which cast forth a stinking and carion-like filth, whence the part gangrenates, unless you withstand them with *Ægyptiacum* and other acrid medicins, being greatly approved by the formerly named Physitians and all Chirurgeons. But (saith he) this unguent is poysonous, and therefore hath been the death of many who have been wounded by Gunshot. Verily if any diligently enquire into the composition of this ointment, and consider the nature of all and every the ingredients thereof, he shall understand that this kind of Unguent is so far from poyson, that on the contrary it directly opposes and resists all poyson and putrefaction which may happen to a fleshy part, through occasion of any wound.

The force of the air in breeding and augmenting diseases.

It is most false and dissonant from the doctrine of *Hippocrates* to affirm, that the seasons of the year swerving from the Law of nature, and the air, not truly the simple and elementary, but that which is defiled and polluted by the various mixture of putrid and pestilent vapours, either raised from the earth, or sent from above, make not wounds more malign and hard to cure at some times than they are at othersome. For the air either very hot, or cold, drawn into the body by inspiration or transpiration, generates a condition in us like its qualities. Therefore why may it not, when defiled with

the

the putredinous vapours of bodies lying unburied after great battails, and ſhipwracks of great Armadoes, infect with the like quality our bodies and wounds?

In the year 1562. when the civill wars concerning Religion firſt begun in *France*, at *Pene* a Caſtle lying upon the River *Lot*, many ſlain bodies were caſt into a Well, ſome hundred cubits deep, ſo ſtinking and peſtilent a vapour aroſe from hence ſome two months after, that many thouſand of people dyed all over the Province of *Agenois*, as if the Plague had been amongſt them, the pernicious contagion being ſpread twenty miles in compaſs; which none ought to think ſtrange, eſpecially ſeeing the the putrid exhalations by the force of the winds may be driven and carried into divers and moſt remote regions, diſperſed like the ſeeds of the Peſtilence; whence proceeds a deadly corruption of the ſpirits, humors, and wounds, not to be attributed to the proper malignity, or perverſe cure of wounds, but to be the fault of the air. Therefore *Francis Daleſchampe* in his *French* Chirurgery, in reckoning up theſe things which hinder the healing of Ulcers, hath not omitted that common cauſe which proceeds from the air defiled or tainted with the ſeeds of the peſtilence. For he had learnt from his Maſter *Hippocrates* that the mutations of times chiefly bring diſeaſes, and he had read in *Guido*, that this was the chief occaſion, that wounds of the head at *Paris*, and of the legs at *Avignion*, were more difficultly healed. Laſtly, even Barbers and ſuch as have leaſt skill in Chirurgery know, that wounds eaſily turn into a Gangrene in hot and moiſt conſtitutions of the air. Wherefore when the wind is ſoutherly, the Butchers will kill no more fleſh than to ſerve them for one day. I have formerly declared the malignity of the wounds occaſioned by the air in the ſiege of *Roven*, which ſpared none, no not the Princes of the blood, who had all things which were requiſite for their health. Which cauſed me, made at length more skilfull by experience, to uſe *Vnguentum Ægyptiacum* and medicins of the like faculty in ſtead of ſuppuratives, to wounds during all that ſeaſon, that ſo I might withſtand the putrefaction and Gangrene which ſo commonly aſſailed them. But if the various motion of the ſtars, can by their influx ſend a Plague into the air, why then may it not by depravation of their qualities infect, and as by poyſoning corrupt both wounds and wounded bodies obnoxious to their changes and that of the air? We learnt long ſince by experience, that all pains but principally of wounds, grow worſe in a rainy and moiſt ſeaſon, ſpecially becauſe in that ſoutherly conſtitution the air replete with thick and foggy vapours, cauſes the humors to abound in the body, which forthwith eaſily fall upon the affected parts, and cauſe increaſe of pain. But ſaith our Adverſary, in the battell at *Dreux*, and at S. *Dennis* which were fought in winter, there dyed a great number of men who were wounded by Gunſhot: This I confeſs is true; but this I deny, that it was occaſioned by applying ſuppuratives; or corroſives, but ratherby the vehemency and largeneſs of their wounds, & the ſpoil the bullet made in their members, but above all by reaſon of the cold. For cold is moſt hurtfull to wounds and ulcers, (as *Hippocrates* teſtifies) it hardens the skin and cauſes a Gangrene. If this my Gentleman had been with me in the ſiege of *Metz*, he might have ſeen the Legs of many ſouldiers to have rotted, and preſently taken with a Gangrene to have faln away, by the only extremity of cold; if he will not beleeve me, let him make tryall himſelf; and go in winter to the Chappell at Mount *Senis* one of the Alpine hills, where the bodies of ſuch as were frozen to death in paſſing that way are buried, and he ſhall learn and feel how true I ſpeak. In the mean time I think it fit to confute the laſt point of his reprehenſion.

A. Hiſtory.

Hip. Aph. 1. ſect. 3.

In our ſecond diſcourſe.

The power of the ſtars upon the air and our bodies.

Aphor. 20. ſect. 5.

He cavills for that I compared Thunder and Lightning with the diſcharging peeces of Ordnance. Firſt he cannot deny but that they are alike in effects. For it is certain that the flame ariſing from Gunpowder ſet on fire, reſembles Lightning; in this alſo that you may ſee it before you hear the crack or report. I judg for that the eye almoſt in a moment perceives its objects; but the ear cannot but in ſome certain ſpace of time, and by diſtinct gradations. But the rumbling noiſe is like in both, and certainly the report of great Ordnance may be heard ſometimes at forty miles diſtance, whilſt they make any great battery in the beſieging of Cities. Beſides alſo, Iron Bullets caſt forth with incredible celerity by the fired Gunpouder, throw down all things with a horrid force, and that more ſpeedily and violently by how much they reſiſt the more powerfully by their hardneſs. They report that Lightning melts the mony not hurting the purſe; Now many by the only violence of the air agitated and vehemently moved by ſhooting a peece of Ordnance, as touched with Lightning have dyed in a moment, their bones being ſhivered and broken, no ſign of hurt appearing in the skin. The ſmell of Gunpouder when it is fired, is hurtfull, firy and ſulphurous, juſt like that which exhales or comes from bodies killed with Lightning. For men do not only ſhun this ſmell, but alſo wild Beaſts leave their Dens if touched with Lightnings. Now the cruelty of great Ordnance makes no leſs ſpoil amongſt buildings, nor ſlaughter amongſt men and beaſts, than Lightnings do, as we have formerly ſhown by examples, not only horrid to ſee, but even to hear reported, as of Mines, the Arcenall of *Paris*, the City of *Maligines*: Theſe may ſeem ſufficient to teach, that thunder and lightning have a great ſimilitude with the ſhooting of great Ordnance, which notwithſtanding I would not have a like in all things. For they neither agree in ſubſtance, nor matter, but only in the manner of violent breaking aſunder the objects.

The ſimilitude betweeen Thunder and great Ordnance, maintained.

Now let us ſee and examin what manner of cure of wounds made by Gunſhot our adverſary ſubſtitutes for ours. For he would have ſuppuratives uſed and applyed, yet ſuch as ſhould not be hot & moiſt in quality, or of an Emplaſtick conſiſtence, but hot and dry things. For (ſaith he) here is not the ſame reaſon as in Abſceſſes, where the Phyſitian intends nothing but ſuppuration. But here becauſe a contuſion is preſent with the wound, this requires to be ripened with ſuppuratives, but the wound to be dryed.

Our adverſaries method, and manner of cure reproved.

Now to anſwer this objection, I will refer him to *Galen*, who will teach him the nature of ſuppuratives; from whom alſo he may learn that great regard is to be had of the cauſe and more urgent order in the cure of compound diſeaſes; then would I willingly learn of him, whether he can heal a wound made by Gunſhot, not firſt bringing that which is contuſed to perfect maturity. If he affirm he can, I

Gal. lib. 9. ſimpl. 10. Method.

will be judged by whatsoever Practitioners he will, to judg how obscure these things are. Whereby you may the better understand there is nothing more commodious than our *Basilicon* and oil of Whelps to ripen wounds made by Gunshot, if so be that putrefaction, corruption, a Gangrene or some other thing do not hinder. Then would he have *Oxycrate* poured into these wounds to stay their bleeding, which if it cannot so be stayed, he would have a medicin applyed consisting of the white of an Egge, Bole Armenick, oil of Roses and salt. But I leave it to other mens judgment, whether these medicins have power to stay bleeding if put into the wound; certainly they will make it bleed the more. For vinegar seeing it is of a tenuious substance and biting, it is no doubt but that it will cause pain, defluxion and inflammation. To which purpose I remember I put to stanch bleeding, for want of another remedie, a medicin wherein was some Vinegar, into a wound received by a Moor, an attendant of the Earl of *Roissy*, hurt with a Lance, run through his arm before *Bologne* by an *English* horseman. But he comes again to me a little after, complaining and crying out that all his arm burnt like fire; wherefore I was glad to dress him again, and put another medicin into his wound, and laid an astringent medicin upon the wound, bnt poured it not therein. And then above all other remedies he extols his Balsam composed of oil of Wax, and Myrrh beaten together with the white of an Egge; which he saith is equall in operation to the naturall Balsam of *Peru*. For he affirms that this hath a faculty to consume the excrementitious humidity of wounds, and so strengthens the part that no symptom afterwards troubles them. Yet he saith, this doth not so well heal and agglutinate these wounds, as it doth others which are cut. Verily it is ridiculous to think that contused wounds can be healed after the same manner as simple wounds may, which only require the uniting of the looséd continuity.

Vinegar put into a wound doth not stay but causes bleeding. A History.

Balms are fit to heal simple but not contused wounds.

Therefore neither can these Balsams be fit remedies to heal wounds made by Gunshot, seeing by reason of their dryness they hinder suppuration, which unless it be procured the Patient cannot be healed. Wherefore such things ought not be put into wounds of this nature, before they be ripened, washed and clensed from their filth. Yet can I scarse conceive, where we shall be able to find out so many Chymists which may furnish us with these things sufficiently to dress so many wounded souldiers as usually are in an Army, or whence the souldiers have sufficient means to bear the charge thereof. Also that which he saith is absurd, that these Balsams must be put into the wounds without Tents; and presently forgetting himself, he saith, it will not be amiss, if there be a little and slender Tent put into the wound, which may only serve to hinder the agglutination thereof. But how can these Balsams come to the bottomes of wounds without Tents, when as it is their chief property to carry medicins even to the innermost parts of the wounds, and alwayes keep open a free passage for the evacuation of the quitture? But it is not worthy, that after he hath rejected *unguentum Ægyptiacum*, he nevertheless bids to apply it, from the beginning untill the contusion come to perfect maturation, dissolving it in a decoction of the tops of wormwood, S. *John Wurt*, the lesser Centory and Plantain, and so injecting it into the wound. Besides also a little after he gives another way of using it, which is, to boil a quantity of Hony of Roses in plantain water, carefully skimming it, untill it be boiled to the consistence of Hony, and then to add as much *Ægyptiacum* thereto, and so to make an ointment most fit to bring these wounds to suppuration. But I leave it for any skilful in Chirurgery to judg, whether such medicins can be suppuratives, or whether they be not rather detersives. Last of all he writes, that these wounds must be dresst but every fourth day. And if there be a fracture of the bone joyned with the wound, then to move nothing after the first dressing untill the eighth day after; then presently in another place he saith, it will be good, and expedient, to drop ten or twelve drops of the formerly described Balsam every day into the wound. Verily such doctrin which neither agrees with its self nor the truth, cannot but much pusle a Novice and young Practitioner in Chirurgery, who is not yet in versed the Art, or the operations thereof.

Ægyptiacum howsoever made is a clenser, not a suppurative.

CHAP. XIIII. *Another Apologie, against those who have laboured with new reasons to prove that wounds made by Gunshot are poysoned.*

The occasion of this Apology.

SOme few months agone, I visited a Patient together with some learned Physitians and skilfull Chirurgeons. Now they, as it oft-times happens, in way of discourse, begun to argue of the condition & quality of wounds made by Gunshot, & indeavoured to prove that they might be poysoned by five reasons. Not truly through the occasion of the Gunpouder, for they all confessed that it was free from poyson, whether you have regard to its essence, or to its composition; but by the Bullet, into which the poyson may be transfused and incorporated. The first reason is, that Lead seeing it is of a rare and spongious nature, which the easiness of melting and softness argues, is very fit to drink and soak in what liquors so ever you please. But me thinks this conclusion is very weak; for in all mixtures made by Art, such as this is whereof we speak, there are two things to be considered; that is to say, the matter of the things which enter into the mixture, and the form: for the matter, such bodies must be either liquid, or soft, or friable; and lastly such as may be broken and divided into small particles, that so they may easily in all parts concur and be conjoyned and united. But for their form, there ought to be a certain affinity, consent and sympathy. You may perceive this by water and oil; for each of them though of a liquid substance, and such as may easily be mixed with divers other things, yet cannot they be mixed the one with the other by reason of their antipathy of form. For thus gold and silver are so agreeing with lead, that as oft as they are molten lead is mixed with them. But brass shuns lead as much as gold and silver fly tin and white lead. If therefore brass and lead being melted cannot be mixed together, though contained under the same *Genus*, and common nature of Metalls; how then can it be commixt with another thing distinct in the whole kind, much more in *species*, and form, to wit, poyson? Their second reason is this; Iron, say they, which is more dense,

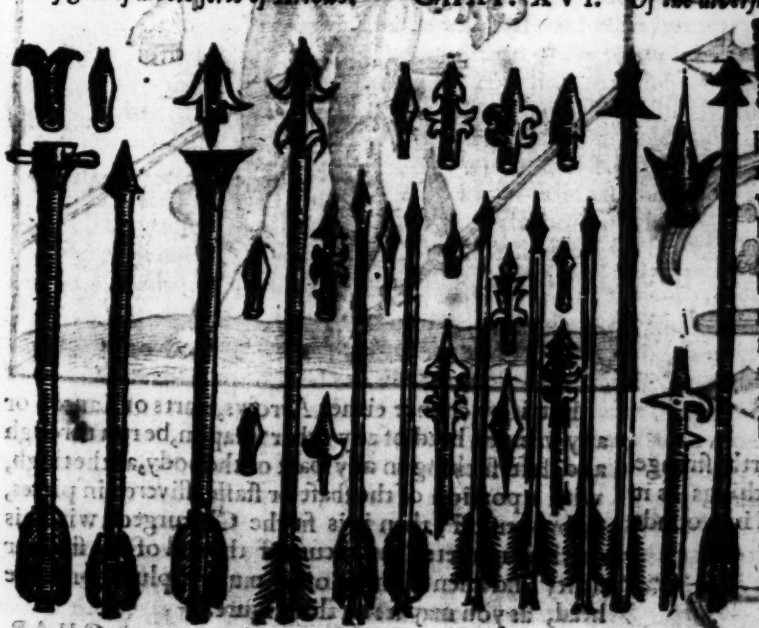
The reason of our adversaries that the Bullets may be poysoned, set down and consuted.

denſe, ſolid, and leſs porous, may receive ſome venenate ſubſtance and quality, as the Arrows of the Ancients which were dipped in poyſon, teſtifie; therefore muſt Lead much more be capable thereof. I anſwer, that the ſurface of Iron may be poyſoned, but not the inner part or ſubſtance by mixture therewith. But here the queſtion is of union, but not of anointing or inunction. The third reaſon is thus framed; though (ſay they) lead caſt off and purges it ſelf from the droſs and unpure parts, yet that is no argument that it will not commix, or ſoak it ſelf in ſome ſtrange liquor or body; for thus Steel, being the moſt ſolid Iron, receives the temper which hardens it by the artificial pouring upon it or quenching it in liquors contrary thereto in their whole kind. I anſwer, that Steel admits into it by that quenching and tempering, none of the juyces or liquors wherewith it is watered or quenched. For if that were neceſſary, it might be better & more eaſily performed, when the metall is firſt caſt, than when it is beaten into plates or bars; which anſwer ſhal ſerve to confute their fourth reaſon; wherin they ſay, that bullets may be made ſo poyſonous by the commixture of the juyces of Muncks-hood, Oleander, Crow-foot, and other ſuch like things which in their whole ſubſtance are contrary to ours, that the wound wch is made with them cannot but be poyſoned. But I on the contrary affirm, that mixture is only of theſe things, which may not only be put, but alſo ſtick thereto, & be mutually united but how can water or any other liquid juice ſo much as only ſtick to lead, as that which is a ſolid & firm body, it is ſo far from being united, therewith? You may give more certain judgment hereof by experience, than by reaſon; wherefore let melted lead be put into the foreſaid juices or the like; then when the lead is cold, weigh each of them ſeverally and you ſhal find, that both of them retain the ſame weight they formerly had. Which is a moſt certain argument that neither the lead hath mixed or united it ſelf with the juices, nor the juices loſt any part of their ſubſtance. Their fifth reaſon is thus; A bullet ſhot out of a Gun againſt ſome hard ſtone, grows not ſo hot, but that you may preſently without any harm take it up in your hand. Therefore it is falſe, that the poyſon commixt & united with the bullet can be diſſipated by the fire and flaſh of Gunpouder. The anſwer to this objection is eaſie. For when we ſay, that although the Bullet may be infected by poyſon perfectly commixt with the lead, yet all the force of the poyſon would be diſſipated by the fire; we would have you thus to underſtand us, that we do not mean this of that fire which is made by the pouder at the diſcharging of the Peice, but of that by force whereof the molten lead is mixed and conjoined with the venenate juice, ſo to make one of many. For this fire exerciſing its force upon the venenate juices hindered by the intercourſe of no *Medium*, and that for ſome ſpace of time, and not for an inſtant, it may, if not conſume, yet much weaken their ſtrength. If there be any, who wil not be ſatisfied by theſe reaſons, let him conſult, & read *Mathiolus*. There are (ſaith he) ſome of theſe later times wholly ignorant of things, who (if we may ſay the the truth) have been ſo madly fooliſh, that they ſaid it was fit and requiſite to put Treacle and Mithridate and ſuch like antidotes amongſt gold and ſilver that was melted to make cups, that ſo receiving the faculties of the Antidote they might reſiſt poyſon. But how abſurd and ridiculous their opinion is, let them judg (for it needs no clearer reproof) who have but a little knowledg in naturall things, but chiefly in metalls. Theſe are my reaſons, theſe the authorities of men excelling in learning & judgment, that confirm me in my ancient & former opinion, that wounds made by Gunſhot do not partake of any venenate quality. *In præfat. 6. Diſcor.*

CHAP. XV. *How wounds made by Arrows differ from ſuch as are made by Gunſhot.*

WOunds made by arrows and bolts ſhot out of Croſs-bows and ſuch like things, differ chiefly in two things, from theſe which are made by gunſhot. The firſt is, for that they are oft-times without contuſion, which the other never are. The other is, for that they oft-times are poyſoned. In both theſe reſpects, their cure is different from the other. But the cure of theſe wounds made by arrows is different in it ſelf, by reaſon of the variety and divers ſorts of Darts or Arrows. *Wounds made with Arrows and ſuch like things, are often without contuſion. But are oft-times poyſoned.*

The figure of divers ſorts of Arrows.



CHAP. XVI. *Of the diverſities of Arrows and Darts.*

ARrows and Darts are different amongſt themſelves both in matter and in form or figure, in number, making, faculty or ſtrength. In matter, for that ſome of them are of wood, ſome of reeds, ſome are blunt headed, others have piles or heads of iron, braſs, lead, tin, horn, glaſſe, bone. In figure, for that ſome are round, others cornered, ſome are ſharpe pointed, ſome barbed, with the barbs ſtanding either to the point, or ſhafts, or elſe acroſſe, or both wayes, but ſome are broad and and cut like a Chiſſell. For their bigneſſe, ſome are three foot long, ſome leſſe. For their number, they differ in that, becauſe ſome have one head, others more. But they vary in making, for that ſome of them *The diffeences of Arrows. In matter. In figu. In bigneſs. In number. In making.*

In force.

have the shaft put into the head, others the head into the shaft; some have their heads nailed to the shaft, others not, but have their heads so loosly set on, that by gentle plucking the shaft, they leave their heads behind them, whence dangerous wounds proceed. But they differ in force, for that some hurt by their Iron only, others besides that, by poyson, wherewith they are infected. You may see the other various shapes represented to you in the preceding Figure.

CHAP. XVII. *Of the difference of the wounded parts.*

You must not leave the weapon in the wound.

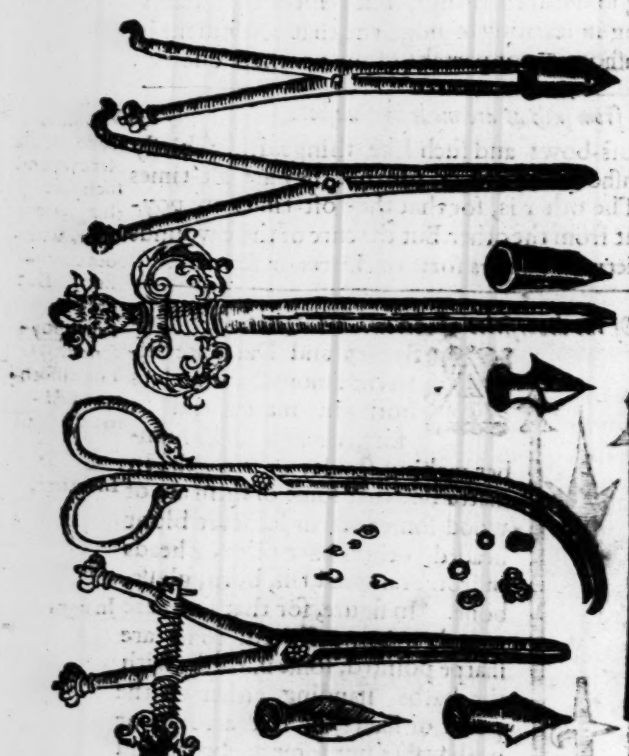
THe wounded parts are either fleshy or bony; some are neer the joints, others seated upon the very joints; some are principall, others serve them; some are externall, others internall. Now in wounds where deadly signs appear, it's fit you give an absolute judgment to that effect; lest you make the Art to be scandalled by the ignorant. But it is an inhumane part, and much digressing from Art, to leave the Iron in the wound; it is sometimes difficult to take it out, yet a charitable and artificiall work. For it is much better to try a doubtfull remedy, than none at all.

CHAP. XVIII. *Of drawing forth Arrows.*

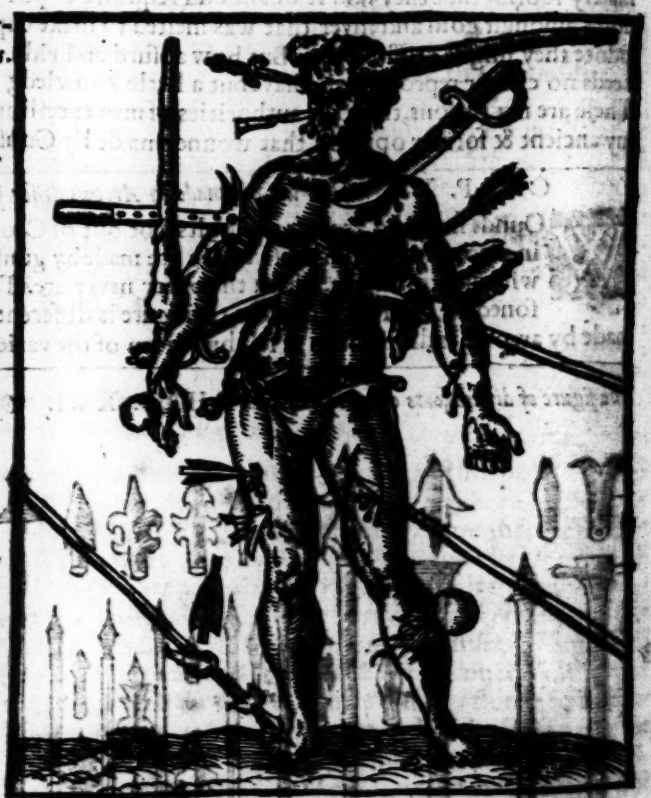
The manner of drawing forth Arrows, and such weapons.

YOu must in drawing forth Arrows shun incisions and dilacerations of Veins and Arteries, Nerves and Tendons. For it is a shamefull and bungling part to do more harm with your hand, than the Iron hath done. Now Arrows are drawn forth two wayes, that is, either by extraction, or impulsion. Now you must presently at the first dressing pull forth all strange bodies, which that you may more easily and happily perform, you shall set the Patient in the same posture, as he stood when he received his wound; and he must have also his Instruments in a readinesse, chiefly that which hath a slit pipe and toothed without, into which there is put a sharpe Iron style, like the Gimblets we formerly mentioned for the taking forth of Bullets; but that it hath no screw at the end, but is larger and thicker, so to widen the pipe, that so widened it may fill up the hole of the Arrows head whereinto the shaft was put, and so bring it forth with it, both out of the fleshy as also out of the bony parts, if so be that the end of the shaft be not broken, and left in the hole of the head. That also is a fit Instrument for this purpose, which opens the other end toothed on the outside, by pressing together of the handle. You shall find the Iron or head that lies hid by these signs, there will be a certain roughnesse and inequality observable on that part if you feel it up and down with your hand; the flesh there will be bruised, livid, or black, and there is heavinesse and pain felt by the Patient both there and in the wound.

A delineation of Instruments fit to draw forth the heads of arrows, & darts, which are left in the wound without their shafts.



A hooked Instrument fit for to draw forth strange bodies, as pieces of Male, and such other things as it can catch hold of, which may also be used in wounds made by Gunshot.



But if by chance either Arrows, Darts or Lances, or any winged head of any other weapon, be run through and left sticking in any part of the body, as the thigh, with a portion of the shaft or staffe, shivered in pieces, or broken off; then it is fit the Chirurgeon with his cutting nullets should cut off the end of the staffe or shaft, and then with his other nullets pluck forth the head, as you may see by this Figure.

CHAP.

CHAP. XIX. *How Arrowes broken in a wound may be drawn forth.*

BUt if it chance that the weapon is so broken in the wound, that it cannot be taken hold on by the formerly mentioned Mullets, then must you draw, or pluck it out with your Crane, or Crows bill, and other formerly described Instruments. But if the shaft be broken neer the head, so that you cannot take hold thereof with your Cranes bill, then you shall draw it forth with your Gimblet which we described before to draw forth bullets; for if such a Gimblet can be fastned in bullets, it may far better take hold of wood. But if the head be barbed, as usually the English arrowes are, then if it may be conveniently done, it will be very fitting to thrust them through the parts. For if they should be drawn out the same way they went in, there would be no small danger of breaking or tearing the Vessells and Nerves by these hooked barbes. Wherefore it is better to make a section on the other side whither the head tended, and so give it passage forth if it may be easily done; for so the wound will be the more easily clensed and consolidated. But on the contrary, if the point tend to any bone, or have many muscles or thick flesh against the head thereof, as it happens sometimes in the Thighs, Legs and Armes: then you must not thrust the head through, but rather draw it out the same way it came in, dilating the wound with fit Instruments, and by skill in Anatomie shunning the larger Nerves and Vessells. Therefore for this purpose put a hollow Dilater into the wound, and therewith take hold of both the barbs or wings of the head; and then take fast hold of the head with your Cranes-bill, and so draw them forth all three together.

When to draw forth the weapon on the contrary side.

When by the same way it went

A Dilater hollowed on the inside, with a Cranes-bill to take hold of the barbed head.

CHAP. XX. *What to be done, when an Arrow is left fastned or sticking in a bone.*

BUt if the weapon be so depact and fastned in a bone that you cannot drive it forth on the other side, neither get it forth by any other way, than that it entred in by; you must first gently move it up and down, if it stick very fast in, but have a speciall care that you do not break it, & so leave some fragment thereof in the bone; then take it forth with your Crowes bill, or some other fit Instrument formerly described. Then press forth the blood, and suffer it to bleed somewhat largely, yet according to the strength of the Patient and nature of the wounded part. For thus the part shall be eased of the fulness and ilness of humors, and less molested with inflammation, putrefaction and other symptomes which are customarily feared. When the weapon is drawn forth, and the wound once dressed, handle it, if simple, as you do simple wounds; if compound, then according to the condition and manner of the complication of the effects; Certainly the Oil of Whelpes formerly described is very good to asswage pain. To conclude, you shall cure the rest of the Symptomes according to the method prescribed in our Treatise of wounds in generall, and to that we have formerly delivered concerning wounds made by Gunshot.

A Caution.

The benefit of bleeding in wounds.

CHAP. XXI. *Of poysoned wounds.*

IF these wounds at any time prove poysoned, they have it from their primitive cause, to wit, the empoisoned Arrowes, or Darts of their enemies. You may find it out both by the property of the pain, if that it be great and pricking, as if continually stung with Bees, for such pain usually ensues in wounds poysoned with hot poyson, as Arrowes usually are; Also you shall know it by the condition of the wounded flesh, for it will become pale and grow livid, with some signs of mortification. To conclude, there happen many and malign symptomes upon wounds which are empoysoned, being such as happen not in the common nature of usuall wounds. Therefore presently after you have plucked forth the strange bodies, encompass the wound with many and deep scarifications, apply ventoses with much flame, that so the poyson may be more powerfully drawn forth; to which purpose the sucking of the wound, performed by one whose mouth hath no soarnes therein, but is filled with oil, that so the poison which he sucks may not stick, nor adhere to the part, will much conduce. Lastly, it must be drawn forth by rubefying, vesicatory and caustick medicins, and assailed by oyntments, cataplasmes, emplaisters, and all sorts of locall medicins.

THE TWELFTH BOOK.

CHAP. I.

Gal. Lib. de artis conſtitut. Sect. 2. lib. de fracturis.

A Contuſion according to *Galen*, is a ſolution of continuity in the fleſh or bone, cauſed by the ſtroak of ſome heavy and obtuſe thing, or a fall from an high. The ſymptome of this diſeaſe is by *Hippocrates* called *Peliosis*, and *Melasma*, that is to ſay, blackneſs and blewneſs; the Latins term it *Sugillatum*. There are divers ſorts of theſe Sugillations or blackneſſes, according as the blood is poured forth into the more inward or outward part of the body. The blood is poured forth into the body, when any (for example) falls from an high, or hath any heavy weight falls upon him, as it often happens to ſuch as work in Mines, or are extreamly racked or tortured; and ſometimes by too loud and forcible exclamation. Beſides alſo by a Bullet ſhot through the body, blood is poured forth into the bellie, and ſo often evacuated by the paſſages of the Guts and bladder. The ſame may happen by the more violent and obtuſe blowes of a hard Trunchion, Club, Stone, and all things which may bruiſe and preſs the blood out of the veſſells either by extending or breaking them. For which cauſes alſo the exteriour parts are contuſed, or bruiſed ſometimes with a wound, ſometimes without, ſo that the skin being whole, and as far as one can diſcern, untoucht, the blood poures it ſelf forth into the empty ſpaces of the muſcles, and between the skin and muſcles; which affect the Ancients have tearmed *Ecchymoſis*; *Hippocrates* calls it by a peculiar name *Nauſioſis*, for that in this affect the ſwoln veins ſeem as it were to vomit, and verily do vomit or caſt forth the ſuperfluous blood which is contained in them. From theſe differences of Contuſions are drawn the indications of curing, as ſhall appear by the enſuing diſcourſe.

Causes of Bruiſes and Sugillations.

Sect. 2. lib. de fract.

CHAP. II. *Of the generall cure of great and enormous Contuſions.*

THe blood poured forth into the body, muſt be evacuated by viſible and not viſible evacuation. The viſible evacuation may be performed by blood-letting, Cupping-glaſſes, horns, ſcrification, horſleeches and fit purgative medicins; if ſo be the Patient have not a ſtrong and continuall feaver; The not viſible evacuation is performed by reſolving and ſudorifick potions, baths, and a ſlender diet. Concerning Blood-letting *Galens* opinion is plain, where he bids, in a fall from an high place, and generally for bruiſes upon what part ſoever they be, to open a vein, though the parties affected are not of a full conſtitution; for that unleſs you draw blood by opening a vein, there may inflammations ariſe from the concreat blood, from whence without doubt evill accidents may enſue. After you have drawn blood give him foure ounces of Oxycrate to drink; for that by the tenuity of its ſubſtance hinders the coagulation of the blood in the belly, or in ſtead thereof you may uſe this following potion. ℞ *rad. Gentianæ* ℥iij. *bulliant in Oxycrato; in colatura diſſolve rhei electi* ℥j. *fiat potio.* Theſe Medicins diſſolve, and caſt forth by ſpitting and vomit the congealed blood, if any thereof be contained in the ventricle or lungs; it will be expedient to wrap the Patient preſently in a ſheeps skin, being hot and newly taken from the ſheep, and ſprinkled over with a little myrrhe, creſſes and ſalt, and ſo to put him preſently in his bed, & then cover him ſo that he may ſweat plentifully. The next day take away the ſheeps-skin, and anoint the body with the following anodyne and reſolving unguent. ℞ *unguent. de althæa* ℥vj. *olei Lumbric. chamæm. anethi. an.* ℥ij. *terebinth. venetæ* ℥iiij. *farinæ fœnugræ. roſar. rub. pulv. iſat. pul. myrtillorum, an.* ℥j. *fiat litus ut dictum eſt.* Then give this potion which is ſudorifick and diſſolves the congealed blood. ℞ *Ligni guajaci* ℥viij. *radicis enulæ camp. conſolid. majoris, ireos Florent. polypod. querni, ſcabioſæ, viperini, aniſi, an.* ℥ß. *glycyrhiz.* ℥ij. *nepetæ, centaureæ, caryophyl. cardui ben. verbenæ, an. m. j. aquæ fontanæ lib.* xij. Let them be all beaten and infuſed for the ſpace of twelve houres, then let them boil over a gentle fire untill the one half be conſumed; let the Patient drink ſome half pinte of this drink in the morning, and then ſweat ſome hour upon it in his bed, and doe this for ſeaven or eight dayes. If any poor man light upon ſuch a miſchance, who for want of means cannot be at ſuch coſt, it will be good, having wrapped him in a ſheet, to bury him up to the chin in Dung mixed with ſome hay or ſtraw, and there to keep him, untill he have ſweat ſufficiently. I have done thus to many with very good ſucceſs. You ſhall alſo give the Patient potions made with ſyrups which have power to hinder the coagulation and putrefaction of the blood; ſuch as ſyrup of Vinegar, or Lemons, of the juice of Citrons and ſuch others to the quantitie of an ounce diſſolved in ſcabius, or *Cardum* water. You may alſo preſently after the fall give this drink, which hath power to hinder the coagulation of the blood, and ſtrengthen the bowells. ℞ *Rhei elect. in pul. redacti* ℥j. *aquæ rubiæ majoris, & plantag. in. an.* ℥j. *theriacæ* ℥ß. *ſyrupi de roſis ſiccis* ℥ß, *fiat potus.* Let him take it in the morning for foure or five dayes. In ſtead hereof you may make a potion of one dram of *Sperma ceti* diſſolved in bugloſs or ſome other of the waters formerly mentioned, and half an ounce of ſyrup of Maiden-hair; if the diſeaſe yeeld not at all to theſe formerly preſcribed medicins, it will be good to give the Patient for nine dayes, three or foure houres before meat ſome of the following powder. ℞ *rhei torrefacti, rad. rub. majoris, centaurei, gentianæ, ariſtolo. rotundæ, an.* ℥ß. give ℥j. hereof with ſyrup of Vinegar and *Carduus* water. They ſay that the water of green Walnuts, diſtilled by an Alembick, is good to diſſolve congealed and knotted blood. Alſo you may uſe baths made of the decoction of the roots of Orris, Elecampane, Sorrell, Fennell, Marſhmallowes, Water-fern, or Oſmund

Ad ſentent. 62. ſect. 3. lib. de Articulis.

A potion to diſſolve and evacuate clotted blood.

A hot ſheeps skin.

A diſcuſſing oyntment.

A ſudorifick potion to diſſolve congealed blood.

Symps hindering putrefaction & congealing of blood.

A drink for the ſame purpoſe.

A powder for the ſame.

The diſtilled water of green Walnuts.

Baths.

mund the waterman, the greater Comfrey, the seeds of Fænugreek, the leaves of Sage, Marjerum; the flowres of Camomile, Melilote, and the like. For a warm bath hath power to rarifie the skin, to dissolve the clotted blood, by cutting the tough and mitigating the acrid humors, by calling them forth into the surface of the body, and relaxing the passages thereof; so that the rebellious qualities being orecome, there insues an easie evacuation of the matter by vomit, or expectoration, if it flote in the stomach, or be contained in the Chest; but by stool & urin, if it lye in the lower parts; by sweats and transpiration, if it lye next under the skin. Wherefore bathes are good for those who have a *Peripneumonia* or inflammation of their Lungs, or a Plurisie, according to the mind of *Hippocrates*, if so be that they be used, when the feaver begins to be asswaged; for so they mitigate pain, help forwards suppuration, and hasten the spitting up of the purulent matter. But we would not have the Patient enter into the bath, unless he have first used generall remedies, as blood-letting and purging; for otherwise there will be no small danger, lest the humors diffused by the heat of the bath, cause a new defluxion into the parts affected. Wherefore do not thou by any means attempt, to use this or the like remedy, having not first had the advice of a Physitian.

Lib.3.de vict.acut. & lib.3.de morb.

CHAP. III. *How we must handle Contusions, when they are joyned with a wound.*

EVery great Contusion forthwith requires blood-letting, or purging, or both; and these either for evacuation, or revulsion. For thus *Hippocrates* in a contusion of the heel, gives a vomitory portion, the same day, or else the next day after the heel is broken. And then if the Contusion have a wound associating it, the defluxion must be stayed at the beginning with an ointment made of Bole Armenick, the whites of egs, and oil of roses, and myrtles, with the pouders of red roses, allome and mastich. At the second dressing apply a digestive made of the yoalk of an eg, oil of violets and turpentine. This following cataplasm shall be applyed to the near parts to help forwards suppuration. ℞. *rad. althææ, & lilii, an.* ℥ iiij. *fol. malv. violar. senecionis, an. M. ff. coquantur complete, & passentur per setaceum, addendo butyri recentis & olei viol. an.* ℥ iij. *farinæ volatilis quant. sufficit; fiat cataplasma ad formam pultis liquidæ.* Yet have a care in using of Cataplasms, that you do not too much exceed; for too frequent and immoderate use of them makes wounds phlegmonous, sordid and putrid. Wherefore the wound after it is come to suppuration must be clensed, filled with flesh and cicatrized, unlesse happily the contused flesh shall be very much torn, so that the native heat forsake it, for then it must be cut away. But if there be any hope to agglutinate it, let it be sowed, and other things performed according to Art; but the stitches must not be made so close together, as when the wound is simple, and without contusion; for such wounds are easily inflamed and swell up, which would occasion either the breaking of the thred or flesh, or tearing of the skin.

Sect.lib. fract.

A suppurative Cataplasm.

A caution to be observed.

How contused wounds must be sowed.

CHAP. IV. *Of these Contusions which are without a wound.*

IF the skin being whole and not hurt, as far as can be discerned, the flesh which lies under it be contused, and the bloud poured forth under the skin make an *Ecchymosis*, then the Patient must be governed according to Art untill the malign symptomes which commonly happen, be no more to be feared. Wherefore in the beginning draw bloud on the opposite side, both for evacuation and revulsion. The contused part shall be scarified with equall scarifications; then shall you apply cupping-glasses or horns, both for evacuation of the bloud which causes the tumor and tension in the part; as also to ventilate and refrigerate the heat of the part, lest it turn into an Abscesse. Neither must we in the mean while omit gentle purging of the belly. The first to pick medicins ought to be astrictives, which must lye some short while upon the part, that so the Veins, and Arteries may be as it were straitned and closed up; and so the defluxion hindred; as also that the part it self may be strengthened. This may be the form of such a remedy, ℞. *Albumina ovorum nu.* iij. *olei myrtini & rosacei, an.* ℥ j. *boli armeni, & sanguin. dracon. an.* ℥ ß. *nucum cupres. gallarum, pul. aluminis usti, an.* ℥ ij. *incorporentur omnia addendo aceti parum, fiat medicamentum.* Then you shall resolve it with a fomentation, cataplasm and discussing emplaisters.

Phleborotomy.

Scarifying Cupping-glasses.

Astrictives how good in Contusions.

After astrictives must follow discussives.

CHAP. V. *By what means the contused part may be freed from the fear and imminent danger of a Gangrene.*

GReat contusions are dangerous even for this cause, for that a Gangrene and mortification sometimes follows them; which *Hippocrates* teacheth to happen, when as the affected part is grown very hard and liquid. Wherefore when the part grows livid and black, and the native colour thereof, by reason of the efflux of the concreat bloud, is almost extinct; chiefly to ease the part of that burden, cupping-glasses and horns shal be applyed to the part it self being first scarified with a Lancet, or else the following Instrument termed a *Scarificator*, which hath 18. little wheels sharp and cutting like a razour, which may be straitened and slacked by the pins noted by *D.* and *P.* This instrument is to be commended for that it performs the operation quickly and gently, for it makes 18 incisions in the space that you make one with a Lancet or knife.

Sect.2.lib. de fract.

The cause of a Gangrene.

The use of a Scarificator.

Then shall you foment the part with strong vinegar wherein the roots of radish or of Dragons, Cuckow-pint, *Salomons* Seal, *Auripigmentum* and the like have been boiled; for such acrid things do powerfully heat, resolve and draw the concreat blood from the inner part of the body unto the skin, which by its setling in the part affected, prohibits the entrance of the vitall spirits, the preservers of its integrity; yea also extinguisheth the native heat of the same part. Now we must not use these things but with great discretion, lest so we draw not only that blood which is poured forth of the vessels,

A fomentation to discusse and draw to the skin.

but

but alſo the other which is contained in the veſſels. Moreover alſo we muſt not uſe them, unleſſe when the defluxion is ſtayed. For ſmall contuſions (which *Galen* judgeth by the ſoftneſſe of the contuſed part) it will be ſufficient to apply to diſcuſſe them, Virgins wax diſſolved and mixed with Cummin ſeeds, Cloves, the root of black Briony, (which hath a wonderfull faculty to diſcuſſe all blacknesſes and ſugillations:) for the ſame purpoſe, you may alſo apply wormwood bruiſed and ſo warmed in a diſh and ſprinkled over with a little white wine. Alſo fry wormwood with oil of camomill, bran, the powder of Cloves, and Nutmegs, adding thereto a little *aquæ vitæ*, then put all in a linnen cloth and apply it hot to the part. The following emplaiſter doth powerfully diſcuſſe congealed blood.

In ſect. 2. lib. de fract.

A Scarificator.

A. *Shews the cover.* B. *The Box, or Caſe.*

A diſcuſſing plaiſter. R. *Picis nigræ* ℥ ij. *Gum. Elemi* ℥ i ß. *ſtyracis liquidæ & terebinth. com. an.* ℥ ß. *ſulphuris vivi* ℥ j. *Liquefiant ſimul, fiat Emplaſtrum*; and let it be ſpred upon leather and ſo applyed.

CHAP. VI. *Of that ſtrange kind of ſymptome which happens upon contuſions of the ribs.*

Hip ſect. 3. lib. de art. ſent. 58. & 65.

THe fleſh contuſed ſometimes by great violence becomes mucous and ſwoln, or puffed up like Veal, which the butchers blow up, the skin remaining whole. This is ſeen and happens chiefly in that fleſh which is about the ribs; for this being bruiſed either by a blow, or fall, or renitency, or any other ſuch like cauſe; if you preſs it with your hand, a certain windineſs goeth out thereof with a ſmall whizzing, which may be heard, and the print of your fingers wil remain as in *œdema's*. Unleſs you quickly make fit proviſion againſt this ſymptome, there is gathered in that ſpace which the fleſh departing from the bones, leaves empty, a certain purulent *ſanies*, which divers times fouls and corrupts the ribs. It will be cured, if the mucous tumor be preſently preſſed, & ſtraitly bound with ligatures, yet ſo that you hinder not the breathing, when as the affect happens upon the ribs and parts of the Cheſt. Then apply to the part a plaiſter of *Oxycroceum* or *diachylon Ireatum* with the emplaiſter *de meliloto*; alſo diſcuſſing fomentations ſhall be uſed. The cauſe of ſuch a tumor is a certain mucous flegm; ſeeing that nature is ſo weak that it cannot well digeſt the nouriſhment, and aſſimilate it to the part, but leaves ſomething as it were half concocted. No otherwiſe than the conjunctive coat of the eye is ſometime ſo lifted up and ſwoln by a ſtroak, that it ſtarts as it were out of the orb of the eye, leaving ſuch filth or matter as we ſee thoſe which are blear eyed to be troubled withall; becauſe the force and naturall ſtrength of the eyes is become more weak, either by the fault of the proper diſtemperature, or the abundance of moiſture which flows thither, as it happens in thoſe tumors which are againſt nature. For flatulencies are eaſily raiſed from a waterish and phlegmatick humor wrought upon by weak heat, which mixed with the reſt of the humor, the tumor becomes higher.

Remedies for a mucous and flatulent tumor of the ribs.

The cauſe.

CHAP. VII. *A diſcourſe of* Mumia, *or Mummy.*

PEradventure it may ſeem ſtrange what may be the cauſe, why in this Treatiſe of curing contuſions, or bruiſes, I have made no mention of giving Mummy either in bole, or potion to ſuch as have faln from high places, or have been otherwiſe bruiſed, eſpecially ſeeing it is ſo common and uſual, yea the very firſt and laſt medicin of almoſt all our practitioners at this day in ſuch a caſe. But ſeeing I underſtood, and had learnt from learned Phyſitians, that in uſing remedies, the indication muſt alwayes be taken from that which is contrary to the diſeaſe, how could I? how can any other give Mummie in this kind of diſeaſe, ſeeing we cannot as yet know what Mummie is, or what is the nature and eſſence thereof? So that it cannot certainly be judged; whether it have a certain property contrary to the nature and effects of contuſions. This how it may have, I have thought good to relate ſomewhat at large; neither do the Phyſitians who preſcribe Mummie, nor the Authors that have written of it, nor the Apothecaries that ſell it, know any certainty thereof. For if you read the more ancient *Serapio* and *Avicen* or the modern *Matthiolus* and *Thevet*, you ſhall find quite different opinions. Ask the Merchants who bring it to us, ask the Apothecaries who buy it of them, to ſell it to us, and you ſhall hear them ſpeak diverſly hereof, that in ſuch variety of opinions, there is nothing certain and manifeſt. *Serapio* and *Avicen* have judged Mummie to be nothing elſe but *Piſſaſphaltum*; now *Piſſaſphaltum* is a certain froth or foam riſing from the Sea, or Sea waters; this ſame foam as long as it ſwims upon the water is ſoft and in ſome ſort liquid: but being driven upon the ſhore by force of tempeſt, and working of the ſea, and ſticking in the cavities of the rocks, it concreats into ſomewhat a harder ſubſtance than dryed pitch, as *Dioſcorides* ſaith. *Belonius* ſaith, that Mummie is only known to *Ægypt* and *Greece*. Others write that it is mans fleſh, taken from the carcaſes of ſuch as are dead, and covered over in the ſands in the deſerts of *Arabia*; in which Country they ſay the Sands are ſometimes carryed and raiſed up with ſuch force and violence of the winds, that they overthrow and ſuffocate ſuch paſſengers

Mummie a frequent and uſuall medicin in contuſions. The reaſon that the Author makes no mention thereof amongſt his medicins. The opinion of the Arabians concerning it.

Lib. 4. cap. 84.

Another opinion of Mummie.

as they meet withall; the fleſh of theſe dryed by the ſand and wind they affirm to be Mummie. *Mathiolus* following the more uſuall and common opinion writes, that Mummie is nothing elſe than a liquor flowing from the Aromatick embalments of dead bodies, which becomes dry and hard. For underſtanding whereof you muſt know from all manner of anitiquity, that the *Ægyptians* have been moſt ſtudious in burying and embalming their dead; not for that end that they ſhould become medicins for ſuch as live, for they did not ſo much as reſpect or imagin ſo horrid a wickednes; but either for that they held an opinion of the generall reſurrection, or that in theſe monuments they might have ſomething, whereby they might keep their dead friends in perpetuall remembrance. *Thevet* not much diſſenting from his own opinion, writes that the true Mummie is taken from the monuments and ſtony tombs of the anciently dead in *Egypt*, the chinks of which tombs were cloſed, and cimented with ſuch diligence; but the incloſed bodies embalmed with pretious ſpices with ſuch Art for eternity, that the linnen veſtures which were wrapt about them preſently after their death, may be ſeen whole even to this day; but the bodies themſelves, are ſo freſh that you would judg them ſcarſe to have been three daies buried. And yet in thoſe Sepulchers and Vaults from whence theſe bodies are taken, there have been ſome corps of two thouſands years old. The ſame, or their broken members are brought to *Venice* from *Syria* & *Egypt*, and thence diſperſt over all *Chriſtendom*. But according to the different condition of men, the matter of their embalments were divers; for the bodies of the Nobility or Gentry are embalmed with Myrrh, Aloes, Saffron, and other precious ſpices, and Drugs; but the bodies of the common ſort whoſe poverty and want of means could not undergo ſuch coſt, were embalmed with *aſphaltum* or *piſſaſphaltum*. Another.

Now *Mathiolus* ſaith that all the Mummie which is brought into theſe parts is of this laſt kind & condition. For the Noblemen and chief of the province ſo religiouſly addicted to the monuments of their anceſtors, would never ſuffer the bodies of their friends, and kindred to be tranſported hither for filthy gain, and ſuch deteſted uſe, as we ſhall ſhew more at large at the end of this work. Which thing ſometimes moved certain of our *French* Apothecaries, men wondrous audacious, and covetous, to ſteal by night the bodies of ſuch as were hanged, and embalming them with Salt and Drugs they dryed them in an Oven, ſo to ſel them thus adulterated in ſtead of true Mummie. Wherefore we are thus compelled both fooliſhly and cruelly to devoure the mangled and putrid particles of the carkaſſes of the baſeſt people of *Egypt*, or of ſuch as are hanged, as though there were no other way to help or recover one bruiſed with a fall from a high place, than to bury man by an horrid inſertion in their, that is, in mans guts. Now if this Drug were any way powerfull for that they require, they might perhaps have ſome pretence, for this their more than barbarous inhumanity. But the caſe ſtands thus, that this wicked kind of Drug, doth nothing help the diſeaſed, in that caſe, wherefore and wherein it is adminiſtred, as I have tryed an hundred times, & as *Thevet* witneſſes, he tryed in himſelf, when as he took ſome thereof by the advice of a certain *Iewiſh* Phyſitian in *Egypt*, from whence it is brought; but it alſo infers many troubleſome ſymptomes, as the pain of the heart or ſtomach, vomiting and ſtink of the mouth. What our Mummie uſually is. Mummie is no way good for contuſions;

I perſwaded by theſe reaſons, do not only my ſelf preſcribe any hereof, to my Patients, but alſo in conſultations, endeavour what I may, that it be not preſcribed by others. It is far better according to *Galens* opinion *in Method. med.* to drink ſome oxycrate, which by its frigidity reſtrains the flowing blood, and by its tenuity of ſubſtance diſſolves and diſcuſſes the congealed clots thereof. Many reaſons of learned Phyſitians (from whom I have learned this Hiſtory of Mummie) drawn from Philoſophy, whereby they make it apparent, that there can be no uſe of this or that Mummie in contuſions, or againſt flowing or congealed blood, I willingly omit; for that I think it not much beneficiall to Chirurgeons to inſert them here. Wherefore I judg it better to begin to treat of combuſtions, or burns. But hurtfull, and how? The effects of oxycrate in Contuſions.

CHAP. VIII. *Of Combuſtions and their differences.*

ALL Combuſtions whether occaſioned by Gunpouder, or by ſcalding oil, water, ſome metall or what things ſoever elſe, differ only in magnitude. Theſe firſt cauſe pain in the part, and imprint in it an unnaturall heat. Which ſavouring of the fire, leaves that impreſſion, which the Greeks call *Empyreuma*. There are more or leſſe ſigns of this impreſſion, according to the efficacy of the thing burning, the condition of the part burned, and ſtay upon the ſame. If the combuſtion be ſuperficiary, the skin riſes into puſtules and bliſters, unleſſe it be ſpeedily prevented. If it be low or deep in, it is covered with an *Eſchar* or cruſt, the burnt fleſh by the force of the fire turning into that cruſty hardneſſe. The burning force of the fire, upon whatſoever part it falls, leaves a hot diſtemper therein, condenſates, contracts, and thickens the skin, whence pain proceeds; from pain there comes an attraction of humors, from the adjacent and remote parts. Theſe humors preſently turned into waterish or ſerous moiſture, whilſt they ſeek to paſſe forth, and are hindred thereof by the skin condenſated by the action of the fire, they lift it up higher, and raiſe the bliſters which we ſee. Hence divers Indications are drawn, whence proceeds the variety of medicins for burns. For ſome take away the *Empyreuma*, that is, the heat of the fire, (as we term it) & aſſuage the pain; other hinder the riſing of bliſters; other ſome are fit to cure the ulcer, firſt to procure the falling away of the *Eſchar*, then to cleanſe, generate fleſh and cicatrize it. Remedies fit to aſſwage pain, and take away the fiery heat, are of two kinds; for ſome do it by a cooling faculty, by which they extinguiſh the preternaturall heat, and repreſs or keep back the blood and humors, which flow into the parts by reaſon of heat and pain. Others endued with contrary facultie, are hot and attractive; as which by relaxing the skin, and opening the pores, reſolve and diſſipate the ſerous humors, which yeeld both beginning, and matter to the puſtules, and ſo by accident aſſwage the pain and heat. Refrigerating things are cold water, the water of Plantain, Night-ſhade, Henbane, Hemlock, the juyces of cooling hearbs, as Purſlane, Lettuce, Plantain, Houſleek, Poppy, Mandrake and the like. Of theſe ſome may be compounded, as ſuppoſe of the fore-named The cauſe and ſymptomes of combuſtions. The cauſe of the bliſters riſing upon burns. Variety of medicins to take away the heat and aſſwage the pain.

named juices beaten with the white of an egge; Clay beaten and diſſolved in ſtrong Vinegar; roch Alome diſſolved in water, with the whites of egs beaten therein; writing ink mixed with Vinegar, and a little Camphire; *Vnguentum nutritum*, and alſo *Populeon* newly made. Theſe and the like ſhall be now and then renewed chiefly at the firſt, untill the heat and pain be gone. But theſe ſame remedies muſt be applyed warm, for if they ſhould be laid, or put to cold, they would cauſe pain, and conſequently defluxion; beſides alſo their ſtrength could not paſſe, or enter into the part, or be brought into action; but ſo applyed they aſſwage pain, hinder inflammation and the riſing of bliſters.

CHAP. IX. *Of hot and attractive medicins to be applyed to burnes.*

How fire may aſſwage the pain of burning.

AMongſt the hot and attractive things which by rarifying, drawing out, and diſſolving, aſſwage the pain and heat of combuſtions, the fire challenges the firſt place, eſpecially when the burning is but ſmall. For the very common people know and find by dayly experience, that the heat of the lightly burnt part vaniſhes away, and the pain is aſſwaged, if they hold the part which is burnt ſome prety while to the heat of a lighted candle, or burning coals; for the ſimilitude cauſeth attraction. Thus the externall fire whileſt it draws forth the fire which is internall and inuſt into the part, is a remedy againſt the diſeaſe it cauſed and bred. It is alſo an eaſily made and approved remedy, if they preſently after the burn apply to the grieved part raw Onions beaten with ſome ſalt.

Beaten Onions good for burns and how.

Now you muſt note, that this medicine takes no place, if it be once gone into an ulcer, for it would increaſe the pain and inflammation; but if it be applyed when the skin is yet whole and not excoriated, it doth no ſuch thing, but hinders the riſing of puſtles and bliſters. *Hippocrates* for this cauſe alſo uſes this kind of remedy in procuring the fall of the *Eſchar*. If any endeavour to gainſay the uſe of this remedy by that principle in Phyſick, which ſayes, that contraries are cured by contraries, and therefore

Lib. 5. ſimpl.

affirm that Onions according to the authority of *Galen*, being hot in the fourth degree, are not good for combuſtions; let him know that Onions are indeed potentially hot, and actually moiſt, therefore they rarifie by their hot quality, and ſoften the skin by their actuall moiſture, whereby it comes to paſs that they attract, draw forth, and diſſipate the imprinted heat, and ſo hinder the breaking forth of puſtles. To conclude, the fire, as we formerly noted, is a remedy againſt the fire. But neither are diſeaſes alwayes healed by their contraries (ſaith *Galen*) but ſometimes by their like; although all healing proceed from the contrary, this word *contrary*, being more largely and ſtrictly taken, for ſo alſo a Phlegmon is often cured by reſolving medicins, which healeth it by diſſipating the matter thereof. Therefore Onions are very profitable for the burnt parts, which are not yet exulcerated or excoriated. But there are alſo many other medicins good to hinder the riſing of bliſters; ſuch as new horſe-dung fryed in oil of Wal-nuts or Roſes, and applyed to the parts. In like manner the leaves of Elder or Dane-wort boiled in oil of nuts, and beaten with a little ſalt. Alſo quenched lime powdered and mixed with *Vnguentum Roſatum*. Or elſe the leaves of Cuckow-pint and Sage beaten together with a little ſalt. Alſo Carpenters Glue diſſolved in water and anointed upon the part with a feather, is good for the ſame purpoſe. Alſo thick Verniſh which poliſhers or ſword cutlers uſe. But if the pain be more vehement, theſe medicins muſt be renewed 3 or 4 times in a day and a night, ſo to mitigate the bitternes of this pain. But if ſo be we cannot by theſe remedies hinder the riſing of bliſters, then we muſt preſently cut them as ſoon as they riſe, for that the humor contained in them, not having paſſage forth, acquires ſuch acrimony that it eats the fleſh which lyeth under it, and ſo cauſeth hollow ulcers: So by the multitude of cauſes and increaſe of matter the inflammation groweth greater, not only for nine dayes (as the common people prattle) but for far longer time; alſo ſome whiles for leſs time, if the body be neither repleat with ill humors, nor plethorick, and you have ſpeedily reſiſted the pain and heat by fit remedies. When the combuſtion ſhall be ſo great as to cauſe an *Eſchar*, the falling away muſt be procured by the uſe of emollient and humective medicins, as of greaſes, oils, butter, with a little *baſilicon*, or the following ointment. ℞ *Mucagin. pſillii. & cydon. an.* ℥iiij. *gummi trag.* ℥ij. *extrahantur cum aqua parietariæ, olei liliorum* ℥iſſ. *cereæ novæ q. ſ. fiat unguentum molle.* For ulcers and excoriations you ſhall apply fit remedies, which are thoſe that are without acrimony, ſuch as *unguentum album camphoratum, deſiccativum rubrum, unguentum roſatum*, made without Venegar, or *nutritum* compoſed after this manner. ℞ *lithargyri auri* ℥iiij. *ol. roſat.* ℥iij. *ol. de papaver.* ℥ijſß. *ung. populeon.* ℥iiij. *camphoræ* ʒj. *fiat unguentum in mortario plumbeo ſecundum artem.* Or oil of Egs tempered in a Leaden mortar. Alſo unquenched lime many times waſhed and mixed with *unguentum roſatum*, or freſh butter without ſalt, and ſome yolks of egs hard roaſted. Or ℞ *Butyri recent. ſine ſale, aſtulati, & colati* ℥vj. *vitell. ovor.* iiij. *ceruſ. lotæ in aqua plantag. vel roſar.* ℥ß. *tuthiæ ſimiliter lotæ*, ℥iij. *plumbi uſti, & lot.* ℥ij. *Miſceantur omnia ſimul, fiat linimentum ut decet.* Or elſe, ℞ *cort. ſambuc. viridis, & olei roſat. an. lib. ʒ. bullian ſimul lento igne, poſtea colentur, & adde olei ovorum* ℥iiij. *pul. ceruſſ. & tuthiæ præparat. an.* ℥ʒ. *cereæ albæ quantum ſufficit, fiat unguent. molle ſecundum artem.* But the quantity of drying medicins may alwayes be increaſed or diminiſhed according as the condition of the ulcer ſhall ſeem to require. The following remedies are fit to aſſwage pain, as the mucilages of Line ſeeds, of the ſeeds of *Pſillium*, or Flea-wort, and quinces extracted in roſewater, or fair water, with the addition of a little camphire; and leſt that it dry too ſpeedily, adde thereto ſome oil of Roſes. Alſo five or ſix yolks of egs mixed with the mucilages of Line ſeed, the ſeed of *Pſillium*, and quinces often renewed, are very powerfull to aſſwage pain. The women which attend upon the people in the Hoſpitall in *Paris*, do happily uſe this medicin againſt burns. ℞ *Lard. conſciſi libram unam*; let it be diſſolved in Roſewater, then ſtrained through a linnen cloath, then waſh it foure times with the water of hen-bane or ſome other of that kind, then let it be incorporated with eight yolks of new laid egs, and ſo make an ointment. If the ſmart be great, as uſually it is in theſe kinds of wounds, the ulcer or ſores ſhall be covered over with a piece of Tiffany, leſt you hurt them, by wiping them with ſumewhat a courſe cloth, and ſo alſo the matter may eaſily come forth,

How often in a day theſe muſt be dreſſed.

Medicins for an *Eſchar*.

A deſcription of *Nutritum*.

A remedy for burns commonly uſed in the Hoſpitall of *Paris*.

and

and the medicins easily enter in. Also you must have a care when the eyelids, lips, sides of the fingers, neck, the armpits, hams, and bending of the elbow are burnt, that you suffer not the parts to touch one the other, without the interposition of some thing; otherwise in continuance of time they would grow and stick together. Therefore you shall provide for this, by fit placing the parts, and putting soft linnen rags between them. But you must note, that deep combustions, and such as cause a thicker *Eschar*, are less painfull, than such as are but only superficiary. The truth hereof you may perceive by the example of such as have their limbs cut off, and seared or cauterised with an hot Iron; for presently after the cauterising is performed they feel little pain. For this great combustion takes away the sense, the vehemency of the sensory or thing affecting the sense, depriving the sensitive parts of their sense; As we have formerly noted when we treated of wounds and pains of the Nerves. The falling away of such *Eschars* shall be procured by somewhat a deep scarification which may pierce even to the quick, that so the humors which lye under it may enjoy freer perspiration, and emollient medicins may the freelier enter in, so to soak, moisten and soften the *Eschar* that it may at length fall away. The rest of the cure shall be performed by detergent and sarcotick medicins, adding to the former ointments metalline powders, when the present necessity shall seem so to require. But we cannot justly say in what proportion and quantity each of these may be mixed, by reason of that variety which is in the temper and consistence of bodies, and the stubbornes and gentleness of diseases. After a burn the scar which remaineth is commonly rough, unequall, and ill favoured: therefore we will tell you in our treatise of the plague how it must be smoothed, and made even.

Why deep combustions are less painfull then superficiary.

I must not here omit to tell you, that Gunpowder set on fire doth often so penetrate into the flesh, not ulcerating nor taking off the skin, and so insinuate and throughly fasten it selfe into the flesh by its tenuity, that it cannot be taken or drawn out thence by any remedies, no not by *Phœnigmes* nor vesicatories, nor scarification, nor ventoses, nor horns, so that the prints thereof alwayes remain, no otherwise than the marks which the Barbarians burn in their slaves, which cannot afterwards be taken away or destroyed by any Art.

Marks or spots made in the face by corns of Gunpowder cannot be taken away.

CHAP. X. *Of a Gangrene and Mortification.*

CErtainly the maligne symptomes which happen upon wounds, and the solutions of Continuity are many, caused either by the ignorance or negligence of the Chirurgeon; or by the Patient, or such as are about him, or by the malignity and violence of the disease: but there can happen no greater then a Gangrene, as that which may cause the mortification and death of the part, and oft times of the whole body; wherefore I have thought good in this place to treat of a Gangrene, first giving you the definition, then shewing you the causes, signs, prognosticks, and lastly the manner of cure. Now a Gangrene is a certain disposition, and way to the mortification of the part, which it seiseth upon, dying by little and little. For when there is a perfect mortification, it is called by the Greeks *Sphacelus*, by the Latines *Sideratio*, our countrymen terme it the fire of Saint *Anthony* or Saint *Marcellus*.

Gal. 2. ad Glauconem.

CHAP. XI. *Of the generall and particular causes of a Gangrene.*

THe most generall cause of a Gangrene is, when by the dissolution of the harmony and joint temper of the foure first qualities, the part is made unapt to receive the faculties, the Naturall, Vitall, and Animall spirits, by which it is nourished, lives, feels, and moves. For a part deprived by any chance of these as of the light, languishes and presently dyes. Now the particular causes are many, and these either primitive, or antecedent. The primitive or externall are combustions caused by things either actually or potentially burning; actually, as by fire, scalding oil or water, gunpowder fired and the like. But potentially by acrid medicins; as Sublimate, vitriol, potentiall cauterics and other things of the same nature: for all these cause a great inflammation in the part. But the ambient air may cause great refrigerations, and also a Gangrene, which caused *Hippocrates lib. de Aer.* to call great refrigerarions of the brain *Sphacelisme*. Therefore the unadvised and unfit application of cold and narcotick things, a fracture, luxation and great contusion, too strait bandages, the biting of beasts, especially of such as are venemous, a puncture of the Nerves and Tendons, the wounds of the nervous parts and joints, especially in bodies which are plethorick and repleat with ill humors, great wounds whereby the vessels which carry life are much cut, whence an *aneurisme*, and lastly many other causes, which perturb that harmony of the foure prime qualities which we formerly mentioned, and so infer a Gangrene.

The generall cause of a Gangrene.

The particular causes.

Cold causeth a Gangrene.

CHAP. XII. *Of the Antecedent causes of a Gangrene.*

NOw the antecedent or internall and corporeall causes of a Gangrene, are plentifull and abundant defluxions of humors, hot or cold, falling into any part. For seeing the faculty of the part is unapt and unable to sustain and govern such plenty of humors, it comes to passe that the native heat of the part is suffocated and extinct for want of transpiration. For the Arteries are hereby so shut or pent up in a strait, that they cannot perform their motions of contraction and dilatation, by which their native heat is preserved and tempered. But then the Gangrene is chiefly uncureable when the influx of humors first takes hold of the bones, and inflammation hath its beginning from them. For in the opinion of *Galen* all these kind of affects which may befall the flesh, are also incident to the bones. Neither only a Phlegmon or inflammation, but also a rotteunesse and corruption

How defluxions cause a Gangrene.

An uncureable Gangrene.

Lib. de me. per omn. corp.

ruption doth oft-times firſt invade and begin at the bones; for thus you may ſee many who are troubled with the Leproſie and French diſeaſe, to have their skin and fleſh whole and fair to look on, whoſe bones notwithſtanding are corrupt and rotten, and oft-times are much decayed in their proper ſubſtance. This miſchief is cauſed by a venemous matter, whoſe occult qualitie we can ſcarſe expreſſe by any other name than poyſon inwardly generated. Oft-times alſo there is a certain acrid and ſtinking filth generated in fleſh with a malign and old ulcer, with which if the bones chance to be moiſtened they become foul and at length mortified: of which this ſaying of *Hippocrates* is extant, Ulcers of a years continuance or longer, muſt neceſſarily foul the bone, and make the ſcars hollow. Whither alſo belongs this ſaying of the ſame party; An *Eriſipelas* is ill in the laying bare of a bone. But this flowing venenate and gangrenous matter is ſomewhiles hot, as in peſtilent Carbuncles, which in the ſpace of four and twenty hours by cauſing an *eſchar*, bring the part to mortification: otherwhiles cold, as we ſee it divers times happens in parts which are poſſeſt with a Gangrene, no pain, tumor, blackneſs, nor any other precedent ſign of a Gangrene going before. For *John de Vigo* ſaith, that happened to a certain gentlewoman of *Genoa* under his cure.

Aph. 5. ſect. 6.

A Gangrene by efflux of a cold matter.

A notable Hiſtory.

I remember the ſame happened to a certain man in *Paris*, who ſupping merrily and without any ſenſe of pain, went to bed, and ſuddainly in the night time a Gangrene ſeiſed on both his legs, cauſed a mortification without tumor, without inflammation; only his legs were in ſome places ſpred over with livid, black and green ſpots, the reſt of the ſubſtance retaining his native colour: yet the ſenſe of theſe parts was quite dead, they felt cold to the touch; and if you thruſt your lancet into the skin no blood came forth. A Councell of Phyſitians being called, they thought good to cut the skin, and fleſh lying under it, with many deep ſcarifications; which when I had done, there came forth a little black, thick and as it were congealed blood; wherefore this remedy, as alſo divers other, proved to no purpoſe, for in concluſion a blackiſh colour comming into his face, and the reſt of his body, he dyed frantick. I leave it to the Readers judgement, whether ſo ſpeedy, and ſuddainly cruell a miſchief could proceed from any other than a venenate matter; yet the hurt of this venenate matter is not peculiar, or by its ſelf. For oft-times the force of cold, whether of the encompaſſing air, or the too immoderate uſe of Narcotick medicins, is ſo great, that in a few hours it takes away life from ſome of the members, and divers times from the whole body, as we may learn by their example, who travell in great ſnowes, and over mountains congealed, and horrd with froſt and ice. Hence alſo is the extinction of the native heat and the ſpirits reſiding in the part, and the ſhutting forth of that which is ſent by nature to aid or defend it. For when as the part is bound with rigid cold, and as it were frozen, they cannot get nor enter therein. Neither if they ſhould enter into the part, can they ſtay long there, becauſe they can there finde no fit habitation, the whole frame and government of nature being ſpoiled, and the harmony of the four prime qualities deſtroyed, by the offenſive dominion of predominant cold their enemy, whereby it cometh to paſſe that flying back from whence they firſt came; they leave the part deſtitute and deprived of the benefit of nouriſhment, life, ſenſe and motion.

Simple cold may cauſe a Gangrene.

A Hiſtory.

A certain Briton an Hoſtler in *Paris*, having drunk ſoundly after ſupper, caſt himſelf upon a bed; the cold air coming in at a window left open, ſo took hold upon one of his legs, that when he waked forth of his ſleep, he could neither ſtand nor goe. Wherefore thinking only that his leg was numb, they made him ſtand to the fire; but putting it very nigh, he burnt the ſole of his foot without any ſenſe of pain, ſome fingers thickneſs, for a mortification had already poſſeſſed more than halfe his leg. Wherefore after he was carryed to the Hoſpitall, the Chirurgeon who belonged thereto, endeavoured by cutting away of the mortified leg to deliver the reſt of the body from imminent death; but it proved in vain; for the mortification taking hold upon the upper parts, he dyed within three dayes, with troubleſome belching and hicketting, raving, cold ſweat, and often ſwounding. Verily all that ſame winter, the cold was ſo vehement that many in the Hoſpitall of *Paris* loſt the wings or ſides of their noſtrills, ſeiſed upon by a mortification without any putrefaction. But you muſt note, that the Gangrene which is cauſed by cold, doth firſt and principally ſeiſe upon the parts moſt diſtant from the heart, the fountain of heat, to wit, the feet and legs; as alſo ſuch as are cold by nature, as griſtly parts, ſuch as the noſe and eares.

What parts are uſually taken by a Gangrene occaſioned by cold.

CHAP. XIII. *Of the ſigns of a Gangrene.*

Sect. 6. lib. de fract.

THe ſigns of a Gangrene which inflammation or a phlegmon hath cauſed, are pain and pulſation without manifeſt cauſe, the ſudden changing of the fiery and red colour into a livid or black, as *Hippocrates* ſhewes where he ſpeaks of the Gangrene of a broken heel. I would have you here to underſtand the pulſifick pain not only to be that which is cauſed by the quicker motion of the Arteries, but that heavy and pricking which the contention of the naturall heat doth produce by raiſing a thick cloud of vapours from theſe humors which the Gangrene ſets upon. The ſigns of a Gangrene cauſed by cold, are, if ſuddainly a ſharp pricking and burning pain aſſaileth the part; for *penetrabile frigus adurit*, (*i*) piercing cold doth burn: if a ſhining redneſs as if you had handled ſnow, preſently turn into a livid colour; if in ſtead of the accidentall heat which was in the part, preſently cold and numbneſs ſhall poſſeſſe it, as if it were ſhook with a quartain feaver. Such cold if it ſhall proceed ſo far as to extinguiſh the native heat, bringeth a mortification upon the Gangrene; alſo oft-times convulſions & violent ſhaking of the whole body, wondrous troubleſome to the brain & the fountains of life. But you ſhall know Gangrenes cauſed by too ſtrait bandages, by fracture, luxation, and contuſion, by the hardneſs which the attraction and flowing down of the humors hath cauſed, little pimples or bliſters ſpreading or riſing upon the skin by reaſon of the great heat, as in a combuſtion; by the weight of the part occaſioned through the defect of the ſpirits not now ſuſtaining the bur-

What a pulſifick pain is.

Signs of a Gangrene proceeding of cold.

Signs of Gangrenes proceeding from ſtrait bandages, or ligatures, &c.

den

den of the member; and lastly from this, the pressing of your finger upon the part, it will leave the print thereof as in an *œdema*; and also rom this, that the skin cometh from the flesh without any manifest cause.

Now you shall know Gangrenes arising from a bite, puncture, *aneurisma*, or wound in plethorick and ill bodies, and in a part indued with most exquisite sense, almost by the same signs as that which was caused by inflammation. For by these and the like causes, there is a far greater defluxion and attraction of the humors than is fit, when the perspiration being intercepted and the passages stopt, the native heat is oppressed and suffocated. But this I would admonish the young Chirurgeon, that when by the fore-mentioned signs he shall find the Gangrene present, that he do not defer the amputation for that he finds some sense, or small motion yet residing in the part. For oft-times the affected parts are in this case moved not by the motion of the whole muscle, but only by means, that the head of the muscle is not yet taken with the Gangrene: with moving it self by its one strength, also moves its proper an continued tendon and tail though dead already; wherefore it is ill to make any delay in such causes. d

Signs of a Gangrene occasioned by a bite, puncture, &c.

CHAP. XIIII. *Of the Prognosticks in Gangrenes.*

HAving given you the signs and causes to know a Gangrene; it is fit we also give you the prognostick. The fierceness and malignity thereof is so great, that unless it be most speedily withstood the part it self will dye, and also take hold of the neighbouring parts by the contagion of its mortification: which hath been the cause that a Gangrene by many hath been termed an *Esthiomenos*. For such corruption creeps out like poyson, and like fire eats, gnaws, and destroyes all the neighbouring parts, untill it hath spread over the whole body. For as *Hippocrates* writes, *Lib. de vulner. capitis*; *Mortui & viventis nulla est proportio*, (*i*) there is no proportion between the dead aud living. Wherefore it is fit presently to separate the dead from the living; for unless that be done, the living wil dye, by the contagion of the dead. In such as are at the point of death a cold sweat flows over all their bodies: they are troubled with ravings, and watchings, belchings and hicketing molest them; and often swoundings invade them, by reason of the vapours abundantly and continually raised from the corruption of the humors and flesh, and so carried to the bowells and principall parts, by the Veins, Nerves, and Arteries. Wherefore when you have foretold these things to the friends of the Patient, then make haste to fall to your work.

Why a Gangrene is called *Esthiomenos*.

The quick impatient of the dead.

CHAP. XV. *Of the generall cure of a Gangrene.*

THe Indications of curing Gangrenes are to be drawn from their differences, for the cure must be diversly instituted according to the essence and magnitude. For some Gangrenes possesse the whole member; others only some portion thereof; some are deep; othersome superficiall only. Also you must have regard to the temper of the body. For soft and delicate bodies, as of children, women, Eunuches, and idle persons, require much milder medicins, than those who by nature and custome, or vocation of life, are more strong and hardy, such as husbandmen, labourers, mariners, huntsmen, porters, and men of the like nature who live sparingly and hardly. Neither must you have respect to the body in generall, but also to the parts affected; for the fleshy and musculous parts, are different from the solid, as the nerves and joints, or more solid, as the *Vertebræ*. Now the hot and moist parts, as the privities, mouth, womb, and fundament, are easilyer and sooner taken hold of by putrefaction, wherefore we must use more speedy means to help them. Wherefore if the Gangrene be chiefly occasioned from an internall cause, he must have a dyet prescribed for the decent and fitting use of the six things not naturall. If the body be plethorick, or full of ill humors; you must purge, or let blood by the advice of a Physitian. Against the ascending up of vapours to the noble parts, the heart must chiefly be strengthened with Treacle dissolved in Sorrell, or *Cardum* water; with a bole of Mithridate, the conserves of Roses and Bugloss; and with Opiates made for the present purpose according to Art; this following Apozeme shall be outwardly applyed to the region of the heart. ℞. *aquæ rosar. & nenuphar. an.* ℥ iiij. *aceti scillitici* ℥ j. *corallorum, santalorum alborum & rubrorum, rosar. rub. in pulver. redactarum, & spodii, an.* ʒ j. *mithrid. & theriacæ, an.* ʒ ij ß. *trochiscorum de Caphura* ʒ ij. *flor. cardial. in pollin. redactarum, ℈ ij. croci* ʒ j. *ex omnibus in pollinem redactis, fiat epithema.* Which may be applyed upon the region of the heart with a scarlet cloth or spunge. These are usually such as happen in the cure of every Gangrene.

Various Indications of curing a Gangrene.

What parts sooneit taken hold by a Gangrene

A cordiall Epithema.

CHAP. XVI. *Of the particular cure of a Gangrene.*

THe cure of a Gangrene, caused by the too plentifull and violent defluxion of humors suffocating the native heat, by reason of great Phlegmons, is performed by evacuating and drying up the humors, which putrefie by delay and collection in the part. For this purpose scarifications and incisions, great, indifferent, small, deep and superficiary according to the condition of the Gangrene, are much commended; that so the burdened part may injoy the benefit of perspiration; and the contained humors, of diffiation, or evacuation of their sooty excrements. Let incisions be made when the affect is great, deep in, and neer to mortification. But scarifications may be used when the part first begins to putrefie, for the greatness of the remedy must answer in proportion to that of the disease. Wherefore if it penetrate to the bones, it will be fit, to cut the skin and flesh with many and deep incisions, with an incision knife made for that purpose; yet take heed of cutting the larger nerves and vessels, unless they be wholly putrefied, for if they be not yet putrefied, you shall make your incisions in the spaces between them; if the Gangrene be less, we must rest

The cure of a Gangrene made by inflammation.

ſatisfied with only ſcarifying it. When the ſcarifications and inciſions are made, we muſt ſuffer much blood to flow forth, that ſo the conjunct matter may be evacuated. Then muſt we apply and put upon it ſuch medicins as may by heating, drying, reſolving, clenſing and opening, amend and correct the putrefaction, and by piercing to the bottom may have power to overcome the virulencie already impact in the part. For this purpoſe Lotions made of the lye of the Aſhes of fig-tree or Oak wherein Lupins have been throughly boyled are good. Or you may with leſſe trouble make a medicin with ſalt water, wherein you may diſſolve Aloes and *Ægyptiacum*, adding in the concluſion a little *Aqua vitæ*; for *aqua vitæ* and calcined vitrioll are ſingular medicins for a Gangrene. Or ℞. *acet. opimi* ℔j. *mel. roſ.* ℥iiij. *ſmyr. acetoſi* ℥iij. *ſalis com.* ℥v. *bulliant ſimul, adde aqua vitæ*, ℔.ſ. Let the part be frequently waſhed with this medicin, for it hath much force to repreſſe Gangrenes. After your Lotion, lay *Ægyptiacum* for a Liniment, and put it into the inciſions; for there is no medicin, more powerfull againſt putrefaction, for by cauſing an *Eſchar*, it ſeparates the putrid fleſh from the ſound. But we muſt not in this kind of affect expect that the putrid fleſh may of it ſelf fall from the ſound; but rather cut off with your inciſion knife or ſiſſers, whatſoever thereof you can, and then put to it *Ægyptiacum* as oft as need ſhall require. The knowledg hereof may be acquired from the colour, ſmell, and ſenſibleneſſe of the fleſh it ſelt. The deſcription of the *Ægyptiacum*, whoſe wondrous effects I have often tryed in theſe cauſes, is this. ℞ *floris æris, aluminis roch. mellis com. an.* ℥iij. *aceti acerrimi* ℥v. *ſalis com.* ℥j. *vitrioli rom.* ℥ ß. *ſublimati pul.* ℥ij. *bulliant omnia ſimul ad ignem, fiat unguent.* If the force of the putrefaction in the part be not ſo great, a weaker *Ægyptiacum* may ſerve. When you have put in the *Ægyptiacum*, then preſently lay the following Cataplaſm thereupon. For it hinders putrefaction, reſolves, clenſes and dryes up the virulent *ſanies*, and by the dry ſubtlety of the parts penetrates into the member, ſtrengthens it, and aſſwages the pain. ℞. *farin. fabar. dei orobi, lent. lupin. an.* ℔.ſ. *ſal. com. mellis ros. at. an.* ℥iiij. *ſucci abſinth. marrub. an.* ℥iiß. *aloes, maſtiches, myrrhæ, & aquæ vit. an.* ℥ij. *oxymelitis ſimpl. quantum ſufficit; fiat Cataplaſma molle ſecundum artem*; Somewhat higher than the part affected, apply this following aſtringent, or defenſitive, to hinder the flowing down of the humors into the part, and the riſing up of the vapours from the putrid part into the whole body. ℞ *olei roſati, & myrtill. an.* ℥iiij. *ſucci plant. ag. ſolani, ſempervivi, an.* ℥ij. *album ovorum* 5. *boli armeni, terræ ſigillatæ ſubtiliter pulverizatorum, an.* ℥j. *oxycrati quantum ſufficit, miſce aduſum dictum.* But theſe medicins muſt be often renewed. If the griet be ſo ſtubborn, that it will not yeeld to the deſcribed remedies, we muſt come to ſtronger, to wit, Cauteries, after whoſe application, *Galen* bids to put upon it the juice of a Leek with ſalt beaten and diſſolved therewith, for that this medicin hath a piercing and drying faculty, and conſequently to hinder putrefaction. But if you prevail nothing with Cauteries, then muſt you come to the laſt remedy and refuge, that is, the amputation of the part; For according to *Hippocrates*, to extream diſeaſes exquiſitely extream remedies are beſt to be applyed. Yet firſt be certain of the mortification of the part; for it is no little or ſmall matter to cut off a member without a cauſe.

The deſcription of an Egyptiacum.

Aſtringents that may be uſed in cure of a Gangrene.

Gal. 2. ad Glauconem.

Aphor. 6. ſect. 11.

Therefore I have thought it fit to ſet down the ſigns, whereby you make know a perfect and abſolute mortification.

CHAP. XVII. *The ſigns of a perfect* Necroſis *or Mortification.*

YOu ſhall certainly know that a Gangrene is turned into a Sphacell, or mortification and that the part is wholly and throughly dead, if it look of a black colour, and be colder than ſtone to your touch, the cauſe of which coldneſſe is not occaſioned by the frigidity of the air; if there be a great ſoftneſſe of the part, ſo that if you preſſe it with your finger it riſes not again, but retains the print of the Impreſſion. If the skin come from the fleſh lying under it; if ſo great and ſtrong a ſmell exhale (eſpecially in an ulcerated Sphacell) that the ſtanders by cannot indure or ſuffer it; if a ſanious moiſture, viſcid, green or blackiſh flow from thence; if it be quite deſtitute of ſenſe and motion, whether it be pulled, beaten, cruſhed, pricked, burnt, or cut off. Here I muſt admoniſh the young Chirurgeon, that he be not deceived concerning the loſſe or privation of the ſenſe of the part. For I know very many deceived as thus; the Patients pricked on that part would ſay they felt much pain there. But that feeling is oft deceitfull, as that which proceeds rather from the ſtrong apprehenſion of great pain which formerly raigned in the part, than from any faculty of feeling as yet remaining. A moſt clear and manifeſt argument of this falſe and deceitfull ſenſe appears after the amputation of the member; for a long while after they will complain of the part which is cut away.

A note concerning the unſenſibleneſſe of the part.

A wondrous ſymptome.

Verily it is a thing wondrous ſtrange and prodigious, and which will ſcarſe be credited, unleſſe by ſuch as have ſeen with their eyes, and heard with their ears the Patients who have many months after the cutting away of the Leg, grievouſly complained that they yet felt exceeding great pain of that leg ſo cut off. Wherefore have a ſpeciall care leſt this hinder your intended amputation; a thing pitifull, yet abſolutely neceſſary for to preſerve the life of the Patient and all the reſt of his body, by cutting away of that member which hath all the ſigns of a Sphacell and perfect mortification; for otherwiſe the neglected fire will in a moment ſpread over all the body, and take away all hope of remedy; for thus *Hippocrates* wiſheth: That Sections, Uſtions, and Terebrations muſt be performed as ſoon as need requires.

Sect. 7. Lib. 6. Epidem.

CHAP. XVIII. *Where Amputation muſt be made.*

The controverſy decided.

IT is not ſufficient to know that Amputation is neceſſary, but alſo you muſt learn in what place of the dead part, it muſt be done, and herein the wiſdom and judgment of the Chirurgeon is moſt apparent. Art bids to take hold of the quick, and to cut off the member in the ſound fleſh; but the ſame art wiſheth us, to preſerve whole that which is ſound, as much as in us lies. I will ſhew thee by a familiar example how thou maiſt carry thy ſelf in theſe difficulties. Let us

us ſuppoſe, that the foot is mortified even to the ancle; here you muſt attentively mark in what place you muſt cut it off. For unleſſe you take hold of the quick fleſh in the amputation, or if you leave any putrefaction, you profit nothing by amputation, for it will creep and ſpread over the reſt of the body. It befits Phyſick ordained for the preſervation of mankind, to defend from the iron or inſtrument & al manner of injury, that which injoyes life and health. Wherefore you ſhall cut off as little of that which is ſound as you poſſibly can; yet ſo that you rather cut away that which is quick, than leave behind any thing that is periſhed, according to the advice of *Celſus*. Yet oft-times the commodity of the action of the reſt of the part, and as it were a certain ornament thereof, changes this counſell. For if you take theſe two things into your conſideration they will induce you in this propounded caſe and example, to cut off the Leg ſome five fingers breadth under the knee. For ſo the Patient may more fitly uſe the reſt of his Leg and with leſſe trouble, that is, he may the better go on a wooden Leg; for otherwiſe, if according to the common rules of Art, you cut it off cloſe to that which is periſhed, the Patient will be forced with trouble to uſe three Legs in ſtead of two. *Lib. 7. cap. 33.*

For I ſo knew Captain *Francis Clerk*, when as his foot was ſtrucken off with an iron bullet ſhot forth of a man of war, and afterwards recovered and healed up, he was much troubled and wearied with the heavy and unprofitable burden of the reſt of his Leg, wherefore though whole and ſound he cauſed the reſt thereof to be cut off, ſome five fingers breadth below his knee; and verily he uſeth it with much more eaſe and facility than before in performance of any motion. We muſt do otherwiſe if any ſuch thing happen in the Arm; that is, you muſt cut off as little of the ſound part as you can. For the action of the Legs much differ from theſe of the Arms, and chiefly in this that the body reſts not, neither is carried upon the Arms, as it is upon the feet and Legs. An obſervable Hiſtory.

CHAP. XIX. *How the ſection or amputation muſt be performed.*

THe firſt care muſt be of the Patients ſtrength, wherefore let him be nouriſhed with meats of good nutriment, eaſie digeſtion, and ſuch as generate many ſpirits; as with the yolks of Egs, and bread toſted and dipped in Sack or Muſkadine. Then let him be placed, as is fit, and drawing the muſcles upwards towards the ſound parts, let them be tyed with a ſtrait ligature a little above that place of the member which is to be cut off, with a ſtrong and broad fillet like that which women uſually bind up their hair withall. This ligature hath a threefold uſe; the firſt is, that it hold the muſcles drawn up together with the skin, ſo that retiring back preſently after the performance of the work, they may cover the ends of the cut bones, and ſerve them in ſtead of boulſters or pillows when they are healed up, & ſo ſuffer with leſſe pain the compreſſion in ſuſtaining the reſt of the body; beſides alſo by this means the wounds are the ſooner healed and cicatrized; for by how much more fleſh or skin is left upon the ends of the bones, by ſo much they are the ſooner healed and cicatrized. The ſecond is, for that it prohibits the flux of bloud by preſſing and ſhutting up the veins and arteries. The third is, for that it dulls the ſenſe of the part by ſtupefying it, the animall ſpirits by the ſtrait compreſſing being hindred from paſſing in by the Nerves. Wherefore when you have made your ligature, cut the fleſh even to the bone with a ſharpe and well cutting inciſion knife, or with a crooked knife, ſuch as is here expreſſed. The Ligature of this part.

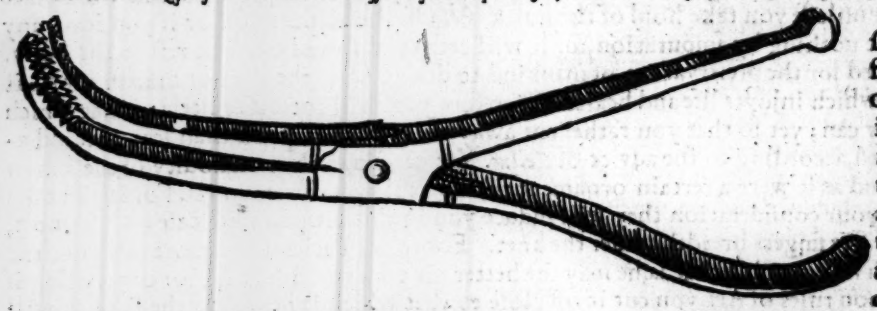
A crooked knife fit for diſmembring, or a diſmembring knife. *The Figure of ſuch a Saw.*

Now you muſt note, that there uſually lies between the bones, a portion of certain muſcles which you cannot eaſily cut with a large inciſion or diſmembring knife, wherefore you muſt carefully divide it and ſeparate it wholly from the bone, with an inſtrument made neatly like a crooked inciſion knife. I thought good to adverriſe thee hereof, for if thou ſhouldeſt leave any thing beſides the bone to be divided by the Saw, you would put the Patient to exceſſive pain in the performance thereof, for ſoft things, as fleſh, tendons and membranes, cannot be eaſily cut with a Saw. Therefore when you ſhall come to the bared bone, all the other parts being wholly cut aſunder and divided, you ſhall nimbly divide it with a little Saw about ſome foot and three inches long, and that as near to the ſound fleſh as you can. And then you muſt ſmooth the front of the bone which the Saw hath made rough. A caution to be obſerved.

CHAP. XX. *How to ſtanch the bleeding when the member is taken off.*

WHen you have cut off and taken away the member, let it bleed a little according to the ſtrength of the Patient, that ſo the reſt of the part may afterwards be leſſe obnoxious to inflammation and other ſymptoms. Then let the veins and arteries be bound up as ſpeedily and ſtraitly as you can; that ſo the courſe of the flowing bloud may be ſtopped and wholly ſtayed. Which may be done by taking hold of the veſſels with your Crows beak, whereof the figure follows.

The Crowes beak fit for to draw the veſſells forth of the fleſh wherein they lye hid, that ſo they may be tyed or bound faſt.



How to draw forth the veſſells and bind them.

The ends of the veſſells lying hid in the fleſh, muſt be taken hold of and drawn with this inſtrument forth of the muſcles whereinto they preſently after the amputation withdrew themſelves, as all parts are ſtill uſed to withdraw themſelves towards their originalls. In performance of this work, you need take no great care, if you together with the veſſells comprehend ſome portion of the neighbouring parts, as of the fleſh, for hereof will enſue no harme; but the veſſells will ſo be conſolidated with the more eaſe, than if they being bloodleſſe parts ſhould grow together by themſelves. To conclude, when you have ſo drawn them forth, bind them with a ſtrong double thred.

CHAP. XXI. *How after the blood is ſtanched, you muſt dreſſe the wounded member.*

How the lips of the diſmembred part are to be joined together.

WHen you have tyed the Veſſells, looſe your Ligature which you made above the place of amputation; then draw together the lips of the wound with four ſtitches made acroſſe, having taken good hold of the fleſh; for thus you ſhall draw over the bones that part of the skin and cut muſcles drawn upwards before the amputation, and cover them as cloſe as you can, that ſo the air may the leſſe come at them, and that ſo the wound may be the more ſpeedily agglutinated. But when we ſay, draw together the lips of the wound with four ſtitches, you muſt not ſo underſtand it, as that you muſt endeavour, to draw them ſo cloſe as to touch each other, for that is impoſſible; for the ſtitches would ſooner break out, and ſo the part would lye bare. Wherefore it will be ſufficient to draw them indifferent cloſe together, that ſo you may ſuffer the skin and fleſh thereunder to enjoy its former liberty which it poſſeſt before the drawing up, and ſo in fine by natures aſſiſtance, the would may be the more eaſily agglutinated.

CHAP. XXII. *How you muſt ſtop the bleeding, if any of the bound up veſſells chance to get looſe.*

THe buſineſs hitherto being performed as we ſaid, if peradventure it happen that any bandage of any of the veſſels be unlooſed, then muſt you again bind the member with that kind of Ligature which you did before the amputation thereof. Or elſe, which is better, more eaſe and leſſe painfull, let your ſervant take hold of the member with both his hands, preſſing his fingers ſtrait, ſtop the paſſage of the looſed veſſell, for ſo he may ſtanch the bleeding. Then let the work-maſter take a needle ſome four fingers long, ſquare, and having ſharp edges, drawing after it a three or four doubled ſtrong thred. With this let him bind the veſſell after the following manner. Let him thruſt his needle on the out ſide into the fleſh, ſome half fingers breadth from the looſed veſſell untill he come to the end thereof, then let him put it about it, and bring it back again, but ſo that there be no more than the ſpace of a fingers breadth between the going in, and coming forth of the needle. In this ſpace let him put a linnen rag three or four times doubled, and thereupon bind ſomewhat ſtrait the two ends of the thred together. For ſo he ſhall hinder the knot from burting the fleſh which lies under it in the bindings, and alſo add ſtrength thereto. For ſo the bound up orifice of the veſſell will in ſhort ſpace be agglutinated to the adjoyning fleſh, and that ſo firmly, that there hath ſeldom been ſeen any one drop of blood to have flowed from a veſſell ſo bound up. But if the blood which flows forth proceed from any ſmall veſſell, you muſt not uſe this ſuture and ligature, nor make any ſuch great matter thereof; for it will quickly be ſtanched by the only application of Aſtringents preſently to be mentioned.

The Hæmorrhagie of ſmall veſſels is not to be regarded.

CHAP. XXIII. *How to perform the reſidue of the cure of the amputated member.*

An emplaſtick medicine.

NOw muſt we ſhew what medicins are fitting to be applyed after the amputation of a member, which are Emplaſticks, as theſe which exceedingly conduce to green wounds. As ℞ *boli arm.* ℥iiij. *farin. vol.* ℥iij. *picis, reſinæ, an.* ℥ij. *pulveriſentur omnia ſubtiliſſimè, & mixta ſint pulveres*; herewith let the wound be ſtrewed, and lay thereupon dry Lint; but let the following repercuſſive or

A repercuſſive.

defenſitive be applyed to the member. ℞ *Albûm ovorum* vj. *boli arm. ſang. drac.* ℈ij. *ſpſi, terræ ſigill. aloes, maſtiches, gallar. combuſt. an.* ℥ij. *in pollinem rediganter omnia, & bene agitentur, addendo olei roſarum & myrtil. an.* ℥j. *fiat defenſitivum ad formam mellis.* This ointment muſt be applyed upon ſtoops dipped in Oxycrate, and that ſo that it may not only cover the cut member; but alſo be ſpread further and cover the neighbouring parts; as when the Leg is cut off, it muſt be laid upon the joint, and ſpread higher than the knee, ſome four fingers upon the thigh; for it hath not only a repercuſſive faculty, but it alſo ſtrengthens the part, hinders defluxion by tempering the blood, aſſwaging pain, and hindring inflammation. It will alſo be good to moiſten your double cloths and bandages in Oxycrate; then muſt you place the member in an indifferent poſture upon a pillow ſtuffed with oaten huſkes or chaffe, Stags hair, or wheat bran. It muſt not be ſtirred after the firſt dreſſing (unleſs great neceſſity urge) for four dayes in winter, but ſomewhat

How to place the member & how often to dreſs it.

ſomewhat ſooner in ſummer. For the ligatures wherewith the veſſells are bound, they muſt not be looſed, or otherwiſe taken away, before the mouthes of the veſſells are covered with their glue or fleſh, leſt by too much haſt you cauſe a new flux of blood. This agglutination will be performed by applying refrigerating, aſtringent, and emplaſtick medicins, ſuch as this following powder. ℞. *boli arm. farin. hord. picis. rej. gypſi, an.* ℥iiij. *Aloes, nucum cup. cort. granat. an.* ℥j. *incorporentur omnia ſimul, fiat pulvis ſubtilis:* herewith let the whole ulcer be ſtrewed over for three or four dayes ſpace; which being ended, let only the ſeats of the veſſells be powdred therewith, and that for eight or ten dayes, ſo that we need no further doubt of the agglutination of the veſſells. In the mean ſpace let the digeſtive be applyed to the reſt of the Ulcer untill it be come to ſuppuration; for then you ſhall give over your digeſtive, and betake you to deterſive and mundificative medicins: As ℞. *terebinth. ven. lotæ in aqua vitæ* ℥ij. *mellis roſ. colati* ℥iiij. *ſucci plantag. Apii, centaur. minoris, an.* ℥ij. *bulliant omnia ſimul uſque ad conſumptionem ſuccorum, auferantur ab igne, addendo farinæ fab. & hord. an.* ℥j, *theriac. Gal.* ℥ß. *aloes, myrrhæ, ariſtoloch. an.* ℥iij. *croci* ℈j. *fiat mundificativum.* But ſeeing the caſe ſtands ſo that the Patients imagin they have their members yet entire, and yet do complain thereof (which I imagin to come to paſs, for that the cut nerves retire themſelves towards their originall, and thereby cauſe a pain like to convulſions; for as *Galen* writes in his book, *De motu muſculorum*, that contraction is the true and proper action of a nerve and muſcle: and again, extenſion is not ſo much an action as a motion:) now we muſt indeavour to give remedy to this ſymptome. Which may be done by anointing the ſpine of the back and all the affected part with the following Liniment, which is very powerful againſt Convulſions, the Palſie, numneſs and all cold effects of the nervous bodies. ℞ *ſalviæ, chamæpytheos, majoranæ, roriſmar. menth. rutæ, lavendulæ, an. m. j. flor. chamæmel. melilot. ſummit. aneth. & hyperici, an.* p. ij. *baccarum lauri & juniperi an.* ℥ij. *radicis pyrethri* ℥ij. *maſtic. aſſæ odorat. an.* ℥iß. *terebinth. venet.* ℔. j. *olei lumbr. aneth. catell. an.* ℥vj. *olei terebinth.* ℥iij. *axung. hum.* ℥ij. *croci* ℥j. *vini albi odoriferi lib.* j. *ceræ quantum ſufficit, contundenda contundantur, pulveriſanda pulveriſentur, deinde macerentur omnia in vino per noctem, poſtea coquantur cum oleis & axungia prædictis in vaſe duplici, fiat linimentum ſecundum artem. in fine adde aquæ vitæ* ℥iiij. Beſides, in dreſſing theſe wounds, the Chirurgeon muſt uſe diligence to procure the falling away of the ends or ſcales of the bones, which the ſaw and the appulſe of the air never before coming hereto, have tainted; which may be done by applying to their ends actuall cauteries, that is, hot irons, in uſing of which you muſt have a ſpeciall care that you touch not the ſenſible parts with fire; neither muſt the bones themſelves be forcibly pluckt off, but gently moved by little and little, ſo that you ſhall think you and the Patient have exceedingly well performed your parts if they fall away at the thirtieth day after the Amputation. All theſe things being performed, you ſhall hinder the growth of proud fleſh with the cathæreticks, ſuch as are burnt vitrioll, the powder of Mercury, and other things, amongſt which is Alum burnt and powdered, which is excellent in theſe kind of wounds, whether by it ſelf or mixed with others. You ſhall uſe theſe and ſuch like, even unto the perfect agglutination and cicatrization of the wound, and you may of your ſelf deviſe other things, ſuch as theſe; as occaſion ſhall offer its ſelf.

An emplaſtick powder.

Deterſives.

VVhy after diſmembring the Patients complain of pain as if the part were yet remaining on.

An ointment for the ſpine of the back againſt all affects of the nerves.

How to procure the falling away of the ends of the bones.

Cathæreticks.

CHAP. XXIIII. *What juſt occaſion moved the Author to deviſe this new form of remedy, to ſtanch the blood after the amputation of a member, and to forſake the common way uſed almoſt by all Chirurgeons; which is, by application of actuall cauteries.*

VErily I confeſs, I formerly have uſed to ſtanch the bleeding of members after amputation, after another manner than that I have a little before mentioned. Whereof I am aſhamed, and agrieved; But what ſhould I do? I have obſerved my maſters whoſe method I intended to follow, alwaies to do the like; who thought themſelves ſingularly well appointed to ſtanch a flux of blood, when they were furniſhed with various ſtore of hot Irons and cauſtick medicins, which they would uſe to the diſmembred part, now one, then another, as they themſelves thought meet. Which thing cannot be ſpoken, or but thought upon without great horror, much leſſe acted. For this kind of remedy could not but bring great and tormenting pain to the Patient, ſeeing ſuch freſh wounds made in the quick and ſound fleſh are endued with exquiſite ſenſe. Neither can any cauſtick be applyed to nervous bodies, but that this horrid impreſſion of the fire will be preſently communicated to the inward parts, whence horrid ſymptomes enſue, & oft-times death it ſelf. And verily of ſuch as were burnt, the third part ſcarſe ever recovered, and that with much adoe, for that combuſt wounds difficultly come to cicatrization; for by this burning are cauſed cruell pains, whence a Feaver, Convulſion, and oft-times other accidents worſe than theſe. Adde hereunto, that when the eſchar fell away, oft-times a new hæmorrhage enſued, for ſtanching whereof they were forced to uſe other cauſtick and burning Inſtruments. Neither did theſe good men know any other courſe; ſo by this repetition there was great loſſe and waſt made of the fleſhy and nervous ſubſtance of the part. Through which occaſion the bones were laid bare, whence many were out of hope of cicatrization, being forced for the remainder of their wretched life to carry about an ulcer upon that part which was diſmembred; which alſo took away the opportunity of fitting or putting to of an artificiall leg or arm in ſtead of that which was taken off. Wherefore I muſt earneſtly entreat all Chirurgeons, that leaving this old, and too too cruell way of healing, they would embrace this new, which I think was taught me by the ſpeciall favour of the ſacred Deity, for I learnt it not of my maſters, nor of any other, neither have I at any time found it uſed by any. Only I have read in *Galen*, that there was no ſpeedier remedy for ſtanching of blood, than to bind the veſſells through which it flowed towards their roots, to wit, the Liver and Heart. This precept of *Galen*, of binding and ſowing the Veins and Arteries in the new wounds, when as I thought it might be drawn to theſe which are made by the amputation of members, I attempted it in many; yet ſo that at firſt in my budding practiſe thereof, I alwayes had my cauteries and hot Irons in a readineſſe,

Hot Irons not to be uſed.

Lib. 5. Meth.

that if any thing happened otherwiſe then I expected in this my new work, I might fetch ſuccour from the ancient practice, untill at length confirmed by the happy experience of almoſt an infinite number of particulars, I bid eternally adieu, to all hot Irons and cauteries which were commonly uſed in this work. And I think it fit that Chirurgeons do the like. For antiquity and cuſtome in ſuch things as are performed by Art, ought not to have any ſway, authority or place contrary to reaſon, as they oft-times have in civill affaires; wherefore let no man ſay unto us, that the Ancients have alwayes done thus.

CHAP. XXV. *The practiſe of the former precepts is declared, together with a memorable hiſtory of a certain ſouldier, whoſe arm was taken off at the Elbow.*

A Hiſtory.

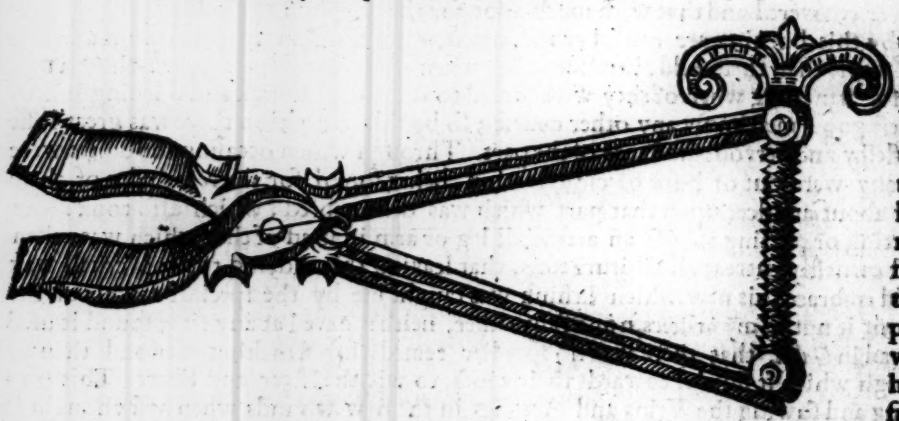
I Think it fit to confirm by an example the preſcribed method of curing a Gangrene and Mortification. Whilſt I was Chirurgeon to the Marſhall of *Montejan* at *Turin*, a certain common ſouldier received a wound on his wriſt with a muſket bullet, by which the bones and tendons being much broken, and the nervous bodies cruelly torn, there followed a Gangrene and at length a mortification even to the Elbow; beſides alſo an inflammation ſeiſed upon the middle part of his Cheſt, and there was as it were a certain diſpoſition to a Gangrene, whereby it followed that he was painfully and dangerouſly troubled with belchings, hicketings, watchings, unquietneſſe and frequent ſwoundings, which occaſioned many Chirurgeons to leave him as deſperate. But it ſo fell out, that I orecome by his friends intreaty, undertook the cure of this wretched perſon, deſtitute of all humane help. Wherefore knowing the mortification by its ſigns, I cut off the arm by the elbow as ſpeedily as I could, making firſt the ligature, whereof I made mention; I ſay I took it off not with a ſaw, but only with an inciſion knife, cutting in ſunder the ligaments which held the bones together, becauſe the ſphacell was not paſſed the joint of the Elbow. Neither ought this ſection to be counted ſtrange, which is made in a joint; for *Hippocrates* much commends it, and ſaith that it is eaſily healed, & that there is nothing to be feared therein beſides ſwounding, by reaſon of the pain cauſed by cutting the common tendons & ligaments. But ſuch inciſion being made, the former ligature could not hinder, but much blood muſt flow from thence, by reaſon of the large veſſels that run that way. Wherefore I let the blood to flow plentifully ſo to disburden the part, and ſo afterwards to free it from the danger and fear of inflammation and a Gangrene; then preſently I ſtanched the blood with an hot Iron, for as yet I knew no other courſe. Then gently looſing the ligature I ſcarifie that part of the brawn of the Arm which was gangrenated, with many and deep inciſions, ſhunning and not touching the inner part, by reaſon of the multitude of the large veſſels and Nerves which run that way; then I preſently applyed a cautery to ſome of the inciſions, both to ſtanch the bleeding, and draw forth the virulent *ſanies* which remained in the part. And then I aſſailed and overcame the ſpreading putrefaction by putting and applying the formerly preſcribed medicins; I uſed all ſorts of reſtrictive medicins, to ſtay the inflammation of the Cheſt; I alſo applyed Epithema's to the region of the heart, and gave him cordial potions and boles, neither did I deſiſt from uſing them untill ſuch time as his belching, hicketting and ſwoundings had left him. Whilſt I more attentively intended theſe things, another miſchief aſſails my Patient, to wit, Convulſions, and that not through any fault of him or me, but by the naughtineſſe of the place wherein he lay, which was in a Barn every where full of chinks and open on every ſide, and then alſo it was in the midſt of winter raging with froſt and ſnow and all ſorts of cold; neither had he any fire or other thing neceſſary for preſervation of life, to leſſen theſe injuries of the air and place; Now his joints were contracted, his teeth ſet, and his mouth and face were drawn awry, when as I pitying his caſe made him to be carried into the neighbouring Stable which ſmoaked with much horſe dung, and bringing in fire in two chafendiſhes, I preſently anointed his neck and all the ſpine of his back, ſhunning the parts of the Cheſt, with liniments formerly deſcribed for convulſions; then ſtraight way I wrapped him in a warm linnen cloth, and buried him even to the neck in hot dung, putting a little freſh ſtraw about him; when he had ſtayed there ſome three dayes, having at length a gentle ſcouring or flux of his belly, and plentifull ſweat, he began by little and little to open his mouth and teeth which before were ſet and cloſe ſhut. Having got by this means ſome opportunity better to do my buſineſſe, I opened his mouth as much as I pleaſed, by putting this following Inſtrument between his teeth.

Diſmembring at a joint.

Sect. 4. Lib. de Art.

Burying in hot horſe dung helps Convulſions.

A Dilater made for to open the mouth and teeth by the means of a ſcrew in the end thereof.



Now drawing out the Inſtrument I kept his mouth open by putting in a willow ſtick on each ſide therof, that ſo I might the more eaſily feed him with meats ſoon made, as with Cows milk and rear egs, untill he had recovered power to eat, the convulſion having left him. He by this means freed from the Convulſion, I then again begin the cure of his arm, and with an actuall cautery ſear the end of the bone, ſo to dry up the perpetuall

petuall afflux of corrupt matter. It is not altogether unworthy of your knowledg, that he said, how that he was wondrously delighted by the application of such actuall cauteries, a certain tickling running the whole length of the arm by reason of the gentle diffusion of the heat by the applying the caustick; which same thing I have observed in many others; especially in such as lay upon the like occasion in the Hospitall of *Paris*. After this cauterizing there fell away many and large scales of the bone, the freer appulse of the air than was fit making much thereto; besides when there was place for fomentation, with the decoction of red Rose leaves, Wormwood, Sage, Bay leaves, flowers of Camomil, Melilote, Dill, I so comforted the part that it also at the same time by the same means drew and took away the virulent *Sanies*, which firmly adhered to the flesh and bones. Lastly, it came to passe, that by Gods assistance, these means I used, and my carefull diligence, he at length recovered. Wherefore I would admonish the young Chirurgeon, that he never account any so desperate, as to give him for lost, content to have let him go with prognosticks; for as an ancient Doctor writes; that as in Nature, so in diseases there are also Monsters.

A fomentation for a Convulsion.

Monsters or miracles in diseases.

The End of the Twelfth Book.

Of Ulcers, Fistula's, and Hæmorrhoides.

THE THIRTEENTH BOOK.

CHAP. I. *Of the nature, causes and differences of Ulcers.*

HAving already handled and treated of the nature, differences, causes, signs and cure of fresh and bloody wounds, reason and order seem to require that we now speak of Ulcers; taking our beginning from the ambiguity of the name. For according to *Hippocrates*, the name of Ulcer most generally taken may signifie all or any solution of Continuity; In which sense it is read that all pain is an Ulcer. Generally, for a wound and Ulcer properly so called; as appears by his Book, *de Ulceribus*. Properly, as when he saith, it is a sign of death when an Ulcer is dryed up through an *Atrophia*, or defect of nourishment. We have here determined to speak of an Ulcer in this last and proper signification. And according thereto we define an Ulcer to be the solution of Continuity in a soft part, and that not bloody, but sordid and unpure, flowing with quitture, *Sanies* or any such like corruption, associated with one or more affects against nature, which hinder the healing and agglutination thereof; or that we may give you it in fewer words according to *Galens* opinion; An ulcer is a solution of Continuity, caused by Erosion. The causes of Ulcers are either internall or externall. The internall are through the default of humors peccant in quality rather than in quantity, or else in both, and so making erosion in the skin and softer parts by their acrimony and malignity; now these things happen either by naughty and irregular diet, or by the ill disposition of the entrails, sending forth and emptying into the habit of the body this their ill disposure. The externall causes are, the excesse of cold seising upon any part, especially more remote from the fountain of heat, whence follows pain, whereunto succeeds an attraction of humors and spirits into the part, and the corruption of these so drawn thither by reason of the debility or extinction of the native heat in that part, whence lastly ulceration proceeds. In this number of externall causes may be ranged a stroak, contusion, the application of sharp and acrid medicins, as causticks, burns; as also impure contagion, as appears by the virulent ulcers acquired by the filthy copulation or too familiar conversation of such as have the *French* disease. How many and what the differences of Ulcers are, you may see here described in this following Scheme.

The divers acceptions of an Ulcer. *Sent. 34. sect. 2. lib. de fract.*

What an Ulcer properly is. *Lib. de constit. Artis cap. 6.*

The interne all causes.

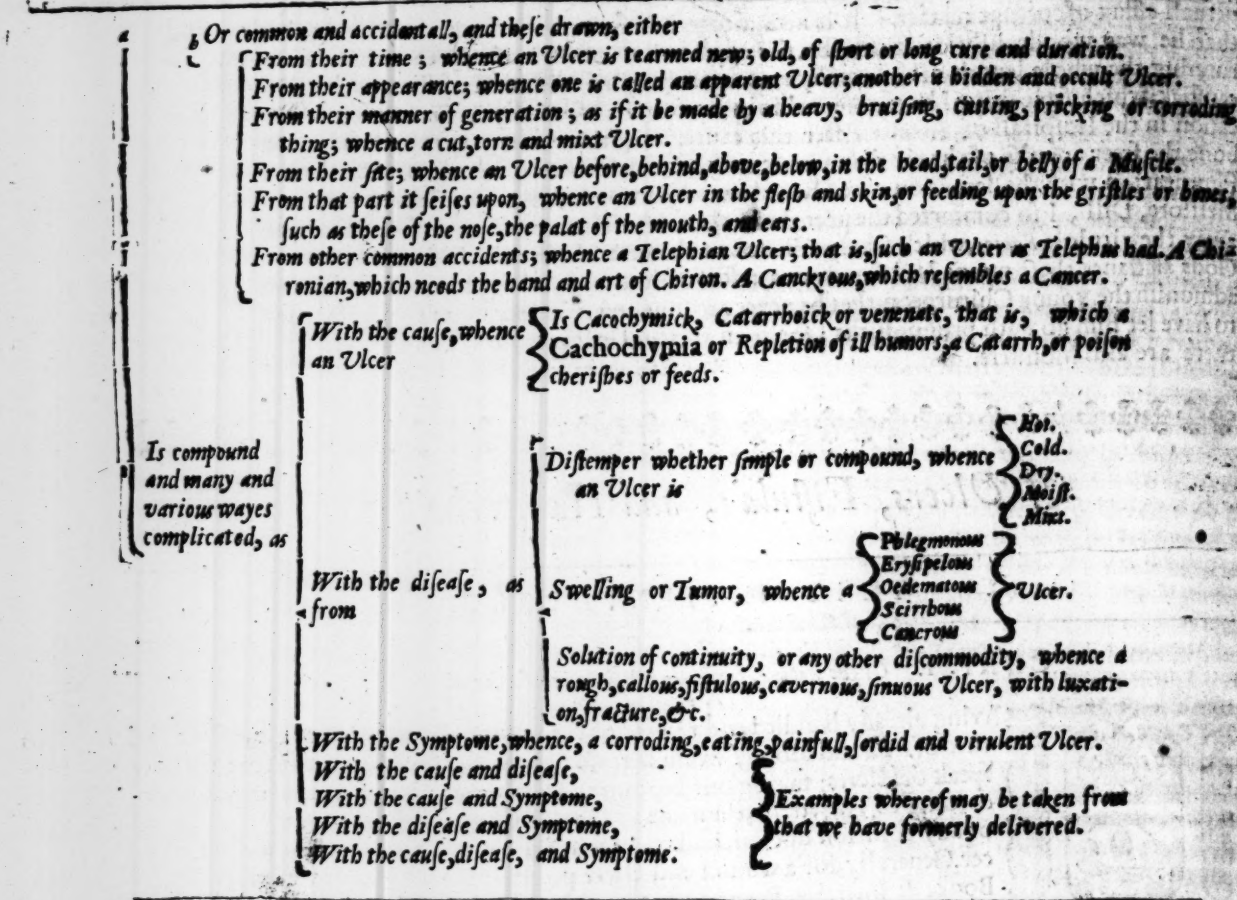
The externall causes.

A Table of the differences of Ulcers.

an Ulcer is an impure solution of continuity in a soft part, flowing with filth and matter or other corruption, whereof there are two chief differences; for one

- *Is simple and solitary without complication of any other affect against nature, and this varies in differences, either*
  - *Proper, which are usually drawn from three things; to wit,*
    - *Figure, whence one Ulcer is called*
      - *Round or circular.*
      - *Sinuous, and variously spread.*
      - *Right or oblique.*
      - *Cornered as triangular.*
    - *Quantity, and that either according to their*
      - *Length; whence an Ulcer is long, short, indifferent.*
      - *Breadth; whence an Ulcer is broad, narrow, indifferent.*
      - *Profundity; whence an Ulcer is deep, superficiary, indifferent.*
    - *Equality or inequality; which consists*
      - *In those differences of dimensions whereof we last treated, they lay in length, breadth and profundity, wherein they are either alike or of the same manner, or else unlike and so of a different manner.*

Or



CHAP. II. *Of the signs of Ulcers.*

The signs of a putrid Ulcer.

THere are various signs of Ulcers according to their differences. For it is the sign of a putrid Ulcer, if it exhale a noysome, grievous, stinking and carion-like vapour, together with filthy matter. An eating Ulcer is known by the eating in, hollownesse and wearing away of the part wherein it resides, together with the adjoining parts. A sordid Ulcer may be known by the grosnesse and viscidity of the excrements it sends forth, and by the loose and spongy softnesse, or the crusted inequality of the flesh which grows over it. A cavernous Ulcer, by the straitnesse of the orifice, and largenesse and deepnesse of the windings within. A fistulous Ulcer, if to the last mentioned signs there accrew a callous hardnesse of the lips or sides of the Ulcer. A cancrous Ulcer is horrible to behold with the lips turned back, hard and swoln, flowing with virulent and stinking corruption, and sometimes also with bloody matter, together with the swelling and lifting up of the adjacent veins. An untemperate, or as they term it, a distempered Ulcer, is such as is nourished by some great distemper whether hot or cold, moist or dry, or compounded of these. An ill * natured or malign Ulcer is known by the difficulty of curing and rebellious contumacy to remedies appointed according to Art and reason. We know a catarrhous Ulcer, if the matter which feeds it flow to it from some *varices* thereunto adjoining, or dilated, swollen and broken veins, or from some entrail, or from the whole body being ill affected. An Apostumatous Ulcer is perceived by the presence of any tumor against nature, whose kind may be found out by sight and handling. *Telephian* Ulcers, are such as affected *Telephus*, and *Chironian* (in whose cure *Chron* excelled) are Ulcers which may be known by their magnitude not much putrid, and consequently not sending forth any ill smell, not eating, not tormenting with pain, but having their lips swoln and hard, and therefore ill to be healed. For although they may be sometimes cicatrized, yet it being but slender may easily be broken, and the Ulcer renewed. They are almost like an ulcerated Cancer, but that they are accompanied with swelling in the adjacent parts; they are also worse than these which are termed *Cacoethe*, that is, ill natured, or malign; whence it is that *Fernelius* thought they had a hidden cause of malignity, besides the common default of the humor, and that such as can scarse be driven away; such commonly are left after the plague. Wherefore *Galen* thinks such to be malign as will not suppurate or yeeld any quitture.

*Gal. cap. 5. lib. 4. Meth. *Vlcus cacoethes.*

Com. ad aphor. 22. sect. 5.

CHAP. III. *Of the Prognosticks of Vlcers.*

Aph. 45. sect. 6.

THe bone must necessarily scale, and hollow scars be left by malign Ulcers of a years continuance or longer, and rebellious to medicins fitly applyed. The bone must scale by reason of the continuall afflux, and wearing by the acrimony of the humor, which looses the composure and glue by which the parts thereof are joined together. But the scars must become hollow, for that the bone (whence all the flesh takes its first originall) or some portion thereof, being taken from under the flesh, as the foundation thereof, so much of the bulk of the flesh

flesh must necessarily sink down, as the magnitude of the portion of the wasted bone comes unto.

You may know that death is at hand, when the Ulcers that arise in or before diseases, are suddainly either livid or dryed, or pale and withered. For such drineſs sheweth the defect of nature, which is not able to send the familiar and accustomed nutriment to the part ulcerated. But the livid or pale colour is not only an argument of the over abundance of choler and melancholy, but also of the extinction of the native heat. In Ulcers where tumors appear, the patients suffer no convulsions, neither are frantick; for the tumor being in the habit of the body possessed with an Ulcer, argues that the nervous parts and their originall are free from the noxious humors. But these tumors suddainly vanishing and without manifest cause, as without application of a discussing medicin, or bleeding, those who have them on their backs have convulsions and distensions, for that the spine of the back is almost wholly nervous; but such as have them on their fore parts, become either frantick, or have a sharp pain of their side, or pleurisie, or else a dysentery if the tumors be reddish; for the forepart of the body is replenished and overspread with many and large vessells, into whose passages the morbifick matter being translated, is presently carryed to these parts which are the seats of such diseases. Soft and loose tumors in Ulcers are good, for they shew a mildneſs and gentleneſs of the humors, but crude and hard swellings are naught, for all digestion in some measure resembles elixation. Ulcers which are smooth and shining are ill, for they shew that there resides an humor malign by its acrimony, which frets asunder the roots of the hairs, and depraves the naturall constitution of the pores of the skin; whence it is that such as are troubled with Quartan agues, the Leprosie or *Lues venerea*, have their hair fall off. A livid flesh is ill in Ulcers which cause a rottenneſs or corruption of the bones lying under the flesh; for it is an argument of the dying heat and corruption of the bone, whence the flesh hath its originall & integrity.

Hip. progn. lib. 1. cap. 8. *Aph. 65. sect. 5.*

Aph. 97. sect. 5.

Aph. 4. sect. 6.

These Ulcers which happen by occasion of any disease, as a Dropsie, are hard to be cured; as also those wherein a *varix* or swoln vessell continually casts in matter; which a present distemper ferments, which have swoln, hard and callous lips, and such as are circular or round. An *Hypersarcosis* or fleshy excrescence usually happens to Ulcers not diligently mundified, and if they possess the arms or Legs, they cause a Phlegmon or some other tumor in the groins, chiefly if the body be full of ill humors, as *Avicen* hath noted. For these parts by reason of their rarity and weakneſs are fit and subject to defluxions. *Albucrasis* writes that for nine causes Ulcers are difficultly replenished with flesh and cicatrized. The first for want of blood, in a bloodleſſe body; the second by reason of ill humors, and the impurity of the blood; the third by the unfit application of unconvenient medicins; the fourth by reason of the forediseases of the Ulcer; the fifth by the putrefaction of the soft and cartilage-like flesh encompassing the Ulcer; the sixth when they take their originall from a common cause which every where rages with fury, such as are those which are left by the pestilence; the seventh by reason of the callous hardneſs of the lips of the Ulcer. The eighth when the heavens and air are of such condition as ministers fuell to the continuance of the Ulcer, as at Sarogoza in Aragon; the ninth when the bones which lye under it are wasted by rottenneſs. An Ulcer that casts forth white, smooth, equall quitture, and little or no stinking, is easily healed; for it argues the victory of the native heat, and the integrity of the solid parts. We terme that smooth quitture which is absolutely concocted, neither yeelds any asperity to the touch, whereby we might suspect that as yet any portion of the humor remains crude; we call that equall wherein you can note no diversity of parts, & white not that which is perfectly so, but that which is of an ash colour, as *Galen* observes. But it will, if when the cure is indifferently forward, a flux of blood suddainly break forth in those Ulcers which beat strongly by reason of the great inflammation adjoyned therewith. For as *Hippocrates* observes, an effusion of blood happening upon a strong pulsation in Ulcers is evill; for the blood breaking out of an Artery cannot be stayed out by force; and also the blood is too furious by reason of the heat and inflammation the nourishers of this Ulcer that it breaks its receptacles, and hence ensues the extinction of the native heat, whence the deſect of suppuration and a Gangrene ensues. Now for this there flowes two sorts of excrements from malign Ulcers, the more chill is termed *ichor* or *sanies*, but the more grosse is named *sordes*, that is virulent and flowes from pricked nerves, and the *pericrania* when they are evill affected, but the other usually flowes from the Ulcers of the joints, and it is the worſe if it be black, reddish, ash-coloured, if muddy or unequall like wine Lees, if it stink. *Sanies* is like the water wherein flesh hath been washed, it argues the preternaturall heat of the part, but when it is pale coloured, it is said to shew the extinction of the heat.

For what causes Ulcers are hard to heal.

The curing of a simple Ulcer, compounded, and the indication.

Gal. 7. Meth. cap. 12.

Gal. lib. 1. de compos. secund. gen.

repletion or ilneſſe of humors. Now by theſe means having taken away the cauſe of the Ulcer, you muſt come to the particular cure thereof, beginning with that which is moſt urgent. Wherefore you muſt firſt aſſwage the pain by application of things contrary to the cauſe thereof, as if it proceed from a Phlegmonous diſtemper, which hath long poſſeſt, diſtended and hardned the part, it muſt be eaſed by evacuation. Firſt, bathing it with warm water, to mollifie and relax the skin, that ſo you may the more eaſily evacuate the contained humors; then ſhall you draw away portion of the matter cauſing the ſwelling and pain by ſcarification, if the Patient ſhall be of ſufficient courage, or elſe by application of horſe-leaches if he be more faint-hearted; and then you ſhall temper the heat thereof by applying *Vnguentum refrigerans Galeni*. To conclude, you ſhall attempt all things which we have formerly delivered (in our treatiſe of Tumors) to take away the ſwelling thereof. When you have brought this to that paſſe you deſire, you ſhall come to thoſe which are ſuch, that it cannot be taken away or healed without them, which ſhall be done by orderly helping the defects againſt nature which were conjoined with the Ulcer, to wit, the rottenneſſe of the bone, which you ſhall help by actuall cauteries: and in the mean while you ſhall draw the Ulcer into another form, to wit, cornered, and you ſhall cut away the callous hardneſſe, and help the rottenneſſe. Then muſt you procure the falling away of the Eſchar, and then provide for the ſcaling of the bone by the means formerly preſcribed, laſtly the mundified Ulcer muſt be filled with fleſh. For generating of fleſh two cauſes muſt concur, the efficient, and materiall; The efficient is, the good temper both of the whole body, as alſo of the Ulcerated part. For this prevailing, there will be an attraction, digeſtion, oppoſition and aſſimilation of the laudable juice to the part affected; verily the laudable temper is preſerved by like things, but the vicious is amended by contraries. The matter to be ſpent upon fleſh is laudable blood, which offends neither in quality, nor quantity. In this regeneration of the fleſh there appear two kinds of excrements, the one more thin and humid called *Sanies*, the other more groſſe termed *Sordes*. Both of theſe for that they are contrary to nature, do therefore hinder the regeneration of fleſh, and therefore muſt be taken away by applying their contraries, as by things drying in the firſt degree, and more ſtrongly or weakly detergent, according to the complexion of the part and the whole body, and the plenty and quality of the excrementitious humor, and the uncleanneſs of the Ulcer. For the part muſt be preſerved by the uſe of the like, but the Ulcer orecome by application of things contrary thereto. After that by natures endeavour and the Chirurgeons help, the ulcer is replete with fleſh, it muſt be cicatrized, that is, covered with a callous skin in ſtead of the true and native skin. It may be cicatrized by ſtrewing of very drying powders having very little or no acrimony. Thus Alum and Vitriol being burnt & made into powder, and thinly ſtrewed upon the part do quickly cicatrize the former fleſhy work. To this purpoſe alſo ſerve the root of *Ariſtolochia*, Aloes, burnt Lead, Pomegranat pills burnt, Litharge, *Tutia*, and alſo plates of Lead beſmeared with quickſilver, whoſe efficacy for this purpoſe Chirurgeons ſometimes find more certain and powerfull than any other remedies.

The things conducing to the generating of fleſh.

What a Scar is.

Things cauſing cicatrization.

CHAP. V. *Of a diſtempered Vlcer.*

Signs of a diſtempered ulcer.

BEfore we ſpeak of a diſtempered ulcer, it is meet, leſt that the Chirurgeon take one diſtemper for another, briefly to relate the ſigns of each. You may know that an ulcer is aſſociated with a dry diſtemper by your ſight, as if the ulcer be as it were wrinkled, if it ſend forth little or no moiſture; alſo it is known by touch, if it feel rough and hard. You ſhall correct this diſtemper by humecting medicins, as fomenting it with warm water according to *Galens* opinion, or elſe with *Hydrelæum* (*i.*) Oil and water mixt, but alwayes you muſt firſt purge, if the body ſhall abound with ill humors, or uſe Phlebotomie if the body be plethorick; otherwiſe you ſhall draw more humors into the part than it can bear. Now you ſhall ſo long foment it, untill the fleſh which is about it begin to look red, wax ſoft and moiſt, and the part it ſelf be a little ſwoln. If you proceed further, you will reſolve all the humor which you have drawn thither, and ſo your labour is in vaine. After the fomentation apply ſuch a remedy to the ulcerated part. ℞. *cremoris hordei* ℥ij. *ſol. melue in aq. coct.* ℥j. *pingued. pur.* ℥iſs. *mellis com.* ℥ß. *miſce in mortario & fiat unguentum.*

Remedies for a dry diſtempered ulcer.

Signs of too moiſt an ulcer.

You ſhall know a moiſt diſtemper aſſociates the ulcer by the plenty of the excrementitious humor, which the ulcer ſends forth, by the ſpongy and fungous ſoftneſſe and growth of the fleſh about it. You ſhal amend this by drying remedies, ſuch as theſe are, which we tearm ſarcoticks, having alwayes regard to the plenty of the humor, the proper temper of the part, and other indications formerly mentioned. Amongſt other remedies *Galen* much commends Alum water, for it dries, cleanſes and corroborates the affected part. Alſo this enſuing fomentation may be applyed to good purpoſe. ℞. *roſar. rub. abſinth. beton. taſſi barbati an. m. j. gallarum, nucum cupreſſi, an.* ℥ij. *aluminis ſcheda* ℥i. *fiat decoctio in vino auſtero, infuſo ſatis tum.* Then let *Empl. de ceruſſa* or *De minio* be applyed to the ulcer. Alſo I have found by experience that the powder of burnt alum lightly ſtrewed upon the ulcer is very effectuall in this caſe. You ſhal know that an hot diſtemper aſſociates the ulcer by redneſs, or yellowneſſe thereof, by the heat manifeſted to your touch, and the propriety of your pain. Then muſt you have recourſe to refrigerating things, ſuch as *ung. Roſatum Meſ. Refrigerans Gal. Papuleon*, ſtoops and clothes dipped in Plantain water, Night-ſhade water, or Oxycrate. I have alſo found by experience that ſcarification, or Leaches being applyed, did more conduce than any other remedy. For ſo the chafed blood, which by that means is apt to corrupt, is drawn away, and the part it ſelf is alſo freed of that burden.

Gal. lib. 1. ſimp. cap. 7.

Signs of a hot diſtempered ulcer.

Signs of a cold diſtempered ulcer.

We know a cold diſtemper by the whitiſh or pale colour, by the touch of the Chirurgeon, and ſpeech of the Patient complaining of the coldneſſe of the ulcerated part. You ſhall correct this by applying and putting bottles filled with water about the part, or elſe ſwines bladders half filled with the following decoction. ℞. *origani, pulegii, chamæm. meliloti, an. m. j. abſinth. maj. an. ſalvie, ſatur. an. m. ß. fol.* decoq.

decoctio in vino generoso, addendo aquæ vitæ quod sufficit. Also the Ulcer may be conveniently fomented with spunges dipped in the same decoction, and let there be applyed thereto *Empl. Oxycroceum, emp. de melilote, de Vigo cum mercurio*, and *sine mercurio*. But if a mixt and compound distemper be joined to the Ulcer, the medicins must in like manner be mixt and composed. The residue of the Chirurgeons care and paine must be spent upon the proper and peculiar cure of the Ulcer, as it is an Ulcer; which we said in the former Chapter was contained in detersion, regenerating flesh and cicatrization thereof.

CHAP. VI. *Of an Ulcer with pain.*

WHere oft-times so great pain accompanieth Ulcers, that it calls thereto the counsell of the Physitian. Wherefore if it proceed from any distemper, it shall be taken away by remedies proper against that distemper, such as we mentioned in the former Chapter. But if it do not so cease, we must go on to Narcoticks. Such are cataplasms of the leaves of Mandrakes, Water lillies, Henbane, Nightshade, Hemlock, the seeds of Poppy and oils of the same; to which also may be added *Opium, Populeon*, and other things of like faculties. But if a malign acrimony and virulency of an humor corroding and eating the flesh lying under it and the lips about it, cause and make the pain, you shall neither assuage it by anodynes, nor Narcoticks; for by application of gentle medicins it will become worse and worse. Wherefore you must betake you to Cathæreticks; For strong medicins are fittest for strong diseases. Wherefore let a pledget dipped in strong and more than ordinarily powerfull *Ægyptiacum*, or in a little oil of Vitriol, be applyed to the Ulcer; for these have power to tame this raging pain, and virulent humors. In the mean season let refrigerating things be put about the Ulcer, lest the vehemency of acrid medicins cause a defluxion.

The matter of Narcotick cataplasms.

Cathæreticks have power to assuage pain.

CHAP. VII. *Of Ulcers with overgrowing or proudnesse of flesh.*

VLcers have oft-times proud or overgrowing flesh in them, either by the negligence of the Chirurgeon, or fault of the Patient. Against this, drying and gently eating or consuming medicins must be applyed; such as are Galls, *rottæ thuris*, Aloes, *Tutia*, Antimony, *Pompholix*, Vitriol, Lead, all of them burnt and washe if need require. Of these powders you may also make ointments with a little oil and wax; but if the proud flesh, as that which is hard and dense, yeeld not to these remedies, we must come to caustick, or else to iron, so to cut it off. For in *Galens* opinion, the taking away of proud flesh is no work of nature, (as the generating, restoring and agglutinating of the flesh is) but it is performed by medicins which dry vehemently, or else by the hand of the Chirurgeon; wherefore amongst the remedies fit for this operation, the powder of Mercury with some small quantity of burnt Alum, or burnt Vitriol alone, seem very effectuall to me. Now for the hard and callous lips of the Ulcer, they must be mollified with medicins which have such a faculty, as with Calves, Goose, Capons or Ducks grease, the oils of Lillies, sweet Almonds, Worms, Whelps, *Oesypus*, the mucilages of Marsh-mallows, Linseed, Fænugreek seed, Gum *Ammoniacum, Galbanum, Bdellium*, of which being mixed may be made Emplaisters, unguents, and liniments; or you shall use *Empl. Diachylon*, or *de Mucilaginibus, De Vigo cum mercurio*. To conclude, after we have for some few dayes used such like remedies, you may apply to the Ulcer a plate of Lead rubbed over with Quicksilver; for this is very effectuall to smooth an Ulcer and depresse the lips: if you shall prevail nothing by this means, you must come to the caustick, by which if you still prevail nothing, for that the lips of the Ulcer are so callous that the caustick cannot pierce into them, you must cleave them with a gentle scarification, or else cut them to the quick, so to make way, or as it were open a window for the medicin to enter in, according to *Galen*. Neither in the interim must you omit *Hippocrates* his advice, which is, that by the same operation we reduce the Ulcer if round, into another figure, to wit, long or triangular.

Things wasting superfluous flesh.

Lib. 3. Meth. cap. 6.

For the callous lips of Ulcers.

Lib. 4. Meth. cap. 9.

CHAP. VIII. *Of an Ulcer putrid and breeding Worms.*

WOrmes are divers times bred in ulcers, whence they are called wormy ulcers; the cause hereof is the too great excrementitious humidity prepared to putrefie by unnaturall and immoderate heat. Which happens, either for that the ulcer is neglected, or else by reason of the distemper and depraved humors of all the body, or the affected part; or else for that the excrementitious humor collected in the ulcer, hath not open and free passage forth; as it happens to the ulcers of the ears, nose, fundament, neck of the womb, and lastly, to all sinuous & cuniculous ulcers. Yet it doth not necessarily follow that all putrid ulcers must have worms in them; as you may perceive by the definition of a putrid ulcer which we gave you before. For the cure of such ulcers after generall means, the worms must first be taken forth, then the excrementitious humor must be drawn away, whence they take their originall. Therefore you shall foment the ulcer with the ensuing decoction, which is of force to kill them, for if any labour to take forth all that are quick he will be much deceived, for they oft times do so tenaciously adhere to the ulcerated part, that you cannot pluck them away without much force and pain. R. *absinth. centaur. majus, marrubii, an M. j. fiat decoctio ad lb. ij. in qua dissolve aloes ℥ j. sanguinis leporini ℥ ij.* Let the ulcer be fomented and washed with this medicin, and let pledgets dipped herein be put into the ulcer; or else if the ulcer be cuniculous or full of windings, make injection therewith which may go into all parts thereof.

The cause of worms breeding in Ulcers.

A fomentation to kill the worms.

Adeo autem mirandis commendatis hoc following medicin. R. *Cerussæ, olei rosarum an. ℥ ß. succi rutæ vel liquidi quantum sufficit, misce in mortario pro linimento.* If the putrefaction be such that these medicins will not suffice for the amendment thereof, you must come to more powerfull, or to cauteries also or hot Irons, or

Ointment.

to section; yet you must still begin with the more gentle, such as this of *Galens* description. R. *ceræ* ℥ij. *ceruſæ* ℥j. *olei roſ.* ℥ij. *ſalis amnon.* ℥ß. *ſquam æris* ʒij. *thur. alum. æruginis, malicor. calcis vivæ, an.* ʒj. *fiat emplaſtrum.* Or R. *terebinth. lotæ* ℥ij. *ceræ albæ* ℥ß. *liquefiant ſimul addendo ſublimati,* ʒß. *ſalis torrefacti, & vitrioli calcinati, an.* ʒj. *fiat mundificativum.* Or you must use our *Ægyptiacum* alone, which hath Sublimate entring into the composition thereof; but in the interim the circuit of the Ulcer must be defended with refrigerating and defensative things for fear of pain.

CHAP. IX. *Of a sordid Ulcer.*

A Sordid Ulcer after the cure of the body in generall, shall be healed with detergent medicins, the indication being drawn from the grosse and tough excrement, which with the excrementitious *sanies*, as it were besieging, and blocking up the ulcerated parts, weakens and as it were dulls the force of medicins though powerfull, which causeth us to begin the cure with fomentations and lotions, as thus. R. *Lixivii com.* ℔. j. *abſinth. marrub. apii, centaur. utriuſque, hypericonis, an. M. ſſ. coquantur, colaturæ, quæ ſufficiat, adde mellis roſati* ℥j. *unguenti ægyptiaci* ℥ß. *fiat fotus.* Then use the following deterſive medicin: R. *ſucci appii, & plantag. an.* ℥ij. *mellis com.* ℥j. *terebinth.* ℥iß. *pul. Ireos Florent. & aloes an.* ℥ß. *fiat medicamentum.* The Chirurgeon must well consider, at how many dressings he shall be able to wash away the grosse *sordes* or filth sticking close to the Ulcer, and dry up the excrementitious *sanies*. For oftimes these things may be done at one dressing; but in others who have more quick sense or feeling, not so soon. But when the Ulcer is freed of such grosse *Sordes* or filth, you must forbear to use more acrid things for fear of pain, defluxion, inflammation, and erosion, whereby the Ulcer would become more hollow. Wherefore then we shall be content to apply remedies which dry and clense without acrimony that we may so help natures indeavours in generating flesh. Such remedies are the pouders of Aloes, Mastich, Myrrh, Orris, Litharge, Antimony, roots of Gentian, Barly flower, and the like, which being strewed upon the Ulcer, you shall cover it with Lint, and put over that a plate of Lead, rubbed over with quick silver; and you shall put on these deterſives and deſiccatives more or lesse strong, as you shall find it requisite and necessary. For the too plentifull use of drying and deterſive things, doth in time hollow the Ulcers, whereby it comes to passe that in short time in like sort, a greater quantity of *Sanies* flows from the Ulcer, the proper substance of the flesh being dissolved by the force or acrimony of deterſive medicin; as also the proper alimentary humor, which flowed to the part, being in the like sort, a greater quantity of *Sanies* flowed from the Ulcer, the proper substance of the flesh being dissolved by the force or acrimony of the deterſive medicine, as also the proper alimentary humor, which flowed to the part, being in like sort defiled; which thing beguiles the unskilfull Chirurgeon. For by how much he sees the Ulcer flow more plentifully with *Sanies*, he endeavours by so much the more to exhaust and dry up with more acrid medicins these humidities as if they were excrementitious; But *Galen* hath long ago admonished us to take heed hereof, setting forth a History of a certain Emperick who dressing a sordid Ulcer with a green, acrid and eating medicin, dissolved the flesh, and so consequently made the Ulcer more hollow, and caused more pain and defluxion; whereby it happened that continually adding more acrid medicins, he continually by his ignorance and unskilfulnesse increased the colliquation of the flesh, the largenesse of the ulcer and excrementitious humidity. Wherefore we must take speciall care whether the sordid Ulcer grow each day worse, by its proper fault and the impurity of the whole body besides, or else by the colliquation of the flesh and corruption of the benign and alimentary humor sent thither for the nutrition of the part, by the too frequent and unskilful use of too acrid a medicin. You may conjecture this by the increase of the pain without reason, and by the heat and redness of the lips of the Ulcer. Therefore you must principally have regard to this, that you give each of your Patients his fit measure, that is, a convenient and agreeable medicin to each of their strengths, taking indication from the strength, distemper, and consistence of the whole body and affected part; for there is a great deal of difference whether you apply a medicin to a plowman or labourer, or to an Eunuch and woman, or whether to the Leg, or eyes. For these medicins which to a dense and hard body and part are only detergent and drying, the same are to delicate and tender bodies and parts cathæretick and eating, by colliquation of the flesh, and corruption of the nouriſhment, making an increase of *Sordes* or filth; on the contrary those things which do laudably and sufficiently clense the flesh in a soft body and dry up the *Sanies*, these same things applyed to a hard body encrease the *Sordes* and *Sanies* by suffering them to breed, neither are they of sufficient power to wash away the tenacious impurity of a dense body. Wherefore the skilfull Chirurgeon will see when he must betake himself from too strongly cleansing and eating medicins, to these which are more milde.

A detergent lotion.

Detergent medicins without acrimony.

A caution very observable in use of detergent things.

A distinction to be observed concerning the impurity of ulcers.

Diligent regard must be had of the patients bodies and the affected part.

CHAP. X. *Of a virulent, eating and malign Ulcer which is tearmed* Cacoethes, *and of a Chironian Ulcer.*

How virulent and eating ulcers differ. Gal lib. 4. de comp med. ſec. genera.

VIrulent and eating Ulcers differ not unlesse in *magis* and *minus*, for we tearm it a virulent Ulcer, which sends forth a virulent *sanies*, which is properly called *Virus*. This *Virus*, or virulency, when it becomes more malign, gnawes and feeds upon the parts which lye under, and are adjoyning to the Ulcer, and makes an eating Ulcer. Such Ulcers are by *Galen* called *Dyſepulotica*, that is, difficultly to be cicatrized; for, saith he, it happens that the Ulcer is Dysepulotick, either for that the part affected may be vitiated either in the habit or temper thereof, so that it may corrupt the humor which flows thither; such an Ulcer is by a particular name tearmed *Cacoethes*; or for that by reason of the evill quality of the blood flowing thither and eating the part, the part affected being too moist cannot heal up. He further adds that a Chironian

How a Chironian ulcer differs from an eating, see before, Cap. 2.

ulcer

ulcer is far more malign than these Ulcers which are termed *Carcithe*. For the cure; by reason that all these Ulcers have a large extent, for some are more malign and ill to be cleatrized than other some; it is also necessary to have divers medicins ready and at hand distinct both in their faculties and the degrees thereof, so that it is no marvail if they oft fail of their purpose, who with the same medicin dresse and think they shall heale all malign Ulcers. This following medicin described by *Asclepiades* is much commended by *Galen*. ℞. *squamæ æris, æruginis, rasæ, ana* ℥j. *ceræ* lb. β. *resinæ laricis* ℥ijß. *quæ liquari possunt aridis affundantur*, and make an emplaister to be laid only upon the Ulcer, for you must lay a defensative about the Ulcer for fear of inflammation. But *Galen* saith that the following Epulotick of *Primion* excels the rest, as that which to desperate Ulcers (which many have taken in hand and left as uncurable,) was of certain and approved use. ℞ *sarcos* ℥ij. *aluminis scissilis, calcis vivæ, ana* ℥ij. *thuris gallarum, in.* ℥iij. *ceræ* lb. j. & ℥iij. *sevi vitulini* lb. j. & ℥vij. *olei veteris quantum sufficit, fiat emplastrum.*

Gal. lib. 4. see Gen. Cap. 5.

Gal. lib. 4. de comp. med. see Gen. Cap. 6.

CHAP. XI. *An advertisement to the young Chirurgeon touching the distance of times wherein malign Ulcers are to be dressed.*

TO shew the use of *Asclepiades* his medicins described in the former Chapter, and convince the error of these Chirurgeons, who think they do well for their Patients, if they twice or thrice on a day dresse malign ulcers; I have here thought good to digresse a little from my purpose and to interpose *Galens* authority. Rightly (saith *Galen*) hath *Asclepiades* added these words to the formerly described medicin. And loose this after three dayes, and foment the ulcer, and fasten the same emplaister being washed, and apply it again; for unlesse the medicin adhere long to the skin, it will do no good. Which thing notwithstanding many Physitians have been ignorant of, thinking if they wiped away the *sanies* from the ulcer thrice on a day, they should do better than those who did the same but twice a day. But those who dresse it but once a day, are reproved by the Patients as negligent. But they are much mistaken; for you must remember, as we have delivered in most of our writings, that the qualities of all neighbouring bodies do mutual situate and affect each other in some degree, although the one thereof be much more powerfull, for by this reason in space of time they be come somewhat alike, though they otherwise differ much. But when the quality of the medicin shall be like the *species* to the body to be cured, there follows the better successe. Wherefore in which moved by these reasons first appointed to use the emplaister formerly applyed, is worthy of commendations; and we ought to follow him much the rather, seeing that which he found out by reason, is approved by experience. Neither did he unadvisedly command to foment the wound every third day, that is, every dressing, for seeing it is a powerfull medicin, therefore it stands in need of mitigation. This much *Galen*, whose opinion grounded on reason, he can again confirm with another reason. It is already sufficiently known, that medicins can do nothing in us unlesse by the force of the native heat, which stirs up the faculty of the medicin to operation. But in ulcers which are absolutely malign, the native heat of the affected part is very languid, being broken and debilitated by the presence of the preternaturall heat; so that it stands in need of a great space of time to situate the vertue and faculty of the medicin. Wherefore, if in that time, when as the native heat hath much moved and stirred up the faculty of the medicin, the ulcer be loosed or opened, and that emplaister cast away which was laid upon the part, and a fresh one laid in stead thereof, the heat implanted in the part is either dissipated by the contact of the air, or is weakened and driven in; and that endeavour which was made by the emplaister was to no purpose, being as it were hopped in the midst of the course. But a new emplaister being laid on, the heat of the part must undergo a new labour, so to stir up the faculty to bring it to act.

Gal. lib. 4. de comp. med. see Gen. Cap. 5.

Gal. lib. 4. de comp. med. see Gen. Cap. 6.

Revulsion.

Medicins are only such in Generality.

For all medicins are, what they are, in faculty. Equall to this is their error, who by too oft renewing their emplaisters on the same day, do too powerfully cleanse; for so they do not only take away the excrementitious humors, both *sordes* and *sanies*, but also the alimentary juice, to wit, the *Rob*, *Cambium*, and *Gluten*, which are the next matter for procreating of laudible flesh. Wherefore it is not good to dresse ulcers so often in one day, and so loose them to apply new emplaisters, unlesse some grievous symptome (as pain) force us to do it, which requires to be allwaged and mitigated by the often changeing and renewing of Anodyne medicins.

CHAP. XII. *How to bind up Ulcers.*

The beginning of your binding.

IN the binding up of ulcers, you must always begin your bandage at the ulcer. Now the Rowler must be so large that it may not only cover and comprehend the ulcer, but also some portion of the adjacent parts above and below; and let it presse the ulcer with that moderation, that it may only presse out the excrementitious humors. For so the ulcer will become dry, and consequently more neer to healing, as it is observed by *Hippocrates*. Let this be the measure of your binding, that it be neither too strait for hence would ensue pain and defluxion; nor too lax, for such is of no use. You may moisten your boulsters and Rowlers in oxycrate or in red and astringent wine, especially in Summer; when you have bound it up the part must be kept quiet. For according to *Hippocrates*, those who have an ulcer in the leg, ought neither to stand, nor sit, but to lye on a bed. Wherefore when the legs are ulcerated the arms must be exercised, by handling, lifting up and casting downe of divers things. But on the contrary if the arms be ulcerated, the legs must be exercised with walking, or frictions from above downwards, if the Patient cannot endure to walk. So the humors and spirits which with more violence and greater plenty run down to the part affected, may be drawn back and diverted.

CHAP. XIII. *Of the cure of particular ulcers, and first of those of the eyes.*

4. *Meth.* For that (in *Galens* opinion) the divers indication in curing diseases is drawn from the condition of the part, to wit, the temper, complexion, site, figure, use, dull or quick sense. Therefore having briefly handled the generall cure both of simple and compound and implicit ulcers, I think it fit to treat of them now as they are distinguished by the parts, beginning with those of the eyes. These according to *Celsus*, are sometimes caused by pustules, or a sharp defluxion which frets or eats in under the coats thereof, or else by a stroak.

Lib. 6. cap. 6. lib. 3. Botryon. Calama. Argemon. Epicauma. *Paulus* sets down these differences of the ulcers of the eyes: If (saith he) a small little and hollow ulcer be upon the horny coat, it is by the Greeks tearmed *Botryon*: but if it be broader and lesse deep, it is termed *Calama*, about the circle of the *Iris* or Rainbow, it is called *Argemon*. If it be crusty and sordid, it is termed *Epicauma*. These in generall require the same cure as the former, that is, to be mundified, incarnated, dryed and cicatrized; but the part affected indicates more gentle medicins. Wherefore having purged the Patient and taken some blood both from his arm, as also from his veins and temporall Arteries, and bathed him if it be needfull; to divert the defluxion you shall to his shoulders apply cupping glasses with scarification; or else bread newly drawn out of the oven, and sprinkt [illegible] *vitæ* or some good wine shall be applyed to the originall of the spinall marrow. But you [illegible] to the forehead and temples an astringent emplaister made of *emplastrum contra rupturas, diapalma* and *rosicatizum rubrum* mixed together. But this ensuing *Collyrium* described by *Celsus* and approved by *Hollerius*, shall be dropped into the eye. R. *cerussæ ustæ, cadmiæ ustæ & lotæ, an. ℥j. ex aqua plantaginis fiat collyrium quod liquore ovi dissolvatur.* But in the mean time you must diligently observe whether you put the eye to any great pain. Wherefore now and then by putting anodyne medicins thereto, it will be good to comfort it. Also you may make *collyria* of the decoction of Plantain, fenugreek, wormwood, with a little quantity of Sugar-candy, *tutia*, gum *tragacanth*, myrrh and vitriol dissolved therein. When the ulcer is mundified, the following sarcotick will be of good use. R. *farcocollæ in lacte mulieb. macerat.* ℥iij. *pul. diarrhod. simplicis, gummi arabici, tragacanth. an. ℥ß. mucilaginis fenugræci quantum sufficit ut inde fiat collyrium.* But you must note that for moist ulcers, powders are more convenient than *Collyria*. When the ulcer is plained or filled with its proper flesh, it may be cicatrized with the following *collyrium*. R. *tutiæ, cadmiæ ut dicetur præparatæ, cerussæ, antimonii, olibani, an. ℥ß. myrrhæ, sarcocollæ, sanguinis Draconis, aloes, epiti, an. ℥ß. cum aqua plantaginis fiat collyrium*; or the powder only may be conveniently strewed thereon.

A sarcotick *Collyrium.* An epulotick *Collyrium.*

Lib. 6. cap. 6. *Celsus* hath noted that the cicatrizing of the eyes is incident to two dangers, that is, lest they be too hollow, or else too thick. If too hollow, they must be filled by the following remedy. R. *Papaveris lachrymæ, ℥ß. lagopeni, opopanacis, an. ℥ß. aruginis ℥j. cumini ℥iij. piperis ℥ij. cadmiæ lotæ & cerussæ, an. ℥ß. cum aqua pluviali fiat collyrium.* But if the scar be thick or grosse, the following remedy will cure them. R. *cadmiæ acaciæ, an. ℥ß. cadmiæ elotæ, cerussæ, myrrhæ, papaveris lachrymæ, gummi arabici, an. ℥j. piperis albi, thuris, an. ℥ß. æris timbusti, ℥iij. cum aqua pluviali fiat collyrium.* But if the scar lie upon the *cornea* or horny coat, so that it cover the *pupilla* or sight, the sight will be intercepted by the denseness of the membrane. Here you must also observe, that the scars that are on the *Cornea* are white; but these on the *Adnata* are red, because this is spred over with more little veins than that.

A Collyrium for hollow scars. The scars of the horny coat are white, and those of the *Adnata* red.

CHAP. XIIII. *Of the Ozæna and Vlcers of the Nose.*

Lib. 6. cap. 8. Gal. lib. 3. de comp. med. secund. locos cap. 8. THe *Ozæna* is a deep and stinking ulcer in the inside of the nose, sending forth many crusty and stinking excrements. *Celsus* saith that such ulcers can scarsly be healed: it is caused (as *Galen* saith) by the distillation of acrid and putrid humors from the head into the nostrills about the mammillary protresses. For the cure, the Patient must eat sparingly, and his meats must neither be sharp nor strong; the humor being prepared must be purged, the head dryed and strengthened, that so it may neither admit the excrementitious humors, nor send them downe: then must we come to the part affected with the ulcer. The ulcer must be dryed with a repelling medicine, such as is the juice of Pomegranats boiled to the half in a brasse vessell; the powder of Calamint, Cresses, white Hellebore, the juice of Cresses with Alum and other things which you may read in *Celsus*. *Galen* out of his stringent wishes, to draw up into the nostrills the juice of Calamint, or that the Calamint it self being dryed, and made into powder, may be blown with a quill into the nose. Others use this following powder. R. *ros. rub. mint. calam. arom. rad. angelicæ, gentian. macis, cariop. an. ℥ß. camph. ambræ, an. gr. iiij. moscb. gr. vj. fiat pulvis subtilissimus. Manardus* writes that the Urine of an Asse, though a nasty medicine, is an excellent remedy in this affect. But if the inveterate and contumacious evill do not yeeld to these remedies, then you must have recourse to Coprose, Verdigreece, *sal ammoniacum*, and Alum with Vinegar. It doth sometimes happen that the ulcer spreading on, comes to take hold of the *Ossa ethmoides* or five-like bones; in which case you must not forcibly pluck them out, but refer the whole business to nature, who will expell them when they shall come away of themselves, making in the mean while injections into the nostrills of *aqua vitæ*, wherein Cephalick powders have been steeped for the greater drying.

Lib. 2. epist. 1. An injection when the *Ozæna* shall come to the *Ossa Ethmoides.*

CHAP. XV. *Of the Vlcers of the mouth.*

Aph. 24. sect. 3. Celsus lib. 6. cap. 11. Gal. com. ad 3. lib. epidem. OF this tribe are the *Aphthæ* ulcers familiar to little children, according to *Hippocrates*. They oft-times begin at the gums, and by the palat of the mouth creep into the throat, and over all the mouth, as *Celsus* saith. *Galen* makes two kinds of *Aphthæ*; the one (the cure of such as that which usually troubles children by reason of the acrimony of the nourishment) the other is malign by reason of an afflux of an evill humor (that is, venenate and malign) into the mouth.

mouth. For the cure, it ſhall be good to abſtain from all acrid things, and if it be a ſucking child, it will not be amiſſe to temper the nurſes milk with refrigerating meats, bathing the whole body, and fomenting the dugs with warm water; for all the members in children are moſt tender, and as it were mucous, and their mouths are unaccuſtomed to meats and drinks. For topick medicins, you muſt make choice of ſuch which may quickly and readily work the effect; for here the condition of the affected part is ſuch, that they cannot long remain and adhere thereto. Therefore if the ulcer be malign, it muſt be lightly touched with *aqua fortis* which hath been uſed in ſeparating metalls and which beſides is tempered with ſix parts of common water. You may for the ſame purpoſe uſe the oils of Vitrioll, Sulphur, Antimony, Mercury water and the like. *Aetius* wiſhes you to touch and correct ſuch ulcers with a lock of wooll dipped in ſcalding oil, and ſo faſtned to the end of a probe, untill they wax white and become ſmooth or plain. For ſo their eating and ſpreading force will at length be bridled, and laudable fleſh grow up in place of that which is eaten. After ſuch burning it will be good to waſh the mouth with the following gargariſm, which alſo of its ſelf alone will ſerve to cure Aphtha's, which are not malign. ℞ *hordei integri* p. j. *plantag. ceterach, piloſellæ, agrimoniæ, an.* M. j. *fiat decoctio ad* lb. j. *in qua diſſolve mellis roſati* ℥j. *diamoron.* ℥ß. *fiat gargariſma.* You may alſo make other gargles, of Pomegranate pills, Balauſties, Sumach, Berberies, red roſes being boyled, and diſſolving in the ſtrained liquor *Diamoron* and *Dianucum* with a little Alum. For *Galen* writes, that ſimple ulcers of the mouth are healed with things which dry with moderation; now *Diamoron* and *Dianucum* are ſuch. But others ſtand in need of ſtrong medicins, with ſuch like. If the palat be ſeiſed upon, we muſt uſe the more diligence and care; for there is danger, leſt being the part is hot and moiſt, the bone which lyes under which is rare and humide, may be corrupted by the contagion and fall away, and the voice or ſpeech be ſpoiled. If the ulcer be pocky, omitting the common remedies of ulcers, you muſt ſpeedily betake your ſelf to the proper antidote of that diſeaſe, to wit, quick-ſilver. Fiſtulous ulcers often take hold on the Gums, whence the root of the next tooth becomes rotten, and ſo far that the acrimony of the *Sanies* oft-times makes its ſelf a paſſage forth on the outſide under the chin; which thing puts many into a falſe conceit of the *ſcrophulæ* or Kings evill, and conſequently of an uncurable diſeaſe. In ſuch a caſe *Aetius*, and *Celſus* counſell is, to take out the rotten tooth, for ſo the *Fiſtula* will be taken away, the Gum preſſing and thruſting its ſelf into the place of the tooth which was taken forth; and ſo the cauſe nouriſhing the putrefaction being taken away, (that is, the tooth) the reſt of the cure will be more eaſy. The ulcers of the tongue may be cured by the ſame remedies by which the reſt of the mouth; yet thoſe which breed on the ſide thereof endure very long, and you muſt look whether or no there be not ſome ſharp tooth over againſt it, which will not ſuffer the ulcer in that place to heal; which if there be, then muſt you take it away with a file.

The cure.

A gargariſm for the *Aphthæ*. *Lib. 6. meth. Cap.* 10.

Ulcers of the palat muſt be quickly and carefully dreſſed. *Aetius Lib. 6. cap. 3. Celſus lib. 6. cap.* 13.

CHAP. XVI. *Of the Vlcers of the Ears.*

Vlcers are bred in the auditory paſſage both by an externall cauſe, as a ſtroak, or fall, as alſo by an internall, as an abſceſs there generated. They oft-times flow with much matter, not that the brain doth that way disburden its ſelf.

Their cauſes.

For the cure, the chief regard muſt be had of the antecedent cauſe, which feeds the ulcer, and it muſt be diverted by purging medicins, Maſticatories, and Errhines. This is the form of a Maſticatory. ℞ *Maſtich.* ℥j. *ſtaphi ſagr. & pyreth. an.* ℈j. *cinam. & caryoph. an.* ℥ß. *fiant Maſticatoria, utatur mane & veſperi.* But this is the form of an Errhin. ℞ *ſucci betonic. mercurial. & meliſſæ, an.* ℥ß. *vini albi* ℥j. *miſce & frequenter naribus attrahatur.* For topick medicins we muſt ſhun all fatty and oily things, as *Galen* ſet down *in Method. medendi*, where he finds fault with a certain follower of *Theſſalus* who by uſing *Tetrapharmacum*, made the ulcer in the ear grow each day more filthy than other, which *Galen* healed with the Trochiſces of *Andronius* diſſolved in Vinegar, whoſe compoſure is as followeth. ℞ *balauſt.* ℥ij. *alumin.* ℥j. *atrament. ſutor.* ℥ij. *myrrhæ* ℥j. *thur. ariſtoloch. gallarum, an* ℥ij. *ſalis Ammon.* ℥j. *excipiantur omnia melicrato, & fiant trochiſci.*

The cure.

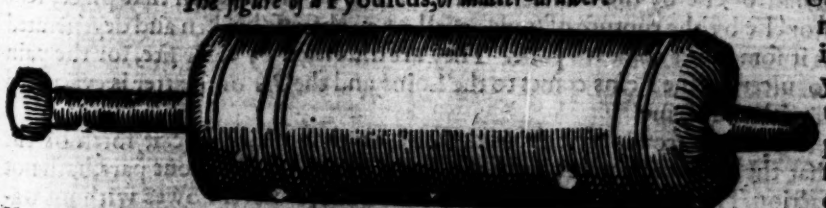
A maſticatory.

An Errhin.

The compoſition of *Andronius* his trochiſces.

Scales of Iron.

The figure of a Pyoulcus, *or matter-drawer.*



Galen in the ſame place witneſſeth, that he hath healed inveterate ulcers & of two years old of this kind, with the ſcales of Iron made into powder, and then boiled in ſharp Vinegar untill it acquired the conſiſtence of Honey: Moreover an Oxes gall diſſolved in ſtrong Vinegar, and dropped in warm, amends and dryes up the putrefaction wherewith theſe ulcers flow. Alſo the ſcales of Iron made into powder boyled in ſharp Vinegar, dryed and ſtrewed upon them. But if the ſtraitneſs of the paſſages ſhould not give leave to the matter contained in the windings of the ears to paſſe forth, then muſt it be drawn out with an Inſtrument thereupon called a *Pyoulcus*, or matter-drawer, whereof this is the figure.

Of the Pyoulcus *Galen* makes mention 2. *ad Glauconem.*

CHAP. XVII. *Of the ulcers of the windpipe, weazon, ſtomach and Guts.*

These parts are ulcerated either by an externall cauſe, as an acrid medicine, or poyſon ſwallowed down; or by an internall cauſe, as a malign fretting humor which may equall the force of poyſon generated in the body, and reſtrained in theſe parts. If the pain be encreaſed by ſwallowing or breathing, it is the ſign of an ulcer in the weazon, or windpipe joining thereto. But the pain is moſt ſenſibly felt when as that which is ſwallowed is either ſour or acrid, or the

The Cauſes.

Signs.

air breathed in, is more hot or cold than ordinary. But if the cause of pain lye fastned in the stomach, more grievous symptomes urge; for sometimes they swound, have a nauseous disposition and vomiting, convulsions, gnawings, and pain almost intolerable, & the coldness of the extream parts; all which when present at once, few scape unless such as are young, and have very strong bodies. The same affect may befall the whole stomach, but because both for the bitterness of pain, and greatness of danger, that ulcer is far more grievous which takes hold of the mouth of the Ventricle, honoured by the Ancients with the name of the Heart; therefore Physitians do not make so great a reckoning of that which happens in the lower part of the stomach. Now we know that the Guts are ulcerated if *Pus*, or much purulent matter come forth by stool; if blood come that way with much griping; for by the *Pus* flaying and as it were gathered together in that place, there is as it were a certain continuall *Tenesmus*, or desire to goe to stool. Now all such ulcers are cured by meats and drinks, rather than by medicins, according to *Galen*. Therefore you must make choice of all such meats and drinks as are gentle, and have a lenitive faculty, shunning acrid things; for *Tutia*, Lytharge, Ceruse, Verdigreece & the like, have no place here, as they have in other ulcers. But when as the ulcer shall be in the Gullet or Weazon, you must have a care that such things may have some viscidity or toughnesse, and be swallowed by little and little, and at divers times; otherwise they will not much avail, because they cannot make any stay, in these commune wayes of breath and meat; therefore they presently slip down and flow away; wherefore all such things shall be used in form of an *Eglegma*, to be taken lying on the back, and swallowed down by little and little, opening the muscles of the throat, lest the medicin passing down suddainly and in great quantity, cause a cough, a thing exceeding hurtfull to these kinds of ulcers. When they must be clensed, you shall have crude honey, which hath a singular faculty, above all other detergent things, in these kind of ulcers. But when they can conveniently swallow, you shall mix Gum Tragacanth dissolved in some astringent decoction. In ulcers of the stomach all acrid things (as I have formerly advised) must be shunned, as those which may cause pain, inflammation and vomit, and besides hinder the digestion of the meat. Therefore let them frequently use a ptisan, and sugred gellyes wherein gum Tragacanth, and bole Armenick have been put, the decoction of Prunes, Dates, Figs, Raisons, Honey, Cowes milk boyled with the yolks of egs, and a little common honey. When they are to be agglutinated, it will be convenient to make use of austere, astringent, and agglutinative things which want all acrimony, and ungratefull taste, such as are *Hypocistis*, Pomegranate flowres and pills, *terra sigillata*, *sumach*, *acacia*, a decoction of quinces, the Lentisk wood, the tops of Vines, of brambles, myrtles, made in astingent wine, unlesse there be feare of inflammation. Their drink shall be *Hydromel* water with Sugar, syrup of Violets and Iujubes. Honey mixed with other medicins is a very fitting remedy for ulcers of the guts and other parts more remote from the stomach; for if you shall use astringent medicins alone of themselves, they will stick to the stomach; neither will they carry their strength any further; but honey mixed with them, besides that it distributes them to the rest of the body, and helps them forwards to the affected parts, also clenses the ulcers themselves. Here also Asses milk may with good success be used in stead of Goats or Cowes milk. The use of a vulnerary potion is also commendable, if so be that it be made of such hearbes and simples, as by a certain tacit familiarity have respect to the parts affected. But the ulcers of the Guts have this difference amongst themselves, that if the greater guts be affected, you may heal them with a Clyster and injections, made also sharp to correct the putrefaction; such as are those which are made of Barly water, or wine with *Ægyptiacum*. But if the small guts be ulcerated, they must be rather healed by potions and other things taken at the mouth, for that (as *Galen* saith) these things which are put up into the body by the Fundament, do not commonly ascend to the small or slender guts, but such as are taken at the mouth cannot come unless with the losse of their faculty, so far as the great guts.

CHAP. XVIII. *Of the Vlcers of the Kidneys and Bladder.*

Causes.

Signes.

ULcers are caused in the Kidneys and Bladder, either by the use of acrid meats, drinks, or medicins, as *Cantharides*; or else by the collection of an acrid humor bred in that place, sent or faln thither; or else by the rupture of some vessell, or an abscesse broken and degenerated into an ulcer, as it sometimes comes to passe. They are discerned by their site, for the pain and heavinesse of ulcers of the Reins comes to the Loins, and the *Pus* or matter is evacuated well and throughly mixed with the Urine.

Hip. Aphor. 81. sect. 4. *Aphor. 76. sect. 4.* *Aphor. 77. sect. 4.*

Neither doth the *Pus* which flows from the reins stink so ill, as that which is cast forth of the bladder; the reason is, for that the bladder being a bloodlesse, fleshlesse and membranous part, hath not such power to resist putrefaction. That *Pus* which flowes from the Kidneys never flowes without water; and although by long keeping in an Urinall, it at length subsides or falls to the bottome, and may be seen separated; yet when it is first made, you may see it perfectly mixed with the Urine; but that *Pus* which flowes from the bladder is oft-times made alone without Urine; and usually it comes to passe that the *Pus*, or matter which flowes from the ulcerated Kidneys, hath in it certain caruncles, or as it were haires, according to the rule of *Hippocrates*. Those who in a thick Urine have little caruncles, and as it were hairs come forth together therewith, they come from their Kidneys; but on the contrary those who have certain bran-like scales come from them in a thick Urine, their bladder is scabby or troubled with a scabby ulcer.

The cure.

Why we must shun strong purges.

For the cure; it is expedient that the belly be soluble either by nature or Art, and the use of mollifying Clysters. And it is good to vomit sometimes, so to draw back the humors by whose confluxe into the affected part the ulcer might be fed and made more sordid and filthy. You must beware of strong purgations, lest the humors being moved and too much agitated, the matter fit to nourish the

ulcer

Ulcer may fall down upon the kidnies or bladder. The ensuing potion is very effectuall to mundifie those kind of Ulcers. ℞. *Hordei integri, M.* ij. *glycyrrhizæ raſ. & contuſ.* ℥ß. *rad. acetoſæ & petroſel. an.* ℥vj. *fiat decoctio ad* lb. j. *in colatura diſſolve mellis diſpum.* ℥ij. Let him take every morning the quantity of four ounces. *Gordonius* exceedingly commends the following Trochiſces. ℞. *quatuor ſem. frig. maj. mund. atorum, ſem. papaveris albi, ſem. malvæ, portul. cydon. baccarum myrti, tragacanth. gum. arab. nucum pinearum mund. piſtach. glycyrrhizæ mund. muſcaginis ſem. pſilii, amygd. dulc. hordei mund. an.* ℥ij. *bol. armeni ſang. drac. ſpodii, roſarum, myrrhæ, an.* ℥ß. *excipiantur hydromeliti, & fingantur trochiſci ſinguli ponderis* ℥ij. Let him take one thereof in the morning diſſolved in Barley water or Goats milk. *Galen* bids to mixe honey and diuretick things with medicines made for the Ulcers of the reins and bladder, for that they gently move urine, and are as vehicles to carry the medicines to the part affected. Ulcers of the bladder are either in the bottome thereof, or at the neck and urinary paſſage. If they be in the bottome, the pain is almoſt continuall; if in the neck, the pain then pricks and is moſt terrible when they make water and preſently after. The ulcer which is in the bottome ſends forth certain ſcaly or skinny excrements together with the urine; but that which is in the neck, cauſes almoſt a continuall *Tenigo*. Thoſe which are in the bottome are for the moſt part incurable, both by reaſon of the bloodleſs and nervous nature of the part, as alſo for that the ulcer is continually chaſed and troubled by the acrimony of the urine, ſo that it can hardly be cicatrized. For even after making of water ſome reliques of the urine alwayes remain in the bottome of the bladder, which could not therefore paſs forth together with the reſt of the urine, for that for the paſſing forth of the urine, the bladder being diſtended before, fals and is complicated in its ſelfe. Ulcers of the bladder are healed with the ſame medicins as thoſe of the reins are; but theſe not only taken by the mouth but alſo injected by the urinary paſſage. Theſe injections may be made of *Gordonius* his Trochiſces formerly preſcribed, being diſſolved in ſome convenient liquor; but becauſe ulcers of the bladder cauſe greater and more ſharpe pain than thoſe of the kidnies, therefore the Chirurgeon muſt be more diligent in uſing Anodynes. For this purpoſe, I have often by experience found, that the oil of henbane made by expreſſion gives certain help. He ſhall do the ſame with Cataplaſms and liniments applyed to the parts about the *Pecten* and all the lower belly and *perinæum*, as alſo by caſting in of Clyſters. If that they ſtink, it will not be amiſſe to make injection of a little *Ægyptiacum* diſſolved in wine, plantain, or roſe water. For I have often uſed this remedy in ſuch a caſe with very proſperous ſucceſs.

Things to cleanſe theſe ulcers, Trochiſces for the ulcers of the kidnies and bladder. 4. *Method.*

Signs to know what part of the bladder is ulcerated. Why ulcers in the bottome of the bladder are uncurable.

Ægyptiacum for the ulcers of the bladder.

CHAP. XIX. *Of the Ulcers of the Womb.*

ULcers are bred in the womb either by the conflux of an acrid, or biting humour, fretting the coats thereof, or by a tumour againſt nature degenerating into an abſceſſe, or by a difficult and hard labour; they are known by pain at the *perinæum*, and the efflux of *Pus* and *Sanies* by the privity. All of them in the opinion of *Avicen* are either putrid, when as the *Sanies* breaking forth is of a ſtinking ſmell, and in colour reſembles the water wherein fleſh hath been waſhed; or elſe ſordid, when as they flow with many virulent and crude humours; or elſe are eating or ſpreading ulcers, when as they caſt forth black *Sanies*, and have pulſation joined with much paine. Beſides they differ amongſt themſelves in ſite, for either they poſſeſs the neck and are known by the ſight, by putting in a *ſpeculum*, or elſe are in the bottome, and are manifeſted by the condition of the more liquid and ſerous excrements, and the ſite of the pain. They are cured with the ſame remedies wherewith the ulcers of the mouth, to wit, with *aqua fortis*, the oil of Vitriol and Antimony, and other things made ſomewhat more milde, and corrected with that moderation, that the ulcerated parts of the Womb may be ſafely touched with them; it is requiſite that the remedies which are applyed to the ulcers of the womb, do in a moment that which is expected of them, for they cannot long adhere or ſtick in the womb, as neither to the mouth. *Galen* ſaith that very drying medicins are exceeding fit for the ulcers of the womb, that ſo the putrefaction may be hindred or reſtrained, whereto this part as being hot and moiſt is very ſubject; beſides that the whole body unto this part as unto a ſink ſends downe its excrements. If an ulcer take hold of the bottome of the womb, it ſhall be cleanſed and the part alſo ſtrengthened by making this following injection. ℞. *hordei integri* p. ij *guajaci* ℥j. *rad. Ireos.* ℥ß. *abſinth. plant. centaur. utriuſque, an. M.* j. *fiat decoct. in aquæ fabrorum ad* lb. ij. *in quibus diſſolve mellis roſati, & ſyrupi de abſinthio, an.* ℥iij. *fiat injectio.* For amending the ſtinking ſmell I have often had certaine experience of this enſuing remedy. ℞. *vini rub.* lb. j. *unguent. ægyptiaci* ℥ij. *bulliant parum.* Thus the putrefaction may be corrected, and the painfull maliciouſneſs of the humour abated. Ulcers when they are cleanſed muſt preſently be cicatriced; that may be done with Alum water, the water of Plantain wherein a little Vitriol or Alum have been diſſolved. Laſtly, if remedies nothing availing, the ulcer turn into a *cancer*, it muſt be dreſſed with anodynes and remedies proper for a *cancer*, which you may finde ſet down in the proper treatiſe of *Cancers*. The cure of ulcers of the fundament was to be joined to the cure of theſe of the womb; but I have thought good to referre it to the treatiſe of *Fiſtula's*, as I do the cure of theſe of the urinary paſſage to the treatiſe of the *Lues venerea*.

CHAP. XX. *Of the* Varices *and their cure by cutting.*

A *Varix* is the dilatation of a vein, ſome whiles of one and that a ſimple branch, other whiles of many. Every *varix* is either ſtreight or crooked, and as it were infolded into certaine windings within its ſelfe. Many parts are ſubject to *Varices*, as the temples, the region of the belly under the navill, the teſticles, womb, fundament, but principally the thighs and legs. The matter of them is uſually melancholy bloud, for *Varices* often grow in men of a melancholy temper, and which uſually feed on groſs meats, or ſuch as breed groſs and melancholy humours. Alſo women with child are commonly troubled with them, by reaſon of the heaping together of their ſuppreſſed menſtruall evacuation.

What a Varix is, and what be the differences thereof.

The matter.

The cauſes. Signes. The cure. The cutting of *Varices*. For what intention a *Varix* muſt be cut. *Paulus cap. 82. lib. 6.* The manner how to cut it.

cuation. The precedent cauſes are a vehement concuſſion of the body, leaping, running, a painful journey on foot, a fall, the carrying of a heavy burden, torture or racking. This kind of diſeaſe gives manifeſt ſigns therof by the lageneſs, thickneſs, ſwelling and colour of the veines. It is beſt not to meddle with ſuch as are inveterate; for of ſuch being cured there is to be feared a reflux of the melancholly blood to the noble parts, whence there may be imminent danger of malign ulcers, a cancer, madneſs or ſuffocation. When as many *Varices* and diverſly implicit are in the legs, they often ſwell with congealed and dryed bloud, and cauſe pain which is increaſed by going and compreſſion. Such like *varices* are to be opened by dividing the veine with a Lancet, and then the bloud muſt be preſſed out, and evacuated by preſſing it upwards and downwards; which I have oft-times done, and that with happy ſucceſs to the Patients, whom I have made to reſt for ſome few dayes, and have applyed convenient medicins. A *varix* is often cut in the inſide of the leg a little below the knee, in which place commonly the originall thereof is ſeen. He which goes about to intercept a *varix* downwards from the firſt originall and as it were fountain thereof, makes the cure far more difficult. For hence it is divided as it were into many rivelets, all which the Chirurgeon is forced to follow.

A *varix* is therefore cut or taken away ſo to intetcept the paſſage of the blood and humours mixed together therewith, flowing to an ulcer ſeated beneath; or elſe leſt that by the too great quantity of blood, the veſſel ſhould be broken, and death be occaſioned by a hæmorrhagie proceeding from thence. Now this is the manner of cutting it. Let the Patient lye upon his back on a bench or table, then make a ligature upon the leg in two places the diſtance of ſome four fingers each from other, wherein the exciſion may be made, for ſo the vein will ſwell up and come more in ſight, and beſides you may alſo mark it with inke; then taking the skin up between your fingers cut it long wayes according as you have marked it, then free the bared vein from the adjacent bodies, and put thereunder a blunt pointed needle (leſt you prick the vein) thred with a long double thred, and ſo bind it faſt; and then let it be opened with a Lancet in the middle under the ligature juſt as you open a vein, and draw as much therehence as ſhall be fit. Then ſtraight make a ligature in the lower part of the forementioned vein, and then cut away as much of the ſaid vein as is convenient between the ligatures, and ſo let the ends thereof withdraw themſelves into the fleſh above and below; let theſe ligatures alone untill ſuch time as they fall away of themſelves. The operation being performed, let an aſtringent medicine be applyed to the wound and the neighbouring parts; neither muſt you ſtir the wound any more for the ſpace of three dayes. Then do all other things as are fit to be done to other ſuch affects.

CHAP. XXI. *Of Fiſtula's.*

What a Fiſtula is.

A Fiſtula is a ſinuous, white, narrow, callous, and not ſeldome unperceivable ulcer. It took its denomination from the ſimilitude of a reeden (Fiſtula) that is, a pipe, like whoſe hollowneſs it is. A Fiſtula is bred in ſundry parts of the body, and commonly followes upon abſceſſes or ulcers not well cured.

What a Callous is. The differences of Fiſtula's.

A *Callous* is a certain fleſhy ſubſtance, white, ſolid, or denſe and hard, dry and without pain, generated by heaping up of dryed excrementitious phlegme, or elſe aduſt melancholy encompaſſing the circuit of the ulcer, and ſubſtituting it ſelfe into the place of laudable fleſh. The *Sinus* or cavity of a Fiſtula is ſometimes dry, and other while drops with continuall moiſture: ſometimes the dropping of the matter ſodainly ceaſes, and the orifice thereof is ſhut up, that ſo it may deceive both the Chirurgeon and the Patient with a falſe ſhew of an abſolute cure; for within a while after it will open again and run as formerly it did. Some Fiſtula's are bred by the corruption of a bone, others of a nerve, others of membranes, and others of other parts of the body. Some run ſtraight in, others and that the greater part, have turnings and windings; ſome have one, others have more orifices and windings, ſome are at the joints, others penetrate into ſome capacity of the body, as into the cheſt, belly, guts, womb, bladder; ſome are eaſily, others difficultly cured, and ſome wholly uncurable. There are divers ſigns of Fiſtula's according to the variety of the parts they poſſeſs; for if that which you touch with the end of your probe make reſiſtance, and reſound, then you may know that it is come to the bone; and then if the end of the probe ſlip up and down as on a ſmooth and polite ſuperficies, it is a ſign that the bone is yet ſound; but if it ſtop and ſtay in any place as in a rough way, then know that the bone is eaten, rough and periſhed; ſometimes the bone lies bare, and then you need not uſe the probe. Beſides alſo it is a ſign that the bone is affected, if there be a purulent efflux of an unctuous or oily matter, not much unlike that marrow wherewith the bone is nouriſhed. For every excrement ſhewes the condition of the nouriſhment of the part whence it is ſent; in a Fiſtula which penetrates to a nerve, the Patient is troubled with a pricking paine, eſpecially when you come to ſearch with a probe, eſpecially if the matter which flowes down be more acrid. Oft-times if it be cold, the member is ſtupified the motion being weakened; beſides alſo the matter which flowes from thence is more ſubtle, and ſomewhat like unto that which flowes from the bones, yet not oily nor fat, but ſanious and viſcous, reſembling the condition of the alimentary humour of the nerves. The ſame uſually appears and happens in Fiſtula's which penetrate to the Tendons and thoſe membranes which involve the muſcles. If the Fiſtula be within the fleſh, the matter flowing thence is more thick and plentiful, ſmooth, white, and equall. If it deſcend into the veins or arteries, the ſame happen as in thoſe of the nerves, but that there is no ſuch great pain in ſearching with your probe, nor no offence or impediment in the uſe of any member: yet if the matter of the fiſtulous ulcer be ſo acrid, as that it corrode the veſſels, blood will flow forth; and that more thick if it be from a vein, but more ſubtle and with ſome murmuring if from an artery. Old Fiſtula's and ſuch as have run for many years, if ſuddainly ſhut up, cauſe death, eſpecially in an ancient and weak body.

The ſignes. The ſigne that the bone is bare from the condition of the matter which is caſt forth. *Aetius tetr. 4. ſect. 2. cap. 55.* Old Fiſtula's if cloſed prove mortall.

CHAP.

CHAP. XXII. *Of the cure of Fistula's.*

FOr the cure; in the first place it will be expedient to search the Fistula, and that either with a wax size, a probe of lead, gold or silver, to find out the depth and windings or corners thereof. But if the Fistula be hollowed with two or more sinuses, and those cuniculous, so that you cannot possibly and certainly search or find them all out with your probe; then must you cast an injection into some one of those holes, and so observe the places where it comes forth, for so you may learn how many, and how deep or superficiary cavities there be; then by making incisions you must lay open and cut away the callous parts. You must make incisions with an incision knife or razour, or else apply actuall [illegible] unless the callous substance be first taken away, for [illegible] generate flesh or agglutinate the distant bodies. For hard things cannot grow together, unless by the interposition of [illegible] such as is laudable blood; but a callous body on all sides possessing the surface of the [illegible] hinders the flowing of the blood out of the capillary veins for the restoring of the lost substance and uniting of the disjoined parts. If you at any time make caustick injections into the Fistula, you must presently stop the orifice thereof, that so they may have time to worke the effect for which they are intended. Which thing we may conjecture by the tumor of the part, the disposure of the flowing matter, and its lesser quantity. Then you must hasten the falling away of the Eschar, and then the ulcer must be dressed like other ulcers. Sometimes the *Callous* which possesses the sinuous cavity of a Fistula, overcome by the power of acrid and caustick medicins comes whole forth, and falls out like a pipe, and so leaves a pure ulcer underneath it. Which I observed in a certain Gentleman, when I had washed with strong [illegible] divers times a Fistulous ulcer in his thigh not through with a bullet, then presently by putting in my Balsam formerly described, he grew well in a short time. Fistula's which are neer great vessells, Nerves or principall intrailes, must not be medled with unless with great caution. When a Fistula proceeds by the fault of a corrupt bone, it is to be considered whether that fault in your bone be superficiary, or deeper in, or whether it is wholly rotten and perished. For if the default be superficiary it may easily be taken away with a desquammatory Trepan; but if it penetrate even to the marrow, it must be taken forth with cutting mullets, first having made way with a *Terebellum*. But if the bone be quite rotten and perished, it must be wholly taken away, which may be fitly done, in the joints of the fingers, the *radius* of the Cubit and Leg; but no such thing may be attempted in the socket of the Huckle bone, the head of the Thigh bone, or any of the Rack bones where they are mortified, neither in those Fistula's, which are of their own nature uncurable; but you shall think you have discharged your duty and done sufficiently for the Patient, if you leave it with a prognostick. Of this nature are Fistula's which penetrate even to the bowells, which come into the parts orespread with large vessells or Nerves, which happen to effeminate and tender persons, who had rather dye by much, then to suffer the pain and torment of the operation. Like caution must be used, when by the cutting of a Fistula there is fear of greater danger, as of convulsion if the disease be in a nervous part. In these and the like cases the Chirurgeon shall not set upon the perfect cure of the disease, but shall think it better to prevent by all means possible that the disease by fresh supplies become no worse, which may be done if he prevent the falling down of any new defluxion into the part; if by an artificiall diet he have a care that excrementitious humors be not too plentifully generated in the body, or so order it, that being generated they may be evacuated at certain times, or else diverted from the more noble to the base parts. But in the mean space it shall be requisite to waste the faulty flesh, which growes up more then is fitting in the ulcer, and to cleanse the *sordes* or filth, with medicins, which may do it without biting or acrimony and putrefaction.

CHAP. XXIII. *Of the Fistula's in the Fundament.*

FIstula's in the Fundament are bred of the same causes as other kinds of Fistula's are; to wit, of a wound or absteste not well cured, or of a hæmorrhoid which is suppurated. Such as are occult, may be known by dropping down of the *sanious* and purulent humor by the Fundament and the pain of the adjacent parts. But such as are manifest by the help of your probe you may find whither they goe and how far they reach. For this purpose the Chirurgeon shall put his finger into the Fundament of the Patient, and then put a Leaden probe into the orifice of the Fistula, which if it come to the finger without interposition of any *medium*, it is a sign it penetrates into the capacity of the Gut. Besides also then there flowes not only by the Fundament, but also by the orifice which the malign humor hath opened by its acrimony, much matter, somewhiles sanious, and oft-times also breeding Worms. Fistula's may be judged cuniculous, and running into many turnings and windings, if the probe do not enter far in, and yet notwithstanding more matter flowes therehence then reason requires should proceed from so small an ulcer. You may in the orifices of all Fistula's, perceive a certain callous ware, which the common Chirurgeons tearm a Hens arse. Many symptomes accompany Fistula's which are in the Fundament, as a *Tenesmus*, strangury and falling down of the Fundament. If the Fistula must be cured by manuall operation, let the Patient lye so upon his back, that lifting up his legs, his thighs may presse his belly, then let the Chirurgeon, having his nail pared, put his finger besmeared with some ointment into the Patients Fundament; then let him thrust in at the orifice of the Fistula a thick Leaden needle drawing after it a thread consisting of thread and horse hairs woven together, and then with his finger taking hold thereof and somewhat crooking it, draw it forth at the Fundament, together with the end of the Thread. Then let him knit the two ends of the thread with a draw or loose knot, that so he may straiten them at his pleasure.

The causes.

Signs.

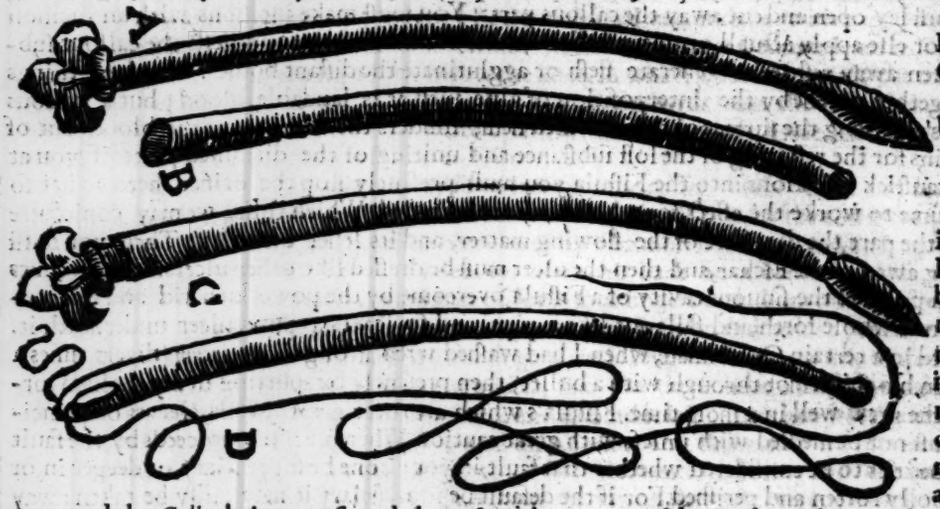
Symptomes.

The art of binding and cutting a Fistula of the Fundament.

But

But before you bind them you ſhall draw the thread ſomewhat roughly towards you as though you meant to ſaw the fleſh therein contained, that you may by this means cut the Fiſtula without any fear of an Hæmorrhage, or flux of blood. It ſometimes happens that ſuch Fiſtula's penetrate not into the Gut; ſo that the finger by interpoſition of ſome callous body cannot meet with the needle or probe. Then it is convenient to put in a hollow Iron or ſilver probe ſo through the cavity thereof to thruſt a ſharp pointed needle, & that by pricking and cutting may deſtroy the *Callus*; which thing you cannot perform with the formerly deſcribed leaden probe, which hath a blunt point, unleſs with great pain.

The deſcription of a hollow ſilver Probe to be uſed with a needle; as alſo a Leaden Probe.



A. *Shewes the Needle.*
B. *The hollow probe.*
C. *The needle with the probe.*
D. *The Leaden needle drawing a thread after it.*

The *Callus* being waſted, the Fiſtula ſhall be bound as we formerly mentioned. That which is ſuperficiary needs no binding, onely it muſt be cut with a crooked *ſcalprum*, and the *Callus* being conſumed, the reſt of the cure muſt be performed after the manner of other ulcers. But you muſt note, that if any parcell of the Callous body remain untoucht by the medicin or Inſtrument, the Fiſtula reviving again will cauſe a relapſe.

CHAP. XXIIII. *Of Hæmorrhoides.*

What they are.

Their differences.

HÆmorrhoides, as the word is uſually taken, are tumors at the extreamities of the veins encompaſſing the Fundament, cauſed by the defluxion of an humor commonly melancholick, and repreſenting a certain kind of *Varices*. Some of theſe run at an hole being opened, which ſometimes in ſpace of time contracts a *Callus*; others only ſwell, and caſt forth no moiſture; ſome are manifeſt; other lye only hid within. Thoſe which run, commonly caſt forth blood mixed with yellowiſh ſerous moiſture, which ſtimulates the blood to break forth, and by its acrimony opens the mouths of the veins. But ſuch as do not run, are either like bliſters, ſuch as happen in burns, and by practitioners are uſually called *veſicales*, and are cauſed by the defluxion of a phlegmatick and ſerous humor; or elſe repreſent a Grape, whence they are called *Vvales*, generated by the afflux of blood laudable in quality, but overabundant in quantity; or elſe they expreſſe the manner of a diſeaſe, whence they are termed *morales*, proceeding from the ſuppreſſion of melancholick blood; or elſe they repreſent warts, whence they are ſtiled *Verrucales*, enjoying the ſame materiall cauſe of the generation as the *morales* do. This affect is cauſe of many accidents in men; for the perpetuall efflux of blood extinguiſheth the vivid and lively colour of the face, calls on a dropſie, overthrows the ſtrength of the whole body. The flux of Hæmorrhoides is commonly every moneth, ſometimes only foure times in a yeare. Great pain, inflammation, an Abſceſſe which may at length end in a Fiſtula, unleſſe it be reſiſted by convenient remedies, do oft-times forerun the evacuation of the Hæmorrhoides. But if the Hæmorrhoides flow in a moderate quantity, if the Patients brook it well, they ought not to be ſtayed, for that they free the Patients from the fear of iminent evills, as melancholy, leproſie, ſtrangury and the like. Beſides, if they be ſtopped without a cauſe, they by their reflux into the Lungs cauſe their inflammation, or elſe break the veſſells thereof, and by flowing to the Liver cauſe a dropſie by the ſuffocation of the native heat; they cauſe a dropſie, and univerſall leanneſſe on the contrary, if they flow immoderately, by refrigerating the Liver by loſſe of too much blood; wherefore when as they flow too immoderately, they muſt be ſtayed with a pledget of hares down dipped in the enſuing medicin. *℞ pul. aloes, thuris, balauſt. ſang. draconis, an. ℥ß. incorporentur ſimul cum ovi albumine, fiat medicamentum ad uſum.* When they are ſtretched out and ſwoln without bleeding, it is convenient to beat an Onion roaſted in the embers with an Oxes gall; and apply this medicin to the ſwoln places, and renew it every five houres. This kind of remedy is very prevalent for internall Hæmorrhoides; but ſuch as are manifeſt may be opened with horſleaches, or a Lancet. The juice or maſſe of the hearb called commonly Dead-nettle or Ark-angell, applyed to the ſwoln Hæmorrhoides opens them, and makes the congealed blood flow therehence. The *Fungus* and *Thymus* being diſeaſes about the fundament are cured by the ſame remedy. If acrimony, heat and pain do too cruelly afflict the Patient, you muſt make him enter into a bath, and preſently after apply to the ulcers (if any ſuch be) this following remedy. *℞ Olei roſ. ℥iiij. ceruſæ ℥j. Litharg. ℥ß. cereæ novæ, ℥vj. opii ℈j. fiat unguent. ſecundum artem.* Or elſe, *℞ thuris, myrrhæ, creti, an. ℥j. opii ℈j. fiat unguentum cum oleo roſarum & mucagine ſem. pſillii, addendo vitellum unius ovi.* You may eaſily proſecute the reſidue of the cure according to the generall rules of Art.

OF BANDAGES, OR, LIGATVRES.

THE FOURTEENTH BOOK.

CHAP. I. *Of the differences of Bandages.*

BAndages, wherewith we use to bind, do much differ amongst themselves. But their differences (in *Galens* opinion) are chiefly drawn from six things; to wit, their matter, figure, length, breadth, making, and parts whereof they consist. Now the matter of Bandages is threefold; Membranous or of skins, which is accommodated peculiarly to the fractured grisles of the Nose; of Woollen, proper to inflamed parts, as those which have need of no astriction; of Linnen, as when any thing is to be fast bound: and of Linnen cloaths, some are made of flax, othersome of hemp, as *Hippocrates* observes. But Bandages do thus differ amongst themselves in structure, for that some thereof consist of that matter which is sufficiently close and strong of it self, such are the membranous; others are woven, as the linnen ones. But that linnen is to be made choice of for this use, and judged the best, not which is new and never formerly used, but that which hath already been worn and served for other uses, that so the Bandages made thereof may be the more soft and pliable: yet must they be of such strength, that they may not break with stretching, & that they may straitly contain & repell the humor ready to flow down, and so hinder it from entring the part. These, besides, must not be hemmed nor stitched, must have no lace nor seam; for hems and seams by their hardness presse into, and hurt the flesh that lyes under them. Lace, whether in the midst or edges of the rowler, makes the Ligature unequall. For the Member where it is touched with the lace, as that which will not yeeld, is pressed more hard; but with the cloth in the middle more gently, as that which is more lax. Furthermore, these Ligatures must be of clean cloth, that if occasion be, they may be moistened or steeped in liquor appropriate to the disease, and that they may not corrupt, or make worse that liquor by their moistening therein. Now the Bandages which are made of Linnen clothes must be cut long-wayes, and not athwart, for so they shall keep more firm and strong that which they bind, and besides, they will be alwaies alike, and not broader in one place then in another. But they thus differ in figure, for that some of them are rowled up, to which nothing must be sowed, for that they ought to be of a due length to bind up the member: others are cut or divided, which truely consist of one piece, but that divided in the end (such are usually taken to bind up the breasts) or else in the midst; others are sowed together, which consist of many branches sowed together, and ending in divers heads, and representing divers figures, such are the Bandages appropriated to the head. But they thus differ in length, for that some of them are shorter, others longer: so in like sort for breadth; for some are broader, others narrower. Yet we cannot certainly define nor set down neither the length, nor breadth of Rowlers, for that they must be various, according to the different length and thickness of the members or parts. Generally they ought both in length and breadth to fit the parts, whereunto they are used. For these parts require a binding different each from other, the head, the neck, shoulders, arms, breasts, groins, testicles, fundament, hips, thighs, legs, feet and toes. For the parts of Bandages, we tearm one part their body, another their heads. By the body we mean their due length and breadth, but their ends, whether they run long-wayes or a-crosse, we according to *Galen*, term them their heads.

Com. ad sect. 22 sect. 2. de offic. chir.

CHAP. II. *Sheweth the indications and generall precepts of fitting of Bandages and Ligatures.*

THere are, in *Hippocrates* opinion, two indications of fitting Bandages or Ligatures; the one whereof is taken from the part affected, the other from the affect it self. From the part affected: so the leg, if you at any time bind it up, must be bound long-wayes, for if you bind it overthwart, the binding will loosen as soon as the Patient begins to go, and put forth his leg, for then the muscles take upon them another figure. On the contrary the Arm or Elbow must be bound up, bending in and turned to the breast, for otherwise at the first bending, if it be bound when it is stretched forth, the Ligature will be slacked, for that (as we formerly said) the figure of the muscles is perverted. Now for this indication, let each one perswade himself thus much, that the part must be bound up in that figure, wherein we would have it remain.

1. & 2. sect. lib. de fract.

Now for that indication which is drawn from the disease, if there be a hollow ulcer, sinuous and cuniculous, casting forth great store of *Sanies*, then must you begin the ligature and binding from the bottom of the *sinus*, and end at the orifice of the ulcer; and this precept must you alwayes observe, whether the *sinus* be sealed in the top, bottom, in middle, or sides of the ulcer. For thus the filth thereon contained shall be emptied and cast forth, and the lips of the ulcer too far separated, shall be joined together, otherwise the contained filth will eat into all that lyes neer it, increase the ulcer, and make it im-

We must alwaies begin our ligatures at the bottom of a *sinus*.

uncurable by rotting the bones which lye under it with this acrid *ſanies* or filth. But ſome Ligatures are remedies of themſelves, as thoſe which perform their duties of themſelves, and whereto the cure is committed, as are theſe which reſtore their native unitie, thoſe parts which are disjoined: others are not uſed for their own ſakes, but only to ſerve to hold faſt ſuch medicins as have a curative facultie. This kind of Ligature is either yet a doing, and is termed by *Hippocrates*, *Deligatio operans*; or elſe done and finiſhed, and is called, *Deligatio operata*: for the firſt, that the Ligature may be well made, it is fit that it be cloſe rowled together, and beſides, that the Surgeon hold it ſtiffe and ſtrait in his hand, and not careleſly, for ſo he ſhall bind up the member the better. Alſo he muſt in the binding obſerve, that the ends of the Rowler, and conſequently their faſtning may not fall to be on the affected or grieved part, for it is better that they come above or below, or elſe on the ſide: beſides alſo, he muſt have a ſpeciall care that there be no knot tyed upon the ſame place, or upon the region of the back, buttocks, ſides, joints, or back part of the head, or to conclude in any other part upon which the Patient uſes to lean, reſt or lye. Alſo on that part where we intend to ſow or faſten the Rowlers, you muſt double in their ends, that ſo the faſtning or ſuture may be the ſtronger, otherwiſe how cloſe ſoever they ſhall be wrapped or rowled about the member, yet will they not remain firm, eſpecially if they be of a great breadth. For the ſecond kind of Ligature, to wit, that which is already done and finiſhed; the Surgeon, the performer thereof, muſt conſider to what end it was done, and whether he hath performed it well and fitly, as alſo neatly and elegantly, to the ſatisfaction both of himſelf and the beholders. For it is the part of a skilfull Workman every where handſomely and rightly to perform that which may ſo be done.

Hip. cent. 4. Sect 2. offic.

Initio 2 ſect. off.

Ligatures muſt not be only lightly, but alſo neatly performed.

In fractures and luxations and all diſlocations of bones, as alſo in wounds and contuſions, you muſt begin your bandage with two or three windings or wraps about upon the place, and that (if you can) more ſtraitly than in other places, that ſo the ſet bones may be the better kept in their places, and that the humors, if any be already fallen thither, may by this ſtrait compreſſion be preſſed forth, as alſo to hinder and prevent the entrance in of any other which may be ready to fall down. But in fractures (as thoſe which never happen without contuſion) the blood flowes, and is preſſed forth of its proper veſſels, as thoſe which are violently battered and torn, which cauſes ſugillation in the neighbouring fleſh, which firſt looks red, but afterwards black and blue by reaſon of the corruption of the blood poured forth under the skin. Wherefore after theſe firſt windings, which I formerly mentioned, you muſt continue your rowling a great way from the broken or luxated part; he which does otherwiſe, will more and more draw the blood and humors into the affected part, and cauſe Impoſtumes, and other malign accidents. Now the blood which flowes, goes but one way downwards, but that which is preſſed is carryed as it were in two paths, to wit, from above downwards, and from below upwards. Yet you muſt have a care that you rather drive it back into the body and bowels, then towards the extremities thereof, as being parts which are uncapable of ſo much matter, and not furniſhed with ſufficient ſtrength to ſuffer that burden, which threatens to fall upon it, without danger and the increaſe of prenaturall accidents. But when this maſſe and burden of humors is thruſt back into the body, it is then ruled and kept from doing harm by the ſtrength and benefit of the faculties remaining in the bowels and the native heat.

Gal. com. 2 ſent. 25. ſect 1. lib. de fract.

CHAP. III. *Of the three kinds of Bandages neceſſary in fractures.*

Sent. 24. ſect. 2. offic.

TWo ſorts of Ligatures are principally neceſſary for the Surgeon, according to *Hippocrates*, by which the bones aſwell broken as diſlocated may be held firm when they are reſtored to their naturall place.

Hypodeſmides.

Of theſe ſome are called *Hypodeſmides*, that is, Under-binders: others, *Epideſmi*, that is, Over-binders. There are ſometimes but two under-binders uſed, but more commonly three. The firſt muſt firſt of all be caſt over the fracture, and wrapped there ſome three or foure times about, then the Surgeon muſt mark and obſerve the figure of the fracture, for as that ſhall be, ſo muſt he vary the manner of his binding. For the Ligature muſt be drawn ſtrait upon the ſide oppoſite to that whereto the luxation or fracture moſt inclines, that ſo the bone which ſtands forth may be forced into its ſeat, and ſo forced may be the more firmly there contained. Therefore if the right ſide be the more prominent or ſtanding forth, thence muſt you begin your ligation, and ſo draw your ligature to the left ſide. On the contrary, if the left ſide be more prominent, beginning there, you ſhall goe towards the oppoſite ſide in binding and rowling it. Here therefore would I require a Surgeon to be *Ambidexter*, (i.) having both his hands at command, that ſo he may the more exquiſitely perform ſuch variety of ligations. But let him in rowling, bend or move this firſt ligature upwards, that is, towards the body, for the former reaſons. But neither is this manner of ligation peculiar to fractures, but common to them with luxations: for, into what part ſoever the luxated bone flew, then when it is reſtored, that ſide muſt be bound the more looſly and gently whence it departed, and that on the contrary more hard unto which it went. Therefore the ligature muſt be drawn from the ſide whereunto the bone went; ſo that on this ſide it be more looſe and ſoft, and not ſtraitly preſſed with boulſters or rowlers, that ſo it may be more inclined to the ſide oppoſite to the luxation. If the ligation be otherwiſe performed, it ſucceeds not well, for the part is relaxed, and moved out of its natural ſeat: wherefore there will be no ſmall danger, leſt the bone be forced out again, and removed from its place, whereinto it was reſtored by art and the hand. Which thing *Hippocrates* ſo much feared, that on the contrary he willed that the ſet bone ſhould be drawn ſomewhat more unto the part contrary to that whereunto it was driven by force, than the naturall and proper ſite thereof ſhould require. But to return to our former diſcourſe of the three Ligatures: The firſt underbinder being put on, we then take the ſecond, with which we in like ſort begin at the fracture, but having wrapped it once or twice about

but there, for that, as we formerly said, we must not force back, and presse so much blood towards the extremities, as we must do towards the body and bowels. Wherefore this Ligature shall be drawn from above downwards, gently straining it to presse forth the blood contained in the wounded part: When by rowling you shall come to the end of the part, then you shall carry back again that which remains thereof, to wit, upwards. But otherwise you may take the third under-binder, wherewith you may begin to rowle, whereas you left with the second, & you may carry it thus rowling it from below upwards. These under-bindings thus finished, apply your boulsters, after them your over or upper-bindings, which are sometimes two, but sometimes three. The first hath two heads, and is wrapped both from the right hand and the left, for the preservation of the first under-binder and the boulsters, and restoring the muscles to their native figure. The two other which remain, consist of one head, and the one of them must be rowled from below upwards, the other from above downwards, after such a manner, that they may be directly contrary to the under-binders, as if they were rowled from the right hand, that these must be from the left. Now this is the manner of Hippocrates his Ligation, which, for that it is now grown out of use, we must here set down that which is in common use. They do not at this time use any over-binders, such as which we termed the third under-binder serves our Surgeons in stead of the three foremention'd over-binders. Wherefore they carry this third under-binder, wrapped from below upwards (as we formerly said) contrary to the first and second under-binder, as if these began on the right side, this shall be rowled from the left, and shall end where the first under-binder ended. And you must not only draw it indifferently hard, but also make the spires and windings more rare. This third rowler is of this use in this manner of Ligation, that is, it restores the muscles to their native figure, from whence they were somewhat altered by the drawing and rowling of the two former Ligatures. But you must always have regard, that you observe that measure in wrapping your Ligatures, which reason, with the sense of the Patient, and ease in suffering, prescribes, having regard that the tumor become not inflamed. Also the habit of the body ought to prescribe a measure in Ligation: for tender bodies cannot away with so hard binding as hard. Verily, in fractures and luxations, the humors by too strait binding are pressed into the extreme parts of the body, whence grievous and oft-times enormous Oedema's proceed; for healing whereof the Ligature must be loosed, and then the cumbred parts pressed by a new rowling, which must be performed from below upwards, and so, by forcing the matter of the tumor thither, it may be helped; for there is no other hope or way to drive the tumor back again. He which doth this, forsakes the proper cure of the disease, so to resist the symptome, which the Surgeon shall never refuse to do, as often as any peculiary cause shall require it. For this cause *Hippocrates* bids, that the bandages be loosed every three dayes, and then to foment the part with hot water, that to the humors, which (drawne thither by the vehemency of pain) have setled in the part, may be dissolved and dispersed, and itching and other such like symptomes prevented. The sum of all accidents being put, let the Ligation be sooner or later loosed, and more slacked then it formerly was accustomed, that to the blood and laudable matter, whereof a *Callus* may ensue, may flow more freely to the affected part.

When the third under-binder is necessary. *Epidemi.*

The manner of binding now in use.

What mean to be observed in wrapping the Ligatures.

Why *Hippoc.* bids to loose the Ligatures every third day.

CHAP. III. *Of the binding up of Fractures associated with a wound.*

How to bind up a Fracture with a wound.

IT sometimes happens, that a Fracture is associated by a wound, and yet for all this it is fit to bind the part with a Ligature, otherwise there will be no small danger of swelling, inflammation, and other ill accidents, by reason of the too plentifull afflux of humors from the neighbouring parts. But it is not fit to endeavour to use that kind of binding which is performed with many circumvolutions or wrappings about. For seeing the wound must be dressed every day, the part must each day necessarily be stirred, and the Ligature consisting of so many windings, loosed; which thing will cause pain, and consequently hinder the knitting and uniting, which is performed by rest. Therefore this kind of binding may be performed by one only rowling about the wound, and that with a rowler which consists of a twice or thrice doubled cloth, made in manner of a boulster, and sewed with as much convenience as you can, that it may be so large as to encompasse and cover all the wound, for these reasons, which shall be delivered in large in our Treatise of Fractures. But if the wound run long-ways, let the boulsters and splints be applyed to the sides of the wound, that so the lips of the wound may be pressed together, and the contained filth pressed forth. But if it be made overthwart, we must abstain from boulsters and splints: for that, in *Galen's* opinion, they would dilate the wound, and the purulent matter would be pressed out, and cast back into the wound.

Ad sent. 12. sect. de fract.

CHAP. V. *Certain common precepts of the binding up of Fractures and Luxations.*

IN every Fracture and Luxation, the depressed, hollow and extenuated parts, such as are neer unto the joints, ought to be filled up with boulsters, or clothes put about them, so to make the part equall: that so the Ligature may be equally and on every side pressed by the splints, and the bones more firmly contained in their seats. So when the knee is bound up, you must fill the ham or that cavity which is there, that so the ligature may be the better and speedilier performed. The same must be done under the arm-pits about the heel in the ankle and the wrist, and, to conclude, in all other parts which have a cavitie or inequality by reason of some manifest cavitie. When you have finished your binding, then enquire of the Patient whether the member seem not to be bound too strait. For if he say, that he is unable to endure it, for that it causeth pain, then must the binding be found to be too strait. For, too strait binding causeth pain, heat, defluxions, gangrene, and lastly, a spasme or convulsion: but too loose is unprofitable, for that it doth not contain the parts in their due site, as we desire to do by the help of a just ligature, that is neither too strait nor too loose. If the swelling day the part be swoln with an inflammatous tumor, caused

Hipp. sect. 37. & 38. sect. 1. de fract.

The fault of too strait and loose binding.

caused by the blood pressed forth of the broken place, but of too strait ligation, if the part be hard swoln and of too loose, if it be no whit swoln, as that which hath pressed no blood out of the affected part. Now if a hard tumor, caused by too strait binding, trouble the Patient, it must presently be loosed, for fear of more grievous symptomes, and the part must be fomented with warme *Hydrolæum*, and another ligature different, yea verily, more loose ligature must be made in stead thereof, as long as the pain and inflammation shall continue; in which time and for which cause, you shall lay nothing upon the part which is any thing burdensome. When the patient begins to recover, for three or four dayes space, especially if you find him of a more compact habit and a strong man, the ligature must be kept firm and not loosed. If on the third day, and so untill the seventh, the spires or windings be found more loose, and the part affected more slender; then we must judge it to be for the better. For hence you may gather, that there is an expulsion and digestion of the humors, causing the tumor made by force of the ligation. Verily, broken bones fitly bound up, are better set, and more firmly agglutinated, which is the cause why in the place of the fracture the ligation must be made the straiter, in other places more loosly. If the fractured bone stand forth in any part, it must there be more straitly pressed with boulsters and splints. To conclud, the seventh day being past, we must bind the part more straitly then before: for that then inflammation, pain and the like accidents are not to be feared. But these things which we have hitherto spoken of the three kinds of Ligatures, do not take place in each fractured part of the body, as in the chaps, collar-bones, head, nose, ribs. For, seeing such parts are not round and long, a Ligature cannot be wrapped about them, as it may on the arms, thighs, and legs, but only be put on their outsides.

VVhy we must make more strait ligation on the broken part.

CHAP. VI. *The uses for which Ligatures serve.*

BY that which we have formerly delivered, you may understand that Ligatures are of use to restore those things which are separated and moved forth of their places, and join together those which gape; as in fractures, wounds, contusions, sinewous ulcers, and other like affects against nature, in which the solution of continuity stands in need of the help of Bandages, for the reparation thereof. Besides also, by the help of Bandages these things are kept asunder or separated, which otherwise would grow together against nature; as in Burns, wherein the fingers and the hams would mutually grow together; as also the Arm-pits to the Chest, the Chin to the Breast, unlesse they be hindred by due ligation. Bandages do also conduce to refresh emaciated parts: wherefore if the right leg wast for want of nourishment, the left leg, beginning at the foot, may be conveniently rowled up even to the groin. If the right arm consume, bind the left with a strait Ligature, beginning at the hand, and ending at the arm-pit. For thus a great portion of blood from the bound-up part is sent back into the *vena cava*, from whence it regurgitates into the almost empty vessels of the emaciated part. But I would have the sound part to be so bound, that thereby it become not painfull, for a dolorifick ligation causes a greater attractation of blood and spirits, as also exercise: wherefore I would have it during that time to be at rest, and keep holy-day. Ligatures also conduce to the stopping of bleedings: which you may perceive by this, that when you open a vein with your lancet, the blood is presently stayed, laying on a boulster and making a Ligature. Also Ligatures, are usefull for women presently after their delivery; for their womb being bound about with Ligatures, the blood wherewith their womb was too much moistened, is expelled, the strength of the expulsive faculty being by this means stirred up to the expulsion thereof: and it also hinders the empty womb from being swoln up with wind, which otherwise would presently enter thereinto. This same Ligature is a help to such as are with child, for the more easie carrying of their burden; especially those whose Child lyes so far down-wards, that lying as it were in the den of the hips, it hangs between the thighs, and so hinders the free going of the mother. Therefore the woman with child is not only eased by this binding of her womb with this Ligature, which is commonly termed, the navill Ligature; but also, her child being held up higher in her womb, she hath freer and more liberty to walk. Ligatures are in like sort good for revulsion and derivation; as also for holding of medicins which are laid to a part, as the neck, breast or belly. Lastly, there is a triple use of Ligatures in amputation of members, as arms and legs. The first to draw and hold upwards the skin and muscles lying under it, that the operation being performed, they may, by their falling down again, cover the ends of the cut-off bones; and so by that means help forwards the agglutination and cicatrization; and when it is healed up, cause the lame member to move more freely, and with lesse pain; and also to performe the former actions, this, as it were, cushion or boulster of musculous flesh lying thereunder. The second is, they hinder the bleeding by pressing together the veins and arteries. The third is, they by strait binding intercept the free passage of the animall spirits, and so deprive the part which lyes thereunder of the sense of feeling, by making it, as it were, stupid or num.

The first benefit of Ligatures.

The second.

The third.

The fourth.

The fifth.

The sixth.

The seventh

The eighth, the particular use of ligatures in the amputation of members.

CHAP. VII. *Of Boulsters or Compresses.*

BOulsters have a double use; the first is to fill up the cavities and those parts which are not of an equall thickness to their end. We have examples of cavities in the Arm-pits, Clavicles, Hams and Groins; and of parts which grow small towards their ends, in the arms towards the wrests, in the legs towards the feet, in the thighs towards the knees. Therefore you must fill these parts with boulsters & linnen cloths, that so they may be all of one bignes to their ends.

The first use of Boulsters

The second use of them.

The second use of boulsters is to defend and preserve the first two or three Rowlers or Under-Bindings, the which we said before must be applyed immediately to the fractured part. Boulsters, according to their twofold use, differ amongst themselves, for that when they are used in the first mentioned kind, they must be applyed athwart; but when in the latter, long-wayes or down-right.

The third use of them.

You may also use Boulsters, lest the too strait binding of the Ligatures cause pain and trouble to the

new

new set bones. A three or four times doubled cloth will serve for the thickness of your Boulsters, but the length and breadth must be more or less, according to the condition of the parts and disease for which they must be applyed.

CHAP. VIII. *Of the use of Splints, Junks, and Cases.*

HAving delivered the uses of Ligattures and Boulsters, it remains that we say somewhat of the other things, which serve to hold the bones in their places; as Splints, Junks, Cases, and such other like. Splints are made and composed of past-bord, of thin splinters of wood, of leather, such as shoo-soals are made with, of the rinds of trees, or plates of latin, or lead, and such other like, which have a gentle and yeelding stifness; yet would I have them made as light as may be, lest they by their weight become troublesome to the affected part. But for their length, breadth, and number, let them be fitted agreeable to the part whereto they must be used. Let also their figure be streight or crooked according to the condition of the member whereto they must be applyed. You must have a speciall care, that they run not so far as the swellings out, or eminencies of the bones; as the ancles, knees, elbows, and the like, lest they hurt them by their pressure: also you must have a care, that they be smaller at their ends, and thicker in their middles, whereas they lye upon the broken bone. The use of splints is, to hold fast and firm, that they may stir no way the broken and luxated bones, after they be set and restored to their places. That they performe this use, it is fit there be no thick boulsters under them, nor over many rowlers, for so through so thick a space, they would not so straitly presse the part. Junks are made of sticks the bigness of ones finger, wrapped about with rushes, and then with linnen cloth: they are principally used in fractures of the thighs and legs. Cases are made of plates of latin, or else of some lighter wood; their use is, to contain the bones in their due figure, when the Patient is to be carried out of one bed or chamber into another, or else hath need to go to stool: lastly, if we must rest somewhat more strongly upon the broken or luxated members, these Cases will hinder the bones from stirring or flying out on the right side or left, above or below, we sleeping or waking, being willing or unwilling; and in like sort lest being not as yet well knit, or more loosly bound up for fear of pain, inflammation, or a gangrene, they hang downe, fall, or fly in sunder by reason of the inequalities of the bed. Such Cases, Junks, and the like, which serve for restoring and fast holding of broken and luxated bones, we may, according to *Hippocrates* his mind, call them in generall *Glossocomia*. All which things, the young Surgeon, which is not as yet exercised in the works of Art, can scarce tell what they are. But in the mean time, whilest that he may come to be exercised therein, or see others perform these operations, I, as plainly as possibly I could, have in words given him their portraiture or shape.

The matter of Splints.

Their use.

What Junks are.

The end of the Fourteenth Booke.

OF FRACTVRES.

THE FIFTEENTH BOOK.

CHAP. I. *What a Fracture is, and what the differences thereof are.*

A Fracture, in *Galens* opinion, is the solution of continuity in a bone, which by the Greeks is called *Catagma*. There are many sorts of hurting or offending the bones: as the drawing them asunder, luxation, or putting them out of joint; their unnaturall growing together, their cutting or dividing asunder, contution, abscesse, putrefaction, rottennesse, laying bare the *periosteum* being violated or lost; and lastly, that whereof we now treat, a Fracture. Again, the varieties of Fractures are almost infinite. For one is compleat and perfect, another imperfect, one runs long-wise, another transverse, another oblique; one while it is broken into great pieces, another while into little and small scales, which have either a blunt, or else a sharp end, and prick the adjacent bodies of the muscles, nerves, veins or arteries. It sometimes happens, that the bone is not broken into splinters, that is, long-wayes, but together, and at once into two peeces overthwart, which Fracture is called *Raphanedon*, that is, after the manner of a Radish.

A Fracture is made *Caryedon*, or like a nut, when as the bone flyes into many small peeces, severed each from other, as when a Nut is broken with a hammer, or mallet upon an Anvile: Which fracture is also termed *Alphitidon*, by reason of the resemblance it hath to meal or flour; and such is often seen in fractures made by bullets, shot out of guns and such fiery Engins. Contrary to these are those fractures which are called *Schidacidon*, as rent into splinters, or after the manner of a boord or peece of timber, that is, right-down, and alongst the bone; and these fractures are either apparent to the eye, or else not apparent, and therefore called Capillarie, being so small, as that they cannot be perceived by the eye, unlesse you put ink upon them, and then shave them with your Scrapers. Sometimes the bone is only pressed down with the stroke, sometimes on the contrary it flyes up, as if it were vaulted. They call it attrition, when the bone is broken into many small fragments, and as it were scales or chips. The fragments of fractured bones are sometimes smooth and polished, otherwhiles unequall, and as it were

Lib. 6. method.

What it is for a bone to be broken *Raphanedon*.

What *Caryedon*, or *Alphitidon*.

What *Schidacidon*.

were sharp and rough with little teeth, or pricks. Some fractures touch only the surface of the bone, fetching off only a scale; othersome change not the site of fractured bones, but only cleaves them length-wayes, without the plucking away of any fragment; othersome penetrate even to their marrow. Furthermore some fractures are simple and alone by themselves; othersome are accompanied with a troop of other affects and symptomes; as a wound, hæmorrhagie, inflammation, gangrene, and the like. Hereunto you may also adde the differences drawn from the parts which the Fractures possesse; as from the head, ribs, limbs, joints, and other members of the body. Adde also these which are taken from the habit of bodies, aged, young, full of ill humors, well tempered; almost all which have their proper and peculiar indications for curing. Now the causes of Fractures, are the too violent assaults or stroaks of all externall things, which may cut, bruise, break, or shake: in this number of causes may also be reckoned fals from high places, and infinite other things, which would be long and tedious to reckon up.

The causes of fractures.

CHAP. II. *Of the signs of a Fracture.*

WE may know by evident signs that a bone is broken: the first whereof and most certain is, when by handling the part which we suspect to the broken, we feel peeces of the bone severed asunder, and hear a certain crackling of these peeces under our hands, caused by the attrition of the shattered bones. Another sign is taken from the impotency of the part, which chiefly bewrayes it self, when both the bones, the leg, and brace-bones, the ell and wand are broken. For if only the brace-bone or wand be broken, the Patient may go on his leg, and stir his arm: for the brace-bone serves for the sustaining of the muscles, and not of the body, as the leg bone doth. The third sign is drawn from the figure of the part changed besides nature: for it is there hollow, from whence the bone is flown or gone, but gibbous or bunching out whither it is run. Great pain in the interim tormens the Patient by reason of the wronged *periosteum*, and that membrane which involves the marrow and the sympathy of the adjacent parts which are compressed or pricked.

The first sign of a broken bone.

Another.

A third.

CHAP. III. *Of prognosticks to be made in Fractures.*

WE must prognosticate in Fractures whether they are to end in the destruction or welfare of the Patient; or whether their cure shall be long or short, easie, or else difficult and dangerous; and lastly, what accidents & symptomes may happen thereupon. He shall easily attain to the knowledg of all these things, who is not only well seen in the anatomicall description of the bones, but also in the temper, composition and complexion of the whole body. Wherefore in the first place, I think good to admonish the Surgeon of this, that in winter when all is stiffe with cold, by a little fall, or some such sleight occasion, the bones may be quickly and readily broken. For then the bones, being dried, by the dryness of the air encompassing us, become more brittle; which every one of the Vulgar usually observe to happen both in waxen and tallow candles: but when the season is moist, the bones are also more moist, and therefore more flexible and yeelding to the violence of the obvious and offending body. Wherefore also you may gather this to the framing of your Prognosticks, That bones by reason of their naturall drineſs are not so easily agglutinated and consolidated as flesh; though in Children, according to *Galen*, by reason of the abundance of their humidity, the lost substance may be repaired, according (as they term it) to the first intention, that is, by restoring of the same kind of substance or matter. But in others, about the Fractures a certain hard substance usually concreats, of that nourishment of the broken bone which abounds, which glues together the fragments thereof, being fitly put together. This substance is then termed a *Callus*, and it is so hardened in time, that the bone thereafter in the broken part is seen to be more firm and hard, than it is in any other: therefore that usuall saying in Physick is not without reason; That rest is necessary for the uniting of broken bones. For the *Callus* is easily dissolved, if they be moved before their perfect and solid agglutination. The matter of a *Callus* ought to be indifferent and laudable in quantity and quality, even as blood which flowes for the regeneration of the lost flesh in wounds. It is fit that there may be sufficient matter for such a *Callus*, that the parts have a laudable temper, otherwise there either will be no *Callus*, or certainly it will grow more slowly. Fractures are far more easily repaired in young bodies than in old: for in these there is plenty of the primigenious and radicall moisture, that is laudably holding and glutinous; and in the other there is store of watrish, and excrementitious. By this you may easily conjecture, that you cannot certainly set down a time necessary for the generating a *Callus*: for in some it happens later, in some sooner: the cause of which variety is also to be referred to the constitution of the year and region, the temper and diet of the Patient, and manner of Ligation. For, those Patients whose powers are weak, and blood watrish and thin, in these the generation of a *Callus* uses to be more slow: On the contrary, strong powers hasten to agglutinate the bones, if there be plenty of grosse and viscous matter; whereby it comes to passe, that meats of grosse nutriment are to be used, and medicins applyed which may help forwards the endeavour of nature, as we shall declare hereafter. When the bones are broken near unto the joints, the motion afterwards uses to be more difficult, especially if the *Callus*, which is substituted, be somewhat thick and bunching forth. But if, together with the violence and force of the Fracture, the joints shall be broken and bruised, the motion will not only be lost, but the life brought in danger, by reason of the greatness of the inflammation, which usually happens in such affects, and the excesse of pain in a tendinous body. These fractures wherein both the bones of the arm or leg are broken, are more difficult to cure, than those which happen but to one of them. For they are handled and kept in their places with more difficulty,

Why bones are more brittle in frostie weather.

Why the solution of continuity in bones is not so easily repaired. *Gal. in arte par.*

Why bones sooner knit in young bodies.

Meats of grosse and tough nourishment conduce to the generation of a *Callus*.

Fractures at joint dangerous.

ficulty, because that which remains whole, serves the other for a rest or stay to which it may lean. Moreover, there is longer time required to substitute a *Callus* to a great bone, than to a little one. Again these bones which are more rare and spungie, are sooner glued together by the interposition of a *Callus*, than these which are dense and solid. A *Callus* sooner growes in sanguin, than in cholerick bodies. But broken bones cannot be so happily agglutinated, nor restored in any body, but that alwayes some asperity or unequall protuberancy may be seen on that part where the *Callus* is generated. Wherefore the Surgeon ought to make artificiall Ligations, that the *Callus* may not stand out too far, nor sink down too low. That Fracture is least troublesome which is simple; on the contrary, that is more troublesome which is made into splinters; but that is most troublesome and worst of all which is in small and sharp fragments, because there is danger of convulsion by pricking a nerve, or the *periosteum*. Sometimes the fragments of a broken bone keep themselves in their due place: they also oft-times fly forth thereof, so that one of them gets above another; which when it happens, you may perceive an inequality by the depression of the one part and the bunching forth of the other, as also pain by the pricking: besides also the member is made shorter than it was, and than the sound member on the opposite side is, and more swoln by the contraction of the muscles towards their originall. Wherefore when a bone is broken, if you perceive any thing so depressed, presently putting your hand on both sides above and below, stretch forth the bone as forcibly as you can; for otherwise, the muscles and nerves, stretched and contracted, will never of their own accord suffer the bones to be restored to their proper seat and themselves. This extension must be performed in the first dayes, for afterwards there will happen inflammation: which being present, it is dangerous to draw the nerves and tendons too violently; for hence would ensue an impostume, convulsion, gangrene and mortification. Therefore *Hippocrates* forbids you to defer such extension untill the third, or fourth day. Fractures are thought dangerous, whose fragments are great, and fly out, especially in these bones which are filled with marrow on the inside. When broken or dislocated bones cannot be restored to themselves and their naturall place, the part wasts for want of nourishment; both for that the naturall site of the veins, arteries and nerves is perverted, as also because the part it self lies immovable, or scarce movable: whereby it cometh to passe, that the spirits do not freely flow thereto, as neither the nutritive juice cometh thither in sufficient plenty. When the dislocated or broken member is troubled with any great inflammation, it is doubtfull whether or no a convulsion will happen, if we attempt to restore it, or the parts thereof to their seat: therefore it is better, if it may be done, to defer the reducing thereof so long, untill the humor which possesses the part be dissolved, the tumor abated, and the bitterness of pain mitigated.

Hipp. sect. 18. & 19. sect. 1. de fracturis.

Ligations conduce to the handsomnes of a *Callus*.

Extention must presently be made after the bone is broken.

Sent. 36. sect. 3. de fract.

In inflammations the restoring of the bone must not be attempted.

CHAP. IV. *The generall cure of broken and dislocated bones.*

TO cure a broken and dislocated bone, is to restore it to its former figure and site. For the performance whereof, the Surgeon must propose three things to himself: The first is, to restore the bone to its place; The second is, that he contain or stay it being so restored: The third is, that he hinder the increase of malign symptomes and accidents; or else if they do happen, that then he temper and correct their present maliguity. Such accidents are pain, inflammation, a feaver, abscesse, gangrene and sphacell. For the first intention, you may easily restore a broken or dislocated bone, if presently, as soon as the mischance is got, or else the same day, you endeavour to restore it: for the bitterness of pain or inflammation, which may trouble the Patient, is not as yet very great, neither is the contraction of the muscles upwards as yet very much or stubborn. Therefore first of all, the Patient with his whole body, but especially with the broken or dislocated part, as also the Surgeon, must be in some place which hath good and sufficient light. Then let trusty and skilfull attendants be there, good ligatures, and also, if need so require, good engins. His friends which are present, let them see and hold their peace, neither say, nor do any thing which may hinder the Work of the Surgeon. Then putting one hand above, that is, towards the center of the body, and the other below, as neer as he can to the part affected, let him stretch forth the member: for if you lay your hand any distance from the part affected, you will hurt the sound part by too much compression, neither will you much avail your self by stretching it at such a distance. But if you only endeavour below with your hand or ligature, assisting to make extension thereof, it will be dangerous if there be nothing above which may withstand or hold, lest that you draw the whole body to you. This being done, according as I have delivered, it is fit the Surgeon make a right or streight extension of the part affected: for when the bone is either broken or out of joint, there is a contraction of the muscles towards their originall, and consequently of the bones by them, as it is observed by *Galen*. Wherefore it is impossible to restore the bones to their former seat, without the extension of the muscles. But the part being thus extended, the broken bones will sooner and more easily be restored to their former seat. Which being restored, you shall presently with your hand presse it down, if there be any thing that bunches or stands out. And lastly you shall bind it up, by applying boulsters and splints as shall be fit. But if the bone be dislocated or forth of joint, then presently after the extension thereof, it will be requisite to bend it somewhat about, and so to draw it in. The Surgeon is sometimes forced to use engins for this work; especially if the luxation be inveterate, if the broken or luxated bones be great; and that in strong and rustick bodies, and such as have large joints: for that then there is need of greater strength, than is in the hand of the Surgeon alone. For, by how much the muscles of the Patient are the stronger, by so much will they be contracted more powerfully upwards towards their originals. Yet have a care that you extend them not too violently, lest by rending and breaking asunder the muscles and nerves, you cause the forementioned symptomes, pain, convulsion, a palsie and gangrene: all which sooner happen to strong and aged bodies, than to children, eunuches, women, youths, and generally all moist bodies,

Three things to be performed in curing broken and dislocated bones.

How to put the bones to their places.

Hipp. sent. 60. sect. 2. de fract.

Advent. 1. sect. 1. de fract.

When instruments or engins are necessary.

What bodies are sooner hurt by violent extension.

for that they are less hurt by violent extension and pulling, by reason of their native and much humidity and softness. For thus skins of leather, moistened with any liquor, are easily retched, and drawn out as one pleaseth: but such as are dry and hard, being lesse tractable, will sooner rend and tear, than stretch further out. Therefore the Surgeon shall use a mean in extending and drawing forth of members, as shall be most agreeable to the habits of the bodies. You may know the bone is set, and the setting performed as is fit, if the pain be asswaged; to wit, the fibres of the muscles, and the other parts being restored to their former site, and all compression, which the bones moved out of their places have made, being taken away; if, to your feeling there be nothing bunching out, nor rugged, but the surface of the member remain smooth and equall; and lastly, if the broken or dislocated member compares with its opposite in the composure of the joints, as the knees and ancles answer justly and equally in length and thickness. For which purpose it must not suffice the Surgeon to view it once, but even as often as he shall dresse it. For it may happen, that the bone which is well set, may by some chance, as by the Patients unconsiderate turning himself in his bed, or as it were a convulsive twitching of the member or joints whilst he sleeps, the muscles of their own accord contracting themselves towards their originals, that the member may again fall out; and it will give manifest signs thereof by renewing the pain, by pressing or pricking the adjacent bodies: which pain will not cease, before it be restored to its place: and hereof the Surgeon ought to have diligent care. For if, whilst the *Callus* is in growing, one bone ride over another, the bone it self will afterwards be so much the shorter, and consequently the whole member; so that if this errour shall happen in a broken leg, the Patient will halt ever after, to his great grief, and the Surgeons shame. Wherefore the Patient shall take heed, as much as in him lyes, that he stir not the broken member, before that the *Callus* be hardned. Such diligent care needs not be had in dislocations. For these once set, and artificially bound up, do not afterwards so easily fall forth as broken bones. The second scope is, that the bones wich shall be restored may be firmly kept in their state and place. That shall be done by Bandages; as ligatures, boulsters, and other things, whereof hereafter we shall make particular mention. Hither tend proper and fit medicins, to wit, applying of oil of Roses with the whites of Egs, and the like repelling things; and then resolving medicins, as the present necessity shall require. It will be convenient, to moisten your rowlers & boulsters in oxycrate for this purpose, or else in Rose vinegar, if the Fracture be simple, or with red wine, or the like liquor warm (in *Galens* opinion) if a wound be joined to the fracture; and it will be fit to moisten fractures oftner in Summer: For so the part is strengthened, the defluxion being repelled, whereby the inflammation and pain are hindred. You must desist from humecting and watering the part when the symptomes are past, lest you retard the generating of a *Callus*; for which you must labour by these means which we shall hereafter declare. To this purpose also conduces the rest and lying of the part in its proper figure and site accustomed in health, that so it may the longer remain in the same place unstirred. Besides also, it is expedient then only to dresse the part, when it is needfull, and with those things that are requisite, shunning, as much as may be, inflammation and pain. That figure is thought the best, which is the middle, that is, which contains the muscles in their site, which is without pain; so that the Patient may long endure it without labour or trouble. All these things being performed, the Patient must be asked, whether the member be bound up too strait? If he answer, No, (unlesse peradventure a little upon the fracture or luxation, for there it is fit it should be more straitly bound) then may you know that the binding is moderate. And this same first ligation is to be kept in fractures without loosing for three or four dayes space, unlesse peradventure pain urge you to the contrary. In dislocations the same binding may be kept for seven or eight dayes, unless by chance some symptome may happen, which may force us to open it before that time: for the Surgeon must with all his art have a care to prohibit the happening of evill accidents and symptomes, which, how he may bring to passe, shall be declared in the following Chapter.

Signs of a bone well set.

Causes and signs of the relapse of a set bone.

Ad sent. 21. sect. 1. de fract.

VWhat the middle figure is and why best.

Fit time for loosing of Ligatures in fractures and dislocations.

CHAP. V. *By what means you may perform the third intention in curing fractures and dislocations, which is, the hindring and correction of accidents and symptomes.*

Four choice means to hinder accidents.

THat we may attain unto this third scope, it is requisite we handle as gently and without pain, as we may, the broken or dislocated member, we drive away the defluxion ready to fall down upon the part by medicins, repelling the humor, and strengthening the part; we, by appointing a good diet, hinder the begetting of excrements in the body, and divert them by purging and phlebotomy. But if these accidents be already present, we must cure them according to the kind and nature of each of them: for they are various. Amongst which is reckoned itching, which in the beginning torments the Patient: this ariseth from a collection and suppression of subacrid vapours, arising from the blood, and other humors under the skin. Whence a light biting, which causeth a simple itch, or else a more grievous and acrid one, from whence (in *Galens* opinion) proceeds a painfull itching. Wherefore such matter, as the cause, being evacuated, all itching ceaseth. But this cannot easily and freely be evacuated and breathed out, because the pores of the part are shut up, and as it were oppressed with the burden of the emplaisters, boulsters, and ligatures, which are put about the part. Hereunto may be added, that the part its self doth not so perfectly perform and enjoy its wonted faculties and actions: by which it commeth to passe, that the heat thereof is more languid than may suffice to discusse the fuliginous matter there collected. Wherefore it will be convenient to loose the ligatures every third day, that as by loosing their tyes, their sanious and fuliginous excrements, shut up under the skin, may freely passe forth, lest in continuance they should fret and ulcerate it; as it happens to most of those who provide not for it by loosing their ligatures. Besides also, the part must be long fomented with hot water alone, or else with a decoction of sage, chamomile,

The causes and differences of itching.

Remedies against the itching.

rose,

roſes, and melilot made in wine and water: for long fomenting attenuates and evacuates, but ſhorter fils and mollifies, as it is delivered by *Hippocrates*. Alſo gentle frictions, performed with your hand, or a warm linnen cloth upwards, to the right ſide and left, and circularly to every ſide, are good. But if the skin be already riſen into bliſters, they muſt be cut, leſt the matter contained thereunder may corrode and ulcerate the skin: then muſt the skin be anointed with ſome cooling and drying medicin; as, *ung. album Camphoratum Rhaſis, Deſiccativum rubrum, unguentum roſatum ſine aceto*; adding thereto the powder of a rotten poſt, or prepared *Tutia*, or the like. Other accidents more grievous than theſe, do often happen, but we will treat of them hereafter. But if the ſcales of the bone underneath be quite ſevered from the whole, then muſt they be preſently taken forth, eſpecially if they prick the muſcles: but if the bone be broken into ſplinters, and ſo prominent out of the wounded fleſh as that it cannot be reſtored into its ſeat, it muſt be cut off with your cutting mallets, or parrats beak, as occaſion ſhall offer its ſelf. In the interim, you muſt have a care that the part enjoy perſpiration, and by change of place and riſing, now and then it may be as it were ventilated: alſo you muſt ſee that it be not over-burdened, neither too ſtrait bound, otherwiſe it will be apt to inflammation. Thus much concerning fractures and diſlocations in generall: now we muſt deſcend to particulars, beginning with the fracture of the Noſe.

Hipp. ſent. 46 ſect. 3. de fract.

CHAP. VI. *Of the Fracture of the Noſe.*

THe Noſe is griſtly in its lower part, but bony in the upper. Wherefore it ſuffers no fracture in the griſtly part (unleſs peradventure a *Sedes*) but only a depreſſion, diſtortion or contuſion. But a fracture often happens to the bony part, and ſo great a depreſſion to the inner ſide, that unleſs it be provided for by diligent reſtoring it, the noſe will become flat, or wreſted aſide, whence there will be difficulty of breathing. That this kind of fracture may be reſtored, that bone which ſtands too far out, muſt be preſſed down; but that which is depreſt, muſt be lifted up with a ſpathern, or little ſtick handſomely faſhioned and wrapped about with cotten or a linnen rag, ſo to avoid pain. Therefore you ſhall hold the ſpathern in one hand, and reduce and order it with the other. The bone being reſtored, directories or tents of a convenient bigneſs ſhall be put into the noſe; which tents ſhall be made of ſponge, or flax, or a peece of a beaſts or ſheeps lungs. For theſe things are ſoft, and do not only hinder the bones of the Noſe that they fall no more, but alſo lift them up higher. And then the Noſe ſhall be in ſome ſort ſtayed with boulſters on each ſide, even untill the perfect agglutination of the bones, leſt the figure and ſtraitneſs ſhould be vitiated and ſpoiled. I have oft times put golden, ſilver and leaden pipes into fractured noſes, and faſtned them with a thred to the Patients night-cap, which, by one and the ſame means, kept the bones from being again depreſt, gave the matter free paſſage forth, and nothing hindred the breathing. In the mean time we muſt ſee, that we do not preſſe the Noſe with too ſtrait binding, unleſſe peradventure ſome other thing perſwade; leſt they become either too wide, too flat, or crooked. If any wound accompany the fracture, that ſhall be cured after the ſame manner, as the wounds of the head. The fracture reſtored, the following medicin, which hath a faculty to repel and repreſſe the defluxion, to ſtrengthen and keep the part in its due poſture, and to dry up and waſt the matter which hath already fallen down, ſhall be applyed to the Noſe, and all the other dry parts. *℞ thuris, maſtiches, boli armeniæ, ſanguinis draconis, an. ℥ß. aluminis rochæ, reſinæ pini an. ʒij. pulveriſentur ſubtiliſſimè*: Or elſe, *℞ farinæ volatilis ℥ß. albuminum ovorum quantum ſufficit, incorporentur ſimul, & fiat medicamentum.*

Hipp. ſent. 46. ſect. 2. de art.

How to reduce the noſe into its naturall figure.

A fit aſtringent and drying medicin.

Neither ſhall you uſe any other art to cure the cartilagineous part of the noſe being fractured. Wherefore *Hippocrates* termes that ſolution of continuity what there happens, A fracture, as if it were in a bone; becauſe he could find no other name more fitly to expreſſe it: for a griſtle, next to a bone, is the hardeſt of all the parts of our body. A *Callus* uſes to grow in fractured noſes, unleſſe ſomething hinder within the ſpace of twelve or fifteen dayes.

Sent. 47. ſect. 2. de art. & Gal. in Comm.

CHAP. VII. *Of the fracture of the lower Jaw.*

THe lower Jaw runnes into two, as it were, horns or tops: the one whereof ends ſharp, and receives a tendon from the temporall muſcle; the other ends blunt and round under the mammillary proceſs; and it is there implanted in a ſmall cavity; it is joined together in the middle of the chin by *Symphyſis*, and is marrowie within. The Fracture, which happens thereto, is reſtored by putting your fingers into the Patients mouth, and preſſing them on the inſide and outſide, that ſo the fractured bones put together may be ſmoothed and united. But if they be broken wholly athwart, ſo that the bones lye over each other, extenſion muſt be made on both ſides on contrary parts, upwards and downwards, whereby the bones may be compoſed and joined more eaſily to one another. The teeth in the mean while, if they be either ſhaken or removed out of their ſockets, muſt be reſtored to their former places, and tyed with a gold or ſilver wyer, or elſe an ordinary thred, to the next firm teeth, untill ſuch time as they ſhall be faſtned, and the bones perfectly knit by a *Callus*. To which purpoſed the ordered fragments of the fractured bone ſhall be ſtayed, by putting a ſplint on the out ſide, made of ſuch leather as ſhoe ſoals are made; the midſt thereof being divided at the Chin, and of ſuch length and breadth as may ſerve the Jaw; then you ſhall make ligation with a ligature two fingers broad, and of ſuch length as ſhall be ſufficient, divided at both the ends; and cut longwayes in the midſt thereof, that ſo it may engirt the chin on both ſides. Then there will be four heads of ſuch a ligature ſo divided at the ends; the two lower whereof being brought to the crown of the head, ſhall be there faſtned and ſowed to the Patients night-cap. The two upper

A deſcription of the lower Jaw. The manner of reſtoring a broken Jaw.

The deſcription of a fit ligature for the under Jaw.

drawn athwart shall likewise be sowed as artificially as may be, to the cap in the nape of the neck. It is a most certain sign, that the Jaw is restored and well set, if the teeth fastened therein stand in their due rank and order. The Patient shall not lye down upon his broken jaw, lest the fragments of the bone should again fal out, and cause a greater defluxion: Unlesse inflammation, or some other grievous symptome shall happen, it is strengthened with a *Callus* within twenty dayes, for that it is spungious, hollow, and full of marrow, especially in the midst thereof: yet sometimes, it heals more slowly, according as the temper of the Patient is, which takes also place in other fractured bones. The agglutinating and repelling medicin, described in the former chapter, shall be used; as also others, as occasion shall offer it self. The Patient must be fed with liquid meats, which stand not in need of chewing, untill such time as the *Callus* shall grow hard, lest the scarce or ill-jointed fragments should fly in sunder with the labour of chewing. Therefore shall he be nourished with water-grewell, ponadoes, cullasses, barley creams, gellies, broths, rear egs, restaurative liquors, and other things of the like nature.

In what time it may be healed.

CHAP. VIII. *Of the fracture of the Clavicle or Collar-bone.*

Hipp. sent. 63 sect. 1. dearn.
